Dedicated to all the many contributors and supporters of Toronto Notes, both past and present, who have shaped the 2022 edition!

The *Toronto Notes for Medical Students* is dedicated to helping fund many charitable endeavours and medical student initiatives at the University of Toronto's Faculty of Medicine and beyond. Programs that have received *Toronto Notes for Medical Students* funding include:

Community Affairs Programs
Adventures in Science (AIS)
Adventures in Science (AIS) MAM
Allies Live Here
Altitude Mentoring
Altitude Mentoring MAM
Blood Drive
Exercise is Medicine
Growing Up Healthy
Growing Up Healthy MAM
Healing Tonics
Imagine
Immigrant and Refugee Equitable Access to Health Care (iREACH)
Kids2Hear
Kids2See
Kindler Arts
Noteworthy Music Program
Parkdale/Central Toronto Academy Mentorship Program
Saturday Program
Saturday Program MAM
Scadding Court Mentorship Program
Seniors Outreach
Smiling Over Sickness
Student-Senior Isolation Prevention Partnership (SSIPP)
Sun and Skin Awareness
Swimming With A Mission (SWAM)
Varsity Docs
Woodgreen Tutoring Program

Annual Showcase Events
Daffydil, in support of the Canadian Cancer Society
Earth Tones Benefit Concert

Scholarships and Bursaries
Memorial Funds
CaRMS bursary

Other Sponsorships
Community of Support
Indigenous Sutdent Mentorship Fund
Black Health Alliance
Ontario Medical Student's Weekend
Medical Student Research Day
Class formals and graduations

Note:

Many of you have wondered about the *Toronto Notes* logo, which is based on the rod of Asclepius, the Greek god of medicine. The rod of Asclepius consists of a single serpent entwined around a staff. This icon symbolizes both rebirth, by way of a snake shedding its skin, and also authority, by way of the staff.

In ancient Greek mythology, Asclepius was the son of Apollo and a skilled practitioner of medicine who learned the medical arts from the centaur Chiron. Asclepius' healing abilities were so great that he was said to be able to bring back people from the dead. These powers displeased the gods, who punished Asclepius by placing him in the sky as the constellation Orphiuchus.

The rod of Asclepius is at times confused with the caduceus, or wand, of Hermes, a staff entwined with two serpents and often depicted with wings. The caduceus is often used as a symbol of medicine or medical professionals, but there is little historical basis for this symbolism.

As you may have guessed, our logo uses the rod of Asclepius that is modified to also resemble the CN Tower – our way of recognizing the university and community in which we have been privileged to learn the art and science of medicine.

Thomas O'Brien, MD
Class of 2009, M.D. Program, University of Toronto

Preface – From the Editors

Dear reader,

We are grateful to present Toronto Notes 2022 to you. This edition is the product of an exceptional effort from the hundreds of editors and contributors who worked tirelessly with us as we navigated through the challenges posed by the on-going COVID-19 pandemic. Together, we have created the thirty-eighth edition of Toronto Notes, thus continuing our organization's rich tradition of providing an up-to-date, comprehensive, and concisely written medical resource to our readers.

Thirty-eight years ago, Toronto Notes began as a humble initiative, with medical students from the University of Toronto collecting and circulating their notes. Nearly four decades later – with annual editions and an ever-expanding vision – Toronto Notes has become one of the most trusted medical review texts; it is a resource that is cherished by trainees and physicians throughout Canada and around the world.

The Toronto Notes for Medical Students Inc. is a nonprofit corporation whose mission is to provide a trusted medical resource in order to give back to our community. This year, while our global community continued their fight for racial justice and battled the COVID-19 pandemic, locally we were also devastated by the loss of our colleague, Mohammad Asadi-Lari, an MD-PhD student at the Temerty Faculty of Medicine, who was a passenger on the Ukrainian Airlines Flight 752 that crashed on January 8th, 2021. As a country, we also reeled from the discovery of unmarked graves across Residential Schools in Canada, reminding us once again of the discrimination, injustice, and racism Indigenous Peoples have faced and continue to face. Keeping in line with our values and community needs, all proceeds from Toronto Notes sales are directly donated to support both global and local initiatives. This year we have contributed to a new program by the Community of Support at the University of Toronto, the Indigenous Student Mentorship Fund, to support Indigenous students in gaining mentorship for careers in medicine. Toronto Notes also supported the Black Health Alliance with their African, Caribbean, Black (ACB) COVID-19 Public Awareness Initiative – a collaboration with the Black Medical Students Association of Canada, and the Black Youth Helpline. Among other initiatives, we have also supported U of T Medicine class activities, student scholarships and bursaries (such as the Mohammad and Zeynab Asadi-Lari award), our Daffy annual musical fundraiser for the Canadian Cancer Society, and the entirety of our (over twenty-five) student-led outreach programs that seek to enrich lives in the community.

This is why we, and all the members of our U of T team, gladly dedicated so many hours toward this immensely involved project. As our valued reader, we thank you for your honest and vital financial contribution through your purchase of our textbook. Each book sold makes an important difference.

The 2022 edition features substantial content revisions to the text, figures, and graphics of all 32 chapters, following a comprehensive review by our student and faculty editorial team. Up-to-date, evidence-based medicine studies are also summarized in highlighted boxes throughout the text. This year, one of our priorities was to include a table of often discussed Landmark Clinical Trials in every chapter. Alongside our textbook-wide revisions, the Cardiology and Cardiac Surgery, the Geriatric Medicine, and the Infectious Diseases chapters have received substantial expansions to increase their utility in practice. In addition to content updates, the Toronto Notes 2022 Clinical Handbook chapters now include a section on Do Not Miss Diagnoses to guide your learning during clerkship rotations. Toronto Notes prioritizes cultural sensitivity, health equity, and strives for accurate representation of our vibrant and diverse communities. To enhance our team's editorial lens on these concepts while editing the chapters, training was provided by the Anti-Racism and Cultural Diversity Office and Office of Inclusion & Diversity at the University of Toronto.

We sincerely thank each of our 207 student editors and 101 faculty editors, whose meticulous revisions and shared dedication to the bettering of this text has helped make Toronto Notes 2022 possible. We have learned so much from leading this team, and are especially grateful to everyone for contributions to Toronto Notes with challenging time commitments and demands. We thank our incredible Associate Editors – Ming Li, Jacqui van Warmerdam, Thomas Chang, Andreea Damian, Winston Li and Ashmita Singh – for their tireless leadership, exceptional organization, and wonderful teamwork. We, and the success of this edition, lean on their shoulders. We also thank our Clinical Handbook Editors – Benjamin Baker, Cathy Huilin Lu, and Chunyi Christie Tan—for their exceptional editorial leadership and spearheading the work on this resource. We are grateful to our Production Managers – Jennifer Parker and Anders Erickson – who make Toronto Notes' operations a reality with their daily work. We owe a great deal of gratitude to the Editors-in-Chief of the 2021 edition – Megan Drupals and Matthaeus Ware – for their continued guidance over the past two years. Lastly, we thank our longtime partners at Type & Graphics Inc – especially our backbone, Enrica Aguilera and Maria Garcia — for their years of support and excellent work producing Toronto Notes 2022. Finally, we thank you for supporting our initiative by purchasing and reading our product. We hope that you will find Toronto Notes 2022 to be a useful companion on your medical journey, both now and for years to come.

Sincerely,

Yuliya Lytvyn, *PhD, MD student*
Maleeha A. Qazi, *PhD, MD student*
Editors-in-Chief, Toronto Notes 2022

Acknowledgements

We would like to acknowledge the exceptional work of all previous Toronto Notes (formerly MCCQE Notes) Editors-in-Chief and their editorial teams. The 38th edition of this text was made possible with their contributions.

Faculty Contributors, University of Toronto

All of the following contributors have been appointed at the University of Toronto.

PRIMARY

ETHICAL, LEGAL, AND ORGANIZATIONAL MEDICINE

Andria Bianchi, PhD
Bioethicist, University Health Network
Assistant Professor, Dalla Lana School of Public Health, University of Toronto
Affiliate Scientist, KITE Research Institute, Toronto Rehab
Education Investigator 2, TIER (The Institute for Education Research)

Chase Everett McMurren, BA, BEd, MD, CCFP
Department of Family and Community Medicine
University of Toronto

ANESTHESIA

Ahtsham Niazi, MBBS, FCARCSI, FRCPC
Department of Anesthesia and
Pain Management, University Health Network

Diana Tamir, MD, FRCPC
Staff Anesthesiologist
Toronto General Hospital
Clinical Director of the Acute Pain Service
Postgrad Anesthesia Site Assistant Coordinator
Department of Anesthesia and Pain Management
Toronto General Hospital

CLINICAL PHARMACOLOGY

David Juurlink, BPhm, MD, PhD, FRCPC
Division of Clinical Pharmacology and Toxicology, Departments of Medicine and Paediatrics, Sunnybrook Health Sciences Centre

Cindy Woodland, PhD
Associate Professor, Teaching Stream
Director, Collaborative Specialization in Biomedical Toxicology
Director, Applied Clinical Pharmacology Program

DERMATOLOGY

Patrick Fleming, Sc(Nutrition), MSc(Community Health), MD, FRCPC, FCDA
Assistant Professor of Medicine, Department of Medicine, University of Toronto
Dermatologist, York Dermatology & Research Centre
Consultant Dermatologist,
University Health Network

Marissa Joseph, MD, MScCH, FRCPC, FRCPC
Division of Dermatology, Department of Medicine
Women's College Hospital and The Hospital for Sick Children

Jensen Yeung, MD, FRCPC
Division of Dermatology, Department of Medicine
Women's College Hospital

EMERGENCY MEDICINE

Mark Freedman, BSc, MD, FRCPC
Department of Emergency Medicine
Sunnybrook Health Sciences Centre

Adam Kaufman, MD CCFP(EM)
Emergency Physician, Michael Garron Hospital, Toronto East Health Network
Assistant Professor, Department of Family and Community Medicine, University of Toronto

Jo Jo Leung, MD, CCFP(EM), MScCH(HPTE)
Emergency Physician, University Health Network and Trillium Health Partners
Assistant Professor, Department of Family and Community Medicine, University of Toronto

Kaif Pardhan, BSc MD MMEd FRCPC
Emergency Physician
Sunnybrook Health Sciences Centre & McMaster Children's Hospital

David Rosenstein, BSc Arch, MD, CCFP(EM)
Emergency Physician, Michael Garron Hospital, Toronto East Health Network

Sunnybrook Health Sciences Centre

Mara Sobel, MD, MSc, FRCSC
Department of Obstetrics and Gynecology, University of Toronto
Mount Sinai Hospital
University Health Network,
Toronto General Hospital
Women's College Hospital

Melissa Walker, MD, MSc, FRCSC
Staff Obstetrician Gynecologist, Department of Obstetrics & Gynecology, Mount Sinai Hospital
Assistant Professor, Department of Obstetrics & Gynecology, University of Toronto

OPHTHALMOLOGY

Asim Ali, MD, FRCSC
Professor of Ophthalmology, University of Toronto
Ophthalmologist-in-Chief, The Hospital for Sick Children

Wai-Ching Lam, MD, FRCSC
Department of Ophthalmology and Vision Science
University Health Network, Toronto Western Hospital
The Hospital for Sick Children

Jonathan Micieli, MD, FRCSC
Department of Ophthalmology and Vision Sciences; Division of Neurology, Department of Medicine;
Kensington Vision and Research Centre,
St. Michael's Hospital, University of Toronto

ORTHOPAEDIC SURGERY

Paul Kuzyk, MD, MASc, FRCSC
Assistant Professor
Lower Extremity Reconstruction Surgery
Division of Orthopaedic Surgery

Jesse Wolfstadt, MD, MSc, FRCSC
Granovsky Gluskin Division of Orthopaedic Surgery, Department of Surgery
Sinai Health System

OTOLARYNGOLOGY

Yvonne Chan, MD, MSc, FRCSC
Otolaryngologist-in-chief,
St. Michael's Hospital, Unity Health
Associate Professor and Continuing Professional Development Director
Department of Otolaryngology - Head & Neck Surgery

Antoine Eskander, MD, ScM, FRCSC
Assistant Professor
Department of Otolaryngology - Head & Neck Surgery
Sunnybrook Health Sciences Centre,
Odette Cancer Centre
Michael Garron Hospital

Jonathan Irish, MD, MSc, FRCSC
Department of Otolaryngology, Head and Neck Surgery
University Health Network

PLASTIC SURGERY

Siba Haykal, MD, PhD, FRCSC, FACS
Division of Plastic and Reconstructive Surgery, Department of Surgery
University Health Network

Melinda Musgrave, MD, PhD, FRCSC
Division of Plastic and Reconstructive Surgery, Department of Surgery
St. Michael's Hospital

UROLOGY

Yonah Krakowsky, MD, FRCSC
Division of Urology
Women's College & Mount Sinai Hospital

Jason Lee, MD, MHPE, FRCSC
Division of Urology, Department of Surgery
University Health Network, Toronto General Hospital

Michael Ordon, MD, MSc, FRCSC
Division of Urology, Department of Surgery
St. Michael's Hospital

VASCULAR SURGERY

Elisa Greco, BSc, MEd, MD, RPVI, FRCSC
Vascular Surgeon, St Michael's Hospital

George Oreopoulos, MD, MSc, FRCSC
Division of Vascular Surgery,
Department of Surgery
University Health Network

How To Use This Book

This book has been designed to remain as one book or to be taken apart into smaller booklets. Identify the beginning and end of a particular section, then carefully bend the pages along the perforated line next to the spine of the book. Then tear the pages out along the perforation.

The layout of *Toronto Notes* allows easy identification of important information.
These items are indicated by icons interspersed throughout the text:

Icon	Icon Name	Significance
	**Key Objectives**	This icon is found next to headings in the text. It identifies key objectives and conditions as determined by the Medical Council of Canada or the National Board of Medical Examiners in the USA. If it appears beside a dark title bar, all subsequent subheadings should be considered key topics.
	**Clinical Pearl**	This icon is found in sidebars of the text. It identifies concise, important information which will aid in the diagnosis or management of conditions discussed in the accompanying text.
	**Memory Aid**	This icon is found in sidebars of the text. It identifies helpful mnemonic devices and other memory aids.
	**Clinical Flag**	This icon is found in sidebars of the text. It indicates information or findings that require urgent management or specialist referral.
	**Evidence Based Medicine**	This icon is found in sidebars of the text. It identifies key research studies for evidence-based clinical decision making related to topics discussed in the accompanying text.
	**Colour Photo Atlas**	This icon is found next to headings in the text. It indicates topics that correspond with images found in the Colour Photo Atlas available online (www.torontonotes.ca).
	**Radiology Atlas**	This icon is found next to headings in the text. It indicates topics that correspond to images found in the Radiology Atlas available online (www.torontonotes.ca).
	**Online Resources**	This icon is found next to headings in the text. It indicates topics that correspond with electronic resources such as Functional Neuroanatomy or ECGs Made Simple, available online (www.torontonotes.ca).

Chapter Divisions

To aid in studying and finding relevant material quickly, many chapters incorporate the following general framework:

Basic Anatomy/Physiology Review
- features the high-yield, salient background information students are often assumed to have remembered from their early medical school education

Common Differential Diagnoses
- aims to outline a clinically useful framework to tackle the common presentations and problems faced in the area of expertise

Diagnoses
- the bulk of the book
- etiology, epidemiology, pathophysiology, clinical features, investigations, management, complications, and prognosis

Common Medications
- a quick reference section for review of medications commonly prescribed

Common Acronyms and Abbreviations Used in Medicine

The following are common medical acronyms/abbreviations that may be used without definition throughout the Toronto Notes text. These are typically not included in the acronym list at the beginning of each chapter. Please refer back to this list for definitions.

[ ]	concentration
β-hCG	beta human chorionic gonadotropin
ABx	antibiotics
ACE	angiotensin-converting enzyme
ACTH	Adrenocorticotropic hormone
AIDS	acquired immune deficiency syndrome
ALP	alkaline phosphatase
ALT	alanine aminotransferase
AR	absolute risk
ASA	acetylsalicylic acid
AST	aspartate transaminase
aSx	asymptomatic
AXR	abdominal x-ray
BID	twice a day (bis in die)
BMI	body mass index
BP	blood pressure
BPM/bpm	beats per minute
C/I	contraindication
C&S	culture and sensitivity
CAD	coronary artery disease
CBC	complete blood count
CC	chief complaint
CHF	congestive heart failure
COPD	chronic obstructive pulmonary disease
CPR	cardiopulmonary resuscitation
Cr	creatinine
CRH	corticotropin-releasing hormone
CSF	cerebrospinal fluid
CT	computed tomography
CXR	chest x-ray
D&C	dilatation and curettage
dBP	diastolic blood pressure
DDx	differential diagnosis
DM	diabetes mellitus
DNR	do not resuscitate
Dx	diagnosis
ECG	electrocardiogram
ED	emergency department
EEG	electroencephalography
EMG	electromyography
ENT	ears, nose, and throat
ESR	erythrocyte sedimentation rate
EtOH	ethanol/alcohol
FMHx	family medical history
FSH	follicle stimulating hormone
G6PD	glucose-6-phosphate dehydrogenase
GGT	gamma-glutamyl transferase
GH	growth hormone
GHB	gamma hydroxybutyrate
GI	gastrointestinal
GU	genitourinary
Hb	hemoglobin
HIV	human immunodeficiency disease
HR	heart rate
HTN	hypertension
Hx	history
I&D	incision and drainage
ICP	intracranial pressure
ICU	intensive care unit
IM	intramuscular
IV	intravenous
JVP	jugular venous pressure
LDH	lactate dehydrogenase
LFT	liver function test
LH	luteinizing hormone
LR	likelihood ratio

Common Acronyms and Abbreviations Used in Medicine

MAO	monoamine oxidase
MAOI	monoamine oxidase inhibitor
MDI	metered-dose inhaler
MI	myocardial infarction
MRI	magnetic resonance imaging
MSK	musculoskeletal
N/V	nausea/vomiting
NG	nasogastric
NMDA	N-Methyl-D-aspartate
NPO	nothing by mouth (nil per os)
NSAID	non-steroidal anti-inflammatory drug
OR	operating room
OTC	over-the-counter
PCR	polymerase chain reaction
PE	pulmonary embolism
PMHx	past medical history
PO	oral administration (per os)
POCUS	point-of-care ultrasound
PPI	proton pump inhibitor
PRN	as needed (pro re nata)
QID	four times a day (quater in die)
RBC	red blood cell
RCT	randomized controlled trial
ROS	review of symptoms
Rx	medical prescription
sBP	systolic blood pressure
SC	subcutaneous
SL	sublingual
SLE	systemic lupus erythematosus
SOB	shortness of breath
STAT	urgent or immediately (statum)
STI	sexually transmitted infection
Sx	symptom(s)
T1DM	type 1 diabetes mellitus
T2DM	type 2 diabetes mellitus
TB	tuberculosis
TID	three times a day (ter in die)
TNM	tumour, nodes, and metastases
TRH	thyroid releasing hormone
TSH	thyroid stimulating hormone
Tx	treatment
U/A	urinalysis
U/S	ultrasound
UTI	urinary tract infection
UTox	urine toxicology screen
VDRL	Venereal Disease Research Laboratory test
WBC	white blood cell
wt	weight

Common Unit Conversions

To convert from the conventional unit to the SI unit, **multiply** by conversion factor

To convert from the SI unit to the conventional unit, **divide** by conversion factor

	Conventional Unit	Conversion Factor	SI Unit
ACTH	pg/mL	0.22	pmol/L
Albumin	g/dL	10	g/L
Bilirubin	mg/dL	17.1	µmol/L
Calcium	mg/dL	0.25	mmol/L
Cholesterol	mg/dL	0.0259	mmol/L
Cortisol	µg/dL	27.59	nmol/L
Creatinine	mg/dL	88.4	µmol/L
Creatinine clearance	mL/min	0.0167	mL/s
Ethanol	mg/dL	0.217	mmol/L
Ferritin	ng/mL	2.247	pmol/L
Glucose	mg/dL	0.0555	mmol/L
HbA1c	%	0.01	proportion of 1.0
Hemaglobin	g/dL	10	g/L
HDL cholesterol	mg/dL	0.0259	mmol/L
Iron, total	µg/dL	0.179	µmol/L
Lactate (lactic acid)	mg/dL	0.111	mmol/L
LDL cholesterol	mg/dL	0.0259	mmol/L
Leukocytes	x 10^3 cells/mm^3	1	x 10^9 cells/L
Magnesium	mg/dL	0.411	mmol/L
MCV	μm^3	1	fL
Platelets	x 10^3 cells/mm^3	1	x 10^9 cells/L
Reticulocytes	% of RBCs	0.01	proportion of 1.0
Salicylate	mg/L	0.00724	mmol/L
Testosterone	ng/dL	0.0347	nmol/L
Thyroxine (T_4)	ng/dL	12.87	pmol/L
Total Iron Binding Capacity	µg/dL	0.179	µmol/L
Triiodothyronine (T_3)	pg/dL	0.0154	pmol/L
Triglycerides	mg/dL	0.0113	mmol/L
Urea nitrogen	mg/dL	0.357	mmol/L
Uric acid	mg/dL	59.48	µmol/L

Celsius → Fahrenheit	F = (C x 1.8) + 32
Fahrenheit → Celsius	C = (F – 32) x 0.5555
Kilograms → Pounds	1 kg = 2.2 lbs
Pounds → Ounces	1 lb = 16 oz
Ounces → Grams	1 oz = 28.3 g
Inches → Centimetres	1 in = 2.54 cm

Commonly Measured Laboratory Values

Test	Conventional Units	SI Units
Arterial Blood Gases		
pH	7.35-7.45	7.35-7.45
PCO_2	35-45 mmHg	4.7-6.0 kPa
PO_2	80-105 mmHg	10.6-14 kPa
Serum Electrolytes		
Bicarbonate	22-28 mEq/L	22-28 mmol/L
Calcium	8.4-10.2 mg/dL	2.1-2.5 mmol/L
Chloride	95-106 mEq/L	95-106 mmol/L
Magnesium	1.3-2.1 mEq/L	0.65-1.05 mmol/L
Phosphate	2.7-4.5 mg/dL	0.87-1.45 mmol/L
Potassium	3.5-5.0 mEq/L	3.5-5.0 mmol/L
Sodium	136-145 mEq/L	136-145 mmol/L
Serum Nonelectrolytes		
Albumin	3.5-5.0 g/dL	35-50 g/L
ALP	35-100 U/L	35-100 U/L
ALT	8-20 U/L	8-20 U/L
Amylase	25-125 U/L	25-125 U/L
AST	8-20 U/L	8-20 U/L
Bilirubin (direct)	0-0.3 mg/dL	0-5 µmol/L
Bilirubin (total)	0.1-1.0 mg/dL	2-17 µmol/L
BUN	7-18 mg/dL	2.5-7.1 mmol/L
Cholesterol	<200 mg/dL	<5.2 mmol/L
Creatinine (female)	10-70 U/L	10-70 U/L
Creatinine (male)	25-90 U/L	25-90 U/L
Creatine Kinase – MB fraction	0-12 U/L	0-12 U/L
Ferritin (female)	12-150 ng/mL	12-150 µg/L
Ferritin (male)	15-200 ng/mL	15-200 µg/L
Glucose (fasting)	70-110 mg/dL	3.8-6.1 mmol/L
HbA1c	<6%	<0.06
LDH	100-250 U/L	100-250 U/L
Osmolality	275-300 mOsm/kg	275-300 mOsm/kg
Serum Hormones		
ACTH (0800h)	<60 pg/mL	<13.2 pmol/L
Cortisol (0800h)	5-23 µg/dL	138-635 nmol/L
Prolactin	<20 ng/mL	<20 ng/mL
Testosterone (male, free)	9-30 ng/dL	0.31-1 pmol/L
Thyroxine (T_4)	5-12 ng/dL	64-155 nmol/L
Triiodothyronine (T_3)	115-190 ng/dL	1.8-2.9 nmol/L
TSH	0.5-5 µU/mL	0.5-5 µU/mL
Hematologic Values		
ESR (female)	0-20 mm/h	0-20 mm/h
ESR (male)	0-15 mm/h	0-15 mm/h
Hemoglobin (female)	12.3-15.7 g/dL	123-157 g/L
Hemoglobin (male)	13.5-17.5 g/dL	140-174 g/L
Hematocrit (female)	36-46%	36-46%
Hematocrit (male)	41-53%	41-53%
INR	1.0-1.1	1.0-1.1
Leukocytes	4.5-11 x 10^3 cells/mm^3	4.5-11 x 10^9 cells/L
MCV	88-100 μm^3	88-100 fL
Platelets	150-400 x $10^3/mm^3$	150-400 x 10^9/L
PTT	25-35 s	25-35 s
Reticulocytes	0.5-1.5% of RBC	20-84 x 10^9/L

ELOM Ethical, Legal, and Organizational Medicine

Happy Inibhunu, Andrew Lagrotteria, and **Joseph Kates Rose,** chapter editors
Jacqui van Warmerdam and **Ming Li,** associate editors
Dr. Andria Bianchi and **Dr. Chase McMurren,** staff editors

Further information on these topics can be found in the Objectives of the Considerations of the Legal, Ethical, and Organizational Aspects of the Practice of Medicine (CLEO) – which can be downloaded free of charge from the Medical Council of Canada website at http://mcc.ca/wp-content/uploads/CLEO.pdf.

There are three main types of law in Canada: criminal, civil, and administrative. The penalties for violating each are, in general, as follows: criminal fine or incarceration; civil - monetary damages paid to the wronged party; and administrative - sanctions by the regulator (such as a suspension by the College of Physicians and Surgeons). All three types of law can be engaged by a single act. For example, a physician that inappropriately touches a patient can be liable for criminal (sexual assault), civil (monetary damages paid to the patient for the civil wrong of sexual assault), and administrative (fines and sanctions up to and including loss of ability to practice medicine for sexual abuse) penalties.

Canadian law applicable to medical practice varies between jurisdictions and changes over time.

Criminal law is nationwide, but civil and administrative law varies between provinces and territories. This section is meant to serve only as a guide. Students and physicians should ensure that their practices conform to local and current laws.

Acronyms

AE	adverse event	CPSO	College of Physicians and Surgeons of Ontario	LMCC	Licentiate of the Medical Council of Canada	PTMA	Provincial/Territorial Medical Association
ART	assisted reproductive technologies	EMR	electronic medical record	MAID	Medical Assistance in Dying	RCPSC	Royal College of Physicians and Surgeons of Canada
CFMS	Canadian Federation of Medical Students	FMEQ	Fédération médicale étudiante du Québec	MCC	Medical Council of Canada	RDoC	Resident Doctors of Canada
CFPC	College of Family Physicians of Canada	FRCPC	Fellow of the Royal College of Physicians of Canada	OECD	Organization for Economic Co-operation and Development	SDM	substitute decision-maker
CIHR	Canadian Institutes of Health Research	FRCSC	Fellow of the Royal College of Surgeons of Canada	OMA	Ontario Medical Association	TRC	Truth and Reconciliation Commission
CMA	Canadian Medical Association	GA	gestational age	OTC	over the counter		
CME	continuing medical education	GDP	gross domestic product	PHO	Provincial Housestaff Organization		
CMPA	Canadian Medical Protective Association	HCCA	Health Care Consent Act	PIPEDA	Personal Information Protection and Electronic Documents Act		
		IVF	*in vitro* fertilization	POA	Power of Attorney		

The Canadian Healthcare System

Overview of Canadian Healthcare System

- one federal, three territorial, and ten provincial systems
- major complexities in establishment of Canadian health policy include geographical diversity, socioeconomic divisions, and international pressures
- financed by both the public (70%) and private (30%) sectors
- each provincial/territorial plan must cover all medically necessary health services and remain in compliance with the Canada Health Act in order to receive federal transfers
- provincial/territorial governments may choose to offer and fund supplementary services not covered under the Canada Health Act, such as prescription drugs and vision care
- non-insured health services and fees are either covered by private insurance or by the individual
- workers' compensation funds cover treatment for work-related injuries and diseases

Table 1. Division of Government Responsibilities in Healthcare

Federal Government	Provincial Government
Healthcare services for Indigenous peoples (Status First Nations peoples and Inuit only, Non-Insured Health Benefits (NIHB)), federal government employees (RCMP and armed forces), immigrants, and civil aviation personnel	Establishment, maintenance, and management of hospitals, asylums, charities, and charitable institutions (*Constitution Act*, 1867)
Marine hospitals and quarantine (Constitution Act, 1867)	Licensing of physicians, nurses, and other health professionals
Investigations into public health	Determining the standards for licensing all hospitals
Regulation of food and drugs	Administering provincial medical insurance plans
Inspection of medical devices	Financing healthcare facilities
Administration of healthcare insurance	Delivery of certain public health services
General information services related to health conditions and practices	
Role in health derives from constitutional responsibility over criminal law, spending powers, and legislation for 'peace, order, and good government.' Examples include *Canada Health Act, Food and Drugs Act, Controlled Substances Act*, and *Canada Health Transfer Act*)	

Principles of the Canada Health Act

1. Public Administration: provincial/territorial health insurance programs must be administered on a not-for-profit basis by public authorities
2. Comprehensiveness: provincial/territorial health insurance programs must cover all medically necessary diagnostic, physician, and hospital services
3. Universality: all eligible residents must be entitled to healthcare services (including status First Nations peoples and Inuit; note that non-status First Nations and Métis are included under all eligible residents)
4. Portability: emergency health services must be available to Canadians who are outside their home province, paid for by the home province
5. Accessibility: provincial/territorial plans must ensure reasonable access to medically necessary hospital and physician services without financial or other barriers

Legal Foundation

- the legal foundation of the Canadian health system is based on:
  - five constitutional documents:
    1. Royal Proclamation (1763): the foundation for the rights of Indigenous peoples in Canada; sets out the sovereignty of Indigenous peoples in Canada
    2. Constitution Act (1867): deals primarily with the jurisdictional power between federal and provincial governments
    3. Treaty 6 (1876): included the Medicine Chest Clause, which addresses Indigenous sovereignty in healthcare delivery and equitable access to all forms of medicine
    4. Court ruling: Dreaver vs. King (1935): provided the legal precedence for Non-Insured Health Benefits
    5. The Canadian Charter of Rights and Freedoms (1982): does not guarantee a right to healthcare; but, if the government decides to finance healthcare, they are constitutionally obliged to do so consistently with the rights and freedoms outlined in the Charter (including the right to equality, physicians' mobility rights, etc.)

The federal government can reduce its contributions to provinces that violate the key principles of the Canada Health Act

- two statutes:
  1. *Canada Health Act* (1984): outlines the national terms and conditions that provincial health systems must meet in order to receive federal transfer payments
  2. *Canada Health and Social Transfer Act* (1996): federal government gives provinces a single grant for healthcare, social programs, and post-secondary education; division of resources at provinces' discretion

History of the Canadian Healthcare System and Crown-Indigenous Relations Pursuant to Healthcare

1534 Europeans first arrive in Canada
- settlers find healthy inhabitants with complex societies, cultures, and belief systems
- Indigenous peoples' have specific knowledge of local environment and medicines
  - early instance of medical practice occurs when local Indigenous nation (Haudenosaunee) used cedar as a source of vitamin C to treat Europeans settlers for scurvy

1763 *Royal Proclamation*
- identifies Indian Country that was under British sovereignty but Indigenous possession
- sets out guidelines for European settlement of Indigenous territories in what is now North America; statements include: Aboriginal title (a legal term for ancestral land rights) has existed and continues to exist, and that all land would be considered Aboriginal land unless ceded by treaty
  - forbids settlers from claiming land from the Indigenous occupants, unless it was first bought by the Crown and then sold to the settlers
  - only the Crown can buy land from First Nations

1764 *Treaty of Niagara*
- the treaty is signed with 24 Indigenous Nations represented
- Indigenous peoples and the Crown agree to co-exist and build their relationship on Turtle Island

1867 *British North America Act* (now *Constitution Act* 1867)
- establishes Canada as a confederacy
- "establishment, maintenance, and management of hospitals" under provincial jurisdiction
- gives the federal government control over lands reserved for "Indians"

1870 *Manitoba Act*
- Métis land is protected and they are given an additional 1.4 million acres for their descendants
- this act was subsequently ignored and infringed upon as this land was given freely to incoming settlers

1871-1921 *Numbered Treaties*
- transfer large tracts of Indigenous land to the Crown with various promises made to Indigenous Peoples
  - Treaty 6 explicitly includes medicine, while others contain agreements related to social factors affecting health

1876 *Indian Act*
- reinforces the federal government's exclusive jurisdiction over Indians and lands reserved for Indians
- gives complete control of "Indian bands," status, and reserves to the Canadian government
- enfranchisement (the process of terminating one's legal Indian Status, identity, and ancestral rights in order to gain full Canadian citizenship) becomes legally compulsory in many situations (such as becoming a physician)
- outlaws the practice of Indigenous culture and spirituality
- imposes band councils and "Indian agents"

1884-1996 Residential Schools and Indian Hospitals
- legislated genocide (see Public Health and Preventive Medicine, PH7)

1885 Execution of Métis leader Louis Riel
- leader of the North-West Rebellion against the Federal government due to infringement on Métis ancestral lands, rights, and way of life

1939 Court Decision *Reference Re Eskimo* rules that the federal government is has similar responsibility for Inuit people as Indigenous Peoples
- following this decision the government developed policies that enforced assimilation and benefited governmental goals, with disregard for Inuit wellbeing. This lead to extensive harms, some of which are noted below:
  - forced, coercive relocation to isolated and sedentary communities away from ancestral lands, ending seasonally dynamic way of life
  - sled dogs were killed, which discontinued the Inuit traditional way of life and forced them to rely on government supplies
  - discs, to be worn around the neck, were issued with numbers in lieu of Inuit surnames and to ease bureaucratic workload

1965 *Royal Commission on Health Services* (Hall Commission) recommends federal leadership and financial support with provincial government operation

1966 *National Medical Care Insurance Act*
- federal government's first legislation with the goal of free access to healthcare
- federal government to pay half of medicare costs in any province with insurance plans that meet criteria of being universal, publicly administered, portable, and comprehensive
- Indian Health Services budget is reduced under the guise of equality and social and legal integration. Individuals can only receive support for healthcare services if they prove they are Indigenous, have been refused funds from their band, and can not obtain provincial health services. Financial limits are set to prevent "overuse" of services. This creates further barriers to accessing healthcare, while reducing barriers for non-Indigenous peoples

1984 *Canada Health Act* is passed by federal government
- replaces *Medical Care Act* (1966) and *Hospital Insurance and Diagnostic Services Act* (1957)
- provides federal funds to provinces with universal hospital insurance
- maintains federal government contribution at 50% on average, with poorer provinces receiving more funds
- medical insurance must be "comprehensive, portable, universal, and publicly administered"
- bans extra-billing by new fifth criterion: accessibility

1985 *Bill C-31*
- the *Indian Act* forced Indigenous women who married non-Indigenous men to lose their Indian status
- *Bill C-31* attempted to stop the involuntary enfranchisement of Indigenous women (and their children) who married non-Indigenous men
- *Bill C-3* in 2011 and later cases ensured that eligible grandchildren of women who lost status could regain it

1990 Oka Crisis
- land dispute over ancestral Kanienkehaka (Mohawk) territory
- brought about the Royal Commission on Aboriginal Peoples (1996)

1996 *Canada Health and Social Transfer Act* passed by federal government
- federal government gives provinces a single grant for healthcare, social programs, and post-secondary education; division of resources at provinces' discretion

1996 Royal Commission on Aboriginal Peoples
- established in the wake of the Oka Crisis. The Commission's Report, the product of extensive research and community consultation, was a broad survey of historical and contemporary relations between Aboriginal and non-Aboriginal peoples in Canada
- recommendations made on how to repair the relationship between Indigenous peoples and Canada

2001 *Kirby and Romanow Commissions* appointed
- *Kirby Commission* (final report, October 2002)
- examines history of the healthcare system in Canada, pressures and constraints of current healthcare system, role of federal government, and healthcare systems in foreign jurisdictions

Romanow Commission (final report, November 2002)
- dialogue with Canadians on the future of Canada's public healthcare system

2004 *First Ministers' Meeting on the Future of Health Care* produces a 10 year plan
- priorities include reductions in waiting times, development of a national pharmacare plan, and primary care reform

2005 *Chaoulli v. Québec*, Supreme Court of Canada decision
- rules that Québec's banning of private insurance is unconstitutional under the Québec Charter of Rights since patients cannot access the relevant services under the public system in a timely manner

2007 Jordan's Principle
- Jordan Anderson was a First Nations child from Norway House Cree Nation born with complex medical needs
- he spent two unnecessary years in hospital because provincial and federal governments could not decide who was responsible for paying for the home-based care that Jordan needed to be discharged. Consequently, he died in hospital at age 5 without ever going home
- *Jordan's Principle* is a legal obligation that promises that First Nations children will get prompt and equitable access to healthcare and that payments (federal/provincial/local) will be determined later
- in 2016, the Canadian Human Rights Tribunal found that the Canadian government was racially discriminating against First Nations children and their families for its failure to properly implement Jordan's Principle. The Tribunal issued legally binding orders that Canada has an obligation to fulfill

2011 First progress report by the Health Council reviews progress toward 2004 First Ministers' 10 year plan
- significant reductions in wait times for specific healthcare areas (such as cancer care, joint replacements, and sight restoration), but may have inadvertently caused increased wait times for other services
- despite large investments into EMRs, Canada continues to have low uptake, ranking last in the Commonwealth Fund International Health Policy survey, with only 37% use among primary care physicians
- minimal progress in creating a national strategy for equitable access to pharmaceuticals; however, there has been some success in increasing pharmacists' scope of practice, reducing generic drug costs, and implementing drug information systems
- increase funding to provinces at 6% per annum until the 2016-2017 fiscal year; from then onwards, increases tied to nominal GDP at a minimum of 3% per annum

2012 Second progress report by the Health Council reviews progress towards 2004 First Ministers' 10 year plan
- funding is sufficient; however, more innovation is needed including incentivizing through models of remuneration
- 46 recommendations are made to address the lack of progress

2014 Expiry of 10 Year Health Care Funding Agreement between federal and provincial governments
- *Canadian Doctors for Refugee Care v. Canada*, the Federal Court of Canada rules that the federal government could not significantly reduce/eliminate healthcare services for refugee claimants as to do so would constitute "cruel and unusual treatment" contrary to the Charter of Rights and Freedoms

2015 Negotiations underway for a new Health Accord with a $3 billion investment over four years to homecare and mental health services by the elected Liberal government

2015 The Truth and Reconciliation Commission releases 94 calls to action to address reconciliation and inequities in Canada
- the full list of calls to action can be found here: http://trc.ca/assets/pdf/Calls_to_Action_English2.pdf, while health-specific calls and subsequent government actions can be found here: https://www.rcaanc-cirnac.gc.ca/eng/1524499024614/1557512659251
- the seven calls to action included under health are the following:
  18. we call upon the federal, provincial, territorial, and Aboriginal governments to acknowledge that the current state of Aboriginal health in Canada is a direct result of previous Canadian government policies, including residential schools, and to recognize and implement the health-care rights of Aboriginal people as identified in international law, constitutional law, and under the Treaties
  19. we call upon the federal government, in consultation with Aboriginal peoples, to establish measurable goals to identify and close the gaps in health outcomes Calls to Action| 3 between Aboriginal and non-Aboriginal communities, and to publish annual progress reports and assess longterm trends. Such efforts would focus on indicators such as: infant mortality, maternal health, suicide, mental health, addictions, life expectancy, birth rates, infant and child health issues,

chronic diseases, illness and injury incidence, and the availability of appropriate health services

20. in order to address the jurisdictional disputes concerning Aboriginal people who do not reside on reserves, we call upon the federal government to recognize, respect, and address the distinct health needs of the Métis, Inuit, and off-reserve Aboriginal peoples
21. we call upon the federal government to provide sustainable funding for existing and new Aboriginal healing centres to address the physical, mental, emotional, and spiritual harms caused by residential schools, and to ensure that the funding of healing centres in Nunavut and the Northwest Territories is a priority
22. we call upon those who can effect change within the Canadian health-care system to recognize the value of Aboriginal healing practices and use them in the treatment of Aboriginal patients in collaboration with Aboriginal healers and Elders where requested by Aboriginal patients
23. we call upon all levels of government to: i. Increase the number of Aboriginal professionals working in the health-care field. ii. Ensure the retention of Aboriginal health-care providers in Aboriginal communities. iii. Provide cultural competency training for all healthcare professionals
24. we call upon medical and nursing schools in Canada to require all students to take a course dealing with Aboriginal health issues, including the history and legacy of residential schools, the United Nations Declaration on the Rights of Indigenous Peoples, Treaties and Aboriginal rights, and Indigenous teachings and practices. This will require skills-based training in intercultural competency, conflict resolution, human rights, and anti-racism

2016 Canada's Minister of Indigenous Affairs announces their full support for the *United Nations Declaration on the Rights of Indigenous Peoples*

- document describes individual and collective rights of Indigenous peoples and provides guidance about how to maintain a relationship with Indigenous peoples based on equality, partnership, good faith, and mutual respect

2017 New 10 year Canada Health Accord is reached with a $11.5 billion federal investment over 10 years to homecare and mental health services and a 3% annual rise in the Canada Health Transfer (from 6% in the previous agreement)

2019 Missing and Murdered Indigenous Women and Girls Inquiry Final Report and Calls for Justice

- reveals that persistent and deliberate human and Indigenous rights violations and abuses amount to genocide and are the root cause behind Canada's staggering rates of violence against Indigenous women, girls, and 2SLGBTQQIA people
- the report calls for transformative legal and social changes to resolve the crisis that has devastated Indigenous communities across the country

2019 The federal government announces the creation of a national drug agency. It will negotiate prices on behalf of Canada's drug plans, assess the efficacy of prescription drugs, and develop a national formulary

Healthcare Expenditure and Delivery in Canada

- the projected total healthcare expenditure in 2019 was expected to reach $265.5 billion, or $7064 per person. Health spending was expected to comprise 11.5% of Canada's GDP that year

Sources of Healthcare Funding

- 69% of total health expenditure in 2018 came from public-sector funding with 65% coming from the provincial and territorial governments, and another 5% from other parts of the public sector: federal direct government, municipal, and social security funds. 31% is from private sources including out of pocket (16%), private insurance (12%), and other (3%)
- public sector covers services offered on either a fee for service, capitation, or alternate payment plan in physicians' offices and in hospitals
  - fee-for-service is a payment model where services are unbundled and paid for separately. This can serve as an incentive for physicians to provide more services because payment is dependent on the quantity of services provided
  - in Ontario, each service has a corresponding billing code defined by the Ministry of Health and Long-term Care in the Physician Services under the Health Insurance Act
  - capitation is a physician remuneration payment model determined by the number of patients rostered
  - APP is a mutual agreement between a physician (or group of physicians) and their provincial health authority. The agreement outlines the physician's salary, incentives, and various after-hour bonuses

- public sector does not cover services provided by privately practicing health professionals (e.g. dentists, chiropractors, optometrists, massage therapists, osteopaths, physiotherapists, podiatrists, psychologists, private duty nurses, and naturopaths), prescription drugs, OTC drugs, personal health supplies, and use of residential care facilities

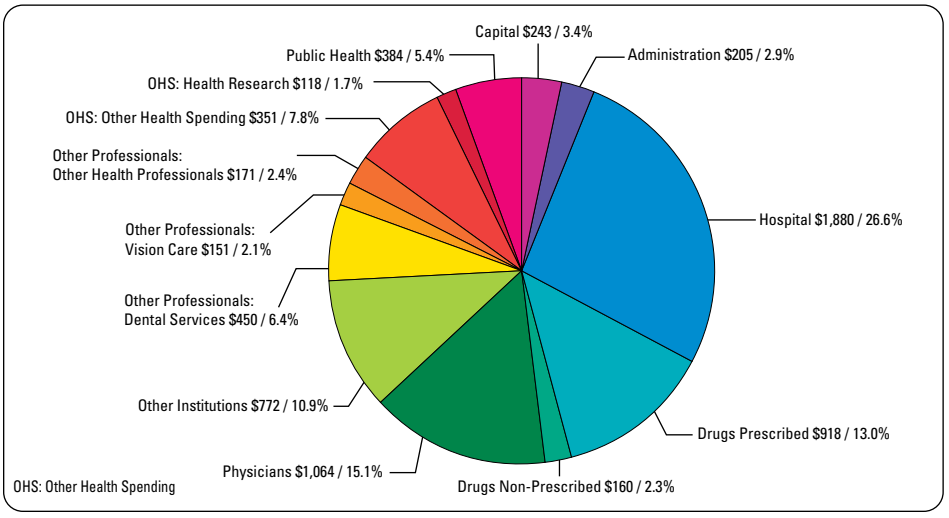

Figure 1. Total health expenditure per capita by use of funds, Canada 2019 (dollars and percentage share)
Source: Canadian Institute for Health Information, National Health Expenditure Trends, Total health expenditure per capita by health spending category, Canada, 2019 (dollars and percentage share), 1975 to 2019. copyright © 2020, Reprinted by Permission of CIHI

Delivery of Healthcare

- hospital services in Canada are publicly funded but delivered through private, not-for-profit institutions owned and operated by communities, religious organizations, and regional health authorities
- other countries have different systems of healthcare delivery, such as the United States (mix of public and private funding, as well as private for-profit and private not-for-profit delivery), and the United Kingdom (primarily public funding and delivery)

Physician Licensure and Certification

Table 2. Key Physician Certification and Licensing Bodies in Canada (and Ontario)

Certifying Body	Description
MCC	Certifies physicians with the LMCC. LMCC acquired by passing the MCC Qualifying Examination Parts I and II
RCPSC	Certifies residents who complete an accredited residency program and pass the appropriate exam
	Voluntary membership of the RCPSC is designated FRCPC or FRCSC
CFPC	Certifies residents who complete an accredited family medicine residency program and pass the Certification Examination in Family Medicine
Licensing Body	13 provincial medical regulatory (licensing) authorities
	All postgraduate residents and all practicing physicians must hold an educational or practice license from the licensing body in the province in which they study or practice
CPSO	Membership to the provincial licensing authority is mandatory
	Licensing authority functions include:
	Provide non-transferable licensure to physicians
	Maintaining ethical, legal, and competency standards and developing policies to guide physicians
	Investigating complaints against physicians
	Disciplining physicians guilty of professional misconduct or incompetence
	At times of license investiture and renewal, physicians must disclose if they have a condition (such as HIV positivity, drug addiction, or other illnesses) that may impact their ability to practice safely

- physician certification is governed nationally, while the medical profession in Canada self-regulates under the authority of provincial legislation
- self-regulation is based on the premise that due to the advanced education and training involved in the practice of medicine, the lay person is not in a position to accurately judge the standards of the profession; the self-regulating colleges have a mandate to regulate the profession in the public interest
- the RCPSC and CFPC are responsible for monitoring ongoing CME and professional development
- certification by the LMCC plus either the RCPSC or CFPC is a minimum requirement for licensure by most provincial licensing authorities

Role of Professional Associations

Table 3. Key Professional Associations

Association	Description
CMA	Provides leadership to physicians and advocates for access to high quality care in Canada
	Represents physician and population concerns at the national level
	Membership is voluntary
PTMAs (such as the OMA)	Negotiates fee and benefit schedules with provincial governments
	Represents the economic and professional interests of physicians
	Membership is voluntary
	Provide physician health support
CMPA	Physician-run organization that protects the integrity of member physicians
	Provides legal defense against allegations of malpractice or negligence
	Provides risk management and educational programs
	Membership is voluntary but all physicians must have some form of liability insurance
RDoC and PHO	Upholds economic and professional interests of residents across Canada
	Facilitates discussion amongst PHOs regarding policy and advocacy items
CFMS and FMÉQ	Medical students are represented at their universities by student bodies, which collectively form the CFMS or FMÉQ
	FMÉQ membership includes that of francophone medical schools

Advocacy and Diversity

- Similar to how the FMÉQ represents the interests of francophone medical schools and the CFMS represents those nation-wide, other professional associations serve and advocate on behalf of different communities
- These associations may serve traditionally underrepresented groups, underserved communities, communities facing structural barriers, and/or communities with unique health needs
- Some examples of professional associations that physicians or medical students may join are: Gay, Lesbian, Bisexual and Transgender (GLBT) Medical Students of Canada; the Black Medical Students Association of Canada; Black Physicians Association of Ontario (BPAO); Muslim Medical Association of Canada and the Indigenous Physicians Association of Canada (IPAC); Indigenous Medical/Dental Students Association (IMDSA, Alberta)

Ethical and Legal Issues in Canadian Medicine

Introduction to the Principles of Ethics

Autonomy vs. Competence vs. Capacity

Autonomy: the right that patients have to make decisions according to their values, beliefs, and preferences

Competence: the ability to make a specific decision for oneself as determined legally by the courts

Capacity: the ability to make a specific decision for oneself as determined by the clinicians proposing the specific treatment

- ethics involves:
  1. principles and values that help to define what is morally permissible and/or impermissible in specific circumstances
  2. rights, duties, and obligations of individuals and groups
- the practice of medicine assumes there is one code of professional ethics for all physicians and that they will be held accountable by that code and its implications
- the physician-patient relationship significantly depends on trust, which is recognized in the concept of fiduciary duty/responsibility of physician towards patient
- a fiduciary duty is a legal duty to act in another party's interest. Profit from the fiduciary relationship must be strictly accounted for with any improper profit (monetary or otherwise) resulting in sanctions against the physician and potential compensation to the patient, even if no physical harm has befallen the patient

Table 4. The Four Principles Approach to Medical Ethics

Principle	Definition
Autonomy	Recognizes an individual's right to make their own decisions in their own way(s) based on their wishes, beliefs, values, and preferences
	It may not be possible for a person to make a fully autonomous decision and/or to have an autonomous decision honoured in some circumstances. For instance, if an autonomous request for a medical intervention is deemed clinically inappropriate from the physician's perspective, then the physician need not offer it
	Autonomy is not synonymous with capacity
Beneficence	Obligation to provide benefit to the patient, based on what is considered to be their best interests. Consideration of best interests should consider the patient's values, beliefs, and preferences, so far as these are known. Best interests extend beyond solely medical considerations
	May be limited by the principle of Autonomy (such as when differences exist between patient and clinician's conception of best interests)
	Paramount in situations where consent/choice is not possible
Non-Maleficence	Obligation to avoid causing harm; primum non nocere ("First, do no harm")
	A limiting principle of the Beneficence principle
Justice	Fair distribution of benefits and harms within a community, regardless of geography, income, or other social factors
	Concept of fairness: Is the patient receiving what they deserve – their fair share? Are they treated the same as equally situated patients? (equity) How does one set of treatment decisions impact others? (equality)
	Equality and equity are different notions of justice. Equality involves providing the distribution of resources to all people irrespective of differing needs, and equity involves distributing resources in a way that considers differing needs (such as circumstance and social context). Both concepts raise different considerations
	Basic human rights, such as freedom from persecution and the right to have one's interests considered and respected

Note: The four principles approach (i.e. principlism) is just one approach to medical ethics. There exist many other ethical principles that are also relevant to medicine (e.g. transparency, trust, etc.).

CMA Code of Ethics

- the CMA developed a Code of Ethics that acts as a common ethical framework for Canadian physicians
- the Code of Ethics is:
  - prepared by physicians for physicians and applies to physicians, residents, and medical students
  - based on the fundamental ethical principles of medicine
  - sources include the Hippocratic Oath, developments in human rights, and recent bioethical discussions
- CMA policy statements address specific ethical issues/topics not mentioned by the code (e.g. abortion, transplantation, medical assistance in dying)

The CMA Code of Ethics and Professionalism is a quasi-legal standard for physicians; if the law sets a minimal moral standard for physicians, the Code seeks to augments these standards

Confidentiality

Overview of Confidentiality

- when determining legal and ethical issues surrounding patient information, start from the foundational assumption point that all information given by the patient is both confidential (meaning it cannot be disclosed to others) and privileged (meaning it cannot be used in court), then determine whether exceptions to this exist
- the legal and ethical basis for maintaining confidentiality is that a full and open exchange of information between patient and physician is central to the development and maintenance of a therapeutic relationship
- privacy is a right of patients (which they may forego), while confidentiality is a duty of physicians (which they must respect barring patient consent or requirements of the law)
  - patients have the right to the expectation that their personal information will receive proper protection from unauthorized access (see *Privacy of Medical Records*, ELOM10)
- if confidentiality is inappropriately breached by a physician, that physician can be sanctioned by the hospital, court, or regulatory authority
- based on the ethical principle of autonomy, patients have the right to control their own health information
- confidentiality may be ethically and legally breached in certain circumstances (e.g. child abuse)
- while physician-patient privilege exists, it is limited in comparison to solicitor-client privilege. During conversations with patients about confidentiality, physicians should avoid promising absolute confidentiality or privilege, as it cannot be guaranteed by law
- physicians should seek advice from their local health authority or the CMPA before disclosing HIV status of a patient to someone else
- many jurisdictions make mandatory not only the reporting of serious communicable diseases (e.g. HIV), but also the reporting of those who harbour the agent of the communicable disease
- physicians failing to abide by such regulations could be subject to professional or civil actions
- legal duty to maintain patient confidentiality is imposed by provincial health information legislation and precedent-setting court cases in the common law

Legal Aspects of Confidentiality
Advice should always be sought from provincial licensing authorities and/or legal counsel when in doubt

CMA Code of Ethics and Professionalism
"Fulfill your duty of confidentiality to the patient by keeping identifiable patient information confidential; collecting, using, and disclosing only as much health information as necessary to benefit the patient; and sharing information only to benefit the patient and within the patient's circle of care. Exceptions include situations where the informed consent of the patient has been obtained for disclosure or as provided for by law"

Statutory Reporting Obligations

- legislation has defined specific instances where public interest overrides the patient's right to confidentiality; varies by province, but may include:
    1. suspected child abuse or neglect – report to local child welfare authorities (e.g. Children's Aid Society)
    2. fitness to drive a vehicle or fly an airplane – report to provincial Ministry of Transportation (see Geriatric Medicine, GM11)
    3. communicable diseases – report to local public health authority (see Public Health and Preventive Medicine, PH32)
    4. improper conduct of other physicians or health professionals – report to College or regulatory body of the health professional (sexual impropriety by physicians is required reporting in some provinces)
    5. vital statistics must be reported; reporting varies by province (e.g. in Ontario, births are required to be reported within 30 d to Office of Registrar General or local municipality; death certificates must be completed by a physician then forwarded to municipal authorities)
    6. reporting to coroners (see *Physician Responsibilities Regarding Death*, ELOM20)
- physicians who fail to report in these situations are subject to prosecution and penalty, and may be liable if a third party has been harmed

Duty to Protect/Warn

- the physician has a duty to protect the public from a known dangerous patient; this may involve taking appropriate clinical action (e.g. involuntary detainment of violent patients for clinical assessment), informing the police, and/or warning the potential victim(s) if a patient expresses an intent to harm
- Canadian courts have not expressly imposed a mandatory duty to report, however, the CMA Code of Ethics and some provincial/territorial regulatory authorities may oblige physicians to report (mandatory reporting rather than permissive)
- concerns of breaching confidentiality should not prevent the physician from exercising the duty to protect; however, the disclosed information should not exceed that required to protect others
- applies in a situation where:
    1. there is an imminent risk
    2. to an identifiable person or group
    3. of serious bodily harm or death

Disclosure for Legal Proceedings

- disclosure of health records can be compelled by a court order, warrant, or subpoena

Privacy of Medical Records

- privacy of health information is protected by professional codes of ethics, provincial and federal legislation, the Canadian Charter of Rights and Freedoms, and the physician's fiduciary duty
- the federal government created the PIPEDA in 2000 which established principles for the collection, use, and disclosure of information that is part of commercial activity (e.g. physician practices, pharmacies, and private labs)
- PIPEDA has been superseded by provincial legislation in many provinces, such as the Ontario Personal Health Information Protection Act, which applies more specifically to health information

Duties of Physicians with Regard to the Privacy of Health Information

- inform patients of information-handling practices through various means (e.g. posting notices, brochures and pamphlets, and/or through discussions with patients)
- obtain the patient's expressed consent to disclose information to third parties
    - under Ontario privacy legislation, the patient's expressed consent need not be obtained to share information between healthcare team members involved in the "circle of care." However, the patient may withdraw consent for this sharing of information and may put parts of the chart in a "lock box"
    - physicians have a professional obligation to facilitate timely transmission of the patient's medical record to third parties (with the patient's consent), such as for insurance claims. Failure to do so has resulted in sanctions by regulatory bodies
    - while patients have a right of access to their medical records, physicians can charge a "reasonable fee" commensurate with the time and material used in providing copies/access
- provide the patient with access to their entire medical record; exceptions include instances where there is potential for serious harm to the patient or a third party
- provide secure storage of information and implement measures to limit access to patient records
- ensure proper destruction of information that is no longer necessary
- regarding taking pictures or videos of patients, findings, or procedures, in addition to patient consent and privacy laws, trespassing laws apply in some provinces
- CPSO published policy is designed to help Ontario physicians understand legal and professional obligations set out under the *Regulated Health Professions Act*, 1991, the *Medicine Act*, 1991, and the *Personal Health Information Protection Act*, 2004. This includes regulations regarding express or implied consent, incapacity, lock boxes, disclosure under exceptional circumstances, mandatory reporting, ministry audits, subpoenas, court orders, and police, as well as electronic records and voice messaging communications: https://www.cpso.on.ca/Physicians/Policies-Guidance/Policies/Protecting-Personal-Health-Information

Ontario's Medical Expert Panel on Duty to Warn
CMAJ 1998;158(11):1473-1479
There should be a duty to inform when a patient reveals that they intend to do serious harm to another person(s) and it is more likely than not that the threat will be carried out
Where a threat is directed at a person or group and there is a specific plan that is concrete and capable of commission and the method for carrying it out is available to the threatener, the physician should immediately notify the police and, in appropriate circumstances, the potential victim. The report should include the threat, the situation, the physician's opinion, and the information upon which it is based
While Canadian courts have not expressly imposed a mandatory "duty to warn" on physicians to alert third parties of a danger posed by a patient, Canadian supreme court decisions have held that a physician is permitted to warn (permissive vs. mandatory)

CMA Code of Ethics and Professionalism
- Protect the health information of your patients
- Provide information reasonable in the circumstances to patients about the reasons for the collection, use, and disclosure of their health information
- Be aware of your patients' rights with respect to the collection, use, disclosure, and access to their health information; ensure that such information is recorded accurately

Reasons to Breach Confidentiality
- Child abuse
- Fitness to drive
- Communicable disease
- Coroner report
- Duty to inform/warn

Lock Boxes
The term "lock boxes" applies to situations where the patient has expressly restricted their physician from disclosing specific aspects of their health information to others, even those involved in the patient's circle of care. Note that the Personal Health Information Protection Act (PHIPA) provisions denote that patients may not prevent physicians from disclosing personal health information permitted/required by the law

- it is the physician's responsibility to ensure appropriate security provisions with respect to electronic records and communications
  - with the advent of digital records, there have been increasing issues with healthcare providers that are not part of a patient's circle of care accessing medical records inappropriately (e.g. out of curiosity or for profit). All staff should be aware that most EMRs log which healthcare providers view records and automatically flag files for further review in certain cases (e.g. same surname, VIP patients, or audit of access to records)

Consent and Capacity

Ethical Principles Underlying Consent and Capacity

- consent is the autonomous authorization of a medical intervention by a patient
- usually the principle of respect for patient autonomy must be balanced with the principle of beneficence, since a physician need not offer an intervention that does not serve some benefit based on their clinical judgment
- informed consent is a process, not a transaction or a signature on a page
- informed refusal is equivalent in principle and approach
- if a patient is deemed incapable of consenting to a proposed medical intervention, then it is the duty of the SDM (or the physician in an emergency) to act on the patient's known prior wishes or, failing that, to act in the patient's best interests
- there is a duty to discover, if possible, what the patient would have wanted when capable
- central to determining best interests is understanding and taking into account the patient's values, beliefs, and preferences, including any relevant cultural and/or religious considerations and the patient's interpretation of those considerations
- more recently expressed wishes take priority over remote ones
- patient wishes may be expressed verbally or in written form
- patients found incapable of making a specific decision should still be involved in the decision-making process as much as possible. If a patient found incapable expresses a willingness to pursue the proposed treatment/intervention, then this is known as assent (rather than 'consent,' which requires capacity)
- agreement or disagreement with medical advice does not determine findings of capacity/incapacity
- however, patients opting for care that puts them at risk of serious harm that most people would want to avoid should have their capacity carefully assessed. Steer clear from the tendency to define what reasonable person standards may be. If appropriate, look to discern patterns of justification offered by patients and their individual values and beliefs, which may be influenced by social context, such as culture and/or religion
- laws pertaining to consent and capacity may vary by province/territory and readers are encouraged to consult provincial/territorial guidelines

Four Basic Requirements of Valid Consent

1. Voluntary
- consent must be given free of coercion or pressure (e.g. from family members who might exert 'undue influence,' from members of the clinical team)
- the physician must not deliberately mislead the patient about the proposed treatment
- the physician must engage in self-reflection prior to entering the conversation regarding their position of power and privilege as well as take measures to mitigate the power differential within the relationship

2. Capable
- the patient must be able to understand and appreciate the nature and effect of their condition as well as of the proposed treatment or decision

3. Specific
- the consent provided is specific to the procedure being proposed and to the provider who will carry out the procedure (e.g. the patient must be informed if students will be involved in providing the treatment)

4. Informed
- sufficient information and time must be provided to allow the patient to make choices in accordance with their wishes, including:
  - the nature of the treatment or investigation proposed and its expected effects
  - all significant risks and special or unusual risks
  - disclose common adverse events and all serious risks (e.g. death), even if remote
  - alternative treatments or investigations and their anticipated effects and significant risks
  - the consequences of declining treatment
  - answers to any questions the patient may have
- the reasonable person test – the physician must provide all information that would be needed "by a reasonable person in the patient's position" to be able to make a decision
- it is the physician's responsibility to make reasonable attempts to ensure that the patient understands the information, including overcoming language barriers, or communication challenges
- physicians have a duty to inform the patient of all legitimate therapeutic options and must not withhold information based on conscientious objections (e.g. not discussing the option of emergency contraception)

CPSO Policy Consent
Obtaining valid consent before carrying out medical, therapeutic, and diagnostic procedures has long been recognized as an elementary step in fulfilling the physician's obligations to the patient

PSO Policy on Capacity
Capacity is an essential component of valid consent, and obtaining valid consent is a policy of the CMA and other professional bodies

4 Basic Elements of Consent
- Voluntary
- Capable
- Specific
- Informed

Professional Considerations

Geriatric Patient
Identify their goals of care and resuscitation options (CPR or DNR) (Note: we should aim to have goals of care discussions with all patients, regardless of age)
Check for documentation of advance care planning (commonly referred to as 'advance directives') and POA where applicable

Paediatric Patient
Identify the primary decision-maker, if applicable (parents, guardian, wards-of-state, emancipated)
Regarding capacity assessment (see *Paediatric Aspects of Capacity*, ELOM14)
Be aware of custody issues, if applicable

Terminally Ill or Palliative Patient
Consider the SPIKES approach to breaking bad news (see ELOM16)
Identify the patient's goals of care (i.e. disease vs. symptom management)?
Identify whether an advance care plan exists (See Palliative Medicine, PM6)
Determine the patient's SDM according to the SDM hierarchy. If the patient has a POA then obtain a copy of the document
Check for documentation of resuscitation options (CPR or DNR)

Incapable Patient
Note: Capacity is treatment-specific and time-specific. An incapable patient is only incapable for the specific treatment at the specific time
If not already present, perform a formal capacity assessment and thoroughly document
Identify if the patient has an SDM or who has their POA and locate it, if applicable
Check the patient's chart for any Mental Health Forms (e.g. Form 1) or any forms they may have on their person (e.g. Form 42)

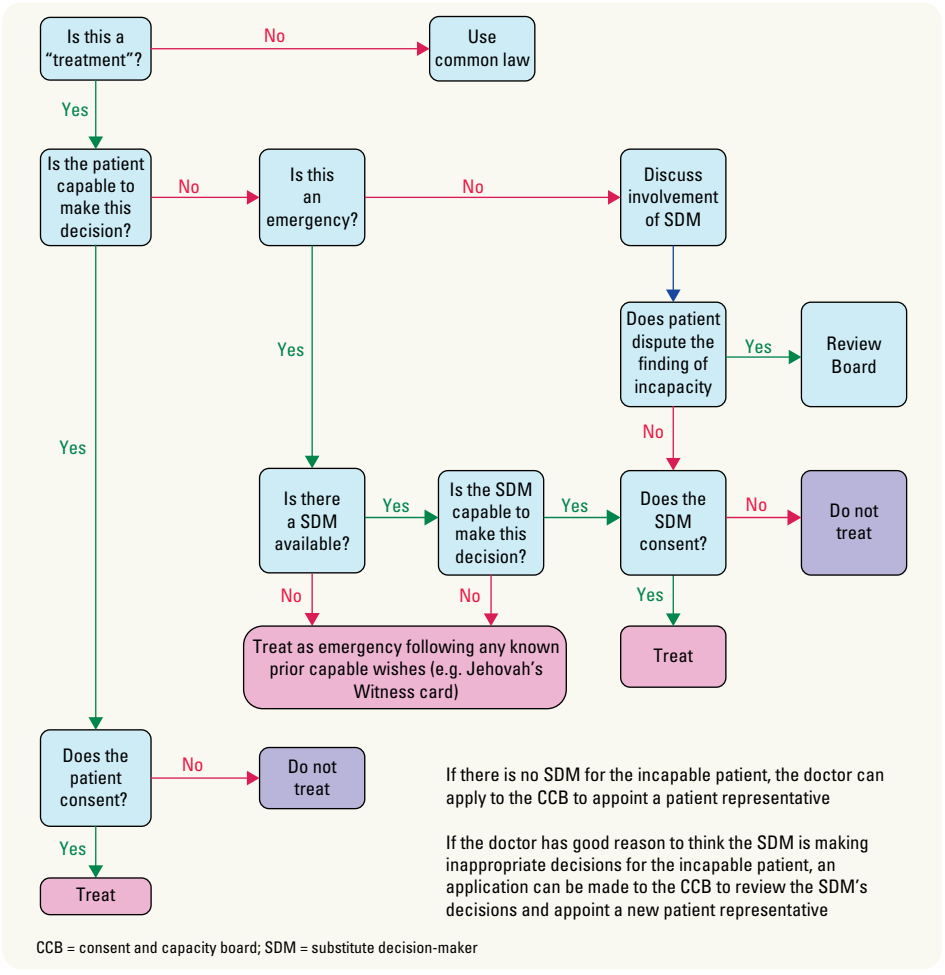

Figure 2. Ontario consent flowchart
Adapted by Hébert P from Sunnybrook Health Sciences Centre Consent Guidelines

Obtaining Legal Consent

- consent of the patient must be obtained before any medical intervention is provided; consent can be:
  - verbal or written, although written is usually preferred
  - a signed consent form is only evidence of consent – it does not replace the process for obtaining valid consent
  - most important component is what the patient understands and appreciates, not what the signed consent form states
  - implied (e.g. a patient holding out their arm for an immunization) or expressed
  - consent is an ongoing process and can be withdrawn or changed after it is given, unless stopping a procedure would put the patient at risk of serious harm, and the patient is not informed of and/or capable of considering these harms
  - if consent has been withdrawn during a procedure, the physician must stop treatment unless stopping the procedure would threaten the patient's life
  - in obtaining consent to continue the procedure, the physician need only re-explain the procedure and risks if there has been a material change in circumstances since obtaining consent originally. If there has been no material change in circumstances, simple assent to continue is sufficient (*Ciarlariello v. Schachter*)
- HCCA of Ontario (1996) covers consent to treatment, admission to a facility, and personal assistance services (e.g. home care)

Exceptions to Consent

1. Emergencies

- treatment can be provided without consent where a patient is experiencing severe suffering, or where a delay in treatment would lead to serious harm or death and consent cannot be obtained from the patient or their SDM
- emergency treatment should not violate a prior expressed wish of the patient (e.g. a signed Jehovah's Witness card)
- if patient is incapable, the physician must document reasons for incapacity and why situation is emergent

- patients have a right to challenge a finding of incapacity as it removes their decision-making ability
- if a SDM is not available, the physician can treat without consent until the SDM is available or the situation is no longer emergent

2. Legislation

- mental health legislation allows for:
  - the detention of patients without their consent
  - psychiatric outpatients may be required to adhere to a care plan in accordance with community treatment orders
- Public Health legislation allows medical officers of health to detain, examine, and treat patients without their consent (e.g. a patient with TB refusing to take medication) to prevent transmission of communicable diseases

3. Special Situations

- public health emergencies (e.g. an epidemic or communicable disease treatment)
- warrant for information by police

Consequences of Failure to Obtain Valid Consent

- treatment without consent is battery (a claim in tort, meaning a civil legal matter, as opposed to a criminal legal matter), even if the treatment is life-saving (excluding situations outlined in Exceptions to Consent)
- treatment of a patient on the basis of poorly informed consent may constitute negligence, also a claim in tort
- the onus of proof that valid consent was not obtained rests with the plaintiff (usually the patient)

Overview of Capacity

- capacity is the ability to:
  - understand information relevant to a treatment decision
  - appreciate the reasonably foreseeable consequences of a decision or lack of a decision
- capacity is specific for each decision (e.g. a person may be capable to consent to having a CXR, but not for a bronchoscopy)
- capacity can change over time (e.g. temporary incapacity secondary to delirium)
- most Canadian jurisdictions distinguish capacity to make healthcare decisions from capacity to make financial decisions; a patient may be deemed capable of one, but not the other
- a person is presumed capable unless there is good evidence to the contrary
- capable patients are entitled to make their own decisions
- capable patients can refuse treatment even if it leads to serious harm or death; however, decisions that put patients at risk of serious harm or death require careful scrutiny

Capacity Assessment Criteria in Ontario

Test for understanding: can the patient recite what you have disclosed to them in their own words?

Test for appreciation: are their beliefs responsive to evidence?

Refer to: JAMA The Rational Clinical Examination "Does This Patient Have Medical Decision-Making Capacity?"

Assessment of Capacity

- capacity assessments must be conducted by the clinician providing treatment and, if appropriate, in consultation with other healthcare professionals (e.g. another physician, a mental health nurse)
- clinical capacity assessment may include:
  - specific capacity assessment (i.e. capacity specific to the decision at hand):
    1. effective disclosure of information and evaluation of patient's reason for decision
    2. understanding of:
       - the condition
       - the nature of the proposed treatment
       - alternatives to the treatment
       - the consequences of accepting and rejecting the treatment
       - the risks and benefits of the various options
    3. for the appreciation needed for decision-making capacity, a person must:
       - acknowledge the symptoms that affect them
       - be able to assess how the various options would affect them
       - be able to reach a decision, and make a choice, not based primarily upon delusional belief
- general impressions
- input from psychiatrists, neurologists, etc. for any underlying mental health or neurological condition that may affect insight or decision-making
- employ "Aid to Capacity Evaluation" or any other capacity assessment tool/guideline
- a decision of incapacity may warrant further assessment by psychiatrist(s), legal review boards (e.g. in Ontario, the Consent and Capacity Review Board (CCB)), or the courts; the patient has the right to a hearing before the CCB
- if found incapable by the Consent and Capacity Review Board, patient must receive notice of their ability to pursue judicial review (and essentially appeal the determination)

Aid to Capacity Evaluation

J Gen Intern Med 1999;14(1):27-34

- Ability to understand the medical problem
- Ability to understand the proposed treatment
- Ability to understand the alternatives (if any) to the proposed treatment
- Ability to understand the option of refusing treatment or of it being withheld or withdrawn
- Ability to appreciate the reasonably foreseeable consequences of accepting the proposed treatment
- Ability to appreciate the reasonably foreseeable consequences of refusing the proposed treatment
- Ability to make a decision that is not substantially based on delusions or depression

Treatment of the Incapable Patient in a Non-Emergent Situation
- obtain informed consent from SDM
- an incapable patient can only be detained against their will to receive treatment if they meet criteria for certification under the *Mental Health Act* (see Psychiatry, PS63); in such a situation:
  - document assessment in chart
  - notify patient of assessment using appropriate Mental Health form(s) under the Mental Health Act (Form 42 in Ontario)
  - notify Rights Advisor

Substitute Decision-Makers
- SDMs must adhere to the following principles when giving informed consent:
  - act in accordance with any previously expressed wishes that were expressed when capable
  - if wishes unknown, act in the patient's best interest, taking the following into account:
    1. values and beliefs held by the patient while capable
    2. whether well-being is likely to improve with vs. without treatment
    3. whether the expected benefit(s) outweighs the risk of harm
    4. whether a less intrusive treatment would be as beneficial as the one proposed
- the final decision of the SDM may and should be challenged by the physician if the physician believes the SDM is not abiding by the above principles

Most provinces have legislated hierarchies for SDMs; the hierarchy in Ontario is:
Legally appointed guardian
Appointed attorney for personal care, if a power of attorney confers authority for treatment consent (see *Powers of Attorney*)
Representative appointed by the Consent and Capacity Board
Spouse or common law partner
Child (age 16 or older) or parent (unless the parent has only a right of access)
Parent with only a right of access
Sibling
Other relative(s)
Public guardian and trustee

Instructional Advance Care Planning
- allow patients to exert control over their care once they are no longer capable
- the patient communicates their decisions about future health care, including who they would allow to make treatment decisions on their behalf and what types of interventions they would/would not want
- to be used once the patient is incapable with respect to treatment decisions
- in Ontario, a person can appoint a Power of Attorney for Personal Care to carry out their advance directives
  - the legal threshold to appoint a Power of Attorney for Personal Care is intentionally set lower than the legal threshold for capacity to consent to many complex medical treatments. This allows a patient that lacks treatment capacity to appoint a person of their choosing to make the decision for them
- patients should be encouraged to review these documents with their family and physicians and to reevaluate them often to ensure they reflect their current wishes

Other Types of Capacity Not Covered by the HCCA
- Testamentary (ability to make a will)
- Fitness (ability to stand trial)
- Financial (ability to manage property – Form 21 of the Mental Health Act)
- Personal (ability to care for oneself on a daily basis)
- Substitute consent for a procedure whose primary purpose is research, sterilization for non-therapeutic purposes, or removal of organs or tissue for transplantation (does not apply to those already declared dead)

POWERS OF ATTORNEY
- all Guardians and Attorneys have fiduciary duties for the dependent person

Definitions
- **Power of Attorney for Personal Care**
  - a legal document in which one person gives another the authority to make personal care decisions (health care, nutrition, shelter, clothing, hygiene, and safety) on their behalf if they become mentally incapable
- **Guardian of the Person**
  - someone who is appointed by the court to make decisions on behalf of an incapable person in some or all areas of personal care, in the absence of a POA for personal care
- **Continuing Power of Attorney for Property**
  - legal document in which a person gives another the legal authority to make decisions about their finances if they become unable to make those decisions
- **Guardian of Property**
  - someone who is appointed by the Public Guardian and Trustee or the courts to look after an incapable person's property or finances
- **Public Guardian and Trustee**
  - acts as a SDM of last resort on behalf of mentally incapable people who do not have another individual to act on their behalf
- **Paediatric Aspects of Capacity Covered**
  - no age of consent in all provinces and territories except Québec; consent depends on patient's decision-making capacity
  - Québec has a specific age of consent, but common law and case law deem underage legal minors capable, allowing these individuals to make their own choices
  - infants and children are assumed to lack mature decision-making capacity for consent but they should still be involved in decision-making processes when appropriate (i.e. be provided with information appropriate to their comprehension level)
  - adolescents are usually treated as adults
  - preferably, assent should still be obtained from patient, even if not capable of giving consent
  - in the event that the physician believes the SDM is not acting in the child's best interests, an appeal must be made to the local child welfare authorities
  - under normal circumstances, parents have right of access to the child's medical record

There is no age of consent in Ontario
Capacity is assessed on an individual basis

Negligence

Ethical Basis
- the physician-patient relationship is primarily based on trust, which is recognized in the concept of fiduciary duty the responsibility to act in the patient's best interest
- negligence or malpractice is a form of failure on the part of the physician in fulfilling their fiduciary duty in providing appropriate care and leading to harm of the patient (and/or abuse of patient's trust)

Legal Basis
- physicians are legally liable to their patients for causing harm (tort) through a failure to meet the standard of care applicable under the circumstances
- standard/duty of care is defined as one that would reasonably be expected under similar circumstances of an ordinary, prudent physician of the same training, experience, specialization, and standing
- liability arises from physician's common law duty of care to their patients in the physician/patient relationship (or, in Québec, from the Civil Code provisions regarding general civil liability)
- action(s) in negligence (or civil liability) against a physician must be launched by a patient within a specific prescribed period required by the respective province in which the actions occurred

Four Basic Elements for Action Against a Physician to Succeed in Negligence
1. A duty of care owed to the patient (i.e. physician/patient relationship must be established)
2. A breach of the duty of care
3. Some harm or injury to the patient
4. The harm or injury must have been caused by the breach of the duty of care

Truth-Telling

Ethical Basis
- helps to promote and maintain a trusting physician-patient relationship
- patients have a right to be told important information that physicians have regarding their care
- enables patients to make informed and autonomous decisions about health care and their lives

Legal Basis
- required for valid patient consent (see *Consent and Capacity*, ELOM11)
  - goal is to disclose information that a reasonable person in the patient's position would need in order to make an informed decision ("standard of disclosure")
- withholding information can be a breach of fiduciary duty and duty of care
- obtaining consent based on misleading information and/or insufficient information can be seen as negligent and/or coercive

CPSO Policy on Truth-Telling
Physicians should provide patients with whatever information that will, from the patient's perspective, have a bearing on medical decision-making and communicate that information in a way that is comprehensible to the patient

Evidence about Truth-Telling
- it is a patient's right to have the option of knowing about any clinical condition(s)/diagnoses that they may have
- most patients want to be provided with information regarding their health
- although some patients may want to protect family members from bad news, they themselves would want to be informed in the same situation
- truth-telling improves trust, adherence, and health outcomes
- informed patients are more satisfied with their care and most often receive news about their health better than expected
- negative consequences of truth-telling can include decreased emotional well-being, anxiety, worry, social stigmatization, and loss of insurability

Medical Error
- medical error may be defined as 'preventable adverse events (AEs)' caused by the patient's medical care and not the patient's underlying illness; some errors may be identified before they harm the patient, so not all errors are truly 'adverse'
- many jurisdictions and professional associations expect and require physicians to disclose medical error; that is, any event that harms or threatens to harm patients must be disclosed to the patient or the patient's decision-maker(s) and reported to the appropriate health authorities
- physicians must disclose to patients the occurrence of AEs or errors caused by medical management, but should not suggest that they resulted from negligence because:
  - negligence is a legal determination
  - error is not equal to negligence
- disclosure allows the injured patient to seek appropriate corrective treatment promptly, if possible
- physicians should avoid simple attributions as to the cause and sole responsibility of others or oneself
- physicians should offer apologies or empathic expressions of regret (e.g. "I wish things had turned out differently") as these may help to maintain and/or rebuild trust and are not admissions of guilt or liability
- *Apology Acts* across Canada protect apologies, both as expressions of regret and admissions of responsibility, from being used as evidence of liability and negligence

Errors of care are compatible with non-negligent care if they are ones that a reasonably cautious and skilled physician could make (i.e. mistakes can be made due to 'honest error')

Adverse Event
An unintended injury or complication from health care management resulting in disability, death, or prolonged hospital stay

Breaking Bad News

- 'bad news' may be any information that reveals conditions or illnesses threatening the patient's sense of well-being; different patients may classify 'bad news' in different ways
- disclosing medical information in a poor or insensitive manner may be as harmful as non-disclosure
  - caution patients in advance of serious tests and about the possibility of bad findings
  - give time for patient to reflect upon the situation prior to disclosing such news
  - give warnings of impending bad news by reviewing prior discussions
  - provide time for the patient to ask questions
  - adequate supports and strategies should always be provided following the disclosure of difficult news
- **SPIKES** protocol was developed to facilitate "breaking bad news" in a conscientious and effective manner
  - **S**etting, **P**erceptions, **I**nvitation, **K**nowledge, **E**mpathy, **S**trategy (see Palliative Medicine, PM6)
  - other tools such as the Serious Illness Conversation Guide or Vital Talk can also assist with conversations with patients with serious illness

Examples of Warning of Impending Bad News

Remember to clarify (invite) the level of knowledge desired by the patient

"I have something difficult to tell you..."

"Unfortunately, the results are not what we were hoping for..."

"This may come as a shock to you, but the tests indicate..."

"There is no easy way for me to tell you this, so I will tell you straight away that you have a serious problem..."

Arguments Against Truth-Telling

- may go against certain cultural norms and expectations
- may lead to patient harm, but only in extreme, rare situations
- medical uncertainty may result in the disclosure of uncertain or inaccurate information

Exceptions to Truth-Telling

- a patient may waive their right to know the truth about their situation (i.e. decline to receive information that would normally be disclosed) when:
  - the patient clearly declines to be informed
  - a strong cultural component exists that should be respected and acknowledged
  - the patient may wish for others to be informed and to make the relevant medical decision(s) for them
- the more weight of the consequences for the patient from non-disclosure, the more carefully one must consider the right to ignorance
- 'emergencies': an urgent need to treat may legitimately delay full disclosure to the patient and/or the SDM; the presumption is that most people would want such treatment and the appropriate SDM cannot be found
- 'therapeutic privilege'
  - withholding of information by the clinician in the belief that disclosure of the information would itself lead to severe anxiety, psychological distress, or physical harm to the patient
  - clinicians should avoid invoking therapeutic privilege due to its paternalistic overtones; it is a defence of non-disclosure that is rarely accepted anymore
  - it is often not the truth that is unpalatable; it is how it is conveyed that can harm the patient

Ethical Issues in Health Care

Managing Controversial and Ethical Issues in Practice

- discuss the issue(s) in a manner that is as objective and non-judgmental as possible
- ensure patients have full access to relevant and necessary information to make informed decisions about their care
- identify if any options are outside of the physician's moral boundaries (e.g. something to which the physician has a conscientious objection) and refer to another physician if appropriate
- consult with a bioethicist and/or the appropriate ethics committees or boards
- protect freedom of moral choice for students or trainees

The Tri-Council Policy Statement

1. Genetic treatment aimed at altering germ cells is prohibited in Canada and elsewhere
2. Embryo research is permitted up to 14 d post-fertilization
3. Embryos created for reproductive purposes that are no longer required may be used
4. Gamete providers must give free and informed consent for research use
5. No commercial transactions in the creation and use of the embryos are permitted
6. Creation of embryos solely for research purposes is prohibited
7. Human cloning is strictly prohibited
8. Risks of coercion must be minimized (i.e. the fertility treatment team may not be pressured to generate more embryos than necessary)
9. One may only discuss the option of using fetal tissue for research after the patient makes a free and informed choice to have a therapeutic abortion
10. Physicians responsible for fertility treatment may not be part of a stem cell research team

Reproductive Technologies

- reproductive technologies may be accessed by people of all genders
  - e.g. a female to male transgender man with a uterus may become pregnant. Please note that use of the words "maternal, mother, and woman" may refer to gender diverse individuals

Overview of the Maternal-Fetal Considerations

- medico-legally, maternal body and fetal body are considered one. In general, maternal and fetal interests align; however, maternal health takes precedence

Ethical Issues and Arguments

- principle of reproductive freedom: pregnant individuals have the right to reproductive choice
- coercion of a gestating individual to accept medical advice is an unacceptable infringement of their personal autonomy
  - Canada's colonial history includes a legacy of infringement of reproductive rights, both rhetorical and practical. Therefore, engaging in conversation with patients around their reproductive rights must be done in a well informed and patient-centered manner

Legal Issues and Arguments

- the law protects a gestating individual's right to life, liberty, and security of person. Key aspects of the gestating individual's rights include:
  - an individual with capacity has the right to consent or refuse medical recommendations regardless of whether or not they are gestating
  - the fetus does not have legal rights until it is born alive and with complete delivery
  - a pregnant person with comorbid substance use disorder cannot be detained and treated to protect the fetus (*Winnipeg Child and Family Services (Northwest Area) v. G. (D.F.), [1997] 3 S.C.R. 925*)
  - a fetus is not a "human being" within the meaning of the Criminal Code of Canada, thus medical negligence during delivery resulting in the death of a fetus that has not been born alive does not constitute criminal negligence causing death (manslaughter) and cannot attract criminal penalties (*R v Sullivan*)

Royal Commission on New Reproductive Technologies (1993) recommendations:

1. medical treatment must never be imposed upon a competent pregnant woman against her wishes
2. no law should be used to confine a pregnant woman in the interest of her fetus
3. the conduct of a pregnant woman in relation to her fetus should not be criminalized
4. child welfare should never be used to control a woman's behaviour during pregnancy
5. civil liability should never be imposed upon a woman for harm done to her fetus during pregnancy

Examples involving the use of established guidelines

- a person is permitted to refuse HIV testing during pregnancy, even if vertical transmission to fetus results; however, once the baby is born, breastfeeding and even theoretical transmission of HIV may attract criminal liability (this area of law is unsettled)
- a person is permitted to refuse caesarean delivery in labour that is not progressing, despite evidence of fetal distress

Assisted Reproductive Therapies

- includes non-coital insemination, hormonal ovarian stimulation, and IVF
- topics with ethical concerns surrounding assisted reproductive therapies (ART):
  - donor anonymity vs. child-centred reproduction (i.e. knowledge about genetic medical history)
  - preimplantation genetic testing for diagnosis before pregnancy
  - use of new techniques without patients appreciating their experimental nature
  - embryo status – the Supreme Court of Canada maintains that fetuses are "unique" but not persons under law; this view would likely apply to embryos as well
  - access to ART
  - private vs. public funding of ART
  - social factors limiting access to ART (e.g. same-sex couples)
  - the 'commercialization' of reproduction

Fetal Tissue

- pluripotent stem cells can currently be derived from human embryonic and fetal tissue
- use of stem cells in research is reviewed by the "Stem Cell Oversight Committee" as part of the CIHR
- potential uses of stem cells in research:
  - studying human development and factors that direct cell specialization
  - evaluating drugs for efficacy and safety in human models
  - cell therapy: using stem cells grown *in vitro* to repair or replace degenerated/destroyed/malignant tissues (e.g. Parkinson's disease)
  - genetic treatment aimed at altering somatic cells (e.g. myocardial or immunological cells) is acceptable and ongoing

Induced Abortion

- CMA definition of induced abortion: the active termination of a pregnancy before fetal viability (fetus >500 g or >20 wk GA)
- CMA policy on induced abortion
  1. induced abortion should not be used as an alternative to contraception
  2. counselling on contraception must be readily available
  3. full and immediate counselling services must be provided in the event of unwanted pregnancy
  4. there should be no delay in the provision of abortion services
  5. no patient should be compelled to have a pregnancy terminated
  6. physicians should not be compelled to participate in abortion – if morally opposed, the physician should inform the patient so she may consult another physician. The CPSO requires physicians to provide an effective referral
  7. no discrimination should be directed towards either physicians who do not perform or assist at induced abortions or physicians who do
  8. induced abortion should be uniformly available to all women in Canada and healthcare insurance should cover all the costs (note: the upper limit of GA for which coverage is provided varies between provinces)
  9. elective termination of pregnancy after fetal viability may be indicated under exceptional circumstances

Ethical and Legal Concerns and Arguments
- in Canada, there is no criminal prohibition regarding abortion
- it is a person's medical decision to be made in consultation with whom they wish; there is no mandatory role for spouse/family
- 2nd and 3rd trimester abortions are not illegal in Canada, but are usually only carried out when there are serious risks to the person's health, or if the fetus has died in utero or has major malformations (e.g. anencephaly). Medical termination of pregnancy is the standard up to 9 weeks gestational age, with surgical methods of varying degrees of invasiveness used subsequently

Prenatal/Antenatal Genetic Testing
- uses:
  1. to confirm a clinical diagnosis
  2. to detect genetic predisposition to a disease
  3. allows preventative steps to be taken and helps patient prepare for the future
  4. gives parents the option to terminate a pregnancy or begin early treatment
- ethical dilemmas arise because of the sensitive nature of genetic information; important considerations of genetic testing include:
  - the individual and familial implications
  - its pertinence to future disease
  - its ability to identify disorders for which there are no effective treatments or preventive steps
  - its ability to identify the sex of the fetus
  - ethical issues and arguments regarding the use of prenatal/antenatal genetic testing include:
    - obtaining informed consent is difficult due to the complexity of genetic information
    - physician's duty to maintain confidentiality vs. duty to warn family members
    - risk of social discrimination (e.g. insurance) and psychological harm

Legal Aspects
- no current specific legislation exists
- testing requires informed consent
- no standard of care exists for clinical genetics, but physicians are legally obligated to inform patients that prenatal testing exists and is available
- a physician may be able to breach confidentiality in order to warn family members about a condition if harm can possibly be prevented via treatment or prevention. In general, the patient's consent is required, unless the harm to be avoided is sufficiently serious to rise to the level of imminent risk of serious bodily harm or death (i.e. not a chronic condition, but an acute life-threatening condition)

Genetic Testing: Ethically Appropriate Actions
- thorough discussion and realistic planning with patient before testing is done
- genetic counselling for delivery of complex information

End-of-Life Care

Overview of Palliative and End-of-Life Care
- focus of care is comfort and respect for person nearing death and maximizing quality of life for patient, family, and loved ones
  - palliative care is an approach that improves the quality of life of patients facing life-threatening illness, through the prevention and relief of suffering, including treating pain, physical, psychosocial, and spiritual concerns
- appropriate for any patient at any stage of a serious or life-limiting illness
- may occur in a hospital, hospice, in the community, or at home
- often involves an interdisciplinary team of caregivers
- addresses the medical, psychosocial, and spiritual dimensions of care
- palliative sedation: the use of sedative medications for patients that are terminally ill to relieve suffering and manage symptoms. Though the intent is not to hasten death, this may be a foreseeable consequence
- withdrawing or withholding life sustaining interventions (e.g. artificial ventilation or nutrition) that are keeping the patient alive but no longer wanted or indicated

Palliative Care – Not the Same as Medical Assistance in Dying
Palliative care is an approach designed to improve symptoms and quality of life for the duration of a person's life, but unlike Medical Assistance in Dying, it does not aim directly at or intend to end the person's life. Many palliative care physicians are incorporating MAID into their practice, though some may conscientiously object

Euthanasia and Medical Assistance in Dying
- euthanasia: knowingly and intentionally performing an act, with or without consent, that is explicitly intended to end another person's life where that person has an incurable illness
- medical assistance in dying: the administering or prescribing for self-administration, by a medical practitioner or nurse practitioner, of a substance, at the request of a person, that causes their death

Common Ethical Arguments/Opinions
- criminally prohibiting medical assistance in dying may influence some individuals to end their own lives and/or to endure intolerable suffering until their natural death occurs
- patient has the right to make autonomous choices about the time of their own death
- belief that there is no ethical difference between the acts of euthanasia/assisted suicide and forgoing life-sustaining treatments

- belief that these acts benefit terminally ill patients by relieving suffering
- belief that patient autonomy has limits and that one cannot and/or should not be allowed to make an autonomous request to end one's life
- death should be the consequence of the morally justified withdrawal of life-sustaining treatments only in cases where there is a fatal underlying condition, and it is the condition (not the withdrawal of treatment) that causes death
- an argument presented in the Carter case (see below) suggested permitting MAID will detract support for palliative care, since with proper palliative care, the number of requests for MAID would decrease. This argument was rejected in *Carter v. Canada*, as it was deemed unacceptable to make people suffer intolerably to potentially improve and/or increase support for palliative care

Legal Aspect

- in the *Carter v. Canada* decision of February 2015, the criminal prohibition on assistance in suicide was ruled unconstitutional to the extent that they prohibit physician-assisted death for a competent adult person who (1) clearly consents to the termination of life and (2) has a grievous and irremediable medical condition that causes enduring suffering that is intolerable to the individual in the circumstances of his or her condition
- Bill C-14 (June 17, 2016) legalized MAID by amending the Criminal Code to create exemptions permitting medical practitioners to provide MAID, specified the eligibility criteria, safeguards, and required documentation and authorization from the Minister of Health, as well as new offences for failure to comply with the new regulations. http://www.parl.ca/DocumentViewer/en/42-1/bill/C-14/royal-assent as the Bill C-14 criteria are narrower than the Carter decision, there are ongoing constitutional challenges to the MAID framework as it currently stands

Bill C-14 Criteria for MAID

- patient is eligible for publicly-funded health services in Canada
- at least 18 yr, and has capacity for clear and freely given consent
- grievous and irremediable medical condition: in an advanced state of irreversible decline in capability
- suffering intolerable to the patient, not relieved under conditions they consider acceptable
- recent update eliminated criteria of "reasonable foreseeability of natural death"
- MAID Process
  1. eligibility criteria satisfied
  2. patient signs and dates a written request for MAID
  3. two independent witnesses sign the written request. Witnesses must be 18 y/o, understand the nature of MAID, and must not a) benefit (financially or otherwise) from the death, b) be an owner or operator of the healthcare facility where the patient is receiving care, c) be directly involved in the provision of health or personal care of the patient
  4. HCP must inform the patient that they can withdraw their consent at any time
  5. two independent assessors (physician or NP) must provide written confirmation that eligibility criteria are met
  6. 10 clear days must elapse between the request and the day on which MAID is provided, unless both healthcare providers agree that a shorter period is appropriate due to the patient's imminent death or loss of capacity
  7. as per the new MAID legislation (updated in 2021), a patient may request MAID even if death is not reasonably foreseeable. For a patient whose death is not reasonably foreseeable, their eligibility assessment must be a minimum of 90 days unless the assessments are completed sooner and the patient is at immediate risk of losing the capacity to consent.
  8. throughout the 10 or 90 day period and immediately before providing MAID, the HCP must give the individual an opportunity to withdraw the request and ensure that the patient gives express consent to receive MAID
     - contravention of this process is an offence punishable by up to 5 yr in prison
  9. as of changes to the legislation in 2021, a patient may waive the requirement for giving final consent just before MAID is administered only if: (1) the patient's death is reasonably foreseeable and (2) while the patient has decision-making capacity the patient is:
     (a) assessed and approved for MAID,
     (b) advised that they are at risk of losing capacity to provide final consent and
     (c) the patient makes a written arrangement with their HCP where they consent in advance to receive MAID on a chosen date if they (i.e. the patient) no longer has capacity to consent on that date

Acceptable Use of Palliative and End-of-Life Care

- the use of palliative sedation with opioids in end-of-life care, knowing that death may occur as an unintended consequence (principle of double effect) is distinguished from euthanasia and assisted suicide where death is the primary intent
- the appropriate withdrawal of life-support is distinguished from euthanasia and assisted suicide as it is seen as allowing the underlying disease to take its 'natural course,' but this distinction may be more theoretical than real
- consent for withdrawal of life-support must be sought from the capable patient, or in case of incapable patient the SDMs, as per the *Health Care Consent Act* and *Substitute Decisions Act*, and as re-affirmed by the ruling in *Cuthbertson v. Rasouli* in 2013, as palliative care would be instituted and consent for that would require SDM consent

MAID: Ethically Appropriate Actions

- Respect capable decisions to forgo available treatment options and/or palliative care options
- Provide appropriate palliative measures with patient consent
- Try to assess reasons for MAID requests to see if there are 'reversible factors' that are directly and unduly influencing one's desire to receive MAID (e.g. depression, pain, loneliness, anxiety) that can be treated

Exploring the Experience of Supporting a Loved One through a Medically Assisted Death in Canada

Can Fam Physician. 2018;64(9):e387-e393

Purpose: To explore the experience of family and close friends of patients seeking MAID in Canada.

Methods: Primary support givers of clinic patients seeking MAID were identified during consultations for an assisted death evaluation. The identified support givers were then invited to participate in the study, and those interested were asked to contact interviewers. Semi-structured interviews were conducted, transcribed, coded, and subjected to content analysis to elucidate common themes.

Results: 18 support people for patients seeking MAID were interviewed. All participants were supportive of their loved one's wishes for MAID and provided emotional and practical support in preparation for the procedure. Some participants reported feeling opposed, however, changed their minds after seeing the suffering their loved ones had to endure. The time before the procedure involved saying goodbye and ceremonial rituals. Those interviewed after the procedure found the death peaceful and reported that it offered advantages compared with natural death in their loved one's individual circumstances.

Conclusion: Participants were supportive of their loved one's wishes for assistance in death to end suffering and found the process to be peaceful overall.

- refusals of care by the patient that may lead to death as well as requests for a hastened death, ought to be carefully explored by the physician to rule out any 'reversible factors' (e.g. poor palliation, depression, poverty, ill-education, isolation) that may be hindering authentic choice
- Government of Canada – Services and Information for End-of-Life Care:
  - https://www.canada.ca/en/health-canada/topics/end-life-care.html
  - options and decision making at end of life: palliative care, do not resuscitate orders, refusal or withdrawal of treatment, refusal of food and drink, palliative sedation, MAID
  - decisions at end of life: informed and capacity for consent, substitute decision maker, advanced care planning (written plan, will, or medical directive) often established through a family meeting

Notify coroner if death occurs due to:
- Violence, negligence, misconduct
- Pregnancy
- Sudden or unexpected causes
- Disease not treated
- Cause other than disease
- Suspicious circumstances
- MAID

Physician Responsibilities Regarding Death
- physicians are required by law to complete a medical certificate of death unless the coroner needs notification; failure to report death is a criminal offence
- *Coroner's Act*, 1990 (specific to Ontario, similar in other provinces) requires physicians to notify a coroner or police officer if death occurs:
  - due to violence, negligence, misconduct, misadventure, or malpractice
  - during pregnancy or is attributable to pregnancy
  - suddenly and unexpectedly
  - from disease which was not treated by a legally qualified medical practitioner
  - from any cause other than disease
  - under suspicious circumstances
  - death from MAID
- coroner investigates these deaths, as well as deaths that occur in psychiatric institutions, jails, foster homes, nursing homes, hospitals to which a person was transferred from a facility, institution or home, etc.
- in consultation with forensic pathologists and other specialists, the coroner establishes:
  - the identity of the deceased
  - where and when the death occurred
  - the medical cause of death
  - the means of death (i.e. natural, accidental, suicide, homicide, or undetermined)
- coroners do not make decisions regarding criminality or legal responsibility
- while the Supreme Court of Canada noted that nothing in the *Carter v. Canada* decision compelled a physician to participate in MAID, the College of Physicians and Surgeons of Ontario mandatory referral policy, which has been upheld by the courts, requires physicians in Ontario to provide an effective referral if the physician conscientiously objects to MAID
  - the impact of MAID on religious institutions' obligation towards patients is not yet clear

Physician Competence and Professional Conduct

CanMEDS Competencies (Ethical/Policy Statement)
- a framework of professional competencies established by the Medical Council of Canada (MCC) as objectives for the MCC Qualifying Exam
- further information on Medical Council of Canada objectives can be found at www.mcc.ca

CPSO Policy: Treating Self and Family Members
Physicians will not diagnose or treat themselves or family members except for minor conditions or in emergencies and then only if no other physician is readily available

Legal Considerations
- physicians' conduct and competence are legally regulated to protect patients and society via mandatory membership to provincial governing bodies (e.g. the CPSO)
- physicians are legally required to maintain a license with the appropriate authority, and are thus legally bound to outlined policies on matters of conduct within their medical practice
- the ultimate constraint on physician behaviour with regards to unprofessionalism is 'conduct unbecoming a physician,' such as inappropriate behaviour with colleagues, conflicts of interest, untruthfulness, unethical billing practices, and sexual impropriety with patients

CPSO Policy: Ending the Physician-Patient Relationship
- Discontinuing services that are needed is an act of professional misconduct
- Exceptions include patient request, alternative services arranged, or adequate notice has been given

Common Policies on Physician Conduct
- physicians must ensure that patients have access to continuous on-call coverage and are never abandoned
  - physicians are required to comply with the law, which include human rights laws. A failure to accommodate a disability in violation of human rights legislation can result in the regulatory body sanctioning the physician in addition to any penalties assigned by the human rights tribunal
- sexual conduct with patients, even when consented to by the patient, is a serious matter that can lead to accusations of battery by the patient and professional misconduct by the provincial governing body. Important notes on this topic include:
  - inappropriate sexual conduct includes intercourse, undue touching, inappropriate and unrelated references to sexual matters, sexual jokes, and physician presence when capable patients undress or dress
  - in specific situations, physicians may have a personal relationship with a patient provided a year has passed since the last therapeutic contact

CMA Code of Ethics
Report any unprofessional conduct by colleagues to the appropriate authority

  - physicians are permanently prohibited from personal relationships with patients whom they saw for psychotherapy
  - in Ontario, physicians must report any colleagues of whom they have information regarding sexual impropriety (as per CPSO Policy on Boundary Violations)
- physicians must maintain adequate records for each patient, which include:
  - demonstration that care has been continuous and comprehensive
  - minimal standards for record-keeping, including readability, diagnosis, differential diagnosis, appropriate tests and referrals, and a coherent patient record, including drugs, a cumulative patient profile, and all aspects of charting that are required for safe patient care (full standards available at www.cpso.on.ca). Another physician should be able to take over the safe care of the patient based on the record
  - records stored for 10 yr in most jurisdictions
  - although the medical record is the property of the physician or an institution, the following is true:
    - the patient or the patient's delegate must be allowed full access to information in the medical record
    - the patient or delegate must obtain access within a reasonable period of time, usually upon a written request
    - the physician can charge a reasonable fee for this service
- in the hospital, physicians must ensure their own competence, respect hospital by-laws and regulations, practice only within the limits of granted privileges, cooperate with other hospital personnel, and maintain adequate hospital records

Research Ethics

- involves the systematic analysis of ethical dilemmas arising during research involving human subjects to ensure that:
  - study participants are protected
  - clinical research is conducted to serve the interests of the participants and/or society as a whole
- major ethical dilemmas arise when a physician's obligation to the patient comes into conflict with research obligations and/or incentives
- any exceptions to disclosure for therapeutic consent do not apply in an experimental situation
- important ethical principles to consider when conducting research on human subjects are laid out in the *Declaration of Helsinki, the Belmont Report*, and the *Tri-Council Policy Statement: Ethical Conduct on Research Involving Human Subjects*

Table 5. Ethical Principles for Research Involving Human Subjects

A patient's participation in research should not put them at a known or probable disadvantage with respect to medical care (i.e. cannot deny participants in research 'known effective care,' e.g. randomizing patients with depression to a placebo arm with no treatment). This is known as the principle of clinical equipoise
Must include access to the treatment that is considered standard (placebo-controlled trials are generally acceptable where patients still receive the standard of care, or, if not, are informed about the placebo arm and what that entails)
Must employ a scientifically valid design to answer the research question (ensured via peer review, expert opinion)
Must demonstrate sufficient value to justify any risk posed to participants
Must be conducted honestly (i.e. carried out as stated in the approved protocol)
Findings must be reported promptly and accurately without exaggeration, to allow practicing clinicians to draw reasonable conclusions
Patients must not be enticed into risky research by financial incentives and investigators must not trade the interests of patients for disproportionate recompense by a sponsor; both participants and investigators are due fair recompense for their time and efforts
Any significant interventional trial ought to have a data safety monitoring board that is independent of the sponsor and can ensure safety of the ongoing trial

Ethics on Research with Indigenous People

- the Ownership, Control, Access, and Possession (OCAP) principles are "a set of standards that establish important ground rules about how Indigenous peoples' data should be collected, protected, used, or shared"
- the principles were developed because Indigenous peoples were historically subjects of research without consent, resulting in significant morbidity and mortality
- OCAP principles are:
  - ownership: the community or group owns the information collectively
  - control: Indigenous peoples, their communities, and representatives have the right to control all aspects of "research and information management processes that impact them"
  - access: "Indigenous peoples must have access to information and data about themselves and their communities regardless of where it is held"
  - possession: Indigenous peoples are stewards of the data. As they possess the data, it is within their jurisdiction and control
- researchers working with Indigenous communities are expected to uphold OCAP principles in their research

CanMEDS Competencies
- Communicator
- Collaborator
- Health Advocate
- Leader
- Professional
- Scholar
- Medical Expert

Guiding Principles for Research Ethics
There are a number of principles that are important to research ethics – the three listed are primary ones that are typically cited, but this list is non-exhaustive.
Respect for persons: informed consent
Beneficence: harm vs. benefit
Justice: avoid exploitation/unjustified exclusion criteria

Informed Consent for Research
- Purpose of study
- Expectations of the research participant
- Name and probability of harm and benefits
  - whether and/or how participants can withdraw their consent to participate
  - confidentiality (e.g. how will it be maintained? Are participants going to be deidentified and anonymized?)
  - privacy (e.g. for how long will participants' data be stored?)
- Nature of physician's participation including compensation
- Proposals for research must be submitted to a Research Ethics Board (REB) research ethics board

CMA and CPSO Guidelines for Ethically Appropriate Physician-Industry Relations
- The primary goal should be the advancement of the health of Canadians
- Relationships should be guided by the CMA Code of Ethics
- The physician's primary obligation is to the patient
- Physicians should avoid any self-interest in their prescribing and referral practices
- Physicians should always maintain professional autonomy, independence, and commitment to the scientific method

- First Nations, Inuit, and Métis (FNIM) communities are self-determining, and as such, may have their own version of OCAP. Investigators should respect each community's autonomy with respect to research, data collection, analysis, interpretation, and knowledge transfer

The First Nations Principles of OCAP® [Internet]. Akwesasne (ON): First Nations Information Governance Centre (FNIGC); 2020 [cited 2020 Apr 12]. Available from: www.FNIGC.ca/OCAP. OCAP® is a registered trademark of the First Nations Information Governance Centre (FNIGC)

Physician-Industry Relations

- healthcare delivery in Canada involves collaboration between physicians and the pharmaceutical and health supply industries in the areas of research, education, and clinical evaluation packages (e.g. product samples)
- however, unlike physicians, pharmaceutical and health supply industries do not have a fiduciary duty to patients and are profit-driven
  - e.g. the dissemination of free product samples by pharmaceutical companies is associated with increased patient preference for new drugs that are often more expensive, thus incurring a greater long-term cost for patients and the healthcare system
  - new pharmaceutical products are not always more effective than previous standard of care and may have less robust safety evidence by virtue of being new drugs
- physicians must ensure that their participation in such collaborative efforts is in keeping with their duties to their patients and society; however, physicians often struggle to properly identify situations in which a conflict of interest is present
- even seemingly innocuous gifts or other interactions (pens with pharmaceutical logo, research honoraria, meals, speaker fees, etc.) can subconsciously influence physician practices and beliefs in favour of promoted products, resulting in the prescription of medications for reasons other than their efficacy and safety profile
- gifts or free products from the pharmaceutical industry are usually inappropriate:
  - sponsorship for travel and fees for conference attendance may be accepted only where the physician is a conference presenter and not just in attendance
  - physicians receiving such sponsorship must disclose this at presentations and/or in written articles; it is important to note, however, that the disclosure of conflicts does not eliminate the potential influence that the conflict may have on physician behaviours

Resource Allocation

- definition: the distribution of goods and services to programs and people
- physicians have the duty to inform
- physicians must make healthcare resources available to patients in a manner which is fair and equitable, without bias or discrimination
  - need and benefit are morally relevant criteria for resource allocation
  - gender, sexual orientation, religion, level of education, or age alone are morally irrelevant criteria. They must be weighed against need and benefit to justify equitable allocation of resources
- ethical dilemmas that arise when deciding how best to allocate resources:
  - fair chances vs. best outcome: favouring best outcome vs. giving all patients fair access to limited resources (e.g. transplant list prioritization)
  - aggregation problem: modest benefits to many vs. significant benefits to few
  - democracy problem: when to rely on a fair democratic process to arrive at a decision

Guidelines for Appropriately Allocating Resources

- the physician's primary obligation is to:
  - protect and promote the welfare and best interests of their patients
  - choose interventions known to be beneficial on the basis of evidence of effectiveness
  - seek the tests or treatments that will accomplish the diagnostic or therapeutic goal for the least cost
  - advocate for one's patients, but avoid manipulating the system to gain unfair advantage for them
  - resolve conflicting claims for scarce resources justly and equitably, on the basis of morally relevant criteria such as need and benefit, using fair and publicly defensible procedures
  - inform patients of the impact of cost constraints on care, but in a sensitive way
  - seek resolution of unacceptable shortages at the level of hospital management or government

Choosing Wisely Canada is the national voice for reducing unnecessary tests and treatments in healthcare. Refer to https://choosingwiselycanada.org/recommendations/ for a comprehensive list of recommendations to assist in decision making as healthcare stewards

Conscientious Objection

Patients Refusing Treatment

- in accordance with the principle of autonomy, it is generally acceptable for capable patients to refuse medical interventions for themselves or others, although exceptions may occur
- the onus of justifying reasons for refusal or agreement is higher on SDMs than on capable patients
- if parents or SDMs make decisions that are clearly not in the "best interests" of an incapable child, physicians may have ethical grounds for administering treatment, depending on the acuity of the clinical situation
  - in high-acuity scenarios (e.g. refusing blood transfusion based on religious grounds for a child in hemorrhagic shock), physicians have a stronger obligation to act in the child's best interests
  - in lower acuity scenarios (e.g. refusing childhood immunization in a developed nation), there is a stronger obligation to respect the autonomy of the decision-makers
  - in 2014, a child was found not to be "a child in need of protection" when her mother refused chemotherapy and pursued traditional Indigenous healing. While this decision purported to establish a new constitutional right to Indigenous healing, the decision was amended such that "the best interests of the child are paramount." These statements could be interpreted in contradiction with each other, so the current status of the law is unclear. See *Hamilton Health Sciences Centre v. DH* for more information

Physicians Refusing to Provide Treatment

- physicians may refuse to provide treatment or discontinue relationships with patients, but must ensure these patients can access services elsewhere by way of referring the patient to a willing practitioner (e.g. a paediatrician who refuses to treat an unvaccinated child should refer the family to another practice)

Implicit Bias

- what is implicit bias?
  - implicit attitudes, thoughts, or feelings that may exist outside of conscious awareness and are therefore difficult to consciously acknowledge and control
  - negative implicit attitudes towards people of colour may contribute to disparities in quality of health care received
  - these attitudes reflect constant pervasive exposure to stereotypical portrayals of members of different "social groups" including, but not exclusive to: people of colour, FNIM, gender, sexual orientation, nationality, religion, ability, socioeconomic status, education, profession, etc.
- prevalence of implicit bias in healthcare
  - a systematic review of 15 American studies which mostly used the Implicit Association Test (IAT) on healthcare professionals found evidence of low-to-moderate levels of implicit bias against people of colour
  - one study used recommendation of thrombolysis treatment when indicated as a proxy to assess quality of care. In cases when Black and white patients both met indications for thrombolysis treatment, physicians who held a pro-white implicit bias were more likely to recommend that treatment to white patients than Black patients
  - in paediatric studies where a vignette of Black and white patients was provided, paediatricians in the study were less likely to recommend adequate pain treatment for Black children than white children
  - bias and stereotypes of all forms cause harmful, adverse health outcomes
- patient perception
  - physicians face a pro-white, anti-Black implicit bias where white patients feel more respected and Black patients feel less respected by their healthcare provider
- bias and stereotypes can be lethal
  - on September 21, 2008, Brian Sinclair, an Indigenous man, presented to a Winnipeg emergency department with a blocked catheter. His presence was not recorded by triage
  - while he waited in the emergency department waiting room, he lost consciousness, but was not checked on by healthcare staff
  - after being in the waiting room for 34 h, he passed away without having received any medical attention
  - later, an inquest found that healthcare staff thought he was intoxicated or homeless
  - a Manitoba court stated that Brian Sinclair's race, and consequently the stereotypes staff held leading to the assumption that he was intoxicated, were relevant factors in his tragic and preventable death

Suggestions for Noticing Implicit Bias

- before a clinical encounter, readers are advised to "check-in" with themselves
- readers should ask themselves:
  - how are they feeling?
  - what are they worried about?
  - what do they notice in their body?
  - what is their intention for the interaction?

Working with Vaccine-Hesitant Parents: An Update
Canadian Paediatric Society 2018

1. Understanding the health provider's key role in parental decision-making and not dismissing vaccine refusers from practice
2. Using presumptive and motivational interviewing techniques to identify specific vaccine concerns
3. Using effective, clear language to present evidence for disease risks and vaccine benefits fairly and accurately
4. Managing pain during immunization
5. Reinforcing the importance of and parental responsibility for community protection

  - what do they need to feel more grounded and supported before going into the clinical space?
  - how can they leave some of their assumptions and fears in the hall, instead of bringing them into the examination room?
- we are more likely to be biased, without realizing it, when:
  - we're under stress
  - we're working under significant time constraints
  - we're multitasking
  - there's a need for closure or decision-making (e.g. admit or discharge? Refer or not refer? etc.)

Indigenous Health

Overview of the History and Impact of Colonialism

- the Indigenous health crisis that exists today is a result of many factors, including the impact of colonial laws, oppression, and genocide
- Indigenous health is deeply connected to the land and freedom which have been systematically stolen from its people
- physicians can consider how oppressive legislation plays a role in precluding many Indigenous patients from experiencing health

- long before the arrival of European newcomers, Indigenous peoples lived on and cared for Turtle Island (now known as North America). This history is richly steeped in culture, relationship, and a holistic worldview. The Indigenous peoples had a flourishing trade, complex social and legal systems, and scientific knowledge about astronomy, ecology, agriculture, and medicine. Despite hundreds of years of adversity, Indigenous peoples and their rich cultures persist and thrive today – an indication of the resilience and tenacity of Indigenous peoples and communities

- upon European arrival, Indigenous and non-Indigenous people formed friendships based on mutual respect. These relationships were formalized through treaties. Treaties provided a framework for relationships and the sharing of Indigenous lands in a peaceful and respectful way

- one example of how treaties were documented and enacted was through wampum belts. Wampum belts are intricate visual displays made from clam shells. These belts serve as a living record of agreements. The two-row wampum belt is particularly important for understanding the relationship between Indigenous peoples and Europeans

- in 1613, Kanienkehaka (Mohawk) peoples noticed that settlers were using and living on their traditional lands. The Haudenosaunee Confederation met and discussed how they could live and work together peacefully on the land. Through these discussions, they learned much about one another and the two-row wampum was created: "In one row is a ship with our White Brothers' ways; in the other a canoe with our ways. Each will travel down the river of life side by side. Neither will attempt to steer the other's vessel." This wampum represented three principles: friendship, peace, and the concept of forever

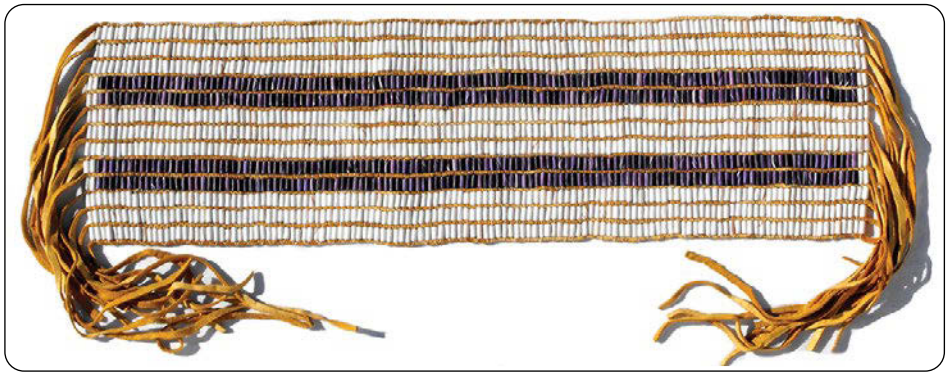

Figure 3. Image of a two row wampum belt. It represents friendship, peace, and the concept of forever
Bonaparte D. The Two Row Wampum Belt: An Akwesasne Tradition of the Vessel and Canoe [Internet]. [place unknown]: The People's Voice. 2005 Aug 5 [cited 2020 Apr 16]. Available from: http://www.wampumchronicles.com/tworowwampumbelt.html

- soon after these treaties were forged, greed and colonial policies began to erode these relationships.
- the treaties and the rights they established with Indigenous peoples became an inconvenience to the expanding European empire and, consequently, they began to be ignored, as they continue to be today
- the Doctrine of Discovery was the piece of colonial law that let European explorers 'discover' lands previously occupied for thousands of years. This doctrine arose from a series of statements from the Pope that morally and legally justified the dispossession of lands from their Indigenous inhabitants (Terra Nullius)

- this justification is based erroneously on the supposed 'inferiority' of Indigenous peoples to their 'superior' European counterparts. This allowed monarchs to exploit North American land and resources regardless of its original caretakers and use the power of this doctrine to extinguish Indigenous rights. This doctrine continues to have devastating impacts on Indigenous peoples in Canada

- in 1763, King George III issued the *Royal Proclamation* that delineated the process of British settlement of Indigenous lands. This proclamation gave ownership of North America to King George III; however, it stated that Indigenous title existed and would continue to exist. Therefore, any land would belong to the Indigenous people unless otherwise noted and agreed upon in a treaty. This prevented European settlers from taking possession of land that was occupied by Indigenous peoples, unless already purchased by the Crown
- this document unequivocally recognizes Indigenous rights, title, and self-determination. To this day, no law has overruled the *Royal Proclamation*; therefore, it is still valid according to Canadian law. Additionally, the notion of Indigenous rights is protected in *section 25* of the *Constitution Act*. Although Indigenous rights cannot be legally diminished or extinguished, the Canadian government frequently disregards this fact

- in 1764, the year following the *Royal Proclamation*, the *Treaty of Niagara* would lay the foundation for the relationship between the Crown and First Nations and their coexistence on Turtle Island. At this instance, the Silver Covenant Chain of Friendship was affirmed and both Indigenous and British sovereignty were recognized. The Treaty of Niagara established a multinational, familial relationship between the Crown and the Indigenous nations
- over 2000 Indigenous dignitaries, representatives of 24 Indigenous nations across Turtle Island, were present, and the 24-nation wampum belt was created. This wampum represents the relationship between the Indigenous nations and the Crown

- the *British North America (BNA) Act* of 1867 (later renamed the *Constitution Act*, 1982) gave the Canadian government control over "Indians" (notably excluding Inuit and Métis peoples). This act included New Brunswick, Nova Scotia, Ontario, and Québec as a new self-governing federation. This laid the foundation for Canada's laws and governance and the rights of those living in the territory now defined as Canada. The BNA Act stated that the federal government had jurisdiction over "Indians and lands reserved for Indians." Indigenous peoples were not involved in conversations or proceedings associated with passing this act

- in 1857, *An Act for the Gradual Civilization of the Indian Tribes in Canada* passed and later absorbed under the larger umbrella of the Indian Act.
- "it is desirable to encourage the progress of Civilization among the Indian Tribes in this Province, and the gradual removal of all legal distinctions between them and Her Majesty's other Canadian Subjects, and to facilitate the acquisition of property and of the rights accompanying it, by such Individual Members of the said Tribes as shall be found to desire such encouragement and to have deserved it."
- this act encouraged the voluntary enfranchisement of Indigenous people. Enfranchisement is the legal process of exterminating one's "Indian" status and ancestral rights in order to gain Canadian citizenship. Later, involuntary enfranchisement would be enforced. This would extinguish the status of any Indigenous person who served in the armed forces, received a university degree, or became a professional (e.g. lawyer, engineer, physician)

- this act depicts the deliberate intentions of Canadian parliament to erase Indigenous culture and diversity from Canada. Other assimilatory programs such as residential schools, the Sixties Scoop, and Indian hospitals have been implemented over various time periods since Confederation. These policies have created irreparable harm, and much of the poverty and current physical and mental health crises facing Indigenous communities today can be traced back to these colonial injustices, as well as to ongoing colonialist policies
- a strong understanding of these historical factors can equip physicians to provide better care and cultivate a more empathetic physician-patient relationship

- the *Indian Act* (1876) allows the Canadian government to obtain complete control over First Nations, status, and reserves. It precluded equal political and economic participation and actually made cultural and spiritual practices illegal

- the *Indian Act* still exists today but has morphed significantly since its establishment. This act has taken total political control, imposed foreign governmental structures (band councils), and eliminated the rights of Indigenous peoples to practice their sacred cultural and spiritual beliefs. Indian agents were government workers who enforced these laws and were given the power to prevent Indigenous peoples from leaving their communities. In 1887, Sir John A. MacDonald stated, "The great aim of our legislation has been to do away with the tribal system and assimilate the Indian people in all respects with other inhabitants of the Dominion as speedily as they are fit to change"

- in terms of health, the *Indian Act* gives the Governor in Council control over the decisions made surrounding regulations of public health and treatment. However, this act does not present any obligation of the Canadian government to provide health services for Indigenous peoples

- Section 141 of the *Indian Act* prevented Indigenous peoples from gathering and discussing their rights or hiring legal representation to fight against this oppression

- Judge Alfred Scow describes the impact that this has had on his peoples: "This provision of the *Indian Act* was in place for close to 75 years and what that did was it prevented the passing down of our oral history. It prevented the passing down of our values. It meant an interruption of the respected forms of government that we used to have, and we did have forms of government be they oral and not in writing before any of the Europeans came to this country. We had a system that worked for us. We respected each other. We had ways of dealing with disputes"

- in 1951, some amendments were made to the *Indian Act*. The more oppressive sections were amended or erased, such as the outlawing of sacred practices, the inability to leave reserve without permission of an Indian agent, the inability to hire legal counsel, and the inability of Indigenous women to vote in Band Council elections
- the *Indian Act* continued to oppress Indigenous women uniquely by taking away their status if they married a non-Indigenous man. This means that a woman would have to leave her family and community, and consequently lose her treaty and health benefits, including her right to be buried on reserve with her ancestors. The opposite held true for Indigenous men, as it allowed for non-Indigenous women to gain Indian status through marriage

- in the 1970s-80s, Indigenous women began lobbying for equal rights and *Bill C-31* was passed that nullified this law, allowing many women to regain status. However, this law continues to pose significant controversy as this status is only allowed to be passed down to one generation

- Indian status is defined under section 6 of the *Indian Act* and denotes who qualifies and therefore becomes a ward of the government. This is a paternalistic legal relationship that creates two categories of First Nations status
  - 6(1): this person can pass on their status to their children regardless of their partner's heritage
  - 6(2): this person can only pass on their status if their partner is also Indigenous

- this idea of status complicates the identities of many Indigenous peoples (including non-status First Nations, Métis, and Inuit peoples who do not fall under the *Indian Act*) who are prevented from registering and therefore lose government support, their treaty, and health benefits. They also lose their ability to:
  - participate in community politics
  - partake in land claims
  - connect to their ancestral lands

- this displacement and the misconception that non-status peoples are "less Indian" is extremely harmful and often serves as a platform for lateral violence. In this context, lateral violence refers to when a member of an oppressed group behaves in a malicious or violent manner towards another member of that same oppressed group or in a lower position of power. Lateral violence can be traced back to the impact of colonialism

- Indigenous individuals are generally subject to full taxation, though individuals with status are eligible for select tax exemptions through section 87 of the Indian Act. It is a pervasive and harmful myth that Indigenous individuals do not pay taxes. For the most part, exemptions only apply to financial matters located on-reserve, with complex and specific criteria to be met. Matters located off-reserve are generally taxed in full. A summary of this is available in Bob Joseph's "Dispelling Common Myths about Indigenous Peoples" https://www.ictinc.ca/hubfs/ebooks/ebooks%202019/Common%20Myths%20eBook%20July%202019.pdf

- the *Indian Act* is a controversial piece of legislature because it undermines the nationhood and sovereignty of Indigenous peoples. However, it is important to understand the *Indian Act* because it also provides the basis for the historical and constitutional relationship between Indigenous peoples and the Canadian government. Therefore, it cannot be easily removed without having significant ramifications

Movement Towards Reconciliation

- in 1991, the Royal Commission on Aboriginal Peoples (RCAP) was formed to address the inequities that exist and to work to repair the relationship between Indigenous peoples and Canada. This commission was brought about after the Oka Crisis. The Oka crisis (The Mohawk Resistance) arose from a long-standing history of rejection and ignoring of Indigenous land rights by the Canadian government, and resulted in a 78-day protest of a proposed golf course expansion onto sacred Mohawk territory. The RCAP report (1996) detailed extensive research and recommendations needed to heal and restructure the relationship between Indigenous and non-Indigenous peoples. The majority of these recommendations have not been implemented and there continues to be little government interest in the constitutional issues that affect Indigenous peoples and communities

- in 2008, the Prime Minister of Canada apologized to all those who were affected by the residential school system, where Indigenous children were forced into abusive schools (see Public Health and Preventive Medicine, *Colonization and Healthcare*, PH7). The Truth and Reconciliation Commission was born out of a settlement agreement between the government and residential school survivors. The mission of this commission is to learn and tell the stories of those who attended these schools. This commission hopes to bring about renewed relationships and healing based on mutual understanding and respect. To achieve this goal, the commission put out 94 Calls to Action aiming to bring us closer to reconciliation. These calls urge all levels of the Government of Canada to work together to address systemic inequities by changing policies and programs that continue to oppress Indigenous peoples. Under the category of health, the following recommendations are quoted below:
  - we call upon the federal, provincial, territorial, and Aboriginal governments to acknowledge that the current state of Aboriginal health in Canada is a direct result of previous Canadian government policies, including residential schools, and to recognize and implement the healthcare rights of Aboriginal people as identified in international law, constitutional law, and under the Treaties
  - we call upon the federal government, in consultation with Aboriginal peoples, to establish measurable goals to identify and close the gaps in health outcomes between Aboriginal and non-Aboriginal communities, and to publish annual progress reports and assess long-term trends. Such efforts would focus on indicators such as: infant mortality, maternal health, suicide, mental health, addictions, life expectancy, birth rates, infant and child health issues, chronic diseases, illness and injury incidence, and the availability of appropriate health services
  - in order to address the jurisdictional disputes concerning Aboriginal people who do not reside on reserves, we call upon the federal government to recognize, respect, and address the distinct health needs of the Métis, Inuit, and off-reserve Aboriginal peoples
  - we call upon the federal government to provide sustainable funding for existing and new Aboriginal healing centres to address the physical, mental, emotional, and spiritual harms caused by residential schools, and to ensure that the funding of healing centres in Nunavut and the Northwest Territories is a priority
  - we call upon those who can effect change within the Canadian healthcare system to recognize the value of Aboriginal healing practices and use them in the treatment of Aboriginal patients in collaboration with Aboriginal healers and Elders were requested by Aboriginal patients
  - we call upon all levels of government to:
    1. increase the number of Aboriginal professionals working in the healthcare field
    2. ensure the retention of Aboriginal health-care providers in Aboriginal communities
    3. provide cultural competency training for all healthcare professionals
  - we call upon medical and nursing schools in Canada to require all students to take a course dealing with Aboriginal health issues, including the history and legacy of residential schools, the United Nations Declaration on the Rights of Indigenous Peoples, Treaties and Aboriginal rights, and Indigenous teachings and practices. This will require skills-based training in intercultural competency, conflict resolution, human rights, and anti-racism

- going forward as healthcare professionals, we are uniquely responsible for knowing and understanding the impact these historical and legal truths have on our patients. When addressing health inequities that are disproportionately experienced by Indigenous peoples, we need to take into account the impact of 500 years of colonialism. We need to understand how our patients and their ancestors have experienced structural violence and trauma in order to address their physical, mental, emotional, and spiritual health needs. Physicians need to understand that we are all treaty people, and that the above legislation not only applies to Indigenous peoples, but to physicians as well, and all those who benefit from these laws

Indigenous Disproportionate Over-Representation of Biological, Psychological, and Social Co-Morbidities

- physicians may work in various settings in which Indigenous peoples make up a large proportion of the population. Treatment approaches in these settings must consider issues unique to Indigenous peoples, particularly considering that past colonial practices and historical traumas have led to their over-representation in vulnerable groups. Indigenous peoples in Canada have shown great resilience against a long history of colonialism, structural oppression, dispossession, and harmful policies. These historical realities perpetuate current structural barriers that impact the health of Indigenous peoples (see Public Health and Preventive Medicine, *Colonization and Healthcare*, PH7)

- importantly, physicians will encounter Indigenous peoples from a wide variety of personal and historical experiences. Individuals should be invited to share their backgrounds and perspectives if they would like to do so, in an effort to understand the individual's unique context and to endeavour to provide culturally safe care (see *Resources in Indigenous Health*, ELOM29)

Those Receiving Child Welfare Services (The Cycle of Apprehension and the Millennial Scoop)

- similar continuation of the legacies of the residential school systems and the Sixties Scoop, Indigenous families face higher rates of child apprehension currently. In Canada, 52.2% of children (ages 0-14) in foster care are Indigenous, while Indigenous children account for only 7.7% of all Canadian children in this age range (2016)
- 38% of Indigenous children live in poverty compared to 13% of non-Indigenous non-racialized children in Canada (2011)
- in 2016, the Canadian Human Rights Tribunal ruled that the federal government discriminates against First Nations children on reserves by failing to provide the same level of funding for child welfare services that exists for non-Indigenous children, resulting in inequitable services. Despite the ruling recommending compensation, the Tribunal has issued 10 subsequent orders to ensure Canada's compliance. In 2019, the federal government argued the Tribunal was the wrong forum to discuss compensation and suggested there was no evidence of harm to individual children before the Tribunal. The Tribunal rejected both arguments. In September 2019, the Tribunal found that Canada's ongoing discrimination against First Nations children and families was "wilful and reckless" and that it had caused serious pain and suffering for victims of the discrimination. Canada was ordered to pay the maximum amount allowable under the Canadian Human Rights Act to compensate First Nations children, youth, and families who have been harmed by the child welfare system. In October 2019, the federal government launched a court challenge at the Federal Court in an attempt to quash the compensation order, which was subsequently denied
- only once the Tribunal reinforced the initial ruling in December 2019 did the federal government pass an Act respecting First Nations, Inuit, and Métis children, youth, and families, which came into effect in January 2020. This act allows Indigenous communities to exercise jurisdiction in the welfare of their own children over Indigenous Services Canada and provincial or territorial governments. However, the federal government continues to delay compensation and oppose the order for the maximum allowable amount of compensation, despite other federal parties calling on the government to pay

Those in State Custody and the Colonial Legacy Within the Canadian Judicial System

- there is a direct link between family breakdown due to the residential school system, intergenerational trauma and abuse from colonialism, and subsequent higher rates of child apprehension. Interacting with the foster care system and the instability of multiple (sometimes abusive) homes is a predictor of future interaction with the criminal justice system along with poverty and higher unemployment
- 27-30% of adults and 50% of youth taken into custody in 2016-17 were Indigenous, yet Indigenous peoples make up only 4.1% and 8% of Canada's adult and youth populations, respectively
- Indigenous youth are also overrepresented in community supervision
- from 2000 to 2010, the number of incarcerated Indigenous women increased by 86.4%, representing the fastest growing incarcerated population
- Indigenous-based restorative (rather than punitive) justice programs have been proposed to lower recidivism rates for Indigenous offenders

Those with no Fixed Address and the Colonial Legacy of Homelessness

- in Toronto, Indigenous peoples make up roughly 15% of the homeless population, yet only 0.5% of the total population (2010)
- enfranchisement, on-reserve housing, dislocation, and the legalization of "Indian" status in concert with poor government funding and support are important links to Indigenous homelessness today
- attempts to serve the needs of Indigenous people in urban areas include the employment of traditional healers or cultural coordinators in urban health centres as well as the use of traditional medicines (e.g. sage, cedar, sweetgrass, tobacco)

Missing and Murdered Indigenous Women, Girls and Gender Diverse People

- in Canada, Indigenous women and girls are significantly more likely to be murdered or go missing than any other demographic of women
- between 2001 and 2015, homicide rates for Indigenous women were nearly 6 times higher than for non-Indigenous women
- interpersonal violence within Indigenous communities is closely tied to the lasting trauma suffered in the residential school era and has far-reaching health impacts including acute injuries, chronic pain, sexually transmitted infections, unplanned pregnancies, addiction, self-harm, and suicide
- loss of a mother, sister, or daughter also incurs multi-generational trauma on family and family structure in Indigenous communities

Indigenous Health Coverage and Jurisdictions

- policy pertaining to the health of Indigenous peoples is considered to be shared amongst various levels of government, the private sector, and First Nations communities themselves
- this current model relies heavily on state-imposed definitions of Indigenous identity and limits the right to self-determination and self-governance for Indigenous peoples in Canada
- significant historical legislative vagueness, in combination with the multiplicity of authorities involved, creates much variation across provinces and territories, contributing to inequitable distribution of care for Indigenous peoples
- bureaucratic delays in approving and providing care, and jurisdictional debates between authorities over the responsibilities of care, further contribute to a healthcare system which frequently fails to adequately respond to the needs of Indigenous peoples and communities

- the federal government is responsible for the Non-Insured Health Benefits (NIHB) program, which is managed by the First Nations and Inuit Health Branch of Indigenous Services Canada and is based on the *Indian Health Policy* (1979) and the *Health Transfer Policy* (1989)
  - the role of the NIHB is to provide eligible First Nations and Inuit individuals with coverage for specific health benefits and services (most predominantly: eye and dental care, pharmacare, transport to and from medical appointments, and mental health counselling). There are very strict criteria to have certain medications and procedures covered
  - the NIHB relies on state-imposed definitions of Indigenous identity; access to the NIHB extends only to individuals who are (1) registered under the *Indian Act* (and consequently referred to using the paternalistic term "Status Indian"); (2) Inuk, as recognized by the Inuit Land Claim Organization; or (3) a child under 18 months of age whose parent is registered First Nations or recognized Inuk
  - access to care for non-status First Nations and Métis patients is consequently denied under NIHB criteria, despite encountering similar social determinants of health and barriers to healthcare experienced by eligible individuals
  - clients deemed ineligible for NIHB must then rely on provincial or territorial health insurance, social programs, or private insurance plans for healthcare
  - note that NIHB eligibility does not guarantee access to care, as the criteria for approved services is subject to frequent changes and impacted by factors including whether the applicant lives on- or off-reserve

- the Canadian healthcare system must recognize that Indigenous communities are best positioned to identify their own unique health priorities and manage and deliver healthcare in their communities
  - although there is some development and implementation of Indigenous-led and Indigenous-directed healthcare services in Canada, the effects of colonialist policies and practices continue to perpetuate inequities among Indigenous peoples
  - healthcare providers can work towards dismantling the effects of colonialism in a number of manners, including allyship and advocacy, engaging in cultural safety training, and better educating oneself on Indigenous history, the impact of colonialism, and resources available to meet the unique needs of their patients (see *Resources in Indigenous Health*)
  - British Columbia (BC) has established a First Nations Health Authority which is a step in addressing Indigenous self-determination in healthcare

Resources in Indigenous Health

- the following is a list of fact sheets, reports, and toolkits as well as organizational websites providing resources relating to Indigenous health. All were created by or with Indigenous peoples and organizations unless otherwise stated. These resources share the aim of highlighting Indigenous resilience and promoting strength in Indigenous communities. Though not exhaustive, this list serves as a foundation for the kinds of resources that are available to healthcare providers and/or Indigenous Peoples seeking care. Of note, physicians have a responsibility to become familiar with local or regional services that may be able to provide culturally safe, trauma-informed care for Indigenous People

Table 6. Resources in Indigenous Health

	Resource	Ref #
Health Care		
National Collaborating Centre for Indigenous Health (NCCIH)	Extensive database of Indigenous Health research and resources across Canada. Please note that some of these materials may have been collated without Indigenous consultation	1
Canadian Institutes for Health Research (CIHR)	Recommendations in culturally appropriate care for healthcare providers in Canada working with Indigenous peoples, reviewed by the Aboriginal Health Issues Committee	2
Wellesley Institute		
	Report looking in-depth at the relationship between racism, health, and the well-being of Indigenous peoples in Canada	3
First Nations Health Authority (FNAH) (BC)	BC has its own health authority responsible for the planning, delivery, and funding of First Nations Health Programs across the province	4
Indigenous Health Primer produced by the Royal College of Physicians and Surgeons of Canada	An extensive document that discusses anti-racism interventions, trauma-informed care, Indigenous health principles, impact of policies on Indigenous peoples, and the diversity of present Indigenous communities	5
Thunderbird Partnership Foundation	Offers special skills, knowledge, and resources to healthcare workers providing care to First Nations communities. Has particular expertise in providing addiction care	6
Child and Family		
First Nations Child and Family Services (FNCFS)	Interactive map of Canada with all FNCFS service provider locations	7
National Aboriginal Council of Midwives (NACM)	Subset of the larger organization, Canadian Association of Midwives, that provides Indigenous midwives for natal care	8
Indigenous Services Canada	Social programs, such as women's shelters and income assistance in Indigenous communities, funded federally by Indigenous Services Canada	9
Population-Specific		
Inuit Tapiriit Kanatami (ITK)	The national representational body for Inuit people in Canada, with publications on TB elimination strategies and Inuit-specific health literacy resources	10
Patients Facing Additional Layers of Systemic Barriers		
People with no fixed address	Description of Indigenous homelessness from an Indigenous perspective, emphasizing criteria that are not captured in colonial definitions of "homelessness"	11
Indigenous women, girls, and gender diverse people	Multitude of fact sheets published by the Native Women's Association of Canada covering issues such as housing, violence, and health with an intersectional lens	12
	The Final Report of the National Inquiry into Missing and Murdered Indigenous Women and Girls containing testimonies from survivors and Knowledge Keepers, discussion of influencing factors such as intergenerational trauma and insecure housing, as well as 231 calls for justice directed at Canadians and institutions alike	13
Mental health and suicide	The Centre for Suicide Prevention (branch of the Canadian Mental Health Association) offers many Indigenous-specific resources on suicide prevention, life planning, trauma, and cultural sensitivity	14
	Online course called "River of Life," created for people working with Indigenous youth ages 15-24, discusses strategies to strengthen the protective factors of youth at risk of suicide	15
	Trauma-informed Indigenous programs, e.g. Biidaaban Healing Lodge in Ontario and Tsow-Tun Le Lum Society in BC	16, 17
Building Cultural Competency		
University of Alberta's Indigenous Canada online course	Indigenous Canada is a Massive Open Online Course (MOOC) from the Faculty of Native Studies that explores Indigenous histories and contemporary issues in Canada.	18
Cancer Care Ontario, Indigenous Relationship and Cultural Safety Courses	13 courses available to provide knowledge about the history and culture of First Nations, Inuit and Métis people and communities	19

A Anesthesia

Carlos Khalil, Isabelle Laksono, and **Evan Tang,** chapter editors
Ming Li and **Jacqui van Warmerdam,** associate editors
Vrati Mehra and **Sarah House,** EBM editors
Dr. Ahtsham Niazi and **Dr. Diana Tamir,** staff editors

Acronyms

2,3-BPG	2,3-Bisphosphoglycerate	CVS	cardiovascular system	IOP	intraocular pressure	PCA	patient-controlled analgesia
ABG	arterial blood gas	CVP	central venous pressure	ITP	immune thrombocytopenic purpura	PCV	pressure-controlled ventilation
ACC	American College of Cardiology	CVD	cardiovascular disease			PEEP	positive end-expiratory pressure
ACh	acetylcholine	CXR	chest X-ray	IV	intravenous	PNS	parasympathetic nervous system
AChE	acetylcholinesterase	DIC	disseminated intravascular coagulation	LA	local anesthetic		
ACV	assist-control ventilation			LABA	long-acting β-agonist	PACU	post-anesthetic care unit
AHA	American Heart Association	DKA	diabetic ketoacidosis	LES	lower esophageal sphincter	PONV	postoperative nausea and vomiting
ALS	amyotrophic lateral sclerosis	DM	diabetes mellitus	LMA	laryngeal mask airway		
aPTT	activated partial thromboplastin time	$ETCO_2$	end-tidal CO_2	LOC	level of consciousness	PPV	positive pressure ventilation
		ETT	endotracheal tube	MAC	minimum alveolar concentration	PVD	peripheral vascular disease
ARDS	acute respiratory distress syndrome	FiO_2	fraction of oxygen in inspired air	MAP	mean arterial pressure	RSI	rapid sequence induction
		FFP	fresh frozen plasma	MH	malignant hyperthermia	SABA	short-acting β-agonist
ASA	American Society of Anesthesiologists	FRC	functional residual capacity	MS	multiple sclerosis	SCh	succinylcholine
		GA	general anesthesia	MSK	musculoskeletal	SIADH	syndrome of inappropriate antidiuretic hormone
atm	atmosphere	GE	gastroesophageal	NMJ	neuromuscular junction		
BBB	blood brain barrier	GERD	gastroesophageal reflux disease	NPO	nil per os	SNS	sympathetic nervous system
BMV	bag-mask ventilation	GI	gastrointestinal	NYHA	New York Heart Association	SV	stroke volume
BP	blood pressure	GU	genitourinary	OCS	oral corticosteroids	SVR	systemic vascular resistance
CCS	Canadian Cardiovascular Society	Hb(i)	initial hemoglobin	OG	orogastric	TIA	transient ischemic attack
		Hb(f)	final hemoglobin	OR	operating room	TBW	total body water
CHF	congestive heart failure	Hct	hematocrit	OSA	obstructive sleep apnea	TIVA	total intravenous anesthetic
CK	creatine kinase	HES	hydroxyethyl starch	PA	pulmonary artery	TURP	transurethral resection of prostate
CNS	central nervous system	HHS	hyperosmolar hyperglycemic state	$PaCO_2$	arterial partial pressure of carbon dioxide		
CO	cardiac output					URTI	upper respiratory tract infection
CPAP	continuous positive airway pressure	HR	heart rate			V/Q	ventilation/perfusion
		ICP	intracranial pressure	PaO_2	arterial partial pressure of oxygen	VT	ventricular tachycardia
CSF	cerebrospinal fluid	ICS	inhaled corticosteroids			VTE	venous thromboembolism
CV	cardiovascular	INR	international normalized ratio	PC	patient-controlled		

Overview of Anesthesia

- anesthesia: lack of sensation/perception

Approach to Anesthesia

Preoperative	Preoperative/Intraoperative	Postoperative
1. preoperative assessment 2. patient optimization	3. plan anesthetic pre-medication airway management monitors induction maintenance emergence tracheal extubation	4. postoperative care

Types of Anesthesia

Note that different types of anesthesia can be combined

general	regional	general
e.g. TIVA, inhalational	spinal, epidural peripheral nerve block IV regional	e.g. TIVA, inhalational

Difficult Mask Ventilation
Anesth Analg 2009;109(6):1870-1880
Purpose: Define and predict difficult mask ventilation.
Conclusions: Age >55, obesity with BMI >26, history of snoring, beard, lack of teeth, Mallampati III/IV (see Figure 1), abnormal mandibular protrusion test, and male gender are all independent risk factors that should be used as predictors for difficult mask ventilation.

Preoperative Assessment

Purpose
- identify concerns for medical and surgical management of patient
- allow for questions to help allay any fears or concerns patient and/or family may have
- arrange further investigations, consultations, and treatments for patients not yet optimized
- plan and consent for anesthetic techniques

History and Physical

History
- age and gender
- indication for surgery
- surgical/anesthetic Hx: previous anesthetics, any complications, previous intubations, and PONV

- FMHx: abnormal anesthetic reactions, MH, and pseudocholinesterase deficiency (see *Uncommon Complications*, A29)
- medications, allergies (see *Preoperative Optimization: Medications*, A4)
- PMHx
  - neuro: seizures, TIA/strokes, raised ICP, spinal disease, aneurysm, and conditions affecting NMJ (e.g. myasthenia gravis)
  - CVS: angina/CAD, MI, CHF, HTN, valvular disease, dysrhythmias, PVD, conditions requiring endocarditis prophylaxis, exercise tolerance, and CCS/NYHA class (see Cardiology and Cardiac Surgery sidebar for *CCS Classification*, C31 and sidebar for *New York Heart Association Classification*, C41)
  - respiratory: smoking, asthma, COPD, recent URTI, and sleep apnea
  - GI: GERD, liver disease, and NPO status
  - renal: acute vs. chronic renal insufficiency, dialysis, and chronic kidney disease
  - hematologic: anemia, coagulopathies, and blood dyscrasias
  - MSK: arthritides (e.g. rheumatoid arthritis, scleroderma), cervical spine pathology (e.g. cervical tumours, cervical infections/abscesses, trauma to cervical spine, and previous cervical spine surgery), and cervical spine instability (e.g. trisomy 21)
  - endocrine: DM, thyroid disorders, and adrenal disorders
  - other: morbid obesity, pregnancy, and ethanol/recreational drug use

Physical Exam

- weight, height, BP, HR, respiratory rate, and O_2 saturation
- focused physical exam of the CNS, CVS, and respiratory systems
- general assessment of nutrition, hydration, and mental status
- airway assessment is done to determine intubation difficulty (no single test is specific or sensitive) and ventilation difficulty
  - cervical spine stability and neck movement – upper cervical spine extension, lower cervical spine flexion ("sniffing" position – see Figure 6C, A8)
  - Mallampati classification (see Figure 1)
  - "3-3-2 rule" (see Figure 2)
    - 3 of patient's own fingers can be placed between the incisors (incisor distance)
    - 3 fingers along the floor of the mandible between the mentum and hyoid bone (hyoid-mental distance)
    - 2 fingers in the superior laryngeal notch (thyroid-mouth distance)
  - thyromental distance (distance of lower mandible in midline from the mentum to the thyroid notch); <3 finger breadths (<6 cm) is associated with difficult intubation
  - anterior jaw subluxation; <1 finger breadth is associated with difficult intubation
- tongue size
- dentition, dental appliances/prosthetic caps, existing chipped/loose teeth – pose aspiration risk if dislodged and patients should be informed of rare possibility of damage
- nasal passage patency (if planning nasotracheal intubation)
- assess potential for difficult ventilation
- examination of anatomical sites relevant to lines and blocks
  - bony landmarks and suitability of anatomy for regional anesthesia (if relevant)
  - sites for IV, CVP, and PA catheters

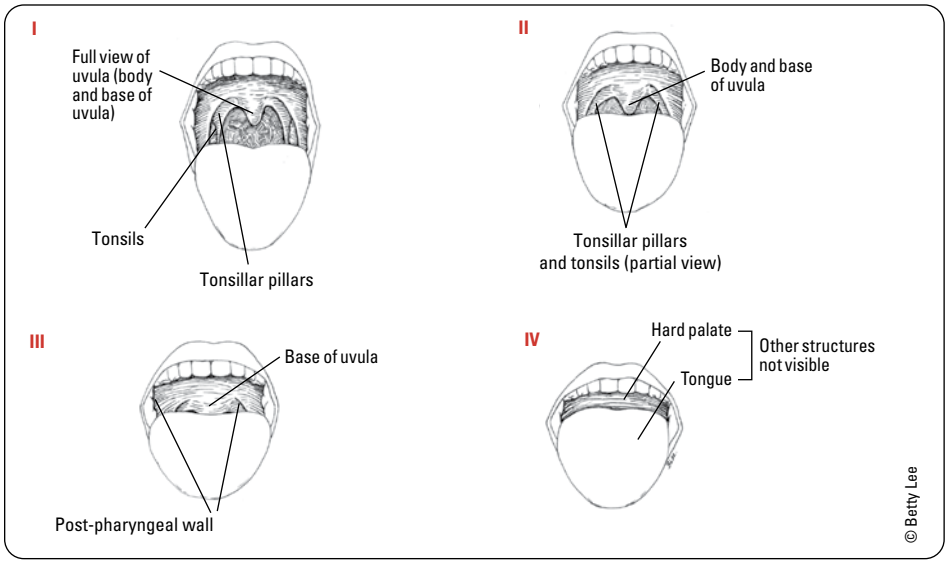

Figure 1. Mallampati classification of oral opening

Evaluation of Difficult Airway

LEMON
Look – obesity, beard, dental/facial abnormalities, neck, facial/neck trauma
Evaluate – 3-3-2 rule
Mallampati score (≥3)
Obstruction – stridor, foreign bodies, masses
Neck mobility

Assessment of Difficult Ventilation
Anesthesiology 2000:92:1229-1236

BONES
Beard
Obesity (BMI>26)
No teeth
Elderly (age>55)
Snoring Hx (sleep apnea)

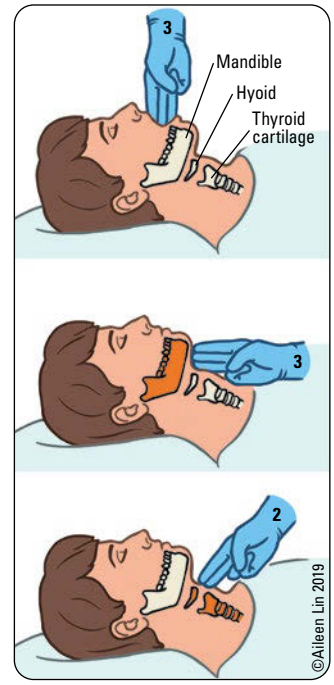

Figure 2. 3-3-2 Rule

Cormack-Lehane Classification of Laryngeal View (Figure 3)
- **Grade 1:** all laryngeal structures revealed
- **Grade 2:** posterior laryngeal 2A (posterior vocal folds) 2B (arytenoids)
- **Grade 3:** Larynx concealed, only epiglottis
- **Grade 4:** Neither glottis nor epiglottis

Preoperative Investigations

- routine preoperative investigations are only necessary if there are comorbidities or certain indications

Table 1. Suggested Indications for Specific Investigations in the Preoperative Period

Test	Indications
CBC	Major surgery requiring group and screen or cross and match; chronic CV pulmonary, renal, or hepatic disease; malignancy; known or suspected anemia; bleeding diathesis or myelosuppression; patient <1 y/o
Sickle Cell Screen	Genetically predisposed patient (hemoglobin electrophoresis if screen is positive)
INR, aPTT	Anticoagulant therapy, bleeding diathesis, liver disease
Electrolytes and Creatinine	HTN, renal disease, DM, pituitary or adrenal disease; vascular disease, digoxin, diuretic, or other drug therapies affecting electrolytes
Fasting Glucose Level	DM (repeat on day of surgery)
Pregnancy (β-hCG)	Women of reproductive age
ECG	Heart disease, DM, other risk factors for cardiac disease; subarachnoid or intracranial hemorrhage, cerebrovascular accident, head trauma
CXR	Patients with new or worsening respiratory symptoms/signs

Guidelines to the Practice of Anesthesia Revised Edition 2013. Supplement to the Canadian Journal of Anesthesia, Vol 60, Dec. 2013. Reproduced with permission © Canadian Anesthesiologists' Society

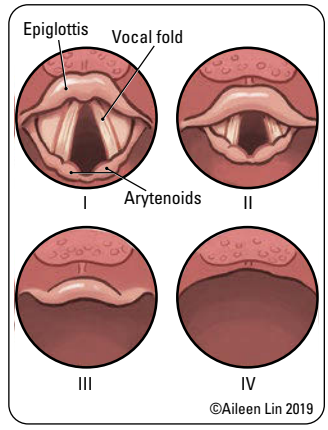

Figure 3. Laryngeal views

American Society of Anesthesiology Classification

- common classification of physical status at the time of surgery
- a gross predictor of overall outcome, NOT used as stratification for anesthetic risk (mortality rates)
- **ASA 1:** a healthy, fit patient
- **ASA 2:** a patient with mild systemic disease
  - e.g. controlled T2DM, controlled essential HTN, obesity, smoker
- **ASA 3:** a patient with severe systemic disease that limits activity
  - e.g. stable CAD, COPD, DM, obesity
- **ASA 4:** a patient with incapacitating disease that is a constant threat to life
  - e.g. unstable CAD, renal failure, acute respiratory failure
- **ASA 5:** a moribund patient not expected to survive 24 h without surgery
  - e.g. ruptured abdominal aortic aneurysm (AAA), head trauma with increased ICP
- **ASA 6:** declared brain dead, a patient whose organs are being removed for donation purposes
- for emergency operations, add the letter E after classification (e.g. ASA 3E)

Preoperative Optimization

- in general, prior to elective surgery:
  - any fluid and/or electrolyte imbalance should be corrected
  - extent of existing comorbidities should be understood, and these conditions should be optimized prior to surgery
  - medications may need adjustment

Medications

- pay particular attention to cardiac and respiratory medications, opioids, and drugs with many side effects and interactions
- **preoperative medications to consider**
  - prophylaxis
    - risk of GE reflux: antacids (e.g. sodium citrate), H_2 antagonists and/or prokinetic agents (e.g. metoclopramide) 30 min-1 h prior to surgery
    - risk of infective endocarditis, GI/GU interventions: antibiotics
    - risk of adrenal suppression: steroid coverage
    - anxiety: consider benzodiazepines
    - COPD, asthma: bronchodilators
    - CAD risk factors: nitroglycerin and β-blockers
- **preoperative medications to stop**
  - oral antihyperglycemics: do not take on morning of surgery
  - angiotensin-converting enzyme inhibitors (ACEI) and angiotensin receptor blockers (ARB): do not take on the day of surgery (controversial – they increase the risk of hypotension post-induction but have not been shown to increase mortality or adverse outcomes; therefore, some people hold and some do not)
  - warfarin (consider bridging with heparin), antiplatelet agents (e.g. clopidogrel), Xa inhibitor, direct thrombin inhibitors
    - discuss perioperative use of ASA, NSAIDs with surgeon (± patient's cardiologist/internist)

Continuation vs. Discontinuation of Antiplatelet Therapy for Bleeding and Ischaemic Events in Adults Undergoing Non-Cardiac Surgery
Cochrane DB Syst Rev 2018; CD012584
Purpose: To compare the effect of continuation vs. discontinuation of antiplatelet therapy on the occurrence of bleeding and ischaemic events in adults undergoing non-cardiac surgery.
Methods: RCTs in Cochrane Central Register of Controlled Trials, MEDLINE, and Embase that compared adults taking single or dual antiplatelet therapy for at least two weeks, including patients with at least one cardiac risk factor. Included general, spinal, and regional anesthesia and excluded minor procedures involving only local anesthetic/sedation.
Results: 5 trials, 666 adult patients. Continuation or discontinuation had no difference on mortality at 30 d postoperative (RR 1.21, 95% CI 0.34-4.27), blood loss (RR 1.37, 95% CI 0.83-2.26), or ischaemic events within 30 d of surgery (RR 0.67, 95% CI 0.25-1.77).
Conclusions: Moderate evidence supporting continuation or discontinuation of antiplatelet therapy makes no difference on bleeding requiring transfusion. Low evidence supporting no difference in mortality or ischaemic events.

Integration of the Duke Activity Status Index into Preoperative Risk Evaluation
Br J Anaesth 2020;124(3):261-270
Purpose: Duke Activity Status Index (DASI) questionnaire could be integrated into preoperative risk assessment.
Methods: Nested cohort analysis of the Measurement of Exercise Tolerance (METS) study to characterize association of preoperative DASI scores with postoperative deaths and complications. Analysis included 1546 patients >40 y/o at elevated cardiac risk that had inpatient non-cardiac surgery.
Results: Results were non-linear but threshold was found. Self-reported functional capacity better than a DASI score of 34 was associated with reduced odds of 30 d death or MI (OR: 0.97 per 1 point increase above 34; 95% CI: 0.96-0.99) and 1 yr death or new disability (OR: 0.96 per 1 point increase above 34; 95% CI: 0.92-0.99).
Conclusion: A DASI score of 34 represents a threshold for identifying patients at risk for myocardial injury, MI, moderate-to-severe complications, and new disability.

        - in patients undergoing non-cardiac surgery, starting or continuing low-dose ASA in the perioperative period does not appear to protect against postoperative MI or death, but increases the risk of major bleeding
            - note: this does not apply to patients with bare metal stents or drug-eluting coronary stents
    - herbal supplements: stop one week prior to elective surgery (ephedra, garlic, ginkgo, ginseng, kava, St. John's Wort, valerian, echinacea)
- **preoperative medications to adjust**
    - insulin (consider insulin/dextrose infusion or holding dose), prednisone, bronchodilators

Hypertension

- BP <180/110 is not an independent risk factor for perioperative cardiovascular complications
- target sBP <180 mmHg, dBP <110 mmHg
- assess for end-organ damage and treat accordingly

Coronary Artery Disease

- ACC/AHA Guidelines (2014) recommend that at least 60 d should elapse after a MI before a non-cardiac surgery in the absence of a coronary intervention
    - this period carries an increased risk of re-infarction/death
    - if operative procedure is essential and cannot be delayed, then invasive intra- and postoperative ICU monitoring is required to reduce the above risk
- mortality with perioperative MI is 20-50%
- perioperative β-blockers
    - may decrease cardiac events and mortality (but increases risk of perioperative strokes)
    - continue β-blocker if patient is routinely taking it prior to surgery
    - consider initiation of β-blocker in:
        - patients with CAD or indication for β-blocker
        - intermediate or high-risk surgery, especially vascular surgery

Perioperative β-blockers for Preventing Surgery-Related Mortality and Morbidity in Adults undergoing Cardiac Surgery
Cochrane DB Syst Rev 2019;9:CD013435
Purpose: To assess the effectiveness of perioperatively administered β-blockers for the prevention of surgery-related mortality and morbidity in adults undergoing cardiac surgery.
Conclusions: No evidence of a difference in early all-cause mortality, MI, cerebrovascular events, hypotension and bradycardia. However, there may be a reduction in AFib and ventricular arrhythmias when β-blockers are used. A larger sample size is likely to increase the certainty of this evidence.

Respiratory Diseases

- smoking
    - adverse effects: altered mucus secretion and clearance, decreased small airway calibre, altered O_2 carrying capacity, increased airway reactivity, and altered immune response
    - abstain at least 4-8 wk preoperatively if possible
    - if unable, abstaining even 24 h preoperatively has been shown to increase O_2 availability to tissues
- asthma
    - preoperative management depends on degree of baseline asthma control
    - increased risk of bronchospasm from intubation
    - administration of short course (up to 1 wk) preoperative corticosteroids and inhaled β2-agonists decreases the risk of bronchospasm and does not increase the risk of infection or delay wound healing
    - avoid non-selective β-blockers due to risk of bronchospasm (cardioselective β-blockers (metoprolol, atenolol) do not increase risk in the short-term)
    - delay elective surgery for poorly controlled asthma (increased cough or sputum production, active wheezing)
    - ideally, delay elective surgery by a minimum of 6 wk if patient develops URTI
- COPD
    - anesthesia, surgery (especially abdominal surgery, in particular upper abdominal surgery) and pain predispose the patient to atelectasis, bronchospasm, pneumonia, prolonged need for mechanical ventilation, and respiratory failure
    - preoperative ABG is needed for all COPD stage II and III patients to assess baseline respiratory acidosis and plan postoperative management of hypercapnia
    - cancel/delay elective surgery for acute exacerbation

Perioperative β-blockers for Preventing Surgery-Related Mortality and Morbidity in Adults undergoing Non-Cardiac Surgery
Cochrane DB Syst Rev 2019;9:CD013438
Purpose: Assess effectiveness of preoperatively administered β-blockers in prevention of surgery-related morbidity and mortality after non-cardiac surgery.
Conclusions: No difference in cerebrovascular events or ventricular arrhythmias. β-blockers may reduce AFib and MI. However, β-blockers may increase bradycardia and probably increase hypotension. Overall low quality and certainty evidence for these findings.

β-blockers
- β1-receptors are located primarily in the heart and kidneys
- β2-receptors are located in the smooth muscle (i.e. bronchi, uterus)
- Non-selective β-blockers block β1 and β2-receptors (labetalol*, carvedilol**, nadolol). Caution is required with non-selective β-blockers, particularly in patients with respiratory conditions where β2 blockade can result in airway reactivity

*labetalol is both an α- and β-blocker
**carvedilol is also both an α and β blocker

Aspiration

- increased risk of aspiration with:
    - decreased LOC (drugs/alcohol, head injury, CNS pathology, trauma/shock)
    - delayed gastric emptying (non-fasted within 8 h, diabetes, narcotics)
    - decreased sphincter competence (GERD, hiatus hernia, nasogastric tube, pregnancy, obesity)
    - increased abdominal pressure (pregnancy, obesity, bowel obstruction, acute abdomen)
    - unprotected airway (LMA mask vs. ETT)
- management
    - manage risk factors if possible
    - utilize protected airway (i.e. ETT)

- reduce gastric volume and acidity
- delay inhibiting airway reflexes with muscular relaxants
- employ RSI (see *Rapid Sequence Induction*, A16)

Fasting Guidelines

Fasting Guidelines Prior to Surgery (Canadian Anesthesiologists' Society)

- fasting guidelines should change depending on patients' pre-existing medical conditions; in the case of emergent procedures, consider the risk of delaying surgery against the risk of aspiration
- before elective procedures, the minimum duration of fasting should be:
  - 8 h after a large meal of solids particularly containing protein (e.g. meat) or fatty foods
  - 6 h after a light meal (e.g. non-fatty meal such as toast)
  - 6 h after ingestion of infant formula, non-human milk, or expressed breast milk fortified with additions
  - 4 h after ingestion of breast milk
  - 2 h after clear fluid intake (including water, pulp-free juice, complex carbohydrate beverages, and tea or coffee without milk) for adults
  - 1 h after clear fluid intake for infants and children

Interventions for Preoperative Smoking Cessation
Cochrane DB Syst Rev 2014;3:CD002294
Purpose: Assess the effect of preoperative smoking intervention on smoking cessation at the time of surgery and 12 mo postoperatively, and on the incidence of postoperative complications.
Methods: Systematic review including RCTs that recruited people who smoked prior to surgery, offered a smoking cessation intervention, and measured preoperative and long-term abstinence from smoking or the incidence of postoperative complications or both.
Results: Thirteen trials enrolling 2010 participants included. Overall quality of evidence was moderate. Compared studies involving intensive intervention, which included multi-session face to face counselling or computer-based scheduled interventions, vs. brief interventions. These were pooled separately. An effect on cessation at the time of surgery was apparent in both subgroups, but the effect was larger for intensive intervention. For long term cessation, only the intensive intervention showed effect. In those that had intensive intervention there was significant effect in preventing any postoperative complications.
Conclusion: There is evidence that preoperative smoking interventions providing behavioural support and offering NRT increase short-term smoking cessation and may reduce postoperative morbidity. Interventions that begin 4 to 8 wk before surgery, include weekly counselling, and use NRT are more likely to have an impact on complications and long-term smoking cessation.

Hematological Disorders

- history of congenital or acquired conditions (sickle cell anemia, factor VIII deficiency, ITP, liver disease)
- evaluate hemoglobin, hematocrit, and coagulation profiles when indicated (see Table 1, A4)
- anemia
  - preoperative treatments to increase hemoglobin (PO or IV iron supplementation, erythropoietin or pre-admission blood collection in certain populations)
- coagulopathies
  - discontinue or modify anticoagulation therapies (warfarin, clopidogrel, ASA, apixaban, dabigatran) in advance of elective surgeries
  - administration of reversal agents if necessary: vitamin K, FFP, prothrombin complex concentrate, recombinant activated factor VII

Preoperative Anemia and Postoperative Outcomes in Non-Cardiac Surgery: A Retrospective Cohort Study
Lancet 2011;378:1396-1407
Purpose: Assess effect of preoperative anemia on 30 d postoperative morbidity and mortality in patients undergoing major non-cardiac surgery.
Methods: Patients undergoing major non-cardiac surgery in 2008 from the American College of Surgeons' National Surgical Quality Improvement Program database.
Results: 227425 adult patients. Postoperative mortality at 30 d was higher in patients with anemia than those without (OR 1.42, 95% CI 1.31-1.54).
Conclusion: Preoperative anemia, even to a mild degree, is independently associated with an increased risk of 30 d morbidity and mortality.

Endocrine Disorders

- DM
  - clarify type 1 vs. type 2
  - clarify treatment – oral anti-hyperglycemics and/or insulin
  - assess glucose control with history and HbA1c; patients with well-controlled diabetes have more stable glucose levels intraoperatively
  - end organ damage: be aware of damage to cardiovascular, renal, and central, peripheral, and autonomic nervous systems
  - preoperative guidelines for DM:
- verify target blood glucose concentration with frequent glucose monitoring: <10 mmol/L in critical patients, <7.8 mmol/L in stable patients
- use insulin therapy to maintain glycemic goals
- hold biguanides, α-glucosidase inhibitors, thiazolidinediones, sulfonylureas and GLP-1 agonists on the morning of surgery
- consider cancelling non-emergency procedures if patient presents with metabolic abnormalities (DKA, HHS, etc.) or glucose reading above 22.2-27.7 mmol/L
  - formulate intraoperative glucose management plan based on type (1 vs. 2), glucose control, and extent of end organ damage
- hyperthyroidism
  - can experience sudden release of thyroid hormone (thyroid storm) if not treated or well-controlled preoperatively
  - treatment: β-blockers and preoperative prophylaxis
- adrenocortical insufficiency (e.g. Addison's, exogenous steroid use)
  - consider intraoperative steroid supplementation

Obesity and Obstructive Sleep Apnea

- assess for co-morbid conditions in obese patient (independent risk factor for CVD, DM, OSA, cholelithiasis, HTN)
- previously undiagnosed conditions may require additional testing to characterize severity
- severity of OSA may be determined from sleep studies and prescribed pressure settings of home CPAP device
- both obesity and OSA independently increase risk of difficult ventilation, intubation and postoperative respiratory complications

Monitoring

Canadian Guidelines to the Practice of Anesthesia and Patient Monitoring

- an anesthetist present: "the only indispensable monitor"
- a completed pre-anesthetic checklist: including ASA class, NPO policy, Hx and investigations
- a perioperative anesthetic record: HR and BP every 5 min, O_2 saturation, $ETCO_2$, dose and route of drugs and fluids
- continuous monitoring: see *Routine Monitors for All Cases*

Routine Monitors for All Cases

- pulse oximeter, BP monitor, ECG, capnography (required for GA and deep procedural sedation, Ramsay Sedation Scale 4-6), and an agent-specific anesthetic gas monitor when inhalational anesthetic agents are used
- the following must also be available: temperature probe, peripheral nerve stimulator, stethoscope, appropriate lighting, spirometry, and manometer to measure ETT cuff pressure

Elements to Monitor

- anesthetic depth
  - end-tidal inhaled anesthetic monitoring and EEG monitoring, such as a Bispectral Index monitor, can be used as assessments of anesthetic depth
  - inadequate: blink reflex present when eyelashes lightly touched, HTN, tachycardia, tearing or sweating. However, these findings are non-specific
  - excessive: hypotension, bradycardia
- oxygenation: pulse oximetry, FiO_2
- ventilation: verify correct position of ETT, chest excursions, breath sounds, $ETCO_2$ analysis, end-tidal inhaled anesthesia analysis
- circulation: HR, rhythm, BP, telemetry, oximetry, pulmonary capillary wedge pressure
- temperature
- hourly urine output

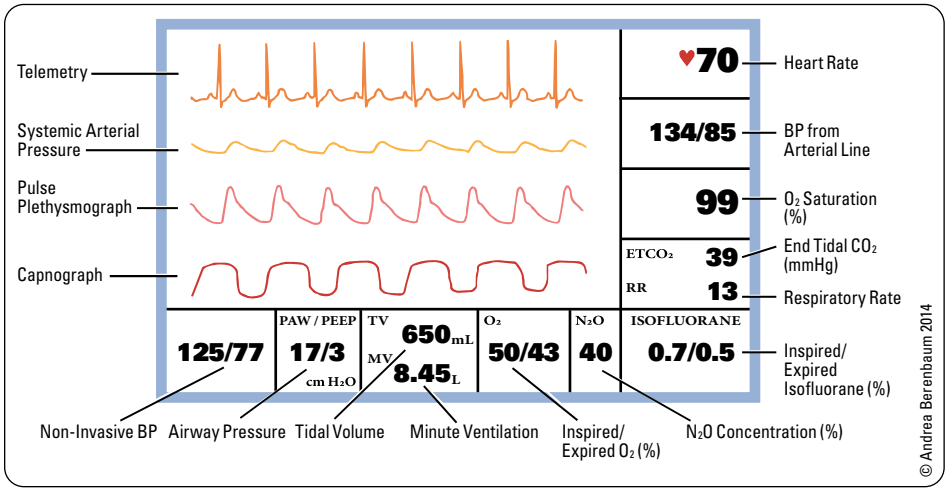

Figure 4. Typical anesthesia monitor

Pre-Anesthetic Checklist

MS MAIDS
Machine: connected, pressures okay, all metres functioning, vaporizers full
Suction: connected and working
Monitor: all monitors appropriate for the case
Airway: laryngoscope and blades, ETT, syringe, stylet, oral and nasal airways, tape, bag, and mask
IV: second IV set-up and ready if needed
Drugs: case-specific drugs ready and emergency medications in correct location and accessible
Special equipment: OG tube, CVP monitor, shoulder roll, etc.

Screening for OSA
Br J Anaesth 2012;108:768–775

STOP-BANG
Snoring – loud
Tiredness – day-time
Observed apnea – during sleep
Pressure – HTN
Body mass index – >35
Age – >50 y/o
Neck – large neck circumference
Gender – male

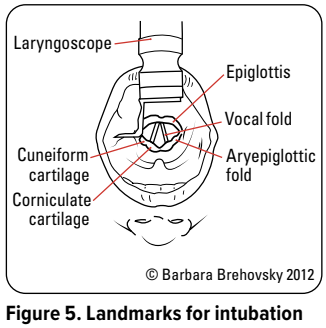

Figure 5. Landmarks for intubation

Airway Management

Airway Anatomy

- resistance to airflow through nasal passages accounts for approximately 2/3 of total airway resistance
- pharyngeal airway extends from posterior aspect of the nose to cricoid cartilage
- glottic opening: triangular space formed between the true vocal cords; narrowest segment of the laryngeal opening in adults
  - space through which one visualizes proper placement of the ETT
- trachea begins at the level of the thyroid cartilage, C6, and bifurcates into the right and left main bronchi at T4-T5 (approximately the sternal angle)

Will This Patient Be Difficult to Intubate?
JAMA 2019;321:493-503
Purpose: To identify risk factors and physical findings that predict difficult intubation.
Methods: Systematic review of MEDLINE and EMBASE databases.
Results: 62 studies, 33559 patients. Physical examination findings that best predicted a difficult intubation included grade of class 3 on upper lip bite test (lower incisors cannot reach upper lip; LR 14, 95% CI 9.9-22), shorter hyomental distance (<3-5.5 cm; LR 9.4, 95% 4.1-10), retrognathia (mandible <9 cm from angle of jaw to tip of chin; LR 6.0, 95% CI 3.1-11), and a Mallampati score ≥3 (LR 4.1, 95% CI 3.0-5.6).

Methods of Supporting Airways

1. non-definitive airway (patent airway)
   - jaw thrust/chin lift
   - oropharyngeal and nasopharyngeal airway
   - bag mask ventilation
   - LMA
2. definitive airway (patent and protected airway)
   - ETT (oral or nasal)
   - surgical airway (cricothyrotomy or tracheostomy)

Table 2. Methods of Supporting the Airway

	Bag and Mask	LMA	ETT
Advantages/Indications	Basic Non-invasive Readily available	Easy to insert Less airway trauma/irritation than ETT Frees up hands (vs. face mask) Primarily used in spontaneously ventilating patient	Indications for intubation (5 Ps) **P**atent airway **P**rotects against aspiration **P**ositive pressure ventilation **P**ulmonary toilet (suction) **P**harmacologic administration during hemodynamic instability
Disadvantages/ Contraindications	Risk of aspiration if decreased LOC Cannot ensure airway patency Inability to deliver precise tidal volume Operator fatigue	Risk of gastric aspiration PPV<20 cm H_2O needed Oropharyngeal/retropharyngeal pathology or foreign body Does not protect against laryngospasm or gastric aspiration	Insertion can be difficult Muscle relaxant usually needed Most invasive – see *Complications During Laryngoscopy and Intubation*, A9 Supraglottic/glottic pathology that would preclude successful intubation
Other	Facilitate airway patency with jaw thrust and chin lift Can use oropharyngeal/ nasopharyngeal airway	Sizing by body weight (approx): 40-50 kg: 3 50-70 kg: 4 70-100 kg: 5	Auscultate to avoid endobronchial intubation Sizing (approx.): Male: 8.0-9.0 mm Female: 7.0-8.0 mm Paediatric Uncuffed (>age 2 y/o): (age/4) + 4 mm

Tracheal Intubation

Preparing for Intubation

- failed attempts at intubation can make further attempts more difficult due to tissue trauma
- plan, prepare, and assess for potential difficulties (see *Preoperative Assessment*, A2)
- ensure equipment is available and working (test ETT cuff, check laryngoscope light and suction, machine check)
- pre-oxygenate/denitrogenate: patient breathes 100% O_2 for 3-5 min or for 4-8 vital capacity breaths
- may need to suction mouth and pharynx first

Proper Positioning for Intubation

- align the three axes (mouth, pharynx, and larynx) to allow visualization from oral cavity to glottis
  - "sniffing position": flexion of lower C-spine (C5-C6), bow head forward, and extension of upper C-spine at atlanto-occipital joint (C1), nose in the air (see Figure 6C)
  - contraindicated in known/suspected C-spine fracture/instability
  - poor/no view of glottic opening can be remediated by anterior laryngeal pressure
- laryngoscope tip placed in the epiglottic vallecula in order to visualize cord

Equipment for Intubation

MDSOLES
Monitors
Drugs
Suction
Oxygen source and self-inflating bag with oropharyngeal and nasopharyngeal airways
Laryngoscope
ETT (appropriate size and one size smaller)
Stylet, Syringe for tube cuff inflation

Medications that can be given through the ETT

NAVEL
Naloxone
Atropine
Ventolin
Epinephrine
Lidocaine

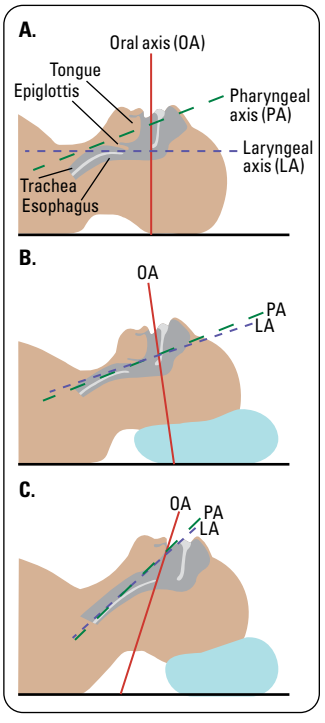

Figure 6. Anatomic considerations in laryngoscopy
A. Neutral position
B. C-spine flexion
C. C-spine flexion with atlanto-occipital extension

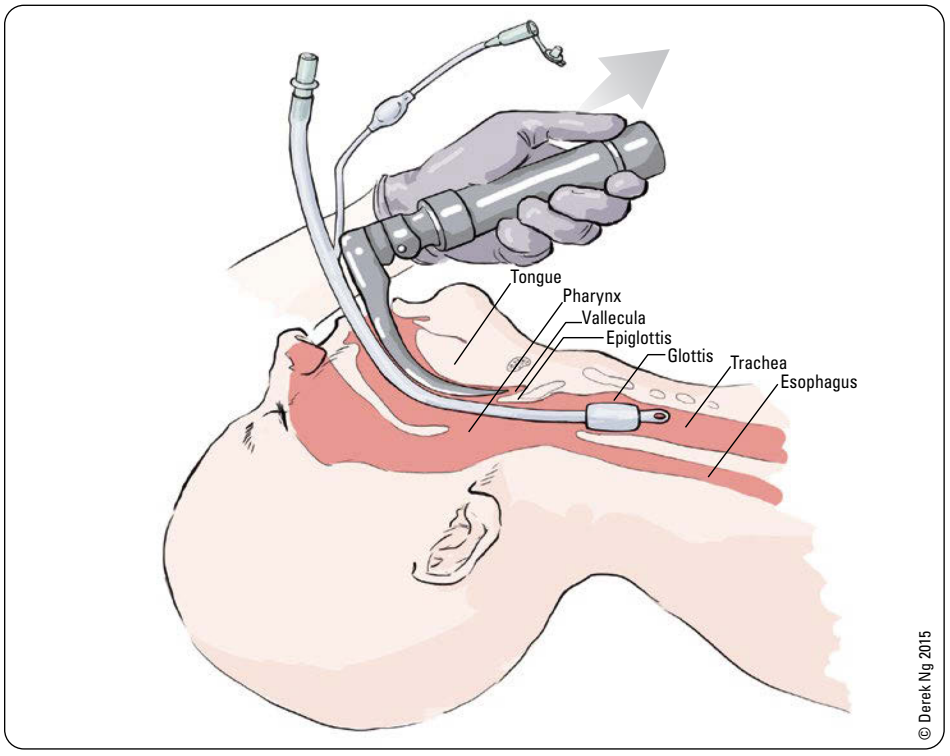

Figure 7. Sagittal view of airway with laryngoscope in vallecula

Tube Insertion

- laryngoscopy and ETT insertion can incite a significant sympathetic response via stimulation of cranial nerves IX and X due to a "foreign body reflex" in the trachea, including tachycardia, dysrhythmias, myocardial ischemia, increased BP, and coughing
- a malpositioned ETT is a potential hazard for the intubated patient
  - if too deep, may result in right endobronchial intubation, which is associated with left-sided atelectasis and right-sided tension pneumothorax
  - if too shallow, may lead to accidental extubation, vocal cord trauma, or laryngeal paralysis as a result of pressure injury by the ETT cuff
- the tip of ETT should be located at the midpoint of the trachea at least 2 cm above the carina, and the proximal end of the cuff should be placed at least 2 cm below the vocal cords
- approximately 20-23 cm mark at the right corner of the mouth for men and 19-21 cm for women

Differential Diagnosis of Poor Bilateral Breath Sounds after Intubation

DOPE
Displaced ETT
Obstruction
Pneumothorax
Esophageal intubation

Confirmation of Tracheal Placement of Endotracheal Tube

- direct
  - visualization of ETT passing through cords
  - bronchoscopic visualization of ETT in trachea
- indirect
  - $ETCO_2$ in exhaled gas measured by capnography (gold standard for confirming the ETT is in the airway)
  - auscultate for equal breath sounds bilaterally and absent breath sounds over epigastrium
  - bilateral chest movement, condensation of water vapour in ETT visible during exhalation, and no abdominal distention
  - refilling of reservoir bag during exhalation
  - CXR (rarely done): only confirms the position of the tip of ETT, not its location in the trachea vs. esophagus, but can confirm endobronchial intubation
- esophageal intubation suspected when:
  - $ETCO_2$ zero or near zero on capnograph
  - abnormal sounds during assisted ventilation
  - impairment of chest excursion
  - hypoxia/cyanosis
  - presence of gastric contents in ETT
  - breath sounds heard when auscultating over epigastrium/left upper quadrant
  - distention of stomach/epigastrium with ventilation

Complications During Laryngoscopy and Intubation

- dental damage
- laceration (lips, gums, tongue, pharynx, vallecula, esophagus)
- laryngeal trauma
- esophageal or endobronchial intubation

- accidental extubation
- insufficient cuff inflation or cuff laceration: results in leaking and aspiration
- laryngospasm (see *Extubation*, A20, for definition)
- bronchospasm
- accidental extubation

Difficult Airway

- difficulties with bag-mask ventilation, supraglottic airway, laryngoscopy, passage of ETT through the cords, infraglottic airway, or surgical airway
- algorithms exist for difficult airways (Can J Anesth 2013;60:1119-1138), see *Appendices*, A30
- preoperative assessment (history of previous difficult airway, airway examination) and pre-oxygenation are important preventative measures
- if difficult airway expected, consider:
  - awake intubation
  - intubating with bronchoscope, trachlight (lighted stylet), fiberoptic laryngoscope, video laryngoscope, etc.
- if intubation unsuccessful after induction:
  1. CALL FOR HELP
  2. ventilate with 100% O_2 via bag and mask
  3. consider returning to spontaneous ventilation and/or waking patient
- if bag and mask ventilation inadequate:
  1. CALL FOR HELP
  2. attempt ventilation with oral airway
  3. consider/attempt LMA
  4. emergency invasive airway access (e.g. surgical or percutaneous airway, jet ventilation, and retrograde intubation)

If you encounter difficulty with tracheal intubation, oxygenation is more important than intubation

Oxygen Therapy

- in general, the goal of O_2 therapy is to maintain arterial O_2 saturation (SaO_2) >90%
- small decrease in saturation below SaO_2 of 90% corresponds to a large drop in PaO_2
- in intubated patients, O_2 is delivered via the ETT
- in patients not intubated, there are many O_2 delivery systems available; the choice depends on O_2 requirements (FiO_2) and the degree to which precise control of delivery is needed
- cyanosis can be detected at SaO_2 <85%, frank cyanosis at SaO_2 = 67%

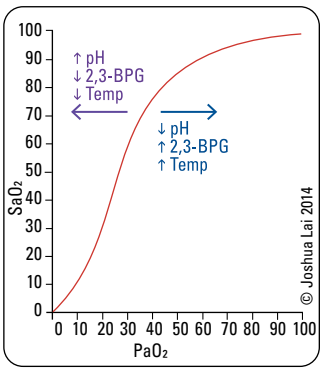

Figure 8. HbO_2 saturation curve

Low Flow Systems

- provide O_2 at flows between 0-10 L/min
- acceptable if tidal volume 300-700 mL, respiratory rate (RR) <25 breaths/min, consistent ventilation pattern
- dilution of O_2 with room air results in a decrease in FiO_2
- an increase in minute ventilation (tidal volume x RR) results in a decrease in FiO_2
- e.g. nasal cannula (prongs)
  - well tolerated if flow rates <5-6 L/min; drying of nasal mucosa at higher flows
  - nasopharynx acts as an anatomic reservoir that collects O_2
  - delivered O_2 concentration (FiO_2) can be estimated by adding 4% for every additional litre of O_2 delivered
  - provides FiO_2 of 24-44% at O_2 flow rates of 1-6 L/min

Composition of Air

78.1%	nitrogen
20.9%	oxygen
0.9%	argon
0.04%	carbon dioxide

Reservoir Systems

- use a volume reservoir to accumulate O_2 during exhalation thus increasing the amount of O_2 available for the next breath
- simple face mask
  - covers patient's nose and mouth and provides an additional reservoir beyond nasopharynx
  - fed by small bore O_2 tubing at a rate of at least 6 L/min to ensure that exhaled CO_2 is flushed through the exhalation ports and not rebreathed
  - provides FiO_2 of 55% at O_2 flow rates of 10 L/min
- non-rebreather mask
  - a reservoir bag and a series of one-way valves prevent expired gases from re-entering the bag
  - during the exhalation phase, the bag accumulates with O_2
  - provides FiO_2 of 80% at O_2 flow rates of 10-15 L/min

High Flow Systems

- generate flows of up to 50-60 L/min
- meet/exceed patient's inspiratory flow requirement
- deliver consistent and predictable concentration of O_2
- Venturi mask
  - delivers specific FiO_2 by varying the size of air entrapment
  - O_2 concentration determined by mask's port and NOT the wall flow rate

- enables control of gas humidity
- FiO_2 ranges from 24-50%

Ventilation

- ventilation is maintained with PPV in patients given muscle relaxants
- assisted or controlled ventilation can also be used to assist spontaneous respirations in patients not given muscle relaxants as an artificial means of supporting ventilation and oxygenation

Mechanical Ventilation

- indications for mechanical ventilation
  - apnea
  - hypoventilation/acute respiratory acidosis
  - intraoperative positioning limiting respiratory excursion (e.g. prone, Trendelenburg)
  - required hyperventilation (to lower ICP)
  - deliver PEEP
  - increased intrathoracic pressure (e.g. laparoscopic procedure)
- complications of mechanical ventilation
  - airway complications
    - tracheal stenosis, laryngeal edema
    - alveolar complications
    - ventilator-induced lung injury (barotrauma, volutrauma, atelectatrauma), ventilator-associated pneumonia (nosocomial pneumonia), inflammation, auto-PEEP, patient-ventilator asynchrony
    - cardiovascular complications
    - reduced venous return (secondary to increased intrathoracic pressure), reduced cardiac output, hypotension
  - neuromuscular complications
    - muscle atrophy
    - increased ICP
  - metabolic
    - decreased CO_2 due to hyperventilation
    - alkalemia with over correction of chronic hypercarbia

Ventilator Strategies

- mode and settings are determined based on patient factors (e.g. ideal body weight, compliance, resistance) and underlying reason for mechanical ventilation
- hypoxemic respiratory failure: ventilator provides supplemental O_2, recruits atelectatic lung segments, helps improve V/Q mismatch, and decreases intrapulmonary shunt
- hypercapnic respiratory failure: ventilator augments alveolar ventilation; may decrease the work of breathing, allowing respiratory muscles to rest

Modes of Ventilation

- assist-control ventilation (ACV) or volume control (VC)
  - every breath is delivered with a pre-set tidal volume and rate or minute ventilation
  - extra controlled breaths may be triggered by patient effort; if no effort is detected within a specified amount of time the ventilator will initiate the breath
- pressure control ventilation (PCV)
  - a minimum frequency is set and patient may trigger additional breaths above the ventilator
  - all breaths delivered at a preset constant inspiratory pressure
  - in traditional PCV, tidal volume is not guaranteed thus changes in compliance and resistance affect tidal volume
- synchronous intermittent mandatory ventilation (SIMV)
  - ventilator provides controlled breaths (either at a set volume or pressure depending on whether in VC or PCV, respectively)
  - patient can breathe spontaneously (these breaths may be pressure supported) between controlled breaths
- pressure support ventilation (PSV)
  - patient initiates all breaths and the ventilator supports each breath with a pre-set inspiratory pressure
  - useful for weaning off ventilator
- high-frequency oscillatory ventilation (HFOV)
  - high breathing rate (up to 900 breaths/min in an adult), very low tidal volumes
  - used commonly in neonatal and paediatric respiratory failure
  - occasionally used in adults when conventional mechanical ventilation is failing
- non-invasive positive pressure ventilation (NPPV)
  - achieved without intubation by using a nasal or face mask
  - BiPAP: increased pressure (like PSV) on inspiration and lower constant pressure on expiration (i.e. PEEP)
  - CPAP: delivers constant pressure on both inspiration and expiration

Tracheostomy
Tracheostomy should be considered in patients who require ventilator support for extended periods of time
Shown to improve patient comfort and give patients a better ability to participate in rehabilitation activities

Changes in peak pressures in ACV and tidal volumes in PCV may reflect changes in lung compliance and/or airway resistance – patient may be getting better or worse

Positive End Expiratory Pressure (PEEP)
- Positive pressure applied at the end of ventilation that helps to keep alveoli open, decreasing V/Q mismatch
- Used with all invasive modes of ventilation

Monitoring Ventilatory Therapy
Pulse oximetry, $ETCO_2$ concentration
Regular arterial blood gases
Assess tolerance regularly

Patients who develop a pneumothorax while on mechanical ventilation require a chest tube

Causes of Intraoperative Hypoxemia

Inadequate Oxygen Supply
e.g. breathing system disconnection, obstructed or malpositioned ETT, leaks in the anesthetic machine, loss of oxygen supply
Hypoventilation
Ventilation-Perfusion Inequalities
e.g. atelectasis, pneumonia, pulmonary edema, pneumothorax
Reduction in Oxygen Carrying Capacity
e.g. anemia, carbon monoxide poisoning, methemoglobinemia, hemoglobinopathy
Leftward Shift of the Hemoglobin-Oxygen Saturation Curve
e.g. hypothermia, decreased 2,3-BPG, alkalosis, hypocarbia, carbon monoxide poisoning
Right-to-Left Cardiac Shunt

Table 3. Causes of Abnormal End Tidal CO_2 Levels

Hypocapnea (Decreased CO_2)	Hypercapnea (Increased CO_2)
Hyperventilation	Hypoventilation
Hypothermia (decreased metabolic rate)	Malignant hyperthermia, other hypermetabolic states
Decreased pulmonary blood flow (decreased cardiac output)	Improved pulmonary blood flow after resuscitation or hypotension
Technical issues Incorrect placement of sampling catheter Inadequate sampling volume	Technical issues Water in capnography device Anesthetic breathing circuit error Inadequate fresh gas flow Rebreathing Exhausted soda lime Faulty circuit absorber valves
V/Q mismatch Pulmonary thromboembolism Incipient pulmonary edema Air embolism	Low bicarbonate

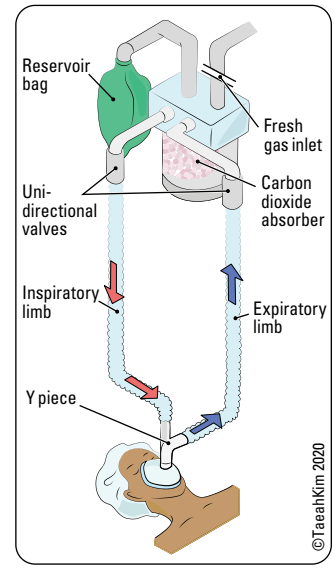

Figure 9. The anesthesia circuit

Intraoperative Management

Temperature

Causes of Hypothermia (<36.0°C)

- intraoperative temperature losses are common (e.g. 90% of intraoperative heat loss is transcutaneous), due to:
  - OR environment (cold room, IV fluids, instruments)
  - open wound
- prevent with forced air warming blankets/warm-water blankets, heated humidification of inspired gases, warmed IV fluid, and increased OR temperature

Causes of Hyperthermia (>37.5-38.3°C)

- drugs (e.g. atropine)
- blood transfusion reaction
- infection/sepsis
- medical disorder (e.g. thyrotoxicosis)
- hypermetabolic states (e.g. malignant hyperthermia, neuroleptic malignant syndrome, pheochromocytoma)
- over-zealous warming efforts

Impact of Hypothermia (<36°C)

- Increased risk of wound infections due to impaired immune function
- Increases the period of hospitalization by delaying healing
- Reduces platelet function and impairs activation of coagulation cascade increasing blood loss and transfusion requirements
- Triples the incidence of VT and morbid cardiac events
- Decreases the metabolism of anesthetic agents prolonging postoperative recovery

See Landmark Anesthesiology Trials table for more information on results from study of Wound Infection and Temperature, which details the impact of normothermia on wound healing and length of stay as seen in 200 patients aged 18-80 years who underwent elective colorectal surgery.

Heart Rate

Cardiac Arrest

- pulseless arrest occurs due to 4 cardiac rhythms divided into shockable and non-shockable rhythms
  - shockable: ventricular fibrillation (VF) and ventricular tachycardia (pVT)
  - non-shockable: asystole and pulseless electrical activity (PEA)
- for VF/pVT, key to survival is good early CPR and defibrillation
- for asystole/PEA, key to survival is good early CPR and exclusion of all reversible causes
- reversible causes of PEA arrest (5 Hs and 5 Ts)
  - 5 Hs: hypothermia, hypovolemia, hypoxia, hydrogen ions (acidosis), hypo/hyperkalemia
  - 5 Ts: tamponade (cardiac), thrombosis (pulmonary), thrombosis (coronary), tension pneumothorax, toxins (overdose/poisoning)
  - when a patient sustains a cardiac arrest during anesthesia, it is important to remember that there are other causes on top of the Hs and Ts to consider (e.g. local anesthetic systemic toxicity (LAST), excessive anesthetic dosing, etc.)
- for management of cardiac arrest, see *Appendices*, A32

Intraoperative Tachycardia

- tachycardia – HR >100 bpm; divided into sinus tachycardia (HR = 100-150 bpm) or supraventricular tachycardia (SVT)
- SVT: can be further divided into narrow complex or wide complex tachycardia
  - narrow complex: atrial fibrillation/flutter, accessory pathway mediated tachycardia, paroxysmal atrial tachycardia
  - wide complex: VT, SVT with aberrant conduction
- causes of sinus tachycardia
  - shock/hypovolemia/blood loss
  - anxiety/pain/light anesthesia
  - full bladder
  - anemia

- febrile illness/sepsis
- drugs (e.g. atropine, cocaine, dopamine, epinephrine, ephedrine, isoflurane, isoproterenol, pancuronium) and withdrawal
- hypermetabolic states: malignant hyperthermia, neuroleptic malignant syndrome, pheochromocytoma, thyrotoxicosis, serotonin syndrome

- for management of tachycardia, see *Appendices*, A33

Intraoperative Bradycardia

- bradycardia – HR <50 bpm; most concerning are 2nd degree (Mobitz type II) and 3rd degree heart block, which can both degenerate into asystole
- causes of sinus bradycardia
  - increased parasympathetic tone vs. decreased sympathetic tone
  - must rule out hypoxemia
  - arrhythmias (see Cardiology and Cardiac Surgery, C19)
  - baroreceptor reflex due to increased ICP or increased BP
  - vagal reflex (oculocardiac reflex, carotid sinus reflex, airway manipulation)
  - drugs (e.g. suprachoroidal hemorrhage, opioids, edrophonium, neostigmine, halothane, digoxin, β-blockers)
  - high spinal/epidural anesthesia
  - hypothermia and hypothyroidism
- for management of bradycardia, see *Appendices*, A33

Intraoperative Shock Box

SHOCKED
Sepsis or Spinal shock
Hypovolemic/Hemorrhagic
Obstructive
Cardiogenic
anaphylacti**K**
Endocrine/other (e.g. Addison's disease, hyperthyroidism, transfusion reaction)
Drugs

BP = CO x SVR, where CO = SV x HR
SV is a function of preload, afterload, and contractility

Blood Pressure

Causes of Intraoperative Hypotension/Shock

- shock: condition characterized by inability of cardiovascular system to maintain adequate end-organ perfusion and delivery of O_2 to tissues

a) septic shock
- see Infectious Diseases, ID20

b) spinal/neurogenic shock
- decreased sympathetic tone
- hypotension without tachycardia or peripheral vasoconstriction (warm skin)

c) hypovolemic/hemorrhagic shock
- most common form of shock, due to decrease in intravascular volume

d) obstructive shock
- obstruction of blood into or out of the heart
- increased JVP, distended neck veins, increased systemic vascular resistance, insufficient CO
- e.g. tension pneumothorax, cardiac tamponade, pulmonary embolism (and other emboli – i.e. fat, air)

e) cardiogenic shock
- increased JVP, distended neck veins, increased SVR, decreased CO
- e.g. myocardial dysfunction, dysrhythmias, ischemia/infarct, cardiomyopathy, acute valvular dysfunction

f) anaphylactic(K) shock
- see Emergency Medicine, ER29

g) endocrine/other
- transfusion reaction, Addisonian crisis, thyrotoxicosis, hypothyroid, aortocaval syndrome
- see Hematology and Endocrinology

h) drugs
- vasodilators, high spinal anesthetic interfering with sympathetic outflow

Causes of Intraoperative Hypertension

- inadequate anesthesia causing pain and anxiety
- pre-existing HTN, coarctation, or preeclampsia
- hypoxemia/hypercarbia
- hypervolemia
- increased intracranial pressure
- full bladder
- drugs (e.g. ephedrine, epinephrine, cocaine, phenylephrine, ketamine) and withdrawal
- allergic/anaphylactic reaction
- hypermetabolic states: malignant hyperthermia, neuroleptic malignant syndrome, serotonin syndrome, thyroid storm, pheochromocytoma (see Endocrinology, E30, E41)

Fluid Balance and Resuscitation

- total requirement = maintenance + deficit + ongoing loss
- in surgical settings, this formula must take into account multiple factors including preoperative fasting/decreased fluid intake, increased losses during or before surgery, fluids given with blood products and medications
- increasingly, Enhanced Recovery After Surgery protocols recommend consumption of clear fluids up to 2 h prior to surgery

- both inadequate fluid resuscitation AND excessive fluid administration increase morbidity postoperatively

Maintenance Fluid

- average healthy adult requires approximately 2500 mL water/d
  - 200 mL/d GI losses
  - 800 mL/d insensible losses (respiration, perspiration)
  - 1500 mL/d urine (beware of renal failure)
- maintenance should not exceed 3 mL/kg/h
- increased requirements with fever, sweating, GI losses (vomiting, diarrhea, NG suction), adrenal insufficiency, hyperventilation, and polyuric renal disease
- decreased requirements with anuria/oliguria, SIADH, highly humidified atmospheres, and CHF
- maintenance electrolytes
  - Na^+: 3 mEq/kg/d
  - K^+: 1 mEq/kg/d
- 4-2-1 rule: 4 mL/h first 10 kg, 2 mL/h next 10 kg, 1 mL/h for every kg after to calculate maintenance fluid requirement
  - alternatively, may add 40 to adults who weigh ≥20kg to calculate maintenance fluid requirement in mL/h
- for example, a 50 kg patient's maintenance requirements
  - fluid = (4 mL/h x 10 kg) + (2 mL/h x 10 kg) + (1 mL/h x 30 kg) = 40 mL/h + 20 mL/h + 30 mL/h = 90 mL/h = 2160 mL/d
  - Na^+ = 150 mEq/d (therefore 150 mEq/2.16 L/d ≈ 69 mEq/L)
  - K^+ = 50 mEq/d (therefore 50 mEq/2.16 L/d ≈ 23 mEq/L)
- above patient's requirements roughly met with 2/3 D5W, 1/3 NS
  - 2/3 + 1/3 at 100 mL/h with 20 mEq KCl per litre

Fluid Deficit

- patients should be adequately hydrated prior to anesthesia
- total body water (TBW) = 60% or 50% of total body weight for an adult male or female, respectively (e.g. for a 70 kg adult male TBW = 70 x 0.6 = 42 L)
- total Na^+ content determines ECF volume; [Na^+] determines ICF volume
- hypovolemia due to volume contraction
  - extra-renal Na^+ loss
    - GI: vomiting, NG suction, drainage, fistulae, diarrhea
    - skin/respiratory: insensible losses (fever), sweating, burns
    - vascular: hemorrhage
    - renal Na^+ and H_2O loss
    - diuretics
    - osmotic diuresis
    - hypoaldosteronism
    - salt-wasting nephropathies
    - renal H_2O loss
    - diabetes insipidus (central or nephrogenic)
    - hypovolemia with normal or expanded ECF volume
    - decreased CO
    - redistribution
- hypoalbuminemia: cirrhosis, nephrotic syndrome
- capillary leakage: acute pancreatitis, rhabdomyolysis, ischemic bowel, sepsis, anaphylaxis
- replace water and electrolytes as determined by patient's needs
- with chronic hyponatremia, correction must be done gradually over >48 h to avoid central pontine myelinolysis

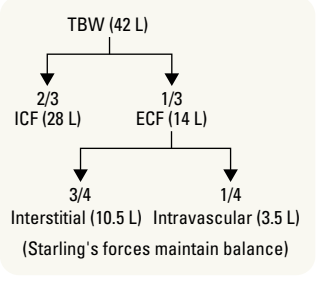

Figure 10. Total body water division in a 70 kg adult

Table 4. Signs and Symptoms of Dehydration

Percentage of Body Water Loss	Severity	Signs and Symptoms
3%	Mild	Decreased skin turgor, sunken eyes, dry mucous membranes, dry tongue, reduced sweating
6%	Moderate	Oliguria, orthostatic hypotension, tachycardia, low volume pulse, cool extremities, reduced filling of peripheral veins and CVP, hemoconcentration, apathy
9%	Severe	Profound oliguria or anuria and compromised CNS function with or without altered sensorium

What are the Ongoing Losses?

- traditionally thought that fluid loss during surgery resulted from blood loss, losses from Foley catheter, NG, surgical drains, and minor losses due to sequestration of fluid into other body compartments
- fluid therapy accounting for these losses often resulted in excess crystalloid administration
- goal-directed fluid regimens associated with lower rate of postoperative complications compared to predetermined calculations. These can be done using point of care ultrasound (POCUS), esophageal doppler, pulse pressure variation available either using arterial line monitoring or certain pulse oximetry

IV Fluids

- replacement fluids include crystalloid and colloid solutions
- IV fluids improve perfusion but NOT O_2 carrying capacity of blood

Initial Distribution of IV Fluids
- H_2O follows ions/molecules to their respective compartments

Crystalloid Infusion
- salt-containing solutions that distribute only within ECF
- consensus guidelines recommend use of balanced crystalloid (i.e. Ringer's lactate) over normal saline (NS) for routine replacement and resuscitation
- maintain euvolemia in patient with blood loss: 3 mL crystalloid infusion per 1 mL of blood loss for volume replacement (i.e. 3:1 replacement)
- best practice is to use goal-directed therapy
- if large volumes are to be given, use balanced fluids such as Ringer's lactate or Plasmalyte®, as too much NS may lead to hyperchloremic metabolic acidosis

Colloid Infusion
- includes protein colloids (albumin and gelatin solutions) and non-protein colloids (dextrans and starches, e.g. hydroxyethyl starch (HES))
- distributes within intravascular volume
- 1:1 ratio (infusion:blood loss) only in terms of replacing intravascular volume
- the use of HES solutions is controversial because of recent RCTs and meta-analyses highlighting their renal (especially in septic patients) and coagulopathic side effects, as well as a lack of specific indications for their use
  - colloids are being used based on mechanistic and experimental evidence but there is a paucity of definitive studies investigating their safety and efficacy; routine use of colloids should be avoided

Table 5. IV Fluid Solutions

		ECF	Ringer's Lactate	0.9% NS	0.45% NS in D5W	D5W	2/3 D5W + 1/3 NS	Plasmalyte
mEq/L	**Na^+**	142	130	154	77	-	51	140
	K^+	4	4	-	-	-	-	5
	Ca^{2+}	4	3	-	-	-	-	-
	Mg^{2+}	3	-	-	-	-	-	3
	Cl^-	103	109	154	77	-	51	98
	HCO_3^-	27	28*	-	-	-	-	27
mOsm/L		280-310	273	308	154	252	269	294
pH		7.4	6.5	5.0	4.5	4.0	4.3	7.4

*Converted from lactate

Table 6. Colloid HES Solutions

	Concentration	Plasma Volume Expansion	Duration (h)	Maximum Daily Dose (mL/kg)
Voluven®	6%	1:1	4-6	33-50
Pentaspan®	10%	1:1.2-1.5	18-24	28

Blood Products

Colloids vs. Crystalloids for Fluid Resuscitation in Critically Ill People
Cochrane DB Syst Rev 2018:CD000567
Purpose: To assess effect of colloids vs. crystalloids in critically ill patients on mortality, need for transfusions or renal replacement therapy, and adverse events.
Methods: Systematic review of RCTs and quasi-RCTs involving trauma, burns, or medical conditions (i.e. sepsis). Searched CENTRAL, MEDLINE, and Embase.
Outcomes: 69 studies, 30020 participants. Starches, dextrans, albumin or FFP (moderate-certainty evidence), or gelatins (low-certainty evidence) vs. crystalloids has no difference on mortality. Starches slightly increase the need for blood transfusion (moderate-certainty evidence), and albumin or FFP may make little or no difference to the need for renal replacement therapy (low-certainty evidence). Evidence for blood transfusions for dextrans, and albumin or FFP, is uncertain.

Calculating Acceptable Blood Losses (ABL)
- Blood volume
  term infant 80 mL/kg
  adult male 70 mL/kg
  adult female 60 mL/kg
- Calculate estimated blood volume (EBV) (e.g. in a 70 kg male, approx. 70 mL/kg)
  EBV = 70 kg x 70 mL/kg = 4900 mL
- Decide on a transfusion trigger, i.e. the Hb level at which you would begin transfusion (e.g. 70 g/L for a person with Hb(initial) = 150 g/L)
  Hb(final) = 70 g/L
- Calculate

$$ABL = \frac{Hb(i) - Hb(f) \times EBV}{Hb(i)}$$
$$= \frac{150 - 70 \times 4900}{150}$$
$$= 2613 \text{ mL}$$

- Therefore, in order to keep the Hb level above 70 g/L, RBCs would have to be given after approximately 2.6 L of blood has been lost

Transfusion Infection Risks

Virus	Risk per 1 unit pRBCs
HIV	1 in 21 million
Hepatitis C virus	1 in 13 million
Hepatitis B virus	1 in 7.5 million
HTLV	1 in 1-1.3 million
Symptomatic Bacterial Sepsis	1 in 40,000 from platelets and 1 in 250,000 from RBC
West Nile virus	No cases since 2003

Induction

Routine Induction vs. Rapid Sequence Induction

- routine induction is the standard in general anesthesia; however, an RSI is indicated in patients at risk of regurgitation/aspiration (see *Aspiration*, A5)
- RSI uses
  1. pre-determined doses of induction drugs given in rapid succession to minimize the time patient is at risk for aspiration (e.g. from the time when they are unconscious without an ETT until the time when the ETT is in and the cuff inflated)
  2. no bag mask ventilation
  3. cricoid pressure may be applied (although there are some exceptions, e.g. trauma to upper airway)
  4. use of rapid onset muscle relaxant (i.e. SCh)

Table 7. Comparison of Routine Induction vs. RSI

Steps	Routine Induction	RSI
1. **Equipment Preparation**	Check equipment, drugs, suction, and monitors; prepare an alternative laryngoscope blade and a second ETT tube one size smaller, suction on	
2. **Pre-Oxygenation/ Denitrogenation**	100% O_2 for 3 min or 4-8 vital capacity breaths; reduce risk of hypoxemia during apneic period following induction	
3. **Pre-Treatment Agents**	Use agent of choice to blunt physiologic responses to airway manipulation 3 min prior to laryngoscopy	Use agent of choice to blunt physiologic responses to airway manipulation; if possible, give 3 min prior to laryngoscopy, but can skip this step in an emergent situation
4. **Induction Agents**	Use IV or inhalation induction agent of choice	Use pre-determined dose of fast acting induction agent of choice
5. **Muscle Relaxants**	Muscle relaxant of choice given after the onset of the induction agent	Pre-determined dose of fast acting muscle relaxant (most commonly SCh, occasionally high dose rocuronium) given IMMEDIATELY after induction agent
6. **Ventilation**	Bag-mask ventilation	DO NOT bag ventilate – can increase risk of aspiration
7. **Additional Helpful Maneuvers**	Laryngeal pressure, apply posterior pressure on thyroid cartilage to improve view of vocal cords as indicated	Traditionally Sellick maneuver, also known as cricoid pressure, to prevent regurgitation and assist in visualization (2 kg pressure with drowsiness, 3 kg with loss of consciousness) but increasingly omitted
8. **Intubation**	Intubate, inflate cuff, confirm ETT position	Intubate once paralyzed (~45 s after SCh given), inflate cuff, confirm ETT position; cricoid pressure maintained until ETT cuff inflated and placement confirmed
9. **Secure**	Secure ETT, and begin manual/machine ventilation	

Rocuronium vs. Succinylcholine for Rapid Sequence Induction Intubation
Cochrane DB Syst Rev 2015:CD002788
Purpose: Whether rocuronium creates intubating conditions comparable to those of succinylcholine during RSI intubations.
Methods: Systematic review of RCTs or CCTs with a dose of at least 0.6 mg/kg for rocuronium and 1 mg/kg for succinylcholine.
Results: 50 trials, 4151 participants. Succinylcholine was superior to rocuronium for achieving excellent intubating conditions (RR 0.86, 95% CI 0.81-0.92) and clinically acceptable intubation conditions (RR 0.97, 95% CI 0.95-0.99).
Conclusion: Succinylcholine created superior intubation conditions to rocuronium in achieving excellent and clinically acceptable intubating conditions.

Induction Agents

- induction of general anesthesia may be achieved with intravenous agents, volatile inhalational agents, or both

Intravenous Agents

- IV induction agents are non-opioid drugs used to provide hypnosis, amnesia, and blunt reflexes to laryngoscopy
- these are initially used to establish the plane of anesthesia rapidly, smoothly
  - most commonly used is propofol or ketamine
  - a continuous propofol infusion may be used as an alternative to inhalational volatile agents during the maintenance phase of general anesthesia. An indication would be malignant hyperthermia

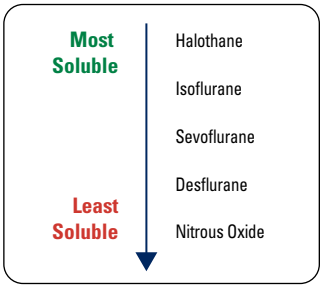

Figure 11. Solubility of volatile anesthetics in blood

Table 8. Intravenous Induction Agents

	Propofol (Diprivan®)	Thiopental (sodium thiopental, sodium thiopentone)*	Ketamine (Ketalar®, Ketaject®)	Benzodiazepines (midazolam (Versed®), diazepam (Valium®), lorazepam (Ativan®))	Etomidate	Methohexital (Brevital®)
Class	Alkylphenol – hypnotic	Short acting thiobarbiturate – hypnotic	Phencyclidine (PCP) derivative – dissociative	Benzodiazepines – anxiolytic	Imidazole derivative - hypnotic	Ultra short-acting barbiturate
Action	Inhibitory at GABA synapse Decreased cerebral metabolic rate and blood flow, decreased ICP, decreased SVR, decreased BP, and decreased SV	Inhibitory at GABA synapse Decreased cerebral metabolic rate and blood flow, decreased CPP, decreased CO, decreased BP, decreased reflex tachycardia, decreased respiration	May act on NMDA (antagonistically), opiate, and other receptors Increased HR, increased BP, increased SVR, increased coronary flow, increased myocardial O_2 uptake CNS and respiratory depression, bronchial smooth muscle relaxation	Inhibitory at GABA synapse Produces antianxiety and skeletal muscle relaxant effects Minimal cardiac depression	Decreases concentration of GABA required to activate receptor CNS depression Minimal cardiac or respiratory depression	Binds to the chloride ionophore site of GABA-A receptor

*As of 2011, Thiopental has been discontinued from production for North America

Table 8. Intravenous Induction Agents

	Propofol (Diprivan®)	Thiopental (sodium thiopental, sodium thiopentone)*	Ketamine (Ketalar®, Ketaject®)	Benzodiazepines (midazolam (Versed®), diazepam (Valium®), lorazepam (Ativan®))	Etomidate	Methohexital (Brevital®)
Indications	Induction Maintenance Total intravenous anesthesia (TIVA)	Induction Control of convulsive states, obstetric patients	Induction when sympathetic stimulation required (e.g. major trauma, hypovolemia), IM induction in children/uncoooperative adults (i.e. when there is lack of IV access), severe asthma because sympathomimetic	Used for sedation, amnesia, and anxiolysis	Induction Poor cardiac function, severe valve lesions, uncontrolled hypertension	Procedural induction ECT
Caution	Patients who cannot tolerate sudden decreased BP (e.g. fixed cardiac output or shock)	Allergy to barbiturates Uncontrolled hypotension, shock, cardiac failure Porphyria, liver disease, status asthmaticus, myxedema	Ketamine allergy TCA medication (interaction causes HTN and dysrhythmias) History of psychosis Patients who cannot tolerate HTN (e.g. CHF, increased ICP, aneurysm)	Marked respiratory depression	Postoperative nausea and vomiting Venous irritation	Contraindicated in acute intermittent porphyria
Dosing	IV induction: 1.5-2.5 mg/kg (less with opioids) Unconscious <1 min Lasts 4-6 min t1/2 = 55 min Decreased postoperative sedation, recovery time, N/V	IV induction: 3-5 mg/kg Unconscious about 30 s Lasts 5 min Accumulation with repeat dosing – not for maintenance t1/2 = 5-10 h Postoperative sedation lasts hours	IV induction 1-2 mg/kg Dissociation in 15 s, analgesia, amnesia, and unconsciousness in 45-60 s Unconscious for 10-15 min, analgesia for 40 min, amnesia for 1-2 h t1/2 = ~3 h	Onset <5 min if given IV Duration of action long but variable/ somewhat unpredictable	IV induction 0.3 mg/kg Onset 30-60 s Lasts 4-8 min	IV induction 1 to 1.5 mg/kg of a 1% solution; doses must be titrated to effect
Special Considerations	-30% decreased BP due to vasodilation Reduce burning at IV site by mixing with lidocaine	Combining with rocuronium causes precipitates to form	High incidence of emergence reactions (vivid dreaming, out-of-body sensation, illusions) Pretreat with glycopyrrolate to decrease salivation	Antagonist: flumazenil (Anexate®) competitive inhibitor, 0.2 mg IV over 15 s, repeat with 0.1 mg/min (max of 2 mg), t1/2 of 60 min Midazolam also has amnestic (antegrade) effect and decreased risk of thrombophlebitis	Adrenal suppression after first dose, cannot repeat dose or use as infusion Myoclonic movements during induction	

*As of 2011, Thiopental has been discontinued from production for North America

Volatile Inhalational Agents

- e.g. sevoflurane, desflurane, isoflurane, enflurane, halothane, and nitrous oxide

Table 9. Volatile Inhalational Agents

	Sevoflurane	Desflurane*	Isoflurane**	Enflurane	Halothane	Nitrous oxide (N_2O)***
MAC (% gas in O_2)	2.0	6.0	1.2	1.7	0.8	104
CNS	Increased ICP	Increased ICP	Decreased cerebral metabolic rate Increased ICP	ECG seizure-like activity Increased ICP	Increased ICP and cerebral blood flow	—
Resp	Respiratory depression (severely decreased TV, increased RR), decreased response to respiratory CO_2 reflexes, bronchodilation					—
CVS	Less decrease of contractility, stable HR	Tachycardia with rapid increase in concentration	Decreased BP and CO, increased HR, theoretical chance of coronary steal**	Stable HR, decreased contractility	Decreased BP, CO, HR, and conduction Sensitizes myocardium to epinephrine-induced arrhythmias	Can cause decreased HR in paediatric patients with existing heart disease
MSK	Muscle relaxation, potentiation of other muscle relaxants, uterine relaxation					

*Airway irritant: desflurane can provoke breath holding, laryngospasm, and salivation, so it is not used for inhalational induction
**Coronary steal: isoflurane causes small vessel dilation which may compromise blood flow to areas of the heart with fixed perfusion (e.g. stents, atherosclerosis)
***Properties and Adverse Effects of N_2O
Due to its high MAC, N_2O is combined with other anesthetic gases to attain surgical anesthesia. A MAC of 104% is possible in a pressurized chamber only
Second Gas Effect
Expansion of closed spaces: closed spaces such as a pneumothorax, the middle ear, bowel lumen, and ETT cuff will markedly enlarge if N_2O is administered
Diffusion hypoxia: during anesthesia, the washout of N_2O from body stores into alveoli can dilute the alveolar [O_2], creating a hypoxic mixture if the original [O_2] is low

See Landmark Anesthesiology Trials table for more information on MYRIAD trial, which details the impact of volatile anesthetics vs. total intravenous anesthesia in patients undergoing CABG.

Minimum Alveolar Concentration

- minimum alveolar concentration (MAC) is the alveolar concentration of a volatile anesthetic at one atmosphere (atm) of pressure that will prevent movement in 50% of patients in response to a surgical stimulus (e.g. abdominal incision) breathing 100% O_2
- potency of inhalational agents is compared using MAC
- MAC of halogenated volatile anesthetics decreases by approximately 6% per additional decade of age in adults
- 1.2-1.3 times MAC will often ablate response to stimuli in the general population
- MAC values are roughly additive when mixing N_2O with another volatile agent; however, this only applies to movement, not other effects such as BP changes (e.g. 0.5 MAC of a potent agent + 0.5 MAC of N_2O = 1 MAC of potent agent)

Factors increasing MAC: chronic alcohol use, hyperthyroidism, hyperthermia, acute amphetamine use, cannabinoids, young age
Factors decreasing MAC: acute alcohol intoxication, hypothermia, sedating drugs, advanced age, chronic amphetamine use, drugs (opioids, benzodiazepines), α2 adrenergic agonists, nitrous oxide, IV anesthetics), shock

- MAC-intubation: the MAC of anesthetic that will inhibit movement and coughing during endotracheal intubation, generally 1.3 MAC
- MAC-block adrenergic response (MAC-BAR): the MAC necessary to blunt the sympathetic response to noxious stimuli, generally 1.5 MAC
- MAC-awake: the MAC of a given volatile anesthetic at which a patient will open their eyes to command, generally 0.3-0.4 of the usual MAC

Muscle Relaxants and Reversing Agents

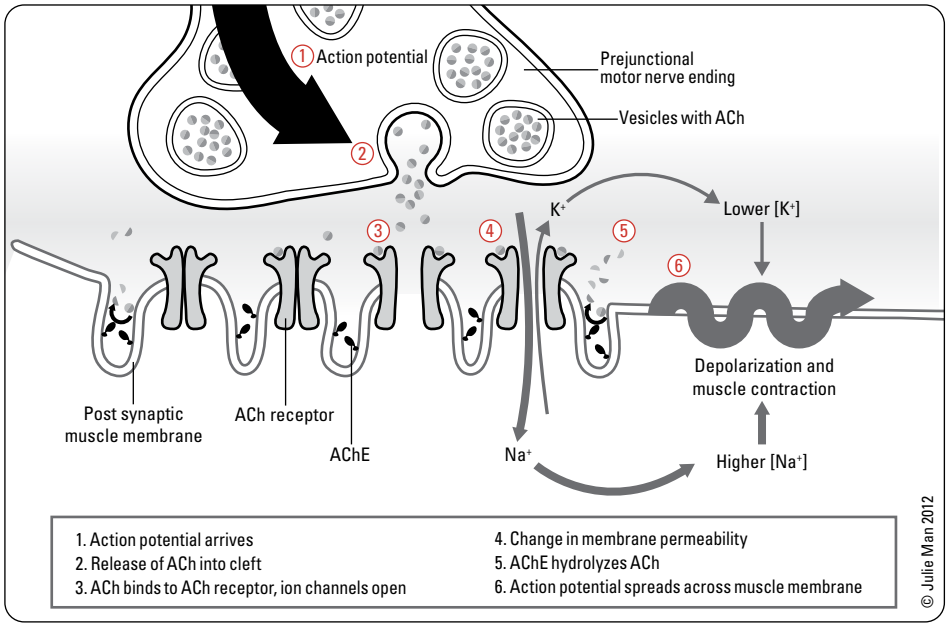

Figure 12. Review of anatomy and physiology of the neuromuscular junction (NMJ)

Muscle Relaxants

- two types of muscle relaxants
  1. depolarizing muscle relaxants: SCh
  2. non-depolarizing muscle relaxants: rocuronium, mivacurium, vecuronium, cistracurium cisatracurium, pancuronium
- block nicotinic cholinergic receptors in NMJ
- provides skeletal muscle paralysis, including the diaphragm, but spares involuntary muscles such as the heart and smooth muscle
- never use muscle relaxants without adequate preparation and equipment to maintain airway and ventilation
- muscle relaxation produces the following desired effects:
  1. facilitates intubation
  2. assists with mechanical ventilation
  3. prevents muscle stretch reflex and decreases muscle tone
  4. allows access to the surgical field (intracavity surgery)
- nerve stimulator (i.e. train of four) is used intraoperatively to assess the degree of nerve block; no twitch response seen with complete neuromuscular blockade

Table 10. Depolarizing Muscle Relaxants (Non-Competitive): Succinylcholine

Mechanism of Action	Mimics ACh and binds to ACh receptors causing prolonged depolarization; initial fasciculation may be seen, followed by temporary paralysis secondary to blocked ACh receptors by SCh
Intubating Dose (mg/kg)	1-1.5
Onset	30-60 s – rapid (fastest of all muscle relaxants)
Duration	3-5 min – short (no reversing agent for SCh)
Metabolism	SCh is hydrolyzed by plasma cholinesterase (i.e. pseudocholinesterase), found only in plasma and not at the NMJ
Indications	Assist intubation Increased risk of aspiration (need rapid paralysis and airway control), e.g. full stomach, hiatus hernia, obesity, pregnancy, trauma Short procedures ECT Laryngospasm

Pseudocholinesterase
Pseudocholinesterase is produced by the liver and metabolizes SCh and mivacurium. A prolonged duration of blockade by SCh occurs with:
(a) decreased quantity of plasma cholinesterase, e.g. congenital (hereditary), liver disease, pregnancy, malignancy, malnutrition, collagen vascular disease, hypothyroidism
(b) abnormal quality of plasma cholinesterase, e.g. normal levels but impaired activity of enzymes, genetically inherited

Table 10. Depolarizing Muscle Relaxants (Non-Competitive): Succinylcholine

Side Effects	1. SCh also stimulates muscarinic cholinergic autonomic receptors (in addition to nicotinic receptors; may cause bradycardia, dysrhythmias, sinus arrest, increased secretions of salivary glands (especially in children)) 2. Hyperkalemia Disruption of motor nerve activity causes proliferation of extrajunctional (outside NMJ) cholinergic receptors Depolarization of an increased number of receptors by SCh may lead to massive release of potassium out of muscle cells Patients at risk 3rd degree burns 24 h-6 mo after injury Traumatic paralysis or neuromuscular diseases (e.g. muscular dystrophy) Severe intra-abdominal infections Severe closed head injury Upper motor neuron lesions 3. Can trigger MH (see *Malignant Hyperthermia*, A29) 4. Increased ICP/intraocular pressure/intragastric pressure (no increased risk of aspiration if competent LES) 5. Fasciculations, postoperative myalgia – may be minimized if small dose of non-depolarizing agent given before SCh administration
Contraindications	
Absolute	Known hypersensitivity or allergy, positive history of MH, myotonia (m. congenita, m. dystrophica, paramyotonia congenital), high-risk for hyperkalemic response
Relative	Known history of plasma cholinesterase deficiency, myasthenia gravis, myasthenic syndrome, familial periodic paralysis, open eye injury

Table 11. Non-Depolarizing Muscle Relaxants (Competitive)

Mechanism of Action	Competitive blockade of postsynaptic ACh receptors preventing depolarization					
Classification	**Short**		**Intermediate**		**Long**	
	Mivacurium	Rocuronium	Vecuronium	Cisatracurium	Pancuronium	
Intubating Dose (mg/kg)	0.2	0.6-1.0	0.1	0.2	0.1	
Onset (min)	2-3	1.5	2-3	3	3-5	
Duration (min)	15-25	30-45	45-60	40-60	90-120	
Metabolism	Plasma cholinesterase	Liver (major) Renal (minor)	Liver	Hofmann Eliminations	Renal (major)	Liver (minor)
Intubating Dose (mg/kg)	0.2	0.6-1.0	0.1	0.2	0.1	
Onset (min)	2-3	1.5	2-3	3	3-5	
Duration (min)	15-25	30-45	45-60	40-60	90-120	
Metabolism	Plasma cholinesterase	Liver (major) Renal (minor)	Liver	Hofmann Eliminations	Renal (major)	Liver (minor)
Indications	Assist intubation, assist mechanical ventilation in some ICU patients, reduce fasciculations, and postoperative myalgias secondary to SCh					
Side Effects						
Histamine Release	Yes	No	No	No	No	
Other	—	—	—	—	Tachycardia	
Considerations	Increased duration of action in renal or liver failure	Quick onset of rocuronium allows its use in rapid sequence induction Cisatracurium is good for patients with renal or hepatic insufficiency				Pancuronium if increased HR and BP desired

Reversal Agents

- sugammadex is a selective relaxant binding agent and can be administered immediately after dose of NMDR
- neostigmine, pyridostigmine, edrophonium are acetylcholinesterase inhibitors - these are competitive inhibitors and therefore can only be administered when there has been some recovery of blockade (i.e. train of four muscle response to stimulation)
- can only reverse the effect of non-depolarizing muscle relaxants
- anticholinergic agents (e.g. atropine, glycopyrrolate) are simultaneously administered to minimize muscarinic effect of reversal agents (i.e. bradycardia, salivation, increased peristalsis, and bronchoconstriction)

Table 12. Reversal Agents for Non-Depolarizing Relaxants

Agent	Pyridostigmine	Neostigmine	Edrophonium	Sugammadex
Onset	Slow	Intermediate	Intermediate	Fast
Mechanism of Action	AChE; inhibit enzymatic degradation of ACh, increase ACh at nicotinic and muscarinic receptors, displace non-depolarizing muscle relaxants Muscarinic effects of reversing agents include unwanted bradycardia, salivation, and increased bowel peristalsis*			Encapsulates and inactivates rocuronium and vecuronium → ↓ amount of agent available to bind to receptors in NMJ
Dose (mg/kg)	0.1-0.4	0.04-0.08	0.5-1	2-16
Recommended Anticholinergic	Glycopyrrolate	Glycopyrrolate	Atropine	NA
Dose of Anticholinergic (per mg)	0.05 mg	0.2 mg	0.014 mg	NA

*Atropine and glycopyrrolate are anticholinergic agents administered to minimize muscarinic effects of reversal agents

Analgesia

- options include opioids (e.g. morphine, fentanyl, hydromorphone), NSAIDS/COX-2- inhibitors, acetaminophen, ketamine, gabapentinoids, local, and regional anesthetic (see Table 15, A25)

Maintenance

- general anesthesia is maintained using volatile inhalation agents and/or IV agents (i.e. propofol infusion)
- analgesia (usually IV opioids)
  - +/- muscle relaxants given as needed

See Landmark Anesthesiology Trials table for more information on results from the ENGAGES trial, which details the efficacy of using EEG guided anesthetic administration in patients with postoperative delirium.

Extubation

- criteria: patient must no longer have intubation requirements
  - patency: airway must be patent
  - protection: airway reflexes intact
  - patient must be oxygenating and ventilating spontaneously
  - patient must be able to localize to tube or obey commands (e.g. open eyes to verbal response)
- general guidelines
  - ensure patient has normal neuromuscular function (peripheral nerve stimulator monitoring) and hemodynamic status
  - ensure patient is breathing spontaneously with adequate rate and tidal volume
  - allow ventilation (spontaneous or controlled) with 100% O_2 for 3-5 min
  - suction secretions from pharynx, deflate cuff, remove ETT on inspiration (vocal cords abducted)
  - ensure patient is breathing adequately after extubation
  - ensure face mask for O_2 delivery available
  - proper positioning of patient during transfer to recovery room (supine, head elevated)

Complications of Extubation

- early extubation: aspiration, laryngospasm
- late extubation: transient vocal cord incompetence, edema (glottic, subglottic), pharyngitis, tracheitis

Laryngospasm

- defined as forceful involuntary spasm of laryngeal muscles caused by stimulation of superior laryngeal nerve (by oropharyngeal secretions, blood, early extubation)
- causes partial or total airway obstruction
- more likely to occur in semi-conscious patients
- prevention: extubate while patient is still deeply under anesthesia or fully awake
- treatment: suction, remove oral airway/ LMA, apply sustained positive pressure (CPAP) with anesthetic reservoir bag and partial closure of APL valve BMV with 100% O_2, low-dose propofol (0.5-1.0 mg/kg) optional, low-dose SCh (approximately 0.25 mg/kg), and re-intubate if hypoxia develops

Regional Anesthesia

- local anesthetic applied around a peripheral nerve at any point along the length of the nerve (from spinal cord up to, but not including, the nerve endings) for the purpose of reducing or preventing impulse transmission
- no CNS depression (unless overdose of LA); patient remains conscious
- regional anesthetic techniques categorized as follows:
  - epidural and spinal anesthesia (neuraxial anesthesia)
  - peripheral nerve blocks
  - IV regional anesthesia (e.g. Bier block)

Patient Preparation
- sedation and/or anxiolysis may be indicated before block
- monitoring should be as extensive as for GA

Epidural and Spinal Anesthesia

- most common for surgeries performed below the level of umbilicus but can be extended to any level (useful in thoracic, abdominal, and lower extremity surgeries). Typically placed in thoracic or lumbar spine

Anatomy of Spinal/Epidural Area
- spinal cord extends to L1; dural sac to S2 in adults
- nerve roots (cauda equina) from L2 to S2
- needle inserted below L2 should not encounter cord, thus L3-L4, L4-L5 interspace commonly used
- structures penetrated (outside to inside)
  - skin
  - subcutaneous fat
  - supraspinous ligament
  - interspinous ligament
  - ligamentum flavum (last layer before epidural space)
  - dura + arachnoid for spinal anesthesia

Table 13. Epidural vs. Spinal Anesthesia

	Epidural	Spinal
Deposition Site	LA injected in epidural space (space between ligamentum flavum and dura) Initial blockade is at the spinal roots followed by some degree of spinal cord anesthesia as LA diffuses into the subarachnoid space through the dura	LA injected into subarachnoid space in the dural sac surrounding the spinal cord and nerve roots
Onset	Significant blockade requires 10-15 min Slower onset of side effects	Rapid blockade (onset in 2-5 min)
Effectiveness	Effectiveness of blockade can be variable	Very effective blockade
Difficulty	Technically more difficult; greater failure rate	Easier to perform due to visual confirmation of CSF flow
Patient Positioning Post-injection	Position of patient not as important; specific gravity not an issue	Hyperbaric LA solution – position of patient important
Specific Gravity/ Spread	Epidural injections spread throughout the potential space; specific gravity of solution does not affect spread	LA solution may be made hyperbaric (of greater specific gravity than the CSF by mixing with 10% dextrose, thus increasing spread of LA to the dependent (low) areas of the subarachnoid space)
Dosage	Larger volume/dose of LA (usually > toxic IV dose)	Smaller dose of LA required (usually < toxic IV dose)
Continuous Infusion	Use of catheter allows for continuous infusion or repeat injections	None
Complications	Failure of technique Hypotension Bradycardia if cardiac sympathetics blocked (only if ~T4 block), e.g. "high block" Epidural or subarachnoid hematoma Accidental subarachnoid injection can produce spinal anesthesia (and any of the above complications) Systemic toxicity of LA (accidental intravenous) Catheter complications (shearing, kinking, vascular, or subarachnoid placement) Infection Post-dural puncture	Failure of technique Hypotension Bradycardia if cardiac sympathetics blocked (only if ~T4 block), e.g. "high spinal" Epidural or subarachnoid hematoma Post-spinal headache (CSF leak) Transient paresthesias Spinal cord trauma Infection
Combined Spinal-Epidural	Combines the benefits of rapid, reliable, intense blockade of spinal anesthesia together with the flexibility of an epidural catheter	

Benefits of Regional Anesthesia
- Reduced perioperative pulmonary complications
- Reduced perioperative analgesia requirements
- Decreased PONV
- Ability to monitor CNS status during procedure
- Improved perfusion
- Lower incidence of VTE
- Shorter recovery and improved rehabilitation
- Pain blockade with preserved motor function

Landmarking Epidural/Spinal Anesthesia
- Spinous processes should be maximally flexed
- L4 spinous processes found between iliac crests
- T7 landmark at the tip of the scapula

Classic Presentation of Dural Puncture Headache
- Onset 6 h-3 d after dural puncture
- Postural component (worse when sitting)
- Occipital or frontal localization
- ± tinnitus, diplopia

Effect of Anaesthesia Type on Postoperative Mortality and Morbidities: A Matched Analysis of the NSQIP Database
Br J Anaesth 2017;118:105-111
Purpose: Determine the effects of RA vs. GA on postoperative survival and morbidities.
Methods: Matched surgical procedures and type of anaesthesia using the US National Surgical Quality Improvement database. Primary outcome was 30 d postoperative mortality and secondary outcomes were hospital length of stay and postoperative organ system dysfunction.
Results: There was no difference in 30 d mortality. RA was significantly associated with increased likelihood of early discharge (HR 1.09; P< 0.001). There were lower odds of intraoperative complications (47%), respiratory complications (24%), DVT (16%), and any one postoperative complication (15%) (OR 0.85; P< 0.001).
Conclusion: RA was associated with significantly lower odds of several postoperative complications, decreased hospital length of stay, but not mortality when compared with GA.

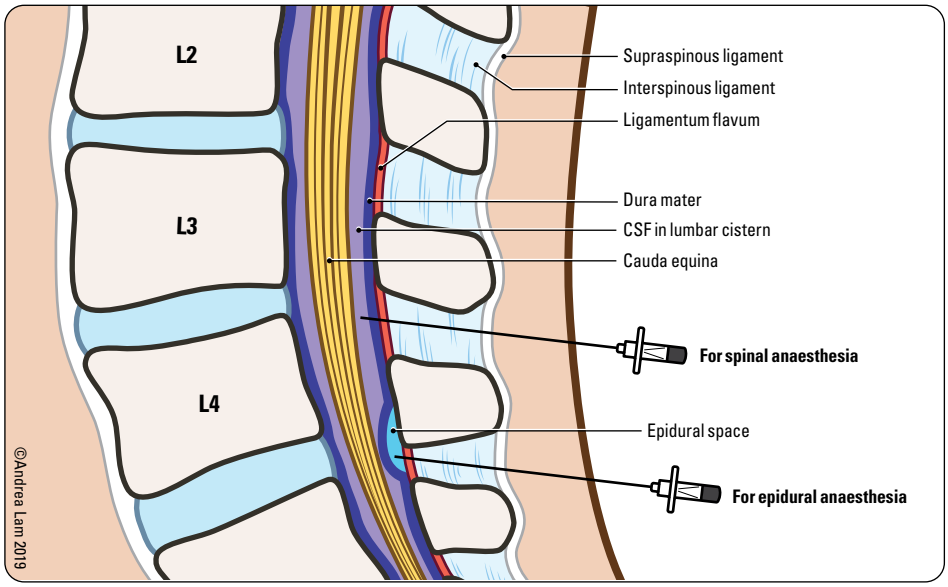

Figure 14. Sagittal cross-section of the anatomy of neuraxial anesthesia

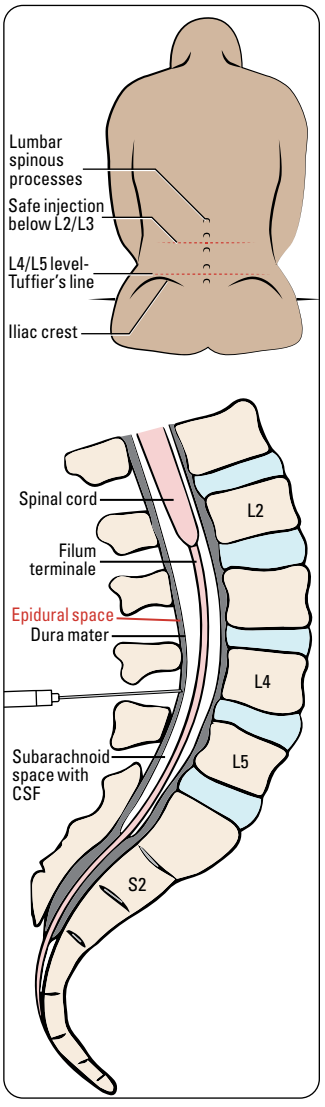

Figure 13. Landmarks for placement of epidural/spinal anesthesia

Contraindications to Spinal/Epidural Anesthesia

- absolute contraindications
  - lack of resuscitative drugs/equipment
  - patient refusal
  - allergy to local anesthetic
  - infection at puncture site or underlying tissues
  - coagulopathies/bleeding diathesis
  - raised ICP
  - sepsis/bacteremia
  - severe hypovolemia
  - cardiac lesion with fixed output states (e.g. severe mitral/aortic stenosis)
  - lack of IV access
- relative contraindications
  - pre-existing neurological disease (e.g. demyelinating lesions)
  - previous spinal surgery; severe spinal deformity
  - prolonged surgery
  - major blood loss or maneuvers that can compromise reaction

Peripheral Nerve Blocks

- deposition of LA around the target nerve or plexus
- ultrasound guidance and peripheral nerve stimulation (needle will stimulate target nerve/plexus) may be used to guide needle to target nerve while avoiding neural trauma or intraneural injection
- most major nerves or nerve plexuses can be targeted (e.g. brachial plexus block, femoral nerve block, sciatic nerve block)
- performed with standard monitors
- approximately 2-4 per 10000 risk of late neurologic injury
- resuscitation equipment must be available

Contraindications to Peripheral Nerve Blockade

- absolute contraindications
  - allergy to LA
  - patient refusal
- relative contraindications
  - certain types of pre-existing neurological dysfunction (e.g. ALS, MS, diabetic neuropathy)
  - local infection at block site
  - bleeding disorder

Local Anesthesia

Local Anesthetic Agents

- see Table 14, A23, for list of LA agents

Definition and Mode of Action
- LA are drugs that block the generation and propagation of impulses in excitable tissues: nerves, skeletal muscle, cardiac muscle, brain
- LA bind to receptors on the cytosolic side of the Na^+ channels, inhibiting Na+ flux and thus blocking impulse conduction
- different types of nerve fibres undergo blockade at different rates

Absorption, Distribution, and Metabolism
- LA readily crosses the BBB once absorbed into the bloodstream
- ester-type LA (e.g. procaine, tetracaine) are broken down by plasma and hepatic esterases; metabolites excreted via kidneys
- amide-type LA (e.g. lidocaine, bupivacaine) are broken down by hepatic mixed-function oxidases (P450 system); metabolites excreted via kidneys

Selection of LA
- choice of LA depends on:
  - onset of action: influenced by pKa (the lower the pKa, the higher the concentration of the base form of the LA, and the faster the onset of action)
  - duration of desired effects: influenced by protein binding (longer duration of action when protein binding of LA is strong)
  - potency: influenced by lipid solubility (agents with high lipid solubility penetrate the nerve membrane more easily)
  - unique needs (e.g. sensory blockade with relative preservation of motor function by bupivacaine at low doses)
  - potential for toxicity

Table 14. Local Anesthetic Agents

	Maximum Dose (mg/kg)	Maximum Dose with Epinephrine (mg/kg)	Potency	Duration	Onset
chloroprocaine	11	14	Low	15-30 min	Fast
lidocaine	5	7	Medium	1-2 h	Fast
mepivacaine	5	7	Medium	3-6 h	Fast
bupivacaine	2.5	3	High	3-8 h	Slow
ropivacaine	2.5	3	High	2-8 h	Medium

Systemic Toxicity
- see Table 14 for maximum doses, potency, and duration of action for common LA agents
- occurs by accidental intravascular injection, LA overdose, or unexpectedly rapid absorption

CNS Effects
- CNS effects first appear to be excitatory due to initial block of inhibitory fibres, followed by subsequent blockade of excitatory fibres
- effects in order of appearance
  - numbness of tongue, perioral tingling, metallic taste
  - disorientation, drowsiness
  - tinnitus
  - visual disturbances
  - muscle twitching, tremors
  - unconsciousness
  - convulsions, seizures
  - generalized CNS depression, coma, respiratory arrest

CVS Effects
- vasodilation, hypotension
- decreased myocardial contractility
- dose-dependent delay in cardiac impulse transmission
  - prolonged PR, QRS intervals
  - sinus bradycardia
- CVS collapse

Treatment of Systemic Toxicity
- early recognition of signs; get help
- 100% O_2, manage ABCs
- diazepam or other anticonvulsant to prevent potential onset of seizures
- manage arrhythmias
- Intralipid® 20% to bind local anesthetic in circulation

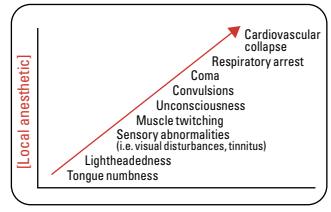

Figure 15. Local anesthetic systemic toxicity

Local Infiltration and Hematoma Blocks

Local Infiltration
- injection of tissue with LA, producing a lack of sensation in the infiltrated area due to LA acting on nerves
- suitable for small incisions, suturing, and excising small lesions
- can use fairly large volumes of dilute LA to infiltrate a large area
- low concentrations of epinephrine (1:100000-1:200000) cause vasoconstriction, thus reducing bleeding and prolonging the effects of LA by reducing systemic absorption

Fracture Hematoma Block
- special type of local infiltration for pain control during manipulation of certain fractures
- hematoma created by fracture is infiltrated with LA to anesthetize surrounding tissues
- sensory blockade may only be partial
- no muscle relaxation

Where Not to Use LA with Epinephrine
"Ears, fingers, toes, penis, nose"

Topical Anesthetics

- various preparations of LAs available for topical use, which may be a mixture of agents (e.g. EMLA cream is a combination of 2.5% lidocaine and prilocaine)
- must be able to penetrate the skin or mucous membrane

Postoperative Care

- pain management should be continuous from OR to PACU to hospital ward and home

Common Postoperative Anesthetic Complications

Uncontrolled/Poorly Controlled Pain
- See below

Nausea and Vomiting
- hypotension and bradycardia must be ruled out
- pain and surgical manipulation also cause nausea
- often treated with dimenhydrinate (Gravol®), ondansetron (Zofran®), granisetron (Kytril®), dexamethasone (Decadron®), metoclopramide (Maxeran®; not with bowel obstruction), prochlorperazine (Stemetil®)

Confusion and Agitation
- ABCs first – confusion or agitation can be caused by airway obstruction, hypercapnia, hypoxemia
- neurologic status (Glasgow Coma Scale, pupils), residual paralysis from anesthetic
- pain, distended bowel/bladder
- fear/anxiety/separation from caregivers, language barriers
- metabolic disturbance (e.g. hypoglycemia, hypercalcemia, hyponatremia – especially post-TURP)
- intracranial cause (e.g. stroke, raised ICP)
- drug effect (e.g. ketamine, anticholinergics, serotonin, benzodiazepines, opioids)
- elderly patients are more susceptible to postoperative delirium

Respiratory Complications
- susceptible to aspiration of gastric contents due to PONV and unreliable airway reflexes
- airway obstruction (secondary to reduced muscle tone from residual anesthetic, soft tissue trauma and edema, or pooled secretions) may lead to inadequate ventilation, hypoxemia, and hypercapnia
- airway obstruction can often be relieved with head tilt, jaw elevation, and anterior displacement of the mandible. If the obstruction is not reversible, a nasal or oral airway may be used

Hypotension
- must be identified and treated quickly to prevent inadequate perfusion and ischemic damage
- reduced cardiac output (the most common cause is hypovolemia) and/or peripheral vasodilation (e.g. residual anesthetic agent)
- first step in treatment is usually the administration of fluids ± inotropic agents

Hypertension
- pain, hypercapnia, hypoxemia, increased intravascular fluid volume, and sympathomimetic drugs can cause hypertension
- IV nitroglycerin, hydralazine, calcium channel blockers, or β-blocking drugs (e.g. esmolol and metoprolol) can be used to treat hypertension

Local Anesthetics and Regional Anaesthesia vs. Conventional Analgesia for Preventing Persistent Postoperative Pain in Adults and Children
Cochrane DB Syst Rev 2018;6:CD007105
Purpose: Compare LA and RA vs. conventional anesthesia for the prevention of persistent postoperative pain (PPP) beyond 3 mo.
Methods: Searched CENTRAL, MEDLINE, and Embase to December 2016. RCTs comparing RA vs. conventional anesthesia were included.
Results: Total 63 RCTs included. Data on RA for the prevention of PPP beyond 3 mo after surgery from 39 studies, enrolling a total of 3027 participants in inclusive analysis. Moderate quality evidence favoring RA over conventional for thoracotomy, C-section (OR 0.52 and OR 0.46 respectively). Moderate quality evidence showing the infusion of IV LA for the prevention of PPP 3-6 mo after breast cancer surgery with an OR of 0.24. Low quality evidence in RA for the prevention of PPP 3-12 mo after breast cancer surgery with an OR of 0.43.
Conclusions: There is moderate-quality evidence that RA may reduce the risk of developing PPP after 3-18 mo after thoracotomy and 3-12 mo after caesarean section. Further studies including larger populations are needed.

Risk Factors for PONV
- Young age*
- Female*
- History of PONV*
- Non-smoker*
- Type of surgery: ophtho, ENT, abdo/pelvic, plastics
- Type of anesthetic: N_2O, opioids, volatile agents

*These factors refer to the Apfel tool for PONV risk stratification and management

See Landmark Anesthesiology Trials table for more information on results from the IMPACT trial which compares the efficacy of six well-established prophylactic antiemetic interventions in patients scheduled to undergo elective surgery during general anesthesia at high risk for postoperative nausea and vomiting.

See Landmark Anesthesiology Trials table for more information on results from the DREAMS trial, which details the effect of preoperative dexamethasone administration in patients with postoperative vomiting.

Pain Management

Definitions
- pain: an unpleasant sensory and emotional experience associated with, or resembling that associated with, actual or potential tissue damage (International Association for the Study of Pain (IASP); definition updated in 2020)
- nociception: detection, transduction, and transmission of noxious stimuli

Pain Classifications
- temporal: acute vs. chronic
- mechanism: nociceptive vs. neuropathic

Acute Pain

- pain of short duration (<6 wk) usually associated with surgery, trauma, or acute illness; often associated with inflammation
- usually limited to the area of damage/trauma and resolves with healing

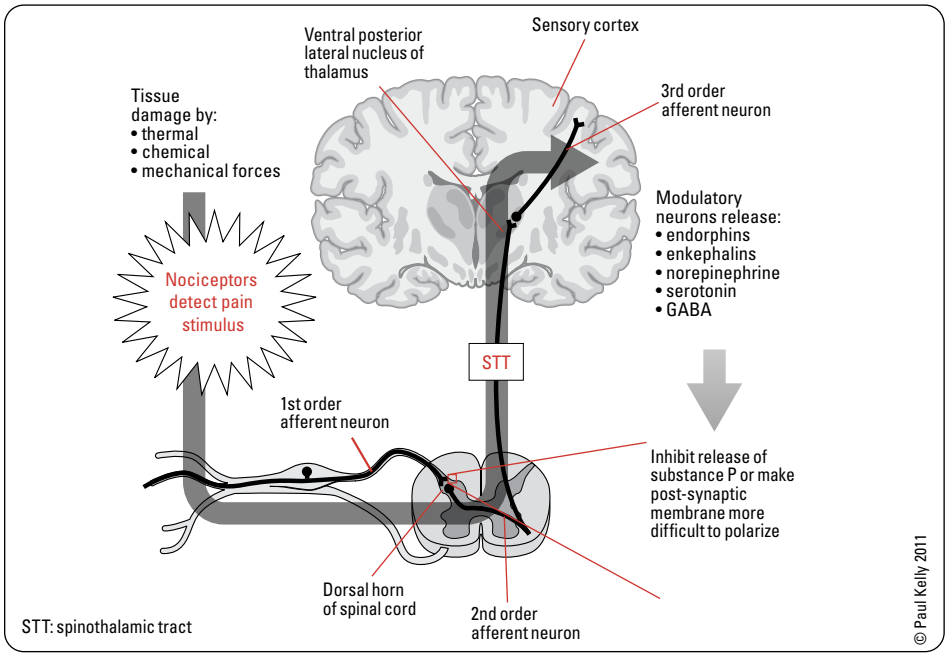

Figure 16. Acute pain mechanism

Pharmacological Management of Acute Pain
- ask the patient to rate the pain out of 10 or use visual analog scale to determine severity
- pharmacological treatment guided by WHO analgesia ladder (Figure 17)

Table 15. Commonly Used Analgesics

	Acetaminophen	NSAIDs	Opioids
Examples	Tylenol®	Aspirin®, ibuprofen, naproxen, ketorolac (IV)	Oral: codeine, oxycodone, morphine, hydromorphone Parenteral: morphine, hydromorphone, fentanyl
Indications	First-line for mild acute pain	Mild-moderate pain	Oral: moderate acute pain Parenteral: moderate-severe acute pain
Mechanism of Action	Unclear, hypothesized cyclooxygenase-2 (COX-2) inhibition Unclear, hypothesized modulation of endogenous cannabinoid system	Non-selective COX-1 and 2 inhibition reducing proinflammatory prostaglandin synthesis	Dampens nociceptive transmission between 1st and 2nd order neurons in the dorsal horn Activates ascending modulatory pathways resulting in release of inhibitory neurotransmitters Inhibits peripheral inflammatory response and hyperalgesia Affects mood and anxiety – alleviates the affective component of perceived pain
Dosing/ Administration	Limited by analgesic ceiling beyond which there is no additional analgesia Opioid-sparing Max dose of 4 g/24 h	Limited by analgesic ceiling beyond which there is no additional analgesia Opioid-sparing Significant inter-individual variation in efficacy	No analgesic ceiling (except for codeine) Can be administered intrathecally (e.g. spinal block) or by continuous infusion Consider breakthrough dose and/or co-administration with anti-emetics, laxatives

See Landmark Anesthesiology Trials table for more information on study by HJ Shin et al. 2019. which highlights differences in postoperative analgesic effect of intraoperative sedation with dexmedetomidine (DEX) vs. propofol.

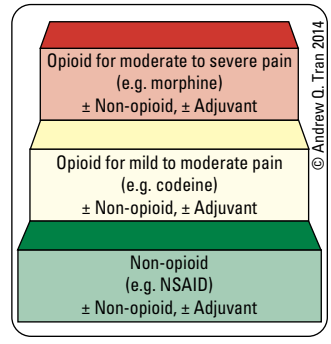

Figure 17. WHO analgesia ladder

Cautionary Use of NSAIDs in Patients with:
- asthma
- coagulopathy
- GI ulcers
- renal insufficiency
- pregnancy, 3rd trimester

Table 15. Commonly Used Analgesics

	Acetaminophen	NSAIDs	Opioids
Side Effects/ Toxicity	Considered relatively safe Liver toxicity in elevated doses	Gastric ulceration/bleeding Decreased renal perfusion Photosensitivity Premature closure of the ductus arteriosus in pregnancy	Respiratory depression Constipation and abdominal pain Urinary retention Sedation N/V Pruritus Confusion (particularly in the elderly) Dependence

Table 16. Opioids

Agent	Relative Dose to 10 mg Morphine IV	Moderate Dose	Onset	Duration	Special Considerations
Codeine	100 mg IV 200 mg PO	15-30 mg PO	Late (30-60 min)	Moderate (4-6 h)	Primarily postoperative use, not for IV use Not ideal, as analgesic effect depends on highly variable CYP2D6 metabolism
Meperidine (Demerol®)	75 mg IV	2-3 mg/kg IV	Moderate (10 min)	Moderate (2-4 h)	Anticholinergic, hallucinations, less pupillary constriction than morphine, metabolite build up may cause seizures Decreased use for pain management due to potential toxicity compared to other opioids. Typically reserved to treat postoperative shivering. Absolute contraindication in patients taking MAO-inhibitors
Morphine	10 mg IV 30 mg PO	0.2-0.3 mg/kg IV 0.4-0.6 mg/kg PO	Moderate (5-10 min)	Moderate (4-5 h)	Histamine release leading to decrease in BP
Morphine Extended Release (e.g M-Eslon®, MS Contin®)	20 mg PO	5-20 mg PO	Late	Long	Do not split, crush, or chew tablet
Oxycodone Controlled Release (Oxyneo®)	20 mg PO	10-20 mg PO (no IV)	Late (30-45 min)	Long (8-12 h)	Do not split, crush, or chew tablet (but can be difficult to swallow)
Oxycodone Regular Tablet (Oxy IR®)	20 mg PO (no IV)	5-15 mg PO	Moderate (15 min)	Moderate (3-6 h)	Percocet® = oxycodone 5 mg + acetaminophen 325 mg
Hydromorphone (Dilaudid®)	1.5-2.0 mg IV 6-8 mg PO	40-60 µg/kg IV 2-4 mg PO	Moderate (15 min)	Moderate (4-5 h)	Less pruritus, N/V, and sedation compared to morphine
Hydromorphone Extended Release (e.g. Hydromorph Contin)	4.0-6.0 mg PO	3-12 mg PO	Late (30-45 min)	Long	Do not split, crush or chew tablet
Fentanyl	100 µg IV	2-3 µg/kg IV	Rapid (<5 min)	Short (0.5-1 h)	Transient muscle rigidity in very high doses
Remifentanil	100 µg IV	0.5-1.5 µg/kg IV	Rapid (1-3 min)	Ultra short (<10 min)	Only use during induction and maintenance of anesthesia
Methadone (opioid agonist)	Morphine to methadone conversion is variable based on patient's morphine dose. Ranges from 1/4 to 1/20	15-40 mg/d in divided doses	Rapid (8 min)	15-90 (24 h average)	Can only be prescribed by federally/provincially licensed physicians and nurse practitioners Acts through both NMDA and mu-opioid receptors Challenging due to variable equianalgesic dose and half-life After titration, accumulates in tissue for once/twice daily dosing Metabolized by CYP3A4 Caution with high doses, may cause QT prolongation, baseline ECG required
Buprenorphine (opioid agonist antagonist)	Varies depending on route of administration (pill/film, transdermal)	Film: 2 mg up to max of 24 mg	Moderate (30 min)	6-8 h	For moderate to severe chronic pain and opioid addiction Ceiling effect for respiratory depression but not analgesia High affinity to mu-opioid receptors, very resistant to reversal with opioid antagonists

In general, parenteral route is 2-3x more potent than oral

Opioid Conversion

	Parenteral (IV)	Equivalent Oral Dose
Morphine	10 mg	30 mg
Hydromorphone	2 mg	4 mg
Codeine	120 mg	200 mg
Oxycodone	N/A	20 mg
Fentanyl IV	100 µg	N/A

Patient Controlled Analgesia

- patient controlled analgesia (PCA) involves the use of computerized pumps that can deliver a constant infusion and bolus breakthrough doses of parenterally-administered opioid analgesics
- limited by lockout intervals
- most commonly used agents: morphine and hydromorphone
- see Table 17, A27 for suggested infusion rate, PCA dose, and lockout intervals

PCA Parameters

- loading dose
- bolus dose
- lockout interval
- continuous infusion (optional)
- maximum 4h dose (limit)

Advantages of PCA

- improved patient satisfaction
- fewer side effects
- accommodates patient variability
- accommodates changes in opioid requirements

Table 17. Opioid PCA Doses

Agent	PCA Dose	PCA Lockout Interval	PCA 4 h Maximum
Morphine	1-2 mg	5 min	30 mg
Hydromorphone	0.2-0.4 mg	5 min	10 mg
Fentanyl	25-50 µg	5 min	400 µg

Opioid Antagonists (naloxone, naltrexone)
- indication: opioid overdose (manifests primarily at CNS, e.g. respiratory depression)
- mechanism of action: competitively inhibit opioid receptors, predominantly µ-opioid receptors
  - naloxone is short-acting (t1/2 = 1 h); effects of narcotic may return when naloxone wears off; therefore, the patient must be observed closely following its administration
  - naltrexone is longer acting (t1/2 = 10 h); less likely to see return of opioid effects
- side effects: relative overdose of naloxone may cause nausea, agitation, sweating, tachycardia, HTN, re-emergence of pain, pulmonary edema, seizures (essentially opioid withdrawal)

Neuropathic Pain

- see Neurology, N43

Chronic Pain

- chronic pain: pain greater than 3 mo, or recurrent pain that occurs at least 3 times throughout 3 mo period
- pain of duration or intensity that persists beyond normal tissue healing and adversely affects functioning
- in the perioperative period, consider continuing regular long-acting analgesics and augmenting with regional techniques, adjuvants, additional opioid analgesia, and non-pharmacological techniques (e.g. mindfulness, physiotherapy, acupuncture)

Central Sensitization
- central sensitization: hyperalgesia (i.e. increased sensitivity to pain) as a result of CNS mechanisms
- may have nociceptive and neuropathic components; dysregulation of analgesic pathways implicated
- plays a role in fibromyalgia

Chronic Post-Surgical Pain
- chronic post-surgical pain (CPSP): pain that develops after surgery and persists for at least 2 mo
- primary predictor of CPSP is history of chronic pain; other risk factors include female gender, surgical procedure/approach, poor social supports, catastrophizing behaviour

Obstetrical Anesthesia

Anesthesia Considerations in Pregnancy
- **Airway**
  - possible difficult airway as tissues becomes edematous and friable, especially in labour
- **Respiratory System**
  - decreased FRC and increased O_2 consumption cause more rapid desaturation during apnea
- **Cardiovascular System**
  - increased blood volume > increased RBC mass results in mild anemia
  - decreased SVR proportionately greater than increased CO results in decreased BP
  - prone to decreased BP due to aortocaval compression (supine hypotensive syndrome) – a pregnant patient is positioned in left uterine displacement (approximately 15° - angle) using a wedge under her right flank when supine
- **Central Nervous System**
  - decreased MAC due to hormonal effects
  - increased block height due to engorged epidural veins
- **Gastrointestinal System**
  - delayed gastric emptying
  - increased volume and acidity of gastric fluid
  - decreased LES tone
  - increased abdominal pressure
  - combined, these lead to an increased risk of aspiration; therefore, for surgery, a pregnant patient is given sodium citrate 30 cc PO immediately before surgery to neutralize gastric acidity

Options for Analgesia during Labour
- psychoprophylaxis – Lamaze method
  - patterns of breathing and focused attention on fixed object

Patient Controlled Opioid Analgesia vs. Non-Patient Controlled Opioid Analgesia for Postoperative Pain
Cochrane DB Syst Rev 2015:CD003348
Purpose: To evaluate the efficacy of patient controlled analgesia (PCA) vs. non-patient controlled opioid analgesia of as-needed opioid analgesia for postoperative pain relief.
Methods: Meta-analyses of RCTs comparing PCA vs. conventional administration of opioid analgesia. Assessment employed a visual analog scale (VAS) for pain intensity along with overall analgesic consumption, patient satisfaction, length of stay, and adverse side effects.
Results: 49 studies with a total of 1725 patients receiving PCA and 1687 patients assigned to a control group. PCA had a lower VAS pain intensity score vs. non-patient controlled analgesia over most time intervals in the first 48 h. PCA was associated with higher patient satisfaction and consumed higher amounts of opioids than controls. PCA was also associated with higher incidence of pruritus but not other adverse events.
Conclusions: Moderate to low quality evidence that PCA is an efficacious alternative to non-patient controlled systemic analgesia for postoperative pain control.

Nociceptive Pathways in Labour and Delivery
Labour
- Cervical dilation and effacement stimulates visceral nerve fibres entering the spinal cord at T10-L1

Delivery
- Distention of lower vagina and perineum causes somatic nociceptive impulses via the pudendal nerve entering the spinal cord at S2-S4

Epidural vs. Non-Epidural or No Analgesia for Pain Management in Labour
Cochrane DB Syst Rev 2018:CD000331
Purpose: To assess effectiveness and safety of all types of epidural analgesia when compared with non-epidural or no pain relief during labour.
Methods: Systematic review of RCTs comparing epidural with any form of pain relief not involving regional blockade, or no pain relief in labour.
Results: 52 studies involving over 11000 women were included; 34 studies compared epidural analgesia with opioids. Epidural analgesia was associated with lower pain intensity, higher satisfaction, and decreased need for additional pain relief vs. opioids. While it was also associated with increased risk of assisted vaginal birth (RR 1.44, 95% CI 1.29-1.60), post-hoc analysis of studies conducted after 2005 eliminates this risk (RR 1.19, 95% CI 0.97-1.46). Women with epidural analgesia experienced more hypotension, motor blockage, fever, and urinary retention with less risk of respiratory depression and nausea/vomiting. There was no difference in neonatal outcomes, admission to NICU, caesarean section rates, or maternal long-term backache.
Conclusions: Epidural analgesia may be more effective in reducing pain during labour and increasing maternal satisfaction than non-epidural methods and, when considering modern approaches, is not associated with increased instrumentation. Epidural analgesia had no impact on the risk of caesarean section or long-term backache, and did not appear to have an immediate effect on neonatal status as determined by Apgar scores or in admissions to NICU.

- systemic medication
  - easy to administer, but risk of maternal or neonatal respiratory depression
  - opioids most commonly used if delivery is not expected within 4 h; fentanyl can be considered
- inhalational analgesia
  - easy to administer, makes uterine contractions more tolerable, but does not relieve pain completely
  - 50% nitrous oxide is insufficient alone but good safety profile for mother and child
- neuraxial anesthesia
  - provides excellent analgesia with minimal depressant effects
  - hypotension is the most common complication
  - maternal BP monitored q2-5 min for 15-20 min after initiation and regularly thereafter
  - epidural usually given as it preferentially blocks sensation, leaving motor function intact

Options for Caesarean Section
- neuraxial: spinal or epidural
- general: used if contraindications or time precludes regional blockade (see *Regional Anesthesia, Epidural and Spinal Anesthesia*, A21)

Techniques for Preventing Hypotension During Spinal Anaesthesia for Caesarean Section
Cochrane DB Syst Rev 2017;8:CD002251
Purpose: To assess the effects of prophylactic interventions for maternal hypotension following spinal anaesthesia for caesarean section.
Methods: Searched Cochrane Pregnancy and Childbirth's Trials Register and reference lists. Included RCTs comparing interventions to prevent hypotension with placebo or alternative treatment.
Results: 126 studies were included involving 9565 participants. Identified 3 intervention groups which were IV fluids (colloid vs. crystalloid vs. no fluid), pharmacological interventions (ephedrine vs. phenylephrine, or ondansetron vs. control), and physical interventions (lower limb compression, or lying vs. walking). All groups showed better control of hypotension with no differences between colloid vs. crystalloid, ephedrine vs. phenylephrine, or lying vs. walking. All evidence was very-low quality to low-quality.
Conclusions: While interventions such as crystalloids, colloids, ephedrine, phenylephrine, ondansetron, or lower leg compression can reduce the incidence of hypotension, none have been shown to be superior to the other.

Paediatric Anesthesia

Respiratory System
- in comparison to adults, anatomical differences in infants include:
  - large head, short trachea/neck, large tongue, larynx positioned more superior and anterior, adenoids, and tonsils
  - narrow nasal passages (obligate nasal breathers until 5 mo)
  - narrowest part of airway at the level of the cricoid vs. glottis in adults
  - epiglottis is longer, U-shaped and angled at 45°; carina is wider and is at the level of T2 (T4 in adults)
- physiologic differences include:
  - faster respiratory rate, immature respiratory centres that are depressed by hypoxia/hypercapnia (airway closure occurs in the neonate at the end of expiration)
  - less O_2 reserve during apnea – decreased total lung volume, vital and FRC together with higher metabolic needs
  - to increase alveolar minute ventilation in neonates, increase respiratory rate, not tidal volume
  - neonate: 30-40 breaths/min
  - age 1-13: (24 – [age/2]) breaths/min
  - greater V/Q mismatch – lower lung compliance due to immature alveoli (mature at 8 yr)
  - greater work of breathing – greater chest wall compliance, weaker intercostals/diaphragm, and higher resistance to airflow

Cardiovascular System
- blood volume at birth is approximately 80 mL/kg; transfusion should be started if >10% of blood volume is lost
- children have a high HR and low BP
- CO is dependent on HR, not SV because of low heart wall compliance; therefore, bradycardia severely compromises CO

Temperature Regulation
- vulnerable to hypothermia
- minimize heat loss by use of warming blankets, covering the infant's head, humidification of inspired gases, and warming of infused solutions

Central Nervous System
- MAC of halothane is increased compared to the adult (0.75% adult, 1.2% infant, 0.87% neonate)
- NMJ is immature for the first 4 wk of life, and thus, there is an increased sensitivity to non-depolarizing relaxants
- parasympathetics mature at birth, sympathetics mature at 4-6 mo; thus, there is an autonomic imbalance
- infant brain is 12% of body weight and receives 34% of CO (adult: 2% body weight and 14% CO)

Glucose Maintenance
- infants <1 yr can become seriously hypoglycemic during preoperative fasting and postoperatively if feeding is not recommenced as soon as possible
- after 1 yr, children are able to maintain normal glucose homeostasis in excess of 8 h

Pharmacology
- higher dose requirements because of higher TBW (75% vs. 60% in adults) and greater volume of distribution
- barbiturates/opioids more potent due to greater permeability of BBB

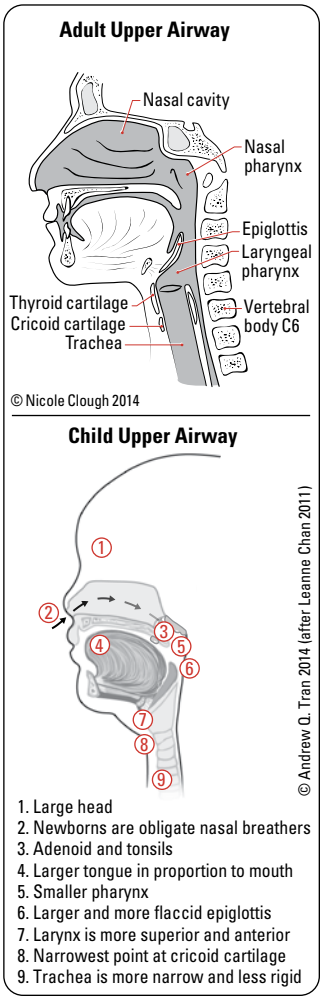

Figure 18. Comparison of paediatric vs. adult airway

- muscle relaxants
  - non-depolarizing
    - immature NMJ, variable response
  - depolarizing
    - must pre-treat with atropine or may experience profound bradycardia and/or sinus node arrest due to PNS > SNS (also dries oral secretions)
    - more susceptible to arrhythmias, hyperkalemia, rhabdomyolysis, myoglobinemia, masseter spasm, and malignant hyperthermia

ETT Sizing in Paediatrics
Diameter (mm) of tracheal tube in children after 1 year = (age/4) + 4
Length (cm) of tracheal tube = (age/2) + 12

See Landmark Anesthesiology Trials table for more information on a study by Sun et al., 2016 , which details the association between a single general anesthesia exposure prior age 36 months and neurocognitive outcomes in later childhood.

Uncommon Complications

Malignant Hyperthermia

- hypermetabolic disorder of skeletal muscle
- due to an uncontrolled increase in intracellular Ca^{2+} (because of an anomaly of the ryanodine receptor that regulates Ca^{2+} channel in the sarcoplasmic reticulum of skeletal muscle)
- autosomal dominant inheritance
- incidence of 1-5 in 100000, may be associated with skeletal muscle abnormalities such as dystrophy or myopathy
- anesthetic drugs triggering MH include:
  - all inhalational agents except nitrous oxide
  - depolarizing muscle relaxants: SCh

Signs of Malignant Hyperthermia
- unexplained rise in $ETCO_2$
- increase in minute ventilation
- tachycardia
- rigidity
- hyperthermia (late sign)

Clinical Picture
- onset: immediate or hours after contact with trigger agent
  - increased O_2 consumption
  - increased $ETCO_2$ on capnograph
  - tachycardia/dysrhythmia
  - tachypnea/cyanosis
  - diaphoresis
  - HTN
  - hyperthermia (late sign)
- muscular symptoms
  - trismus (i.e. masseter spasm) common but not specific for MH (occurs in 1% of children given SCh with halothane anesthesia)
  - tender, swollen muscles due to rhabdomyolysis
  - trunk or total body rigidity

Basic Principles of MH Management

"Some Hot Dude Better Get Iced Fluids Fast"
Stop all triggering agents, give 100% O_2
Hyperventilate
Dantrolene 2.5 mg/kg every 5 min
Bicarbonate
Glucose and insulin
IV fluids; cool patient to 38°C
Fluid output; consider furosemide
Fast Heart [tachycardia]; be prepared to treat VT

Complications
- coma
- DIC
- rhabdomyolysis
- myoglobinuric renal failure/hepatic dysfunction
- electrolyte abnormalities (e.g. hyperkalemia) and secondary arrhythmias
- ARDS
- pulmonary edema
- can be fatal if untreated

Prevention
- suspect MH in patients with a family history of problems/death with anesthetic
- avoid all trigger medications, use vapour free equipment, use regional anesthesia if possible
- central body temp and $ETCO_2$ monitoring

Malignant Hyperthermia Management
Based on Malignant Hyperthermia Association of the U.S. [MHAUS] Guidelines, 2008

1. notify surgeon, discontinue volatile agents and SCh, hyperventilate with 100% O_2 at flows of 10 L/min or more, halt the procedure as soon as possible
2. dantrolene 2.5 mg/kg IV, through large-bore IV if possible
   - repeat until there is control of signs of MH; up to 30 mg/kg as necessary
3. bicarbonate 1-2 mEq/kg if blood gas values are not available for metabolic acidosis
4. cool patients with core temperature >39°C
   - lavage open body cavities, stomach, bladder, rectum; apply ice to surface; infuse cold saline IV
   - stop cooling if temperature is <38°C to prevent drift to <36°C
5. dysrhythmias usually respond to treatment of acidosis and hyperkalemia
   - use standard drug therapy except Ca^{2+} channel blockers as they may cause hyperkalemia and cardiac arrest in presence of dantrolene

6. hyperkalemia
   - treat with hyperventilation, bicarbonate, glucose/insulin, calcium
   - bicarbonate 1-2 mEq/kg IV, calcium chloride 10 mg/kg, or calcium gluconate 10-50 mg/kg for life-threatening hyperkalemia and check glucose levels hourly
7. follow $ETCO_2$, electrolytes, blood gases, creatine kinase (CK), core temperature, urine output/colour with Foley catheter, coagulation studies
   - if CK and/or potassium rises persistently or urine output falls to <0.5 mL/kg/h, induce diuresis to >1 mL/kg/h urine to avoid myoglobinuric renal failure
8. maintain anesthesia with benzodiazepines, opioids, and propofol
9. transfer to ICU bed

Abnormal Pseudocholinesterase

- pseudocholinesterase hydrolyzes SCh and mivacurium
- individuals with abnormal pseudocholinesterase will have prolonged muscular blockade
- SCh and mivacurium are contraindicated in those with abnormal pseudocholinesterase
- if SCh or mivacurium are given accidentally, treat with mechanical ventilation until function returns to normal (do not use cholinesterase inhibitors as it will cause rebound neuromuscular blockade once cholinesterase inhibitor effect is terminated)

Landmark Anesthesiology Trials

Trial Name	Reference	Clinical Trial Details
INTRAOPERATIVE MANAGEMENT		
Study of Wound Infection and Temperature	NEJM 1996; 334:1209-1216	**Title:** Perioperative Normothermia to Reduce the Incidence of Surgical-Wound Infection and Shorten Hospitalization **Purpose:** To test if hypothermia increases susceptibility to surgical-wound infection and lengthens hospitalization. **Methods:** Colorectal surgery patients (n= 200) were randomly assigned to routine intraoperative thermal care (hypothermia group) or additional warming (normothermia group in a double-blind protocol). Wounds evaluated daily until discharge and at 2 week clinic visit. Wounds with pus and positive cultures were considered infected. **Results:** Intraoperative core temperature was found to be significantly different in both groups. Normothermia group had fewer infected wounds, earlier suture removal, and prolonged hospital stay of 2.6 days (20%). **Conclusion:** Hypothermia itself may delay healing and predispose patients to wound infections.
MYRIAD	NEJM 2019;380:1214-1225	**Title:** Volatile Anesthetics vs. Total Intravenous Anesthesia for Cardiac Surgery **Purpose:** Volatile agents have cardioprotective effects which could improve clinical outcomes in cardiac surgery patients. **Methods:** Multicenter, single-blind, controlled trial. Patients scheduled to undergo elective CABG were randomly assigned to an intraoperative anesthetic regimen that included a volatile anesthetic (desflurane, isoflurane, or sevoflurane) or to TIVA. The primary outcome was all-cause mortality at 1 yr. **Results:** A total of 5400 patients were randomized. No significant difference between the groups with respect to all-cause mortality was seen at 1 yr (2.8% in the volatile anesthetics group and 3.0% in the TIVA group; RR, 0.94; 95% CI, 0.69 to 1.29; P=0.71), or at 30 d (1.4% and 1.3%, respectively; RR, 1.11; 95% CI, 0.70 to 1.76). There were no significant differences between the groups in any of the secondary outcomes or in the incidence of prespecified adverse events, including MI. **Conclusion:** Among patients undergoing elective CABG, anesthesia with a volatile agent did not result in significantly fewer deaths at 1 yr than TIVA.
POSTOPERATIVE MANAGEMENT		
IMPACT	NEJM 2004; 350:2441-2451	**Title:** A Factorial Trial of Six Interventions for the Prevention of Postoperative Nausea and Vomiting **Purpose:** To compare the efficacy of six well-established antiemetic strategies and to determine the extent to which efficacy could be improved by combining two or three interventions. **Methods:** Patients (n=5199) were randomly assigned to receive prophylactic antiemetics independently, in combination or placebo. Primary outcome was nausea and vomiting within 24 hours after surgery. **Results:** Ondansetron, dexamethasone, and droperidol each reduced risk of postoperative nausea and vomiting by 26%. Propofol reduced risk by 19%, and nitrogen by 12%. Relative risks associated with combined interventions could be estimated by multiplying the relative risks associated with each intervention. Absolute risk reduction was a critical function of patients' baseline risk. **Conclusion:** All interventions were similarly effective and acted independently. The safest or least expensive should be used first. Moderate-risk patients may benefit from a single intervention and high-risk patients from multiple interventions.
DREAMS	BMJ 2017;357:j1455	**Trial:** Dexamethasone vs. Standard Treatment for Postoperative Nausea and **Vomiting in Gastrointestinal Surgery:** Randomised Controlled Trial (DREAMS Trial) **Purpose:** Whether preoperative dexamethasone reduces postoperative nausea and vomiting (PONV) in patients undergoing elective bowel surgery and whether it is associated with other measurable benefits during recovery from surgery. **Method:** Pragmatic two-arm parallel-group randomized trial with blinded postoperative care and outcome assessment. **Results:** Administration of 8 mg IV dexamethasone at induction was associated with lower rates of vomiting within 24 hours of surgery (NNT=13) and reduced need for antiemetics up to 72h (NNT=8) vs. standard of care. **Conclusions:** A single dose of dexamethasone at induction of anesthesia significantly reduces incidence of PONV and need for rescue antiemetics postoperatively with no increase in adverse events.
Comparison of Intraoperative Sedation With Dexmedetomidine vs. Propofol on Acute Postoperative Pain in Total Knee Arthroplasty Under Spinal Anesthesia: A Randomized Trial, Shin et al., 2019	Anesth Analg 2019;129:1512-1518	**Title:** Comparison of Intraoperative Sedation With Dexmedetomidine vs. Propofol on Acute Postoperative Pain in Total Knee Arthroplasty Under Spinal Anesthesia: A Randomized Trial **Purpose:** Compare the postoperative analgesic effect of intraoperative sedation with dexmedetomidine (DEX) vs. propofol. **Methods:** Patients (n = 48) were enrolled and randomly assigned to either DEX or propofol group. After the initial pre-determined loading dose, drug infusion rate was determined according to sedation level. Cumulative amounts of PCA fentanyl were recorded at 24-48 h postoperatively (primary outcome). The postoperative numerical rating scale for pain was assessed at 6, 12, 24, and 48 h (secondary outcome). **Results:** DEX significantly reduced postoperative fentanyl consumption at all of the studies time points. The numerical rating scale for pain was significantly lower at all time points. **Conclusion:** Intraoperative DEX sedation was associated with a small but clinically important reduction in postoperative opioid use after total knee arthroplasty.
ENGAGES	JAMA 2019;321:473-483	**Title:** Effect of EEG-Guided Anesthetic Administration on Postoperative Delirium Among Older Adults Undergoing Major Surgery: The ENGAGES RCT **Purpose:** To assess whether EEG-guided anesthetic administration decreases the incidence of postoperative delirium. **Methods:** RCT of 1232 adults >60 yr old undergoing major surgery and receiving guided anesthetic. Patients randomized 1:1 to receive EEG-guided anesthetic administration or usual care. Primary outcome was incident delirium during postoperative days 1-5. **Results:** Delirium during postoperative days 1-5 occurred in 26.0% of the guided group and in 23.0% of the usual care group (P = .22). Median end-tidal volatile anesthetic concentration was significantly lower in the guided group than the usual care group, and median cumulative time with EEG suppression was significantly less (7 vs. 13 min; difference, -6.0 [95% CI, -9.9 to -2.1]). **Conclusion:** There is no difference in postoperative delirium between EEG-guided anesthetic or usual care of older adults.
COMPLICATIONS		
Association Between a Single General Anesthesia Exposure Before Age 36 Months and Neurocognitive Outcomes in Later Childhood, Sun et al., 2016	JAMA 2016;315:2312-2320	**Title:** Association Between a Single General Anesthesia Exposure Before Age 36 Months and Neurocognitive Outcomes in Later Childhood **Purpose:** To examine if a single anesthesia exposure in otherwise healthy young children was associated with impaired neurocognitive development and abnormal behaviour in later childhood. **Methods:** Sibling-matched cohort study. Included sibling pairs within 36 mo in age and currently 8-15 y/o with a single exposure to GA during inguinal hernia surgery in the exposed sibling and no anesthesia exposure in the unexposed sibling, before age 36 mo. The primary outcome was global cognitive function (IQ). Secondary outcomes included domain-specific neurocognitive functions and behaviour. **Results:** Sibling pairs (n=105) were included, with age of testing around 10 y/o. Mean IQ scores between exposed siblings and unexposed siblings were not significantly different. No significant differences in mean scores were found between sibling pairs in memory/learning, motor/processing speed, visuospatial function, attention, executive function, language, or behaviour. **Conclusions:** Among healthy children with a single anesthesia exposure before age 36 mo, compared with healthy siblings with no anesthesia exposure, there were no statistically significant differences in neurocognitive outcomes.

Acronyms

A	atrium
AAA	abdominal aortic aneurysm
ABG	arterial blood gas
ACEI	angiotensin converting enzyme inhibitor
ACLS	advanced cardiovascular life support
ACS	acute coronary syndrome
ACT	activated clotting time
AFib	atrial fibrillation
AKI	acute kidney injury
AR	aortic regurgitation
ARB	angiotensin receptor blocker
ARDS	acute respiratory distress syndrome
AS	aortic stenosis
ASA	acetylsalicylic acid (Aspirin®)
ASD	atrial septal defect
AV	atrioventricular
AVNRT	atrioventricular nodal re-entrant tachycardia
AVRT	atrioventricular re-entrant tachycardia
BIMA	bilateral internal mammary artery
BITA	bilateral internal thoracic artery
BBB	bundle branch block
BNP	brain natriuretic peptide
BPM	beats per minute
BiVAD	biventricular assist device
CABG	coronary artery bypass graft
CAD	coronary artery disease
CCB	calcium channel blocker
CHD	coronary heart disease
CM	cardiomyopathy
CMR	cardiovascular magnetic resonance imaging
CO	cardiac output
COPD	chronic obstructive pulmonary disease
CPB	cardiopulmonary bypass
CRT	cardiac resynchronization therapy
CV	cardiovascular
CVP	central venous pressure
DCM	dilated cardiomyopathy
DOAC	direct oral anticoagulant
DVT	deep vein thrombosis
ECASA	enteric coated ASA
echo	echocardiogram
ECMO	extracorporeal membrane oxygenation
EDP	end diastolic pressure
EF	ejection fraction
EPS	electrophysiology studies
GERD	gastroesophageal reflux disease
HCM	hypertrophic cardiomyopathy
HF	heart failure
HFpEF	heart failure with preserved ejection fraction
HFrEF	heart failure with reduced ejection fraction
HFSS	heart failure survival score
HOCM	hypertrophic obstructive cardiomyopathy
HTN	hypertension
ICD	implantable cardioverter-defibrillator
IE	infective endocarditis
IMA	internal mammary artery
ITA	internal thoracic artery
JVP	jugular venous pressure
LA	left atrium
LAD	left anterior descending artery
LAE	left atrial enlargement
LBB	left bundle branch
LBBB	left bundle branch block
LCA	left coronary artery
LCC	left coronary cusp
LCx	left circumflex artery
LIMA	left internal mammary artery
LITA	left internal thoracic artery
LLSB	left lower sternal border
LMWH	low molecular weight heparin
LV	left ventricle
LVAD	left ventricular assist device
LVEF	left ventricular ejection fraction
LVH	left ventricular hypertrophy
LVOT	left ventricular outflow tract
MAP	mean arterial blood pressure
MAT	multifocal atrial tachycardia
MI	myocardial infarction
MPI	myocardial perfusion imaging
MR	mitral regurgitation
MS	mitral stenosis
MVD	multivessel coronary artery disease
MVP	mitral valve prolapse
NSR	normal sinus rhythm
NSTEMI	non-ST elevation myocardial infarction
NYHA	New York Heart Association
OMT	optimal medical therapy
OPCAB	off-pump coronary artery bypass
OS	opening snap
PAC	premature atrial contraction
PCI	percutaneous coronary intervention
PCWP	pulmonary capillary wedge pressure
PDA	posterior descending artery
PFO	patent foramen ovale
PIV	posterior interventricular artery
PMI	point of maximal impulse
PND	paroxysmal nocturnal dyspnea
PR	pulmonary regurgitation
PS	pulmonary stenosis
PT	pulmonary trunk
PTCA	percutaneous transluminal coronary angioplasty
PUD	peptic ulcer disease
PVC	premature ventricular contraction
PVD	peripheral vascular disease
PVR	pulmonary vascular resistance
RA	right atrium
RAAS	renin-angiotensin-aldosterone system
RAE	right atrial enlargement
RBB	right bundle branch
RBBB	right bundle branch block
RCA	right coronary artery
RCC	right coronary cusp
RCM	restrictive cardiomyopathy
RIMA	right internal mammary artery
RITA	right internal thoracic artery
RLSB	right lower sternal border
RV	right ventricle
RVAD	right ventricular assist device
RVH	right ventricular hypertrophy
RVOT	right ventricular outflow trunk
SA	sinoatrial
SAM	systolic anterior motion
SAVR	surgical aortic-valve replacement
SCD	sudden cardiac death
SEM	systolic ejection murmur
SGLT2	sodium-glucose cotransporter 2
SNS	sympathetic nervous system
SOBOE	shortness of breath on exertion
STEMI	ST elevation myocardial infarction
SV	stroke volume
SVC	superior vena cava
SVR	systemic vascular resistance
SVT	supraventricular tachycardia
SYNTAX	synergy between percutaneous coronary intervention with taxus and cardiac surgery
TAVI	transcatheter aortic-valve implantation
TAVR	transcatheter aortic-valve replacement
TEE	transesophageal echocardiography
TIA	transient ischemic attack
TR	tricuspid regurgitation
TS	tricuspid stenosis
TTE	transthoracic echocardiography
UA	unstable angina
V	ventricle
VAD	ventricular assist device
VFib	ventricular fibrillation
VHD	valvular heart disease
VSD	ventricular septal defect
VT	ventricular tachycardia
VTE	venous thromboembolism
WPW	Wolff-Parkinson-White

Basic Anatomy Review

Coronary Circulation

- conventional arterial supply to the heart arises from the right and left coronary arteries, which originate from the root of the aorta
  - RCA:
    - conus artery
    - acute marginal branches
    - AV nodal artery
    - PDA also known as PIV
  - LCA:
    - LAD
      - septal branches
      - diagonal branches
    - LCx
      - obtuse marginal branches
- dominance of circulation
  - determined by whether the RCA or the LCx supplies the PDA
    - right-dominant circulation: PDA and at least one posterolateral branch arise from RCA (80%)
    - left-dominant circulation: PDA and at least one posterolateral branch arise from LCx (15%)
    - balanced circulation: dual supply of posteroinferior LV from RCA and LCx (5%)
- the sinoatrial (SA) node is supplied by the SA nodal artery, which may arise from the RCA (60%) or LCA (40%)
- the AV node is supplied by the AV nodal artery, which may arise from the RCA (90%) or LCx (10%)
- most venous blood from the heart drains into the RA through the coronary sinus, although a small amount drains through Thebesian veins into all four chambers, contributing to the physiologic R-L shunt

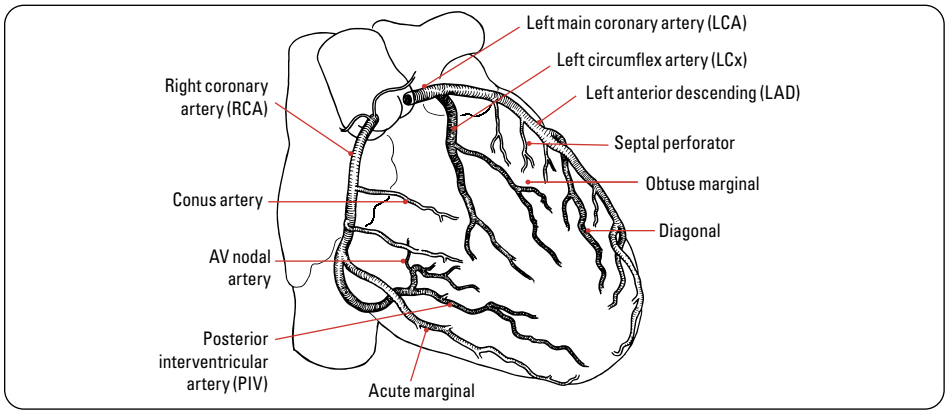

Figure 1. Anatomy of the coronary arteries (right anterior oblique projection)

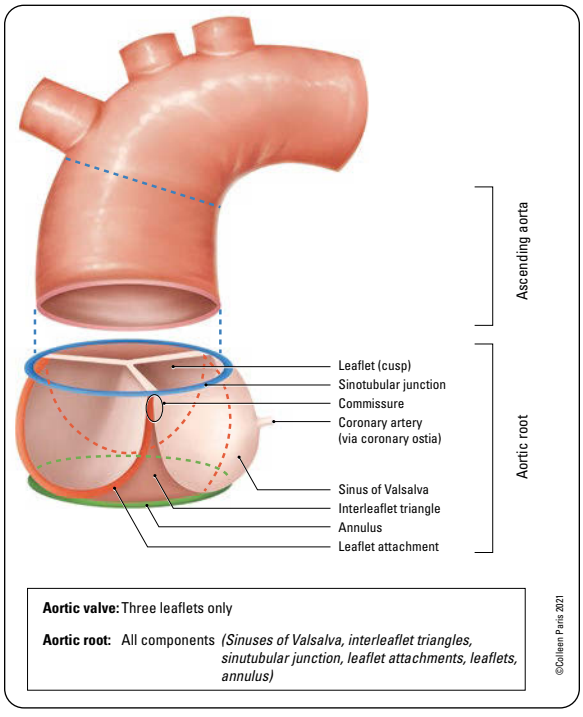

Figure 2a. Aortic root

Modified from Sievers H-H, Hemmer W, The everyday used nomenclature of the aortic root components: the tower of Babel?, European Journal of Cardio-Thoracic Surgery, 2012, 41, 3, 478-82, by permission of Oxford University Press

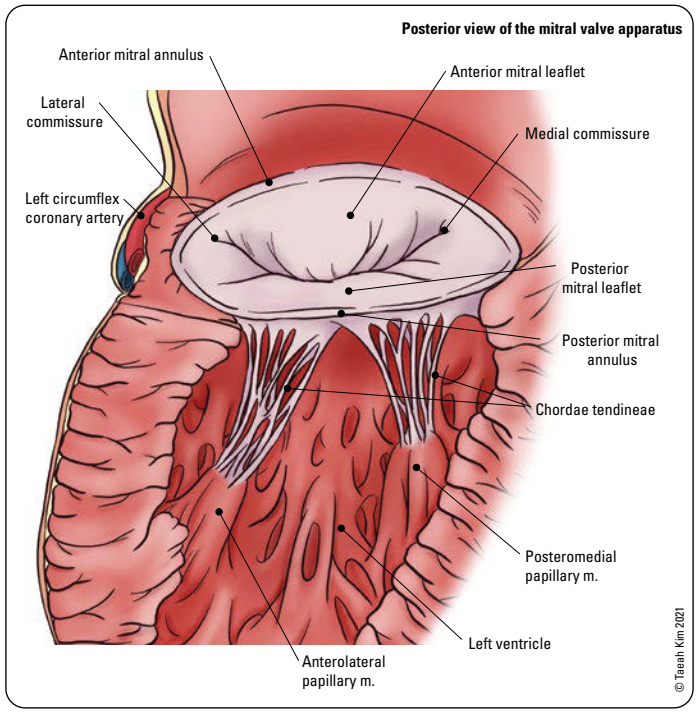

Figure 2b. Mitral valve apparatus

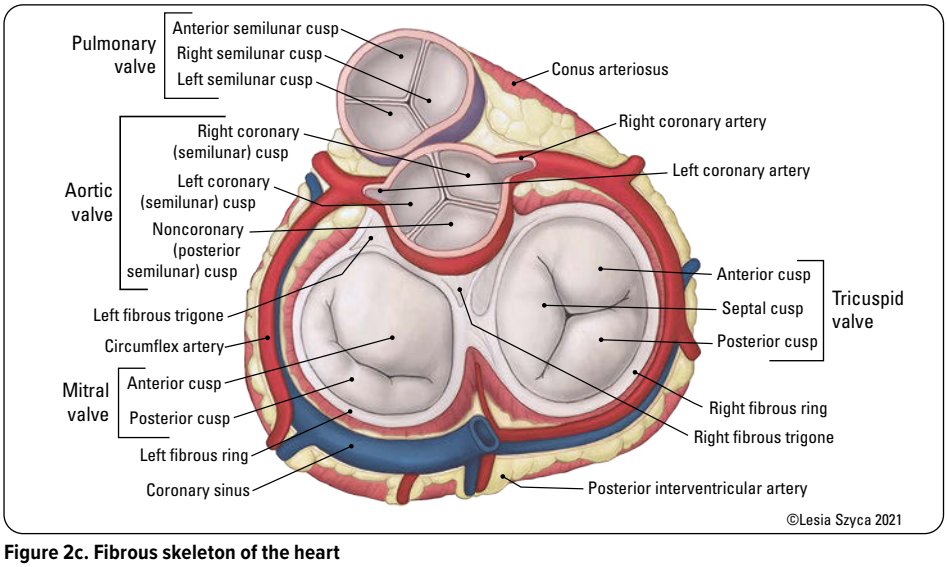

Figure 2c. Fibrous skeleton of the heart

Cardiac Anatomy

- **layers of the heart**
  - endocardium, myocardium, epicardium, visceral pericardium, pericardial cavity, parietal pericardium
- **valves**
  - semilunar valves: 3 leaflets separating outflow tracts from the great arteries
    - aortic valve: noncoronary cusp, LCC, RCC; RCC and LCC have coronary ostia; separates LVOT and ascending aorta
    - pulmonary valve: anterior cusp, left cusp, right cusp; separates RVOT and PT
  - atrioventricular valves: subvalvular apparatus present in the form of chordae tendineae and papillary muscles
    - mitral valve: anterior (2/3 valve area, 1/3 valve circumference) and posterior leaflets (1/3 valve area, 2/3 valve circumference); separates LA and LV
    - tricuspid valve: anterior, posterior, and septal leaflets; separates RA and RV
- **conduction system**
  - SA node
    - located at the junction of SVC and roof of RA
    - governs pace-making; heartbeat originates here
    - anterior-, middle-, and posterior-internal nodal tracts carry impulses in the RA with the atrial impulses converging at the AV node and along Bachmann's bundle in the LA
  - AV node
    - located within the triangle of Koch which is demarcated by: superior margin of the coronary sinus, tendon of Todaro, and hinge of the septal leaflet of the tricuspid valve
    - AV node is the conduit for electrical impulses from atria to ventricles, unless an accessory AV pathway (e.g. WPW syndrome) is present
  - bundle of His
    - AV node connects to the bundle of His, which divides into LBB and RBB
      - LBB further splits into anterior and posterior fascicles
      - RBB and fascicles of LBB give off Purkinje fibres which conduct impulses into the ventricular myocardium

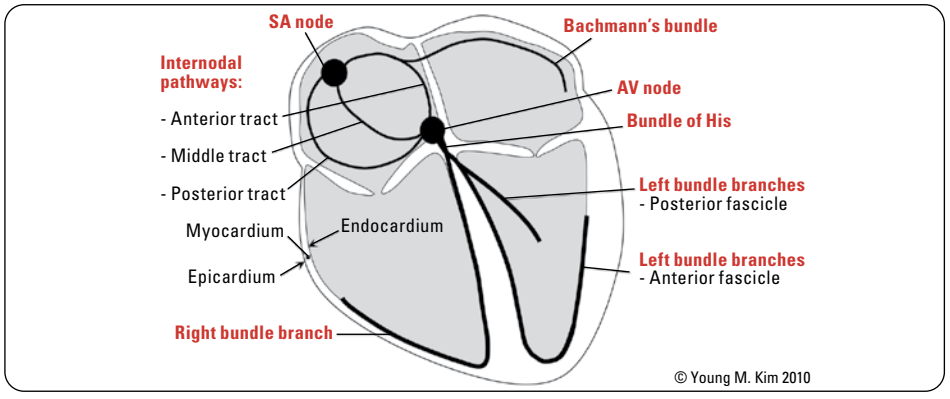

Figure 3. Conduction system of the heart

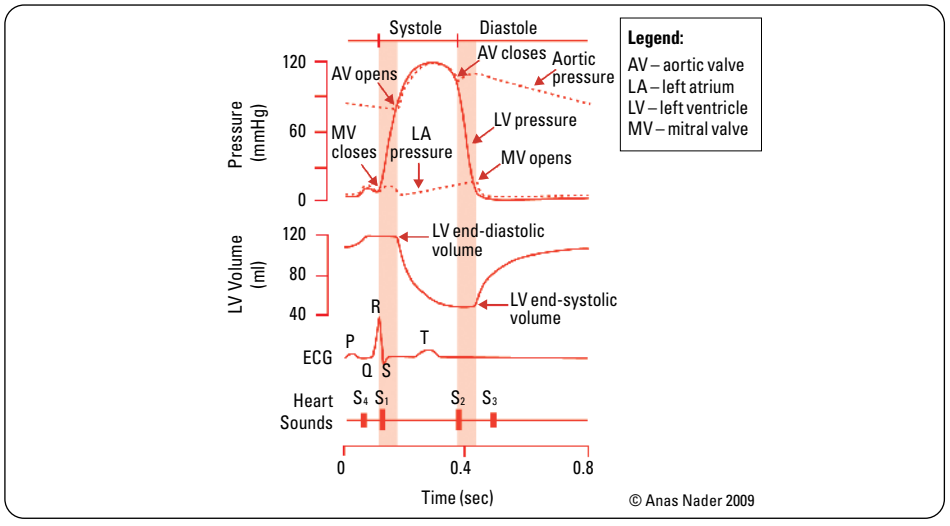

Figure 4. Cardiac cycle
Grey shaded bars indicate isovolumic contraction (left) and isovolumic relaxation (right)

- **cardiovascular innervation**
  - sympathetic nerves
    - innervate the SA node, AV node, ventricular myocardium, and vasculature
    - increased activity of the SA node via the β1 receptor leads to increased HR via more frequent impulse from pacemaking cells (increased chronotropy - increased HR)
    - cardiac muscle (β1) fibres increase contractility (inotropy - leads to increased SV)
    - stimulation of β1- and β2-receptors in the skeletal and coronary circulation causes vasodilatation
  - parasympathetic nerves
    - innervate the SA node, AV node, and atrial myocardium but few vascular beds
    - at rest, vagal tone dominates the tonic sympathetic stimulation of the SA node and AV node, resulting in slow AV conduction, and consequently a prolonged PR interval or second or third degree AV block (i.e. reduced dromotropy (if only affecting AV node conduction))
    - parasympathetics have very little impact on total peripheral vascular resistance

Differential Diagnoses of Common Presentations

Note: **bold** text indicates most common, underlined text indicates life threatening condition

Chest Pain

- often described as pressure, heaviness, discomfort
  - note: ischemic pain is usually dull and diffuse while chest wall and pericardial pain are often sharp, localized, and worse on inspiration (i.e. pleuritic)
- cardiac
  - MI, stable myocardial ischemia (angina), myocarditis, and pericarditis/Dressler's syndrome, tamponade, aortic valve disease
- pulmonary
  - PE, pneumothorax/hemothorax, <u>tension pneumothorax</u>, pneumonia, empyema, pulmonary neoplasm, bronchiectasis, pleuritis, asthma, COPD, pleuritis, sarcoidosis, pulmonary hypertension, and TB
- gastrointestinal
  - esophageal: **GERD**, <u>esophageal rupture</u>, <u>spasm</u>, esophagitis, ulceration, achalasia, neoplasm, and Mallory-Weiss syndrome
  - other structures: PUD, gastritis, pancreatitis, and biliary colic
- mediastinal
  - lymphoma, thymoma
- vascular
  - dissecting aortic aneurysm, aortic rupture
- drug use: methamphetamine or cocaine intoxication
- surface structures
- costochondritis
- rib fracture
- skin (bruising, herpes zoster)
- breast
- anxiety/psychosomatic
- referred pain
- trauma

Loss of Consciousness

1. causes of true syncope (impaired cerebral perfusion)
- reflex mediated/reflex dysfunction
  - **vasovagal** (most common)
  - situational (micturition, cough, carotid hypersensitivity)
  - autonomic dysfunction (often associated with neurologic diseases)
  - postural hypotension (e.g. central nervous system disorders, antihypertensive drugs)
- inadequate circulating volume (bleeding, hypovolemia with orthostasis)
- obstruction to blood flow
  - tamponade
  - pulmonary embolism
  - severe pulmonary HTN
  - severe obstructive valve disease (MS and AS)
  - left ventricular outflow obstruction (HCM)
  - cerebrovascular events (e.g. cerebrovascular accident)
- arrhythmia leading to sudden loss of CO
  - tachyarrhythmia, VT, VFib
  - severe bradycardia (sinus arrest, AV block/AV dyssynchrony)

2. loss of consciousness NOT due to impaired cerebral perfusion
- seizure
- hypoglycemia
- severe hypoxia or hypercarbia
- psychiatric

Local Edema

- venous or lymphatic obstruction
  - thrombophlebitis/deep vein thrombosis, venous insufficiency, chronic lymphangitis, lymphatic tumour infiltration, filariasis
- inflammation/infection
- trauma

Generalized Edema

- increased hydrostatic pressure/fluid overload
  - HF, pregnancy, drugs (e.g. CCBs), iatrogenic (e.g. IV fluids)
- decreased oncotic pressure/hypoalbuminemia
  - **liver cirrhosis**, nephrotic syndrome, malnutrition
- increased interstitial oncotic pressure
  - myxedema
- increased capillary permeability
  - severe sepsis
- hormonal
  - hypothyroidism, exogenous steroids, pregnancy, estrogens

Palpitations

- subjective sense of abnormal/irregular heartbeats
- palpitations that may have continuous rapid heart action:
  - conditions causing sinus tachycardia: endocrine (thyrotoxicosis, pheochromocytoma, and hypoglycemia), systemic (anemia, fever), drugs (stimulants and anticholinergics), and psychiatric (panic attacks, generalized anxiety disorder, and somatization)
  - conditions causing pathologic tachycardia: SVT (atrial tachycardia, AFib, and atrial flutter) and re-entrant SVT, VT
- palpitations that may have irregular/intermittent sensations (e.g. PACs, PVCs)

Dyspnea

- exercise
  - elevated pulmonary venous pressure
  - poor Hb-oxygen dissociation curve kinetics
- cardiovascular
  - due to elevated pulmonary venous pressure: acute MI, CHF/LV failure, aortic/mitral stenosis, AS/MS, AR/MR, arrhythmia, cardiac tamponade, constrictive pericarditis, and left-sided obstructive lesions (e.g. left atrial myxoma)
- respiratory
  - airway disease
    - asthma, COPD exacerbation, and upper airway obstruction (anaphylaxis, foreign body, and mucus plugging)
  - parenchymal lung disease
    - pneumonia, interstitial lung disease
  - pulmonary vascular disease
    - PE, pulmonary HTN, pulmonary vasculitis
  - pleural disease
    - pneumothorax, pleural effusion
- neuromuscular and chest wall disorders
  - cervical spine injury
    - polymyositis, myasthenia gravis, Guillain-Barré syndrome, and kyphoscoliosis
- anxiety/psychosomatic
- hematological/metabolic
  - anemia, acidosis, hypercapnia

Cardiac Diagnostic Tests

Electrocardiography Basics

Description

- a graphical representation (amplitude of electrical vector projection over time) of the heart's electrical activity
- on the ECG graph
  - the horizontal axis represents time (at usual paper speed of 25 mm/s)
    - 1 mm (1 small square) = 40 msec
    - 5 mm (1 large square) = 200 msec
  - the vertical axis represents voltage (at usual standard gain setting of 10 mm/mV)
    - 1 mm (1 small square) = 0.1 mV
    - 10 mm (2 large squares) = 1 mV
  - standard leads of 12-lead ECG
    - limb (bipolar) leads: I, II, III, aVL, aVR, aVF
    - precordial (unipolar) leads: V1-V6 (V1-V2 (septal), V3-V4 (anterior), and V5-V6 (lateral))
  - additional leads
    - right-sided leads: V3R-V6R (useful in RV infarction and dextrocardia)
    - posterior leads: V7-V9 (useful in posterolateral infarction)
  - leads that indicate specific regions of the heart:
    - lateral wall = I, aVL, V5, V6
    - inferior wall = II, III, aVF
    - anterior wall= V1-V4

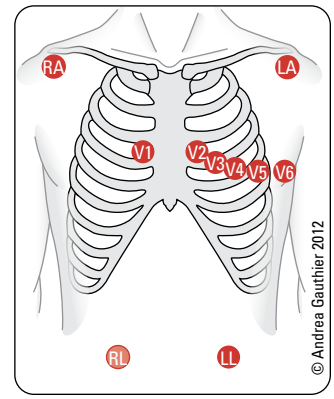

Figure 5. ECG lead placement

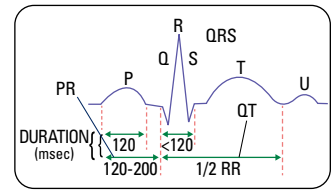

Figure 6. ECG waveforms and normal values

Indications for brief (12-lead ECG) or prolonged (24 hrs or more) monitoring

- myocardial injury, ischemia, or history of prior infarction
- conditions associated with palpitations or risk of serious arrhythmias (e.g. WPW, long QT, HCM, heart block, and bradycardia)
- conduction abnormalities (e.g. LBBB/RBBB)
- electrolyte abnormalities (e.g. hyperkalemia/hypokalemia)
- investigation of syncope or near syncope ("symptom/rhythm correlation")
- can be used for:
  - recording of cardiac rhythm during symptoms or antiarrhythmic drug monitoring
  - assessment of cardiac structure and function (e.g. RVH/LVH and cardiomyopathy)
  - detection of non-sustained arrhythmias that require prophylactic intervention

Approach to ECGs

Introduction

Below, we are presenting both the classical approach and the newer PQRSTU approach to provide students with different ways to view the ECG. Despite methodological differences, the rigor and final result is the same.

Classical Approach to ECGs

RATE

- normal = 50-100 bpm
- atrial rates above normal range:
  - 150-250 bpm = paroxysmal tachycardia
  - 250-350 bpm = atrial flutter
  - >350 bpm = AFib (note: atrial "rate" is not discernible)
- regular rhythm (defined by equal R-R or P-P intervals between beats)
  - rate can be calculated using either of the following two methods:
    - divide 300 by the number of large squares between 2 QRS complexes (there are 300 large squares in 1 min: 300 x 200 msec = 60 s)
    - use the square counting method by counting the number of big boxes between the R waves using the following sequence of numbers: 300 (1 box)-150 (2 boxes)-100 (3 boxes)-75 (4 boxes)-60 (5 boxes)-50 (6 boxes)
- irregular rhythm
  - rate = 6 x number of R-R intervals in 10 s (a standard ECG is 10 s)
- atrial escape rhythm in case of sinus node failure = 60-80 bpm, junctional escape rhythm = 40-60 bpm, ventricular escape rhythm = 20-40 bpm

For more examples and practice visit www.ecgmadesimple.com

Classical Approach to ECG

- Rate
- Rhythm (defined by R-R or P-P intervals between beats)
- Axis
- Conduction abnormalities
- Hypertrophy/chamber enlargement
- Ischemia/infarction
- Miscellaneous ECG changes (e.g. QT interval)

Differential Diagnosis for Left Axis Deviation

- Normal variant (physiologic, often age-related change)
- Left anterior hemiblock
- LVH
- Inferior MI
- WPW
- RV pacing
- Elevated diaphragm
- Lead misplacement
- Congenital heart disease (e.g. primum ASD, endocardial cushion defect)
- Hyperkalemia
- Emphysema

RHYTHM

- regular: R-R interval is the same across the tracing
- irregular: R-R interval varies across the tracing
- regularly irregular: repeating pattern of varying R-R intervals (e.g. atrial flutter with variable block)
- irregularly irregular: R-R intervals vary erratically (e.g. AFib, VFib)
- normal sinus rhythm (NSR)
  - P wave precedes each QRS; QRS follows each P wave
  - P wave axis is normal (positive in 2 of the following 3 leads: I, II, aVF)
  - rate between 50-100 bpm

AXIS

- mean axis indicates the direction of the mean vector
- can be determined for any waveform (P, QRS, T)
  - the standard ECG reported QRS axis usually refers to the mean axis of the frontal plane it indicates the mean direction of ventricular depolarization forces
- QRS axis in the frontal plane
  - normal axis: -30° to 90° (i.e. positive QRS in leads I and II)
  - left axis deviation (LAD): axis <-30°
  - right axis deviation (RAD): axis >90°
- QRS axis in the horizontal plane is not routinely calculated
  - transition from negative to positive is usually in lead V3

Table 1. Conduction Abnormalities

Left Bundle Branch Block (LBBB)	Right Bundle Branch Block (RBBB)
Complete LBBB • QRS duration >120 msec • Broad notched R waves in leads I, aVL, V5, and V6 • Deep broad S waves in leads V1-2 • Secondary ST-T changes (-ve in leads with broad notched R waves, +ve in V1-2) are usually present • LBBB can mask ECG signs of MI • LBBB: lead V1 negative, V6 positive and notched	**Complete RBBB** • QRS duration >120 msec • Positive QRS in lead V1 (rSR' or occasionally broad R wave) • Broad S waves in leads I, V5-6 (>40 msec) • Usually secondary T wave inversion in leads V1-2 • Frontal axis determination using only the first 60 msec • RBBB: V1 is positive (rSR'), V6 has broad S wave

Left Anterior Fascicular Block (LAFB) (Left Anterior Hemiblock)	Left Posterior Fascicular Block (LPFB) (Left Posterior Hemiblock)	Bifascicular Block
Left Axis Deviation (-30° to -90°) • Small Q and prominent R in leads I and aVL • Small R and prominent S in leads II, III, and aVF	**Right Axis Deviation (110° to 180°)** • Small R and prominent S in leads I and aVL • Small Q and prominent R in leads II, III, and aVF	**RBBB Pattern** • Small Q and prominent R • The first 60 msec (1.5 small squares) of the QRS shows the pattern of LAFB or LPFB • Bifascicular block refers to impaired conduction in two of the three fascicles, most commonly a RBBB and left anterior hemiblock; the appearance on an ECG meets the criteria for both types of blocks

Nonspecific Intraventricular Block

- QRS duration >120 msec
- absence of definitive criteria for LBBB or RBBB

Table 2. Hypertrophy/Chamber Enlargement

Left Ventricular Hypertrophy	Right Ventricular Hypertrophy

• S in V1 + R in V5 or V6 >35 mm above age 40, (>40 mm for age 31-40, >45 mm for age 21-30)
• R in aVL >11 mm
• R in I + S in III >25 mm
• Additional criteria
  • LV strain pattern (asymmetric ST depression and T wave inversion in leads I, aVL, and V4-V6)
  • Left atrial enlargement
N.B. The greater the number of criteria, the more likely the diagnosis is LVH. If only one voltage criteria present, it is called minimal voltage criteria for LVH (may be a normal variant)
	• Right axis deviation
	• R/S ratio >1 or qR in lead V1
	• RV strain pattern: ST segment depression and T wave inversion in leads V1-2

Left Atrial Enlargement	**Right Atrial Enlargement**
• Biphasic P wave with the negative terminal component of the P wave in lead V1 ≥1 mm wide and ≥1 mm deep • P wave >100 msec, could be notched in lead II ("P mitrale")	• P wave >2.5 mm in height in leads II, III, or aVF ("P pulmonale")

Differential Diagnosis for Right Axis Deviation

- Normal variant (vertical heart with an axis of 90°)
- RVH
- Left posterior hemiblock
- Pulmonary embolism
- COPD
- Lateral MI
- WPW
- Dextrocardia
- Septal defects

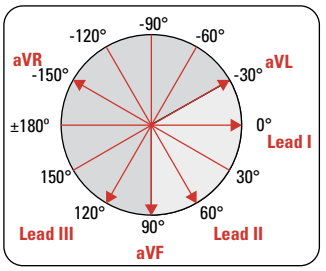

Figure 7. Axial reference system Each lead contains a (+) area displayed by the bold arrows. Impulses traveling toward the positive region of the lead result in an upward deflection in that lead. Normal QRS axis is between -30° and +90°

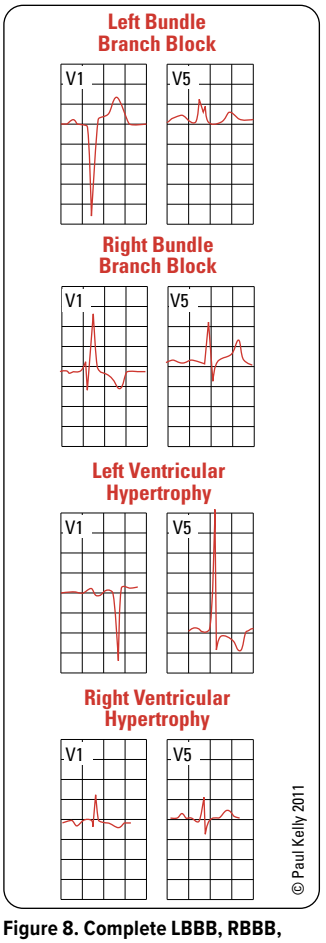

Figure 8. Complete LBBB, RBBB, LVH, and RVH (please see online examples for the full range of waveforms and the text for additional characteristics)

ISCHEMIA/INFARCTION

- look for the anatomic distribution of the following ECG abnormalities (see Table 3)
  - ischemia
    - ST segment depression
    - T wave inversion (most commonly in V1-V6)
  - injury/infarct
    - transmural (involving the epicardium)
  - ST elevation in the leads facing the injured/infarcted area
    - subendocardial
  - marked ST depression in the leads facing the affected area
  - may be accompanied by enzyme changes and other signs of MI

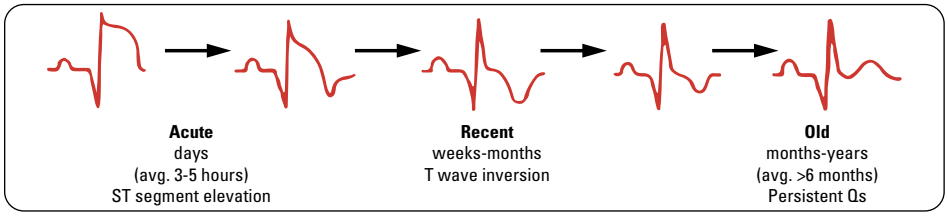

Figure 9. Typical ECG changes with infarction
Note that Q waves may gradually appear over time (not shown here)

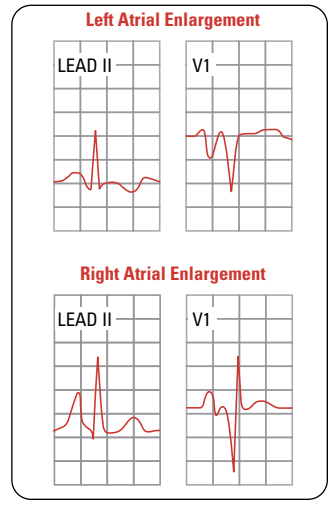

Figure 10. LAE, RAE (please see online examples and the text for characteristics)

  - ST elevation
    - new ST elevation in two contiguous leads of >0.1 mV (in all leads other than leads V2-V3)
    - for leads V2-V3: ≥0.2 mV in men ≥40 yr, ≥0.25 mV in men <40 yr, or ≥0.15 mV in women
- "typical" sequential changes of evolving MI
  1. hyperacute T waves (tall, symmetric T waves) in the leads facing the infarcted area, with or without ST elevation
  2. ST elevation (injury pattern) in the leads facing the infarcted area
     - usually in the first hours post-infarct
     - in acute posterior MI, there is ST depression in V1-V3 (reciprocal to ST elevation in the posterior leads that are not recorded in the standard 12-lead ECG) hence get a 15-lead ECG
  3. significant Q waves: >40 msec or >1/3 of the total QRS amplitude and present in at least 2 consecutive leads in the same territory (hours to days post-infarct)
     - Q waves of infarction may appear in the very early stages, with or without ST changes
     - non-Q wave infarction: there may be only ST or T changes despite clinical evidence of infarction
  4. inverted T waves (one day to weeks after infarction)
- completed infarction
  - abnormal Q waves (Q waves may be present in lead III in normal individuals due to initial septal depolarization)
  - duration >40 msec (>30 msec in aVF for inferior infarction)
  - Q wave is >1/3 of the total QRS amplitude
  - present in at least 2 consecutive leads in the same territory
  - abnormal R waves (R/S ratio >1, duration >40 msec) in V1, and occasionally in V2, are found in posterior infarction (usually in association with signs of inferior and/or lateral infarction)

Table 3. Areas of Infarction/Ischemia (right dominant anatomy)

Vessel Usually Involved	Infarct Area (LAD and LCx)	Leads (LAD and LCx)
LAD	Anteroseptal	V1, V2
	Anterior	V3, V4
	Anterolateral	I, aVL, V3-6
	Extensive anterior	I, aVL, V1-6
RCA	Inferior	II, III, aVF
	Right ventricle	V3R, V4R (right-sided chest leads)
	Posterior MI (associated with inferior MI)	V1, V2 (prominent R waves)
LCx	Lateral	I, aVL, V5-6
	Isolated posterior MI	V1, V2 (prominent R waves)

Pacemakers
- Atrial pacemaker has discharge prior to P wave
- Ventricular pacemaker has a pacemaker spike prior to the QRS which is usually broader with a LBBB morphology

MISCELLANEOUS ECG CHANGES

Electrolyte Disturbances

- hyperkalemia
  - mild to moderate (K^+ 5-7 mmol/L): tall, peaked T waves
  - severe (K^+ >7 mmol/L): progressive changes whereby P waves flatten and disappear, QRS widens and may show abnormal morphology, axis shifts left or right, ST shift with tall T waves, eventually becomes a "sine wave" pattern
- hypokalemia
  - ST segment depression, prolonged QT interval (with risk for Torsades de Pointes VT if extreme), low T waves, prominent U waves (U>T)
  - enhances the toxic effects of digitalis

- hypercalcemia
  - shortened QT interval (more extracellular Ca^{2+} means shorter plateau in cardiac action potential)
- hypocalcemia
  - prolonged QT interval (less extracellular Ca^{2+} means longer plateau in cardiac action potential)

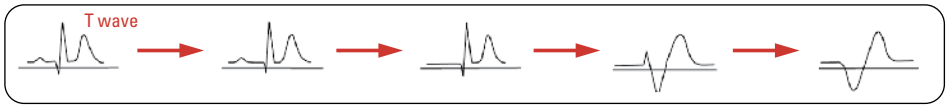

Figure 11. Hyperkalemia

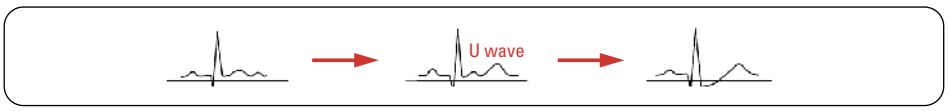

Figure 12. Hypokalemia

Hypothermia

- sinus bradycardia
- when severe, prolonged QRS and QT intervals
- AFib with slow ventricular response and other atrial/ventricular dysrhythmias
- Osborne J waves: "hump-like" waves at the junction of the J point and the ST segment

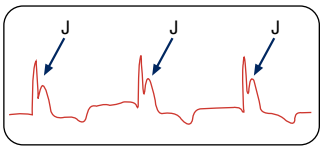

Figure 13. Osborne J waves of a hypothermic patient

Pericarditis

- early: diffuse ST segment elevation ± PR segment depression, upright T waves
- later: isoelectric ST segment, flat or inverted T waves
- ± tachycardia

Drug Effects

- digitalis (cardiac glycoside) poisoning rare in 2021; <1/1000 cardiac patients overall
  - therapeutic levels may be associated with "digitalis effect"
    - ST downsloping or "scooping"
    - T wave depression or inversion
    - QT shortening ± U waves
    - slowing of ventricular rate in AFib
    - most common rhythm disturbance: PVCs
    - toxic levels associated with:
      - arrhythmias: paroxysmal atrial tachycardia (PAT) with conduction block, severe bradycardia in AFib, accelerated junctional rhythms, PVCs, VT (see *Arrhythmias*, C19)
      - "regularization" of ventricular rate in AFib due to complete heart block with junctional escape rhythm
- amiodarone, quinidine, phenothiazines, mood stabilizing medications (including tricyclic antidepressants and antipsychotics), some antihistamines, antifungals, and some antibiotics
  - prolonged QT interval, U waves

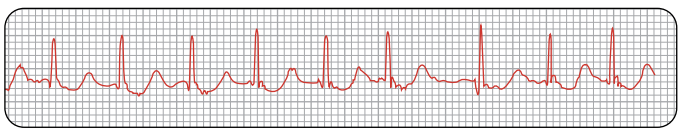

Figure 14. AFib, ST change due to digitalis ("digitalis effect")

Digitalis Side Effects
Palpitations, fatigue, visual changes (yellow vision), decreased appetite, hallucinations, confusion, and depression

Pulmonary Disorders

- cor pulmonale (often secondary to COPD)
  - low voltage, right axis deviation (RAD), poor R wave progression in precordial leads
  - RAE and RVH with strain
  - multifocal atrial tachycardia
- massive pulmonary embolism
  - sinus tachycardia and AFib/atrial flutter are the most common arrhythmias
  - RAD, RVH with strain
  - most specific sign is S1Q3T3 (S in I, Q and inverted T wave in III) but rather uncommon

Alternative PQRSTU Approach to ECGs

Note: the PQRSTU Approach is organized a different way based on the anatomy of the ECG

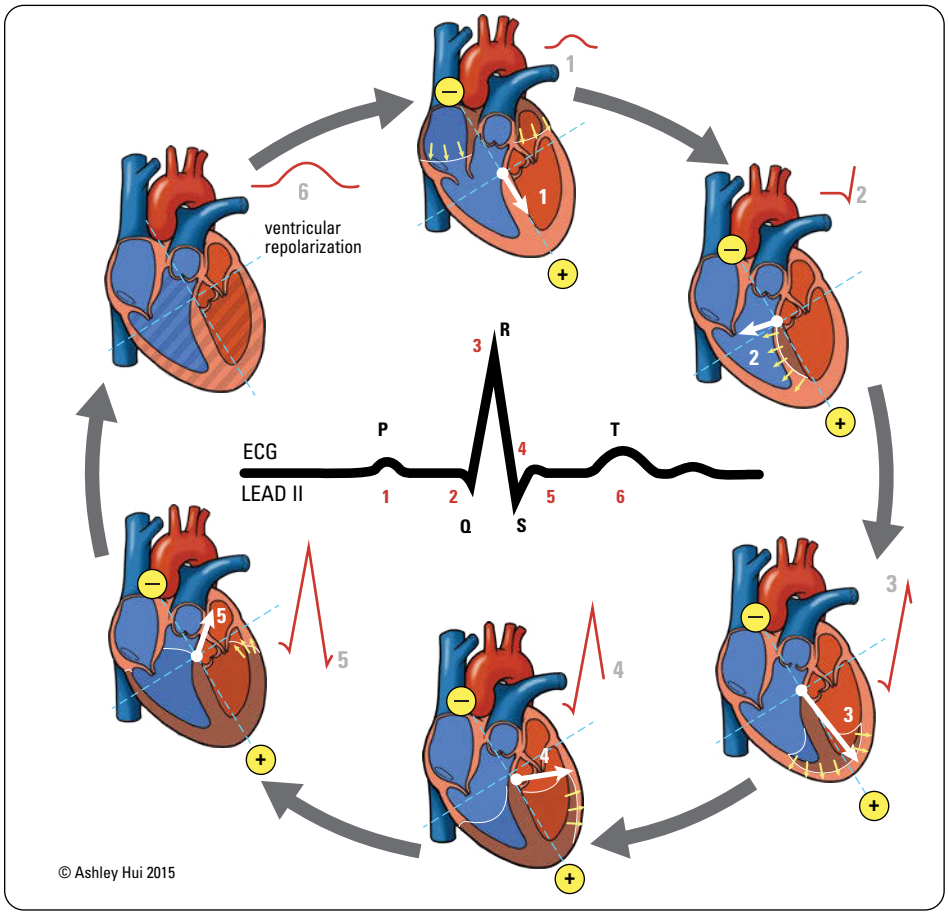

Figure 15. ECG correlations with heart activity

PQRSTU Approach to ECGs
P wave
P-R interval
QRS complex
ST segment
T wave
Q-T interval
U wave

P WAVE

- the P wave represents atrial contraction, best seen in leads: II and V1
  - lead II: the P wave should be rounded, <120 msec and <2.5 mm in height
  - lead V1: the P wave is biphasic with a positive phase slightly greater than the negative phase
- atrial flutter: "sawtooth" P wave with continuous atrial activity at 300 bpm indicates the interval (Hints: flip the ECG upside-down and check inferior leads (II, III, and aVF) to see it better)
- AFib: absent P wave, may have fibrillatory wave, irregular rhythm
- RAE: tall P wave (>2.5 mm) in II or V1 (P pulmonale)
- LAE: biphasic P wave with negative deflection >1 mm deep or >1 mm wide in V1, wide (>100 msec) notched P wave in II may be present (P mitrale)

P-R INTERVAL

- the P-R interval indicates the interval between sinus node activation and the start of ventricular depolarization
  - includes the impulse traveling through the atria, the AV node, and the bundle of His. The magnitude of the conduction velocity is referred to as "dromotropy" (faster = positive dromotropy, slower = negative dromotropy)
  - positive dromotropy associated with increased conduction velocity (e.g. sympathetic stimulation), while negative dromotropy is associated with decreased velocity (e.g. vagal stimulation)
- P-R interval should be 120-200 msec
- long P-R interval (>200 msec)
  - heart block
    - first degree: fixed, prolonged P-R interval (though every P wave has a QRS following)
    - second and third degree AV block: some P waves are NOT followed by a QRS
    - second degree Mobitz I (Wenckebach): gradual prolongation of the P-R interval precedes a dropped P wave
    - second degree Mobitz II (Hay): fixed P-R interval with ratio of beat to dropped beat (e.g. for every 3 beats, there is one dropped beat (3:1))
    - third degree/complete: constant P-P and R-R intervals but variable P-R intervals

Significant ECG Changes
- Look for ST changes starting at 60 msec from J point
- J point = the junction between the QRS complex and the ST segment
- ST elevation: at least 1 mm in 2 adjacent limb leads, or at least 1-2 mm in adjacent precordial leads
- ST depression: downsloping or horizontal
- Q Wave: pathological if Q wave ≥1 small square (≥40 msec) or >1/3 of the total QRS amplitude

  - hypokalemia
  - "trifascicular" block: long PR segment (first degree AV block) and bifascicular block
- short P-R interval (<120 msec)
  - pre-excitation syndrome (delta wave: upsloping of the first part of the QRS complex) due to accessory pathways
  - low atrial rhythm, P waves inverted in II, III, and aVF

QRS COMPLEX

- represents ventricular contraction
- rate: check if R-R interval matches the P-P interval
- amplitude: check for hypertrophy (see Table 2, C8)
- narrow QRS (<120 msec) means that the His-Purkinje system is being used
- wide QRS (>120 msec) means that the His-Purkinje system is being bypassed or is diseased
  - BBB, VT, ventricular hypertrophy, cardiomyopathy, WPW, ectopic ventricular beat, hyperkalemia, or drugs (e.g. tricyclic antidepressants, antiarrhythmics)
- Q wave: the first downward deflection of the QRS complex
  - significant Q wave (>40 msec or >1/3 of total QRS amplitude) indicates myocardial necrosis (new or old)
- R and S wave abnormalities typically show pathology in terms of BBB or intraventricular abnormalities

Insignificant Q Wave
- Septal depolarization by the left bundle
- Seen in leads I, II, III, aVL, V5, and V6
- <40 msec
- Q wave <1/3 of the total QRS amplitude

ST SEGMENT

- located between QRS complex and the beginning of T wave
  - corresponds to the completion of ventricular depolarization
- normally at the same level as baseline (T-P segment)
- ST elevation: see *Infarction*, C9
- ST depression: ischemia
  - ischemia that causes ST depression can result in myocardial damage (NSTEMI)
  - lateral ST depression (leads I, aVL, V5, V6) may actually indicate a STEMI in the right heart
  - ST depression may be nonspecific, or associated with remote MI or ischemia

T WAVE

- repolarization phase of ventricles (repolarization of the atria is obscured by the QRS complex)
- typically positive (except in aVR and V1) on ECG but normal isolated negative T waves may be present (especially in V1 and V2)
- T wave variation in consecutive leads may indicate pathology
  - inversion: BBB, ischemia, hypertrophy, drugs (e.g. digitalis), pulmonary embolism (lead III as part of S1Q3T3 sign)
  - elevation: infarction (STEMI, Prinzmetal, hyperacute), hyperkalemia (wider, peaked)
  - flattened: hypokalemia, pericarditis, drugs (e.g. digitalis), pericardial effusion
    - flat T waves are nonspecific with no clinical significance (common)
  - variations: T wave alternans; beat-to-beat variations due to PVC overlap (R on T phenomenon which may precipitate VT or VFib)
- appropriate T wave discordance: in BBB, T wave deflection should be opposite to that of the terminal QRS deflection (i.e. T wave negative if ends with R or R'; positive if ends with S)
  - inappropriate T wave concordance suggests ischemia or infarction

Differential Diagnosis of ST Segment Changes

ST Elevation – I HELP A PAL
Ischemia with reciprocal changes
Hypothermia (Osborne waves)
Early repolarization (normal variant, need old ECGs to confirm)
LBBB
Post-MI
Acute STEMI
Prinzmetal's (Vasospastic) angina
Acute pericarditis (diffuse changes)
Left/right ventricular aneurysm

ST Depression – WAR SHIP
WPW syndrome
Acute NSTEMI
RBBB/LBBB
STEMI with reciprocal changes
Hypertrophy (LVH or RVH) with strain
Ischemia
Post-MI

Q-T INTERVAL

- duration of ventricular depolarization plus repolarization; often difficult to interpret
- corrected QT (QTc) corrects for the repolarization duration (since QT interval normally shortens with increased HR)
  - $QTc = QT \div \sqrt{RR}$ (Bazett's formula)
- normal QTc is 360-450 msec for males and 360-460 msec for females
  - increased (>450 msec for males and >460 msec for females): risk of Torsades de Pointes (lethal tachyarrhythmia; rare if <520 msec)
    - genetic long QT syndrome (often a channelopathy)
    - drugs: antiarrhythmics (classes I and III), antipsychotics (haloperidol, ziprasidone), antidepressants (citalopram), antibiotics (erythromycin, azithromycin)
    - electrolytes: low Ca^{2+}, low K^{+}, low Mg^{2+}
    - others: hypothyroidism, hypothermia, cardiomyopathy
  - decreased (<360 msec): risk of VFib (very rare)
    - electrolytes: high Ca^{2+}
    - drugs: digoxin
    - others: hyperthyroidism

U WAVE

- origin unclear but may be repolarization of Purkinje fibres or delayed/prolonged repolarization of the myocardium
- more visible at slower heart rates
- deflection follows T wave with <25% of the amplitude
- variations from norm could indicate pathologic conditions
  - prominent (>25% of T wave): electrolyte (low K+), drugs (digoxin, antiarrhythmics)
  - inverted (from T wave): ischemia, volume overload

Cardiac Biomarkers

- provide diagnostic and prognostic information in acute coronary syndromes and in HF

Table 4. Cardiac Enzymes

Enzyme	Peak	Duration Elevated	DDx of Elevation
Troponin I, Troponin T	12-24 h	Up to 2 wk	MI, CHF, AFib, acute PE, aortic dissection, myocarditis, pericarditis, endocarditis, cardiac defibrillation, myocardial damage, infiltrative cardiomyopathy, ischemic stroke, intracranial hemorrhage, acute hypotension, chronic renal insufficiency, sepsis, hypovolemia, acute respiratory distress syndrome, chronic hypertension, diabetes mellitus, hypothyroidism, rhabdomyolysis
Creatine Kinase-MB (CK-MB)	1 d	3 d	MI, myocarditis, pericarditis, muscular dystrophy, cardiac defibrillation, chronic renal insufficiency

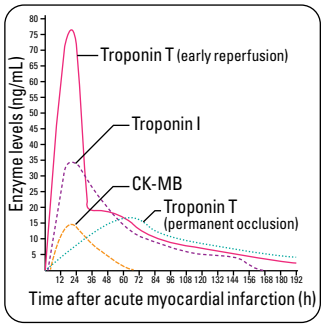

Figure 16. Cardiac enzymes

- timing for troponin measurements is dependent on the assay used
  - high-sensitivity troponin I and T assays detect elevations in cardiac troponin earlier than traditional assays
- new CK-MB elevation can be used to diagnose re-infarction
- other biomarkers of cardiac disease
  - CK-MB, AST, and lactate dehydrogenase (LDH) also increases in MI (low specificity)
  - BNP and N-terminal prohormone of BNP (NT-proBNP): secreted by ventricles in response to increased end-diastolic pressure and volume
    - DDx of elevated BNP: CHF, AFib, PE, pulmonary HTN

Ambulatory ECG

- **description**
  - extended ambulatory ECG monitoring
  - provides a view of only two or three leads of electrocardiographic data over an extended period of time
  - permits evaluation of changing dynamic cardiac electrical phenomena that are often transient
  - the choice of monitor depends on the patient's reported symptom frequency
    - if daily symptoms, use a 24 h or 48 h continuous ECG (Holter) monitor
    - if less frequent (i.e. weekly or monthly), use prolonged continuous monitoring (1-2 wk) or an event monitor
  - **continuous ambulatory monitor**: a small, lightweight, battery-operated recorder (box or patch) which records two or three channels of electrocardiographic data
    - patient activated event markers
    - minimum of 24-72 h, up to 14 d
  - **implantable loop recorder (ILR):** subcutaneous monitoring device for the detection of cardiac arrhythmias
    - typically implanted in the left pectoral region and stores events when the device is activated automatically according to programmed criteria or manually with magnet application
    - generally used for months to years of continuous monitoring for infrequent events
    - note: devices implanted for bradyarrhythmias (pacemakers) or tachyarrhythmias (defibrillators) also record rhythm continuously and have algorithms for automatic rhythm detection and storage
  - **external event monitor**
    - post-event monitoring device: placed on patient's chest after symptom onset and records "real-time" rhythm for a specified period (e.g. 30-150 s)
    - event/loop recorder: constantly records patient's rhythm for a period of time but only saves the data when the patient experiences symptoms and presses the event button (usually 30-60 s recall)
    - auto-triggered event recorder: uses programmed algorithms to auto-detect, capture, and save asymptomatic arrhythmias in addition to patient-triggered events
  - **patient administered single lead ECG**
    - wrist or finger electrodes, commercially available direct to consumer (e.g. Apple Watch, Kardia Mobile)
- **indications**
  - evaluation of cardiac rhythm abnormalities, especially as they correlate with symptoms and provoking factors
  - has also been used for assessing pacemaker and implantable cardioverter-defibrillator function, evidence of myocardial ischemia, late potentials, and HR variability

Echocardiography

Transthoracic Echocardiography

- **description**
  - non-invasive ultrasound beams are directed across the chest wall to obtain real time images of the heart
- **indications**
  - evaluation of cardiac anatomy and functioning including: chamber size, wall thickness, wall motion, valve morphology, proximal great vessel morphology, and LVEF
  - evaluation of clinical cardiac abnormalities including: chest pain with hemodynamic instability, peripheral edema with elevated JVP, murmurs, unexplained hypotension, and syncope with suspected structural cardiac cause
  - evaluation of suspected cardiac diseases including: aortic dissection, congenital heart disease, LV thrombus, MI, pericardial effusion, and pericardial tamponade

Transesophageal Echocardiography

- **description**
  - invasive procedure used to complement TTE
  - ultrasound probe inserted into the esophagus to allow for better resolution of the heart and structures
  - better visualization of posterior structures, including LA, mitral, and aortic valves, inter-atrial septum
- **indications**
  - initial test in certain life-threatening situations (e.g. aortic dissection) when other tests contraindicated (e.g. CT angiography in patient with renal failure or when TTE is technically inadequate
  - key indication is to evaluate valvular morphology, vegetation (e.g. infective endocarditis), and function (e.g. stenosis and regurgitation) especially of the aortic, mitral, and prosthetic valves if present
  - evaluate cardiac disease including: aortic dissection, aortic atheromas, intracardiac thrombi, tumours, and shunts
  - evaluation for left atrial thrombus/left atrial appendage thrombus in a patient with AFib/atrial flutter to facilitate clinical decision making regarding electrical cardioversion or ablation
- **risks**
  - serious complications are extremely rare (<1 in 5000)
  - esophageal perforation
  - gastrointestinal bleeding
  - pharyngeal hematoma

Stress Echocardiography

- **description**
  - echocardiography using exercise (treadmill or bicycle) or pharmacologic agents (dobutamine or adenosine) as physiological stressor
- **indications**
  - when other stress imaging modalities are unequivocal or when ECG is non-diagnostic
  - intermediate pre-test probability with normal/equivocal exercise ECG
  - post-ACS to decide on potential efficacy of revascularization (i.e. myocardial viability)
  - evaluate the clinical significance of valvular heart disease: AS, MS, MR, or AR
  - evaluation of cardiac disease: LV systolic dysfunction of unclear etiology, latent or established pulmonary HTN, LVOT obstruction in HCM, and syncope of unclear etiology
  - dobutamine
    - pharmacologic stress for patients physically unable to exercise; same indications as exercise stress echo
    - low dose dobutamine stress echo can be used to assess myocardial viability and to assess AS with LV systolic dysfunction
- **contraindications**
  - absolute contraindications to exercise testing (see below)
  - contraindications to dobutamine stress echocardiography: tachyarrhythmias and systemic hypertension
  - relative contraindications to both exercise and dobutamine stress echocardiography: AAA, electrolyte abnormalities, left main CAD, and moderate stenotic valvular disease

Contrast Echocardiography with Agitated Saline Contrast

- **description**
  - improves visualization and provides real-time assessment of intracardiac blood flow
  - conventional agent is agitated saline (contains microbubbles of air)
  - visualization of right heart and intracardiac shunts, most commonly PFO and intrapulmonary shunt
  - in a normal heart, microbubbles are still seen but only in the right heart and eventually diffuse into lungs after travelling through pulmonary circulation

- **indications**
  - detection of right-to-left shunts the presence of microbubbles in the left heart chambers indicates a right-to-left intracardiac or extracardiac shunt
  - Doppler signal enhancement agitated saline enhances tricuspid Doppler signals; this could be used to assess transvalvular velocity and to estimate right ventricular systolic pressure
  - diagnosis of persistent left superior vena cava contrast injected in left arm vein appears in the coronary sinus before the RA

Contrast Echocardiography with Transpulmonary Contrast Agents

- **description**
  - newer contrast agents such as Definity® contrast can cross the pulmonary bed and achieve left heart opacification following intravenous injection; these contrast agents improve visualization of endocardial borders and enhance evaluation of LVEF and wall motion abnormalities (in patients with technically inadequate echocardiograms) and intracardiac mass (e.g. LV thrombus)
- **risks**
  - major complications (e.g. risk of non-fatal MI and death are rare)
  - ultrasound contrast agents may cause back pain, headache, urticaria, and anaphylaxis
  - caution in patients with significant intra-cardiac shunts

Stress Testing

EXERCISE TESTING

- **description**
  - cardiovascular stress test that uses treadmill or bicycle exercise with electrocardiographic and blood pressure monitoring for the detection of inducible myocardial ischemia, exercise related symptoms (e.g arrhythmias), or objective measures of exercise tolerance
  - exercise test results stratify patients into 3 risk groups:
    1. low-risk: can treat medically without invasive testing
    2. intermediate-risk: may need additional testing in the form of exercise imaging studies or cardiac catheterization
    3. high-risk: refer for cardiac catheterization
- **indications**
  - patients with intermediate (10-90%) pretest probability of myocardial ischemia (usually due to CAD) based on age, gender, and symptoms
  - ST depression <1 mm at rest, LBBB, digoxin or estrogen use make the ST changes difficult to interpret however, graded exercise stress test can still be valuable
  - important prognostic and diagnostic information (beyond ST changes) is obtained from symptoms, total exercise time, HR, and BP response to exercise, if arrhythmia is provoked
    - note: this is a diagnostic test with false positives and false negatives. Management needs to take into account symptoms and exercise tolerance
- **absolute contraindications**
  - acute MI (within 2 d) or unstable angina pectoris
  - uncontrolled arrhythmias causing symptoms of hemodynamic compromise
  - symptomatic severe valvular stenosis
  - uncontrolled symptomatic HF
  - active endocarditis, acute myocarditis, or pericarditis
  - acute aortic dissection
  - acute pulmonary or systemic embolism
  - acute non-cardiac disorders that may affect exercise performance or may be aggravated by exercise
  - termination of exercise testing
    - target HR achieved
    - patient's desire to stop
    - drop in sBP of >10 mmHg from baseline despite an increase in workload, when accompanied by other evidence of ischemia
    - moderate to severe angina
    - ST elevation (>1 mm) in leads without diagnostic Q-waves (other than V1 or aVR)
    - increasing nervous system symptoms (e.g. ataxia, dizziness, or near syncope)
    - signs of poor perfusion (cyanosis or pallor)
    - technical difficulties in monitoring ECG or sBP
    - sustained VT
- **risks**
  - death, MI, arrhythmia, hemodynamic instability, and orthopaedic injury (<1-5/10000 supervised tests)

Most Commonly Used Treadmill Stress Test Protocols

- The Bruce Protocol: 7 stage test with each stage lasting 3 min. With each successive stage, the treadmill increases in both speed (2.7 km/h to 9.6 km/h) and grade (10% with a 2% increase per stage up to 22%)
- The Modified Bruce, Modified Naughton Protocol: for older individuals or those with limited exercise capacity

Important Contraindications to Exercise Testing

- Acute MI, aortic dissection, pericarditis, myocarditis, PE
- Severe AS, arterial HTN
- Inability to exercise adequately

Important Prognostic Factor
Duke Treadmill Score (DTS) Weighted Index Score

- Treadmill exercise time using standard Bruce protocol
- Maximum net ST segment deviation (depression or elevation)
- Exercise-induced angina provides diagnostic and prognostic information (such as 1 yr mortality)

DTS = exercise time – (5 x MaxST) – (4 x angina index)
Angina index: 0 (no angina), 1 (angina but not exercise-limiting), 2 (exercise-limiting angina)
DTS ≥5: 0.25% 1 yr mortality
DTS 4 to -10: 1.25% 1 yr mortality
DTS ≤ -11: 5.25% 1 yr mortality
Ann Intern Med 1987;106:793-800

Patients with normal imaging (nuclear perfusion or stress echo) studies at peak stress have a <1%/yr incidence of death or nonfatal MI and are thus often spared further invasive evaluation

NUCLEAR CARDIOLOGY

- **description**
  - MPI with ECG-gated single photon emission computed tomography (SPECT), using radiolabelled tracer
  - evaluates myocardial viability, detects ischemia, and assesses perfusion and LV function simultaneously
  - predicts the likelihood of future cardiac event rates independent of the patient's history, examination, resting ECG, and stress ECG
  - often denoted as MIBI scan with reference to radiolabelled tracer (sestamibi)
  - stress with either treadmill or IV vasodilator stress (e.g. dipyridamole, adenosine, regadenoson)
  - images of the heart obtained during stress and at rest 3-4 h later
  - tracers
    - Thallium-201 (^{201}Tl, a K^+ analogue)
    - Technetium-99 (^{99}Tc)-labeled tracer (sestamibi/Cardiolite® or hexamibi/Myoview®)
- **indications**
  - to diagnose CAD in possible ACS patients with non-diagnostic ECG and negative serum biomarker
  - exercise MPI
    - when ECG cannot be interpreted appropriately due to LBBB or abnormal baseline ECG
    - intermediate pre-test probability with normal/equivocal exercise ECG
    - in patients with previous imaging whose symptoms have changed
    - to diagnose ischemia
  - dipyridamole/adenosine MPI
    - exercise testing is always preferred
    - pharmacological stress imaging test for patients who cannot exercise or do not want to hold cardiac medications (β-blockers/CCBs)
    - same indication as exercise MPI
- **contraindications**
  - vasodilators (i.e. adenosine, regadenoson, and dipyridamole) are contraindicated in patients with hypotension, sick sinus syndrome, high-degree AV block (in the absence of backup pacemaker capability), and reactive airways disease
  - pregnancy
- **risks**
  - radiation exposure

STRESS ECHOCARDIOGRAPHY

- see *Echocardiography*, C14

Cardiac Catheterization and Angiography

Right Heart Catheterization (Swan-Ganz Catheter)

- **description**
  - also known as pulmonary artery catheterization
  - obtain direct measurements of central venous, right-sided intracardiac, pulmonary artery, and pulmonary artery occlusion pressures
  - can estimate CO, SVR, and PVR as well as mixed venous oxyhemoglobin saturation, oxygen delivery, and oxygen uptake
  - right atrial, right ventricular, and pulmonary artery pressures are recorded
  - can also be used to measure the Cardiac Index (CI), a measure of cardiac function
    - CI = CO/body surface area
    - 2.6-4.2 L/min/m^2 is considered normal while <1.8 L/min/m^2 usually means cardiogenic shock
  - PCWP
    - obtained by advancing the catheter to wedge in the distal pulmonary artery
    - records pressure measured from the pulmonary venous system
    - in the absence of pulmonary venous disease, reflects left atrial pressure
- **indications**
  - unexplained or unknown volume status in shock
  - severe cardiogenic shock (e.g. acute valvular disease, suspected pericardial tamponade)
  - suspected or known pulmonary artery HTN
  - severe underlying cardiopulmonary disease (e.g. congenital heart disease, left-to-right shunt, severe valvular disease, pulmonary HTN) and undergoing surgery (e.g. corrective)
- **contraindications**
  - infection at the insertion site
  - presence of a right VAD
  - insertion during cardiopulmonary bypass

- **risks**
  - complications for diagnostic catheterization: <1%
  - inadequate diagnostic procedures occur in <1% of cases
  - complications of insertion: atrial and/or ventricular arrhythmias (~3% of patients)
  - catheter misplacement or knotting (uncommon)
  - perforation of a cardiac chamber and rupture of a cardiac valve or the pulmonary artery (rare)
  - complications of catheterization: pulmonary artery rupture, pulmonary infarction, thromboembolic events, infection, and data misinterpretation
  - within 24 h of catheterization: death, MI, or stroke (0.2% to 0.3% of patients)

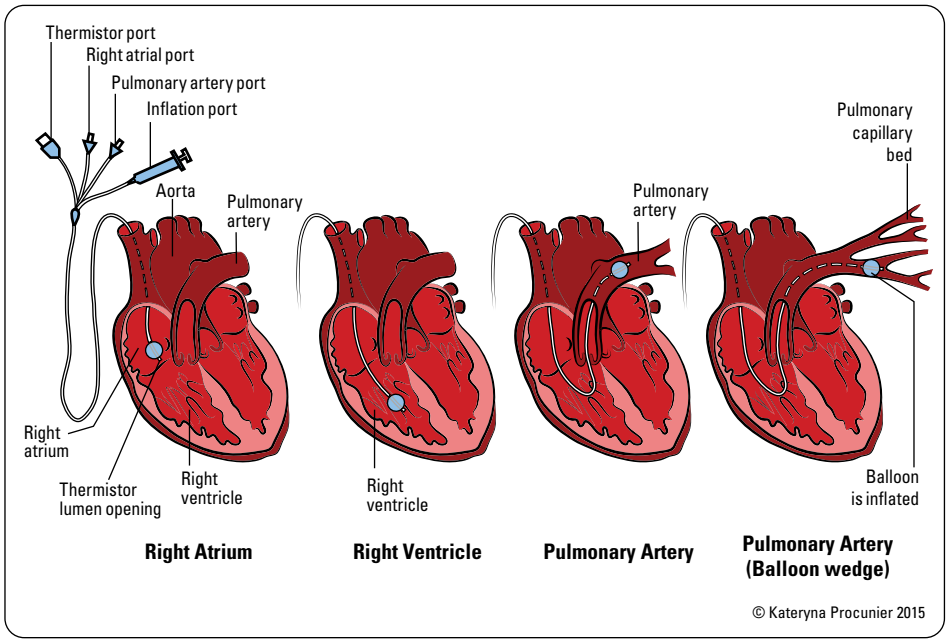

Figure 17. Swan-Ganz catheter placement

Left Heart Catheterization

- **description**
  - accomplished by introducing a catheter into the radial, brachial, or femoral artery and advancing it through the aorta, across the aortic valve, and into the LV
  - evaluates mitral and aortic valvular defects and myocardial disease
  - systolic and end-diastolic pressure tracings recorded
  - LV size, wall motion, and ejection fraction can be assessed by injecting contrast into the LV (left ventriculography) via femoral/radial artery catheterization
- **indications**
  - identification of the extent and severity of CAD and evaluation of left ventricular function
  - assessment of the severity of valvular or myocardial disorders (e.g. AS or insufficiency, MS or insufficiency, and various cardiomyopathies) to determine the need for surgical correction
  - collection of data to confirm and complement non-invasive studies
  - investigating CAD in patients with confusing clinical features or chest pain of uncertain origin
- **contraindications**
  - severe uncontrolled HTN
  - ventricular arrhythmias
  - acute stroke
  - severe anemia
  - active gastrointestinal bleeding
  - allergy to radiographic contrast
  - acute renal failure
  - uncompensated congestive failure (patient cannot lie flat)
  - unexplained febrile illness or untreated active infection
  - electrolyte abnormalities (e.g. hyperkalemia)
  - severe coagulopathy
- **risks**
  - major complications of diagnostic catheterization (i.e. death, MI, stroke): <3 in 1000
  - minor complications (e.g. vascular access issue, kidney dysfunction): <1 in 100
  - inadequate diagnostic procedures occur in <1% of cases

Chambers	Pressure (systolic; mmHg)
Right atrium/central venous	1-8
Right ventricle	1-8 (15-30)
Pulmonary artery	4-12 (15-30)
Left atrium/pulmonary capillary wedge	4-12
Left ventricle end diastolic	4-12

Coronary Angiography

- **description**
  - radiographic visualization of the coronary vessels after injection of radiopaque contrast media
  - coronary vasculature accessed via the coronary ostia
- **indications**
  - to define the coronary anatomy and the degree of luminal obstruction of the coronary arteries
  - to determine the presence and extent of obstructive CAD
  - to assess the feasibility and appropriateness of various forms of therapy, such as revascularization by percutaneous or surgical interventions
  - can be used when the diagnosis of CAD is uncertain and cannot be excluded by non-invasive techniques
- **contraindications**
  - severe renal failure due to contrast agent toxicity (must check patient's renal status)
- **risks**
  - major complications of diagnostic catheterization (i.e. death, MI, stroke): <3 in 1000
  - minor complications (e.g. vascular access issue, kidney damage): <1 in 100

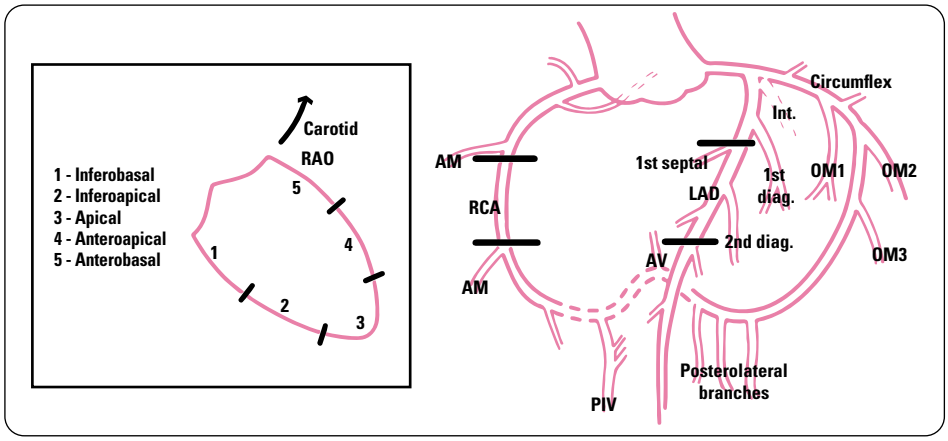

Figure 18. Coronary angiogram schematic
AM = acute marginal; LAD = left anterior descending; OM = obtuse marginal; RAO = right anterior oblique; RCA = right coronary artery

Diagnostic Catheterization

- provocative pharmacological agents can be used to unmask pathology
  - fluid loading may unmask latent pericardial constriction
  - afterload reduction or inotropic stimulation may be used to increase the outflow tract gradient in HCM
  - coronary vasoreactive agents (e.g. methylergonovine, acetylcholine)
  - a variety of pulmonary vasoreactive agents in primary pulmonary HTN (e.g. oxygen, CCBs, adenosine, nitric oxide, prostacyclin)

Contrast-Enhanced CT Coronary Angiography

- **description**: fast ECG-synchronized multi-slice CT image acquisition in the heart to enable non-invasive imaging of the coronary arterial tree
- **indications**: often used to assess coronary artery and previous graft stenosis/viability that could not be seen during coronary angiography
- sensitivity = 85%, specificity = 90% for the diagnosis of obstructive coronary disease with >50% stenosis
- **contraindications**: allergy to contrast dye; severe renal dysfunction; irregular heart rhythm or tachycardia which may impact image quality
- **risks**: radiation exposure; and contrast induced nephropathy

Magnetic Resonance Imaging

- **description**
  - offers high spatial resolution, eliminates the need for iodinated contrast, and does not involve exposure to ionizing radiation
  - often used with gadolinium injection to assess myocardial scar
- **indications**
  - valuable in assessment of congenital cardiac anomalies, abnormalities of the aorta, assessment of viable myocardium, and assessment of cardiomyopathies
    - most accurate measure of ejection fraction
    - especially valuable for assessing RV

ACC/AHA 2011 Recommended Indications for Coronary Angiography
- Disabling chronic stable angina (CCS classes II and IV) despite medical therapy
- High-risk criteria on clinical assessment or non-invasive testing
- Serious ventricular arrhythmia or CHF
- Uncertain diagnosis or prognosis after non-invasive testing
- Inability to undergo non-invasive testing

Coronary Angiography
Gold standard for localizing and quantifying CAD

Hemodynamically significant stenosis is defined as 70% or more narrowing of the luminal diameter

- **contraindications**
  - metallic foreign bodies/implants (e.g. pacemaker, ICD, CRT, cerebral aneurysm clips, metal shrapnel, piercings)
  - kidney dysfunction due to gadolinium contrast medium
- **risks**
  - hazards posed by certain metallic devices inside patients

CARDIAC DISEASE

Arrhythmias

Mechanisms of Arrhythmias

Alterations in Impulse Formation

A. Normal Automaticity

- impulses from the SA node, caused by spontaneous depolarization, result in the basic cardiac pacemaker function. "Downstream" cells in the AV node and Purkinje fibres also depolarize spontaneously, but at a slower rate; they serve as the "backup" pacemaking cells if the upstream rate is slower than the more distal spontaneous rate
- normal automaticity is influenced by:
  - neurohormonal tone (sympathetic tone increases and parasympathetic tone decreases spontaneous firing rate and thus HR)
  - myocardial ischemia/infarction or other cardiac pathology (e.g. HF) may alter HR via these mechanisms
  - abnormal metabolic conditions (e.g. hypoxia, acidosis, hypothermia)
  - electrolyte abnormalities, especially hyperkalemia which slows HR
  - drugs (e.g. digitalis, β-blockers, CCB)
  - athletic training: endurance athletes often have sinus bradycardia
  - age: elderly often have sinus bradycardia

Sinus Arrhythmia
- Normal P waves, with variation of the P-P interval, especially with respiration, due to varying rate of SA node depolarization

Respiratory SA
- Seen more often in young adults
- Normal, physiologic results from changes in autonomic tone during respiratory cycle
- Rate increases with inspiration, slows with expiration

Non-Respiratory SA
- Seen more often in the elderly
- Can occur in the normal heart; if marked may be due to sinus node dysfunction (e.g. in heart disease or after digitalis toxicity)
- Usually does not require treatment

B. Abnormal Automaticity due to Triggered Activity (due to Afterdepolarizations)

1. Early Afterdepolarizations

- during the terminal plateau or repolarization phases of action potential
- consequence of the membrane potential transiently becoming more positive during repolarization (depolarization interrupting repolarization)
  - these are called EADs and DADs (early and delayed afterdepolarization, respectively)
- may result in self-maintaining oscillations of depolarization, giving rise to action potentials thereby generating a tachyarrhythmia (e.g. new baseline voltage is greater than threshold, which automatically triggers a new action potential after the refractory period ends)
- EADs are the basis for the arrhythmias associated with QT prolongation, either congenital or acquired; termed "Torsades de Pointes"

2. Delayed Afterdepolarizations

- occur after the action potential has fully repolarized, but before the next usual action potential
- commonly occurs in situations of high intracellular calcium (e.g. digitalis intoxication, ischemia) or during enhanced catecholamine stimulation (e.g. "twitchy" pacemaker cells)

Alterations in Impulse Conduction

A. Re-Entry Circuits

- the presence of self-sustaining re-entry circuit causes rapid repeated depolarizations in a region of myocardium (see Figure 27, C24, for an example in the context of AV nodal re-entrant tachycardia)
- the conditions necessary for re-entry include block of an impulse into a region of the heart that is refractory (non-excitable tissue or because of local functional block, where the impulse encounters tissue still in its refractory period), followed by "re-entry" of the impulse around a region of block to the site of origin, forming a complete re-entry circuit
  - e.g. myocardium that is infarcted/ischemic will consist of non-excitable and partially excitable zones which will promote the formation of re-entry circuits
  - most sustained tachyarrhythmias are due to re-entry

B. Conduction Block

- ischemia, fibrosis, trauma, and drugs can cause transient or permanent, unidirectional or bidirectional block
- most common cause of block is "functional block" due to refractory myocardium (cardiomyocytes are in refractory period) or "anatomical block" (area of myocardium unexcitable due to fibrosis); cells in the conduction system distal to the block can assume pacemaking control if the block occurs along the specialized conduction system
- the consequence of conduction block are reentry arrhythmias (tachyarrhythmias - see above) or failure of impulses to conduct to ventricular cells (bradycardia)
- conduction block in the AV node or His Purkinje tissue can lead to bradycardia

C. Bypass Tracts

- normally, the only electrical connection between atria (As) and ventricles (Vs) is the AV node and connected penetrating Bundle of His;
- an accessory bypass tract is a direct connection between A and V, histologically similar to atrial tissue, through the valve ring which is normally impervious to electrical impulses (hence "accessory atrio-ventricular bypass tract")
  - see *Pre-Excitation Syndromes*, C25

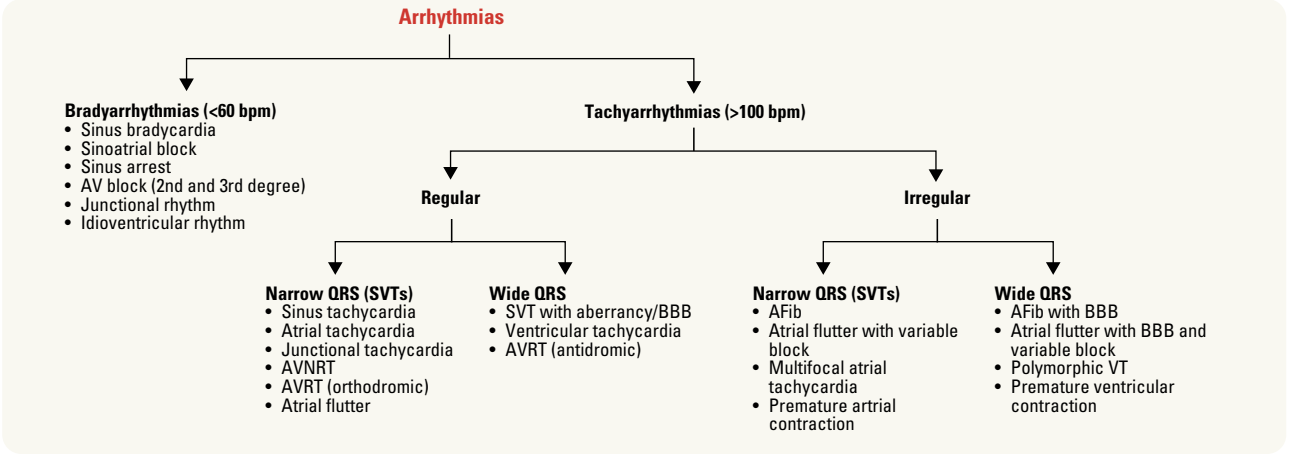

Figure 19. Clinical approach to arrhythmias

Bradyarrhythmias

Table 5. Types of Bradyarrhythmias

1. SA NODAL DYSFUNCTION		
• P axis normal (P waves positive in I and aVF) • Rate <60 bpm; marked sinus bradycardia (<50 bpm) • May be seen in normal adults, particularly athletes, and in elderly individuals • Increased vagal tone or vagal stimulation • Drugs (e.g. β-blockers, CCB) • Ischemia/infarction	Atropine; pacing for sick sinus syndrome			Figure 20. Sinus bradycardia
2. AV CONDUCTION BLOCKS		
A. First Degree AV Block		
• Prolonged PR interval (>220 msec) • Frequently found among otherwise healthy adults	No treatment required			Figure 21. First degree AV block
B. Second Degree AV Block: Type I (Mobitz I)		
• A gradual prolongation of the PR interval precedes the failure of conduction of a P wave (Wenckebach phenomenon) • AV block is usually in AV node (proximal) triggers (usually reversible): increased vagal tone (e.g. following surgery), RCA-mediated ischemia				Figure 22. Second degree AV block with Wenckebach phenomenon (Mobitz I) (4:3 conduction) (lead V1)

Table 5. Types of Bradyarrhythmias

C. Second Degree AV Block: Type II (Mobitz II)

- The PR interval is constant; there is an abrupt failure of conduction of a P wave
- Often associated with distal conduction system disease (BBB)
- AV block is usually distal to the AV node (i.e. bundle of His); increased risk of high grade or third degree AV block

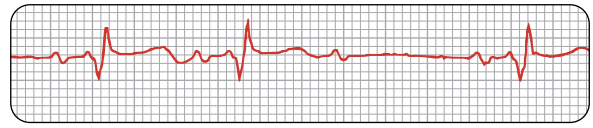

Figure 23. Second degree AV block (Mobitz II) (3:2 conduction) (lead V1)

D. Third Degree AV Block

- Complete failure of conduction of the supraventricular impulses to the ventricles
- Ventricular depolarization initiated by an escape pacemaker distal to the block
- Wide or narrow QRS, P-P and R-R intervals are constant, variable PR intervals
- No relationship between P waves and QRS complexes (P waves "marching through")

Management (see *Electrical Pacing*, C29)

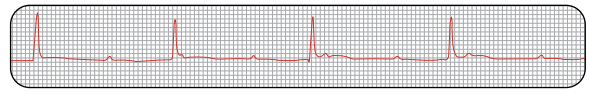

Figure 24. Third degree AV block (complete heart block) (lead II)

Supraventricular Tachyarrhythmias

Presentation for SVT (and Pre-Excitation Syndromes)

- presentation can include: palpitations, dizziness, dyspnea, chest discomfort, presyncope/syncope
- may precipitate CHF, hypotension, or ischemia in patients with underlying cardiovascular disease
- untreated tachycardias of long duration (i.e. days) can cause tachycardia- induced cardiomyopathy (rare, potentially reversible with treatment of SVTs)
- arrhythmias involving the AV node (i.e. AVNRT and AVRT) may terminate spontaneously, after vagal stimulation, or after adenosine treatment

Supraventricular Tachyarrhythmias

- tachyarrhythmias that originate in the atria or involve the AV junction
- this term is used when a more specific diagnosis of mechanism and site of origin cannot be made
- characterized by narrow QRS unless there is pre-existing BBB or aberrant ventricular conduction (abnormal conduction due to a change in cycle length)

1. Sinus Tachycardia

- sinus rhythm with rate >100 bpm
- causes:
  - anxiety, exercise
  - metabolic (e.g. thyrotoxicosis, pheochromocytoma)
  - systemic demand (e.g. pregnancy, anemia, exercise, pain, fever, hypotension, hypovolemia, anemia, CHF, MI, shock, PE)
  - pharmacologic (e.g. cocaine, caffeine, alcohol, β-adrenergic agonists, anticholinergic drugs)
  - idiopathic (IST- " idiopathic sinus tachycardia") or POTS (postural orthostatic tachycardia syndrome)
- treatment:
  - treat underlying disease; consider β-blocker if symptomatic, CCB if β-blockers contraindicated; ivabradine may be considered as an alternative agent for inappropriate sinus tachycardia

2. Premature Beats

- premature atrial contraction
  - ectopic supraventricular beat originating in the atria
  - P wave morphology of the PAC usually differs from that of a normal sinus beat
- junctional premature beat
  - ectopic supraventricular beat that originates in the vicinity of the AV node
  - P wave is usually not seen or an inverted P wave is seen and may be before or closely follow the QRS complex (referred to as a retrograde, or "traveling backward" P wave)
- treatment usually not required

3. Atrial Flutter

- rapid, regular atrial depolarization from a macro re-entry circuit within the atrium (most commonly RA)
- atrial rate 250-350 bpm, usually 300 bpm
- AV block usually occurs; it may be fixed (e.g. 2:1, 3:1, 4:1, etc.) or variable
- etiology: HTN, cardiomyopathy in association with AFib
  - less often: CAD, thyrotoxicosis, mitral valve disease, cardiac surgery, COPD, PE, pericarditis, in association with long term endurance sport/exercise
- ECG: "sawtooth" flutter waves (most common type of flutter, called "isthmus-dependent, typical flutter") in inferior leads, II, III, aVF; narrow QRS (unless aberrancy); commonly seen as 2:1 block with HR of 150

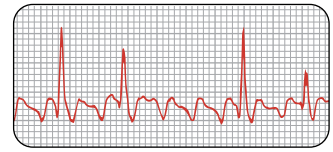

Figure 25. Atrial flutter with variable block

- in atrial flutter with 2:1 block, carotid sinus massage (after checking for bruits), Valsalva maneuver, or adenosine may decrease AV conduction and allow flutter waves to be more easily seen
- treatment of acute atrial flutter
  - if unstable (e.g. hypotension, CHF, angina): electrical cardioversion
  - if stable:
    1. rate control: β-blocker, diltiazem, verapamil, or digoxin
    2. chemical cardioversion: sotalol, amiodarone, type I antiarrhythmics, or electrical cardioversion
    3. anticoagulation guidelines same as for patients with AFib
- long-term treatment of atrial flutter to prevent recurrences includes antiarrhythmics and radiofrequency (RF) ablation (for isthmus dependent, typical flutter, treatment of choice is RF ablation, with rapid atrial pacing also used in patients with pre-existing cardiac devices)

4. Multifocal Atrial Tachycardia (MAT)

- irregular rhythm caused by presence of 3 or more atrial foci (may mimic AFib)
- atrial rate 100-200 bpm
  - 3 or more distinct P wave morphologies
  - PR intervals vary
  - some P waves may not be conducted
- more common in patients with COPD or hypoxemia; less commonly in patients with hypokalemia, hypomagnesemia, sepsis, theophylline use, or digitalis toxicity
- treatment: treat the underlying cause; calcium channel blockers may be used (e.g. diltiazem, verapamil); β-blockers may be contraindicated because of severe pulmonary disease
- no role for electrical cardioversion, antiarrhythmics, or ablation

5. Atrial Fibrillation

- see CCS Atrial Fibrillation Guidelines 2020 for details (free mobile app iCCS available on iOS and Android)
- the most common sustained arrhythmia
- risk factors include: older age, hypertension, heart failure, valvular disease (especially leading to dilated LA), recent cardiac surgery, lung disease, excessive alcohol consumption, sepsis (particularly pneumonia)
- symptoms: palpitations, exercise intolerance, fatigue, dyspnea, dizziness, syncope, may precipitate or worsen HF
- **classification**
  - "lone": generally occurs in persons <65 yr and in whom no clinical or echocardiographic causes are found
  - nonvalvular: not caused by valvular disease (usually MS), or prosthetic heart valves, or valve repair
    - valvular disease is observed in patients/people with MS, prosthetic heart valves, or those who have undergone valve repair
  - paroxysmal: episodes that terminate spontaneously
  - persistent: AFib sustained for more than 7 d or AFib that terminates only with cardioversion
  - permanent/chronic: continuous AFib that is unresponsive to cardioversion or in which clinical judgement has led to a decision not to pursue cardioversion
  - recurrent: two or more episodes of AFib
  - secondary: caused by a separate underlying condition or event (e.g. MI, cardiac surgery, pulmonary disease, hyperthyroidism)
- **initiation**
  - single circuit re-entry and/or ectopic foci, mostly arising from the pulmonary veins, act as aberrant generators producing atrial tachycardia (350-600 bpm)
    - this leads to multiple re-entry circuitry (microre-entry)
  - impulses are conducted irregularly across the atrial myocardium to give rise to fibrillation
  - in most cases, ectopic foci have also been mapped to the pulmonary vein ostia and can be ablated
- **maintenance**
  - the tachycardia causes atrial structural and electrophysiological remodelling changes that further promote AFib; the longer the patient is in AFib, the more difficult it is to restore normal sinus rhythm
- **consequences**
  - the AV node irregularly filters incoming atrial impulses producing an irregular ventricular response (usually <200 bpm); tachycardia leads to suboptimal CO
    - fibrillatory conduction of the atria promotes blood stasis increasing the risk of thrombus formation
      - AFib is an important risk factor for stroke or thromboembolic events (stroke risk can be assessed by CHADS2 score in AFib; CHADS2-VASc if the former gives a score of 0 or 1)
      - all valvular Afib (those with mechanical valves or MS) need anticoagulation but CHADS determines treatment for AS and MR

Table 6. CHADS2 Risk Prediction for Non-Valvular AFib

Risk Factor	Points	CHADS2 Score	Stroke Risk (%/Yr)
Congestive HF	1	0	1.9 (low)
HTN	1	1	2.8 (low-mod)
Age >75	1	2-3	4.0-5.9 (mod), need anticoagulation
Diabetes	1	4-6	8.5-18.2 (high), need anticoagulation
Stroke/TIA (prior)	2		

Can J Cardiol 2014;30:1114-30

- ECG findings
  - no organized P waves due to rapid atrial activity (350-600 bpm) causing a chaotic fibrillatory baseline
  - irregularly irregular ventricular response (typically 100-180 bpm), narrow QRS (unless aberrancy or previous BBB)
  - wide QRS complexes due to aberrancy may occur following a long-short cycle sequence ("Ashman phenomenon")
  - loss of atrial contraction, thus no "a" wave seen in JVP, no S4 on auscultation

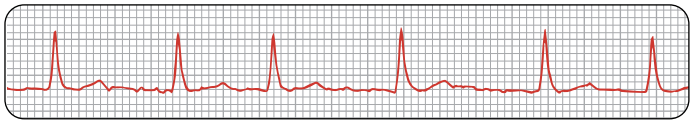

Figure 26. AFib (lead II)

- management (adapted from CCS Atrial Fibrillation Guidelines 2020)
  - primary goal is symptom control
  - stroke prevention is crucial, since patients who are not anticoagulated for AFib have, on average, a 4-5% annual stroke risk
  - all patients should be assessed for stroke risk and receive anticoagulation independent of the rate or rhythm treatment
  - **newly discovered AFib**
    - if the episode is self-limited and not associated with severe symptoms, no need for antiarrhythmic drugs
    - if AFib persists, consider one of the following:
      1. rate control and anticoagulation (as indicated below)
      2. cardioversion (as indicated below)
    - an initial rhythm control strategy for patients with newly diagnosed AFib (i.e. within past year), is associated with reduced cardiovascular death and stroke rate
  - **recurrent or permanent AFib**
    - if episodes are brief or minimally symptomatic, antiarrhythmic drugs may be avoided; rate control and anticoagulation are appropriate
    - patients who have undergone at least one attempt to restore sinus rhythm may remain in AFib after recurrence; permanent AFib may be accepted (with rate control and antithrombotics as indicated by CHADS2 score) in certain clinical situations
    - if symptoms are bothersome or episodes are prolonged, antiarrhythmic drugs should be used
  - **drug selection for rhythm control**
    - no or minimal heart disease: flecainide, propafenone once proven to have no underlying CAD (may consider exercise stress testing)
    - LV dysfunction: amiodarone
    - CAD: β-blockers, amiodarone
    - if antiarrhythmic drugs fail or are not tolerated, can consider RF ablation for rhythm/symptom control
  - **treatment of AFib (RACE):** all patients with AFib (paroxysmal, persistent, or permanent), should be stratified using a predictive index for stroke risk and risk of bleeding, and most patients should receive either an oral anticoagulant (OAC) or ASA
    1. **R**ate control: β-blockers, diltiazem, verapamil (in patients with HF: digoxin, amiodarone)
       – digoxin can be used to achieve rate control in patients whose response to β-blockers and/or CCB is inadequate, contraindicated, or not tolerated
    2. **A**nticoagulation: use either warfarin or DOACs (e.g. apixaban, dabigatran, rivaroxaban, edoxaban) to prevent thromboembolism
       – DOAC use is preferred to warfarin
       – for patients with non-valvular AFib (NVAF), OAC use is recommended for those >65 yr and/or with a CHADS2 ≥1. NVAF is defined as AF *not* due to mechanical valve or moderate-severe mitral stenosis
       – ASA 81 mg is recommended only for patients with none of the risks outlined in the CCS algorithm (age <65 and no CHADS2 risk factors) who also have arterial disease (coronary, aortic, or peripheral)

The 2020 Canadian Cardiovascular Society/ Canadian Heart Rhythm Society Comprehensive Guidelines for the Management of Atrial Fibrillation
Can J Cardiol 2020;36:1847-1948
Rate and Rhythm Control: Long-term rate control therapy in AFib patients is recommended to reduce symptoms and prevent CV events. Based on the paucity of data informing HR targets, it is recommended to titrate rate-controlling agents to achieve a resting HR <100 bpm during AFib. Rhythm control with long-term antiarrhythmic drug therapy might not completely suppress AFib, and thus should be focused on symptom relief, improving functional capacity, and reducing healthcare utilization. Rhythm control strategies are recommended for patients with established AFib who remain symptomatic with rate control therapy, or in whom rate control therapy is unlikely to control symptoms. In patients with newly diagnosed AFib, an initial strategy of rhythm control has been associated with reduced CV death and reduced incidence of stroke. It is recommended to consider catheter ablation of typical right AFib as a reasonable alternative to pharmacologic rate or rhythm control.
Antithrombotic Therapy in AFib: In patients with AFib and coronary or arterial vascular disease, the choice of antithrombotic therapy should be based on a balanced risk assessment of AFib-related stroke, ischemic coronary events, and clinically relevant bleeding. If an oral anticoagulant is indicated, non-Vitamin K antagonist oral anticoagulants (NOACs) are recommended over warfarin.

3. **C**ardioversion (electrical)
   - if AFib <48 h, can usually cardiovert without anticoagulation (<12 h if high stroke risk)
   - if AFib >48 h, anticoagulate 3 wk before and 4 wk after cardioversion due to risk of unstable intra-atrial thrombus
   - if patient is unstable (hypotensive, active angina due to tachycardia, uncontrolled HF), cardiovert immediately
4. **E**tiology
   - HTN, obesity, sleep apnea, CAD, heart failure, valvular disease, pericarditis, cardiomyopathy, myocarditis, ASD, postoperative, PE, COPD, thyrotoxicosis, sick sinus syndrome, alcohol ("holiday heart")
   - may present in young patients without demonstrable disease ("lone AFib") and in the elderly without underlying heart disease
   - studies of patients with AFib suggest that there is no difference in long-term survival when treating patients with a rhythm-control vs. rate-control strategy (recent large study suggests benefit of rhythm control for recent onset AF- see above)
   - many patients with a significant underlying structural heart lesion (e.g. valve disease, cardiomyopathy) will not tolerate AFib well (since may be dependent on atrial kick) and these patients should be cardioverted (chemical or electrical) as soon as possible

- **surgical management in AFib ablation**
  - sutured lesion
    - Cox-maze III: definitive surgical treatment of chronic AFib; indicated in patients who have failed maximal medical therapy and have had embolic events or are symptomatically compromised by AFib; 90-95% postoperative freedom from AFib; less likely to be successful in patients with large left atria (>5 cm) or with longstanding AFib (>5 yr)
    - modified maze and pulmonary vein isolation: more limited patient sets but takes less time to perform than classical maze procedure; selected cases can be done off bypass with concomitant OPCAB; 60-75% postoperative freedom from AFib
  - energy lesion
    - cryoablation: see *Catheter Ablation*, C29
    - radiofrequency ablation: see *Catheter Ablation*, C29
    - current experimental trials include use of laser ablation, microwave ablation, and ultrasound ablation

6. AV Nodal Re-Entrant Tachycardia

- re-entrant circuit using dual pathways (fast conducting β-fibres and slow conducting α-fibres) within or near the AV node; often found in the absence of structural heart disease
  - cause is commonly idiopathic, although familial AVNRT has been reported
- sudden onset and offset with patients often describing "neck pounding" and "shirt flapping"
- fast regular rhythm of 150-250 bpm
- usually initiated by a supraventricular or ventricular premature beat
- AVNRT accounts for 60-70% of all paroxysmal SVTs
- retrograde P waves may be seen but are usually lost in the QRS complex
- treatment
  - acute: Valsalva maneuver or carotid sinus pressure technique, adenosine is first choice if unresponsive to vagal maneuvers; if no response, try metoprolol, digoxin, diltiazem, electrical cardioversion if patient hemodynamically unstable (hypotension, angina, or CHF)
  - long-term: 1st line radiofrequency ablation (>98% cure rate and << 1% complication rate), β-blocker, diltiazem, digoxin; 2nd line flecainide, propafenone

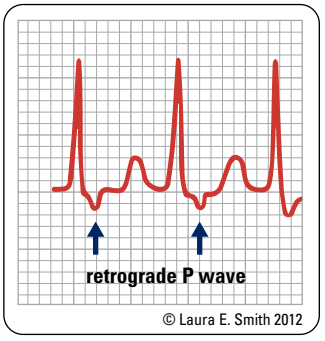

Figure 27. AVNRT

N.B. Refer to ECG Made Simple for further discussion and an animation of the mechanism (www.ecgmadesimple.com)

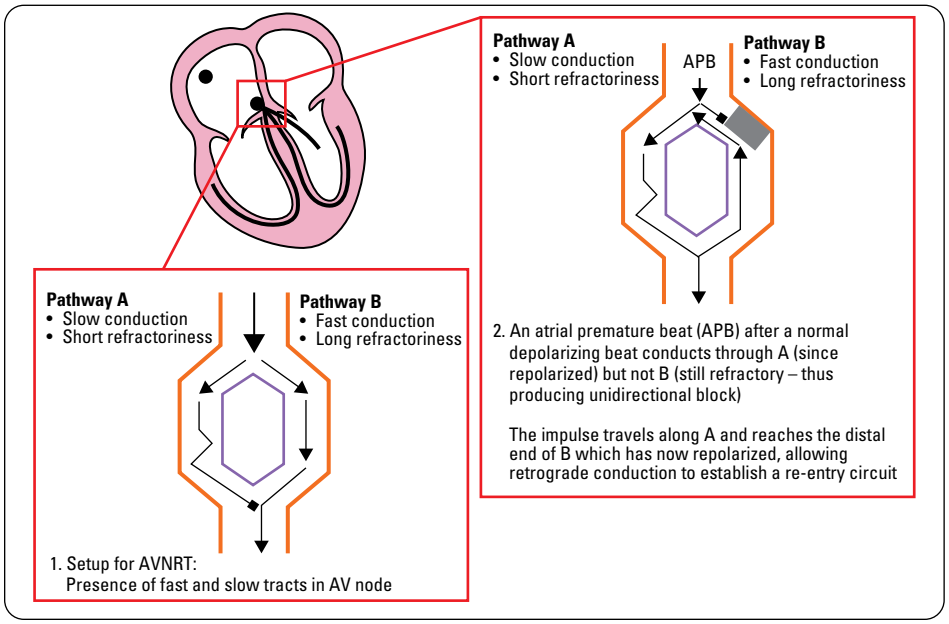

Figure 28. Mechanism for AVNRT

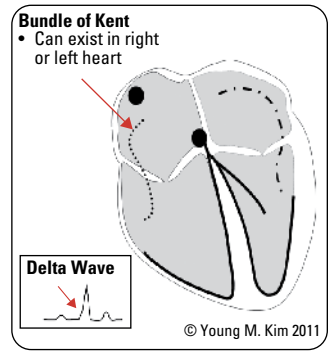

Figure 29. Accessory pathway conduction in WPW. Early ventricular activation leads to the appearance of a delta wave (slurred upstroke of the QRS) on the ECG before usual conduction across the AV node

Pre-Excitation Syndromes

- refers to a subset of SVTs mediated by an accessory pathway which can lead to ventricular pre-excitation

AV Re-Entrant Tachycardia (AVRT)

- re-entrant loop in antegrade via normal conduction system and retrograde via accessory pathway
- usually in patients with an antegradely conducting bypass tract (WPW); may also occur if there is an exclusively retrogradely conducting (i.e. concealed) bypass tract - in these cases the ECG is normal and there are no delta waves
- initiated by a premature atrial or ventricular complex
- treatment
  - acute: treatment is similar to AVNRT but avoid long-acting AV nodal blockers (e.g. digoxin and verapamil)
  - long-term: for recurrent arrhythmias, ablation of the bypass tract is recommended
  - drugs such as flecainide and procainamide can be used

Wolff-Parkinson-White Syndrome

- congenital defect present in 1.5-2/1000 of the general population
- an accessory conduction tract (bundle of Kent; can be in RA or LA) abnormally allows early electrical activation of part of one ventricle
- impulses travel at a greater conduction velocity across the bundle of Kent thereby effectively 'bypassing' AV node
  - since the ventricles are activated earlier, the ECG shows early ventricular depolarization in the form of initial slurring of the QRS complex the so-called "delta wave"
- atrial impulses that conduct to the ventricles through both the bundle of Kent and the normal AV node/His-Purkinje system generate a broad "fusion complex"
- ECG features of WPW
  - PR interval <120 msec
  - delta wave: slurred upstroke of the QRS (the leads with the delta wave vary with site of bypass)
  - widening of the QRS complex due to premature activation
  - secondary ST segment and T wave changes
  - tachyarrhythmias may occur most often AVRT and AFib
- orthodromic AVRT: the most common arrhythmia in WPW stimulus from a premature complex travels up the bypass tract (ventricles to atria) and down the AV node (atria to ventricles) with narrow QRS complex (no delta wave because stimulus travels through normal conduction system)
  - comprises 95% of the re-entrant tachycardias associated with WPW syndrome
- antidromic AVRT: more rarely, the stimulus goes up the AV node (ventricles to atria) and down the bypass tract (atria to ventricles); wide and abnormal QRS as ventricular activation is only via bypass tract

AFib in WPW Patients

- AFib is the index arrhythmia in up to 20% of patients with WPW syndrome
  - usually intermittent rather than persistent or permanent
- rapid atrial depolarizations in AFib are conducted antegradely through the bypass tract which is not able to filter impulses like the AV node can and thus the ventricular rate becomes extremely rapid (>200 bpm) and the QRS complex widens
- treatment: electrical cardioversion, IV procainamide, or IV amiodarone
  - do not use drugs that slow AV node conduction (e.g. digoxin, β-blockers) as this may cause preferential conduction through the bypass tract and precipitate VF
    - note: even without drug administration, AF with WPW comes with a risk of VF and would be an indication for an urgent EPS and ablation
  - long-term: ablation of bypass tract

Ventricular Tachyarrhythmias

Premature Ventricular Contraction or Ventricular Premature Beat

- QRS width >120 msec, no preceding P wave, bizarre QRS morphology
- origin: LBBB morphology of VT = RV origin; RBBB morphology of VT = LV origin
- PVCs may be benign, but are usually significant in the following situations:
  - consecutive (≥3 = VT) or multiform (varied origin)
  - PVC falling on the T wave of the previous beat ("R on T phenomenon"): may precipitate VT or VFib
- risk of sustained arrhythmia depends on the clinical situation (i.e. MI, HF), not the PVCs themselves
- **treatment**
  - lifestyle changes (e.g. limiting or eliminating alcohol, caffeine, and stimulants) may be sufficient in patients with mild symptoms
  - in patients with more severe symptoms or underlying structural disease, β-blockers, catheter ablation, or antiarrhythmic therapy may be indicated

Accelerated Idioventricular Rhythm

- ectopic ventricular rhythm with rate of 50-100 bpm
- more frequently occurs in the presence of sinus bradycardia and is easily overdriven by a faster supraventricular rhythm
- frequently occurs in patients with acute MI or other types of heart disease (i.e. cardiomyopathy, HTN, valvular heart disease) but it does not affect prognosis and does not usually require treatment

Ventricular Tachycardia

- 3 or more consecutive ectopic ventricular complexes
  - rate >100 bpm (usually 140-200)
  - ventricular flutter: if rate approximately 300 bpm and monomorphic sinusoidal pattern
  - "sustained VT" if it lasts longer than 30 s or requires termination due to hemodynamic instability
  - ECG characteristics: wide regular QRS tachycardia (QRS usually >140 msec)
  - AV dissociation, bizarre QRS pattern
  - also favour diagnosis of VT: left axis or right axis deviation, nonspecific intraventricular block pattern, monophasic or biphasic QRS in V1 with RBBB, QRS concordance in V1-V6
  - occasionally, during VT, supraventricular impulses may be conducted to the ventricles; these impulses generate QRS complexes with normal/aberrant supraventricular morphology (i.e. "ventricular capture") or summation pattern (i.e. "fusion complexes")
  - by itself, nonsustained VT (<30 s without hemodynamic collapse) independently increases mortality and cardiovascular events such as stroke; it can also indicate higher than usual risk of subsequent sustained VT, especially with structural heart disease
- **monomorphic VT**
  - identical complexes with uniform morphology
  - more common than polymorphic VT
  - can degenerate into polymorphic VT or VFib
  - typically result from intraventricular re-entry circuit, may be idiopathic without any structural heart disease
  - potential causes: chronic infarct related scarring, cardiomyopathies, myocarditis, arrhythmogenic right ventricular dysplasia, idiopathic, drugs (e.g. cocaine), electrolyte disturbances
- **polymorphic VT**
  - complexes with constantly changing morphology, amplitude, and polarity
  - more frequently associated with hemodynamic instability due to faster rates (typically 200-250 bpm)
  - potential causes: acute MI, severe or silent ischemia, valvular heart disease, HCM, dilated cardiomyopathies, myocarditis, congenital heart disease, WPW with anterograde accessory pathway, electrolyte or acid-base disturbances, and predisposing factors for QT prolongation

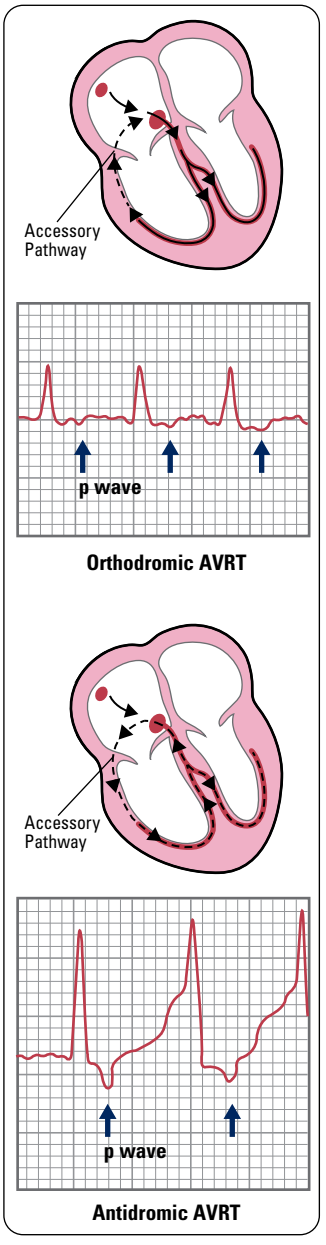

Figure 30. Orthodromic vs. antidromic AVRT

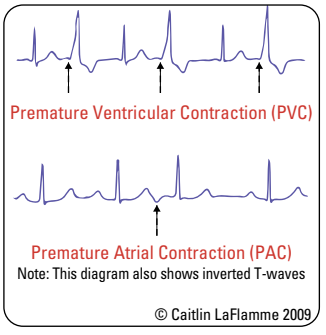

Figure 31. PVC (with bigeminy pattern) and PAC. Note the difference between the normal QRS/T wave and the PVC-generated QRS/T wave

- **treatment**
  - sustained VT (>30 s) is an emergency requiring immediate treatment
  - hemodynamic compromise: treat VT with electrical cardioversion and ACLS
  - no hemodynamic compromise: treat VT with electrical cardioversion, amiodarone, Type IA agents (e.g. procainamide, quinidine)
  - every patient with sustained VT/VFib and comorbid structural heart disease, in the absence of reversible causes, should be considered for ICD implantation to prevent SCD

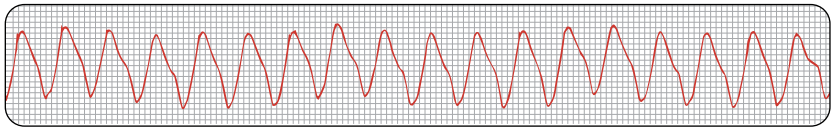

Figure 32. VT (monomorphic)

Table 7. Wide Complex Tachycardia: Clues for Differentiating VT vs. SVT with Aberrancy*

Clinical Clues		ECG Clues	
Presenting symptoms	Not helpful	AV dissociation	VT
History of CAD and previous MI	VT	Capture or fusion beats	VT
Physical exam		QRS width >140 msec	VT
Cannon "a" waves Variable S1	VT	Extreme axis deviation (left or right superior axis)	VT
Carotid sinus massage/adenosine terminates arrhythmia	SVT**	Positive QRS concordance (R wave across chest leads)	VT
		Negative QRS concordance (S wave across chest leads)	May suggest VT
		Axis shift during arrhythmia	VT (polymorphic)

***If patient >65 yr and previous MI or structural heart disease, then chance of VT >95%**
**May terminate VT in some patients with no structural heart disease

Arrhythmias that may present as a Wide QRS Tachycardia
- VT (this is most common, especially in older patients or those with structural heart disease)
- SVT with aberrant conduction (rate related)
- SVT with preexisting BBB or nonspecific intraventricular conduction defect
- AV conduction through a bypass tract in WPW patients during an atrial tachyarrhythmia (e.g. atrial flutter, atrial tachycardia)
- Antidromic AVRT in WPW patients (see *Pre-Excitation Syndromes*, C25)

Torsades de Pointes

- a variant of polymorphic VT that occurs in patients with baseline QT prolongation "twisting of the points"
- looks like usual VT except QRS complexes "rotate around the baseline," changing their axis and amplitude
- ventricular rate >100 bpm, usually 150-300 bpm
  - usual onset after a post-PVC pause associated with "pause dependent" QT prolongation)
- etiology: predisposition in patients with prolonged QT intervals
  - congenital long QT syndromes
  - drugs: e.g. class IA (quinidine), class III (sotalol), phenothiazines (TCAs), erythromycin, quinolones, antihistamines
  - electrolyte disturbances: hypokalemia, hypomagnesemia
  - nutritional deficiencies causing above electrolyte abnormalities
- treatment: IV magnesium, temporary pacing ß blocker, correct the underlying cause of prolonged QT
  - electrical cardioversion and ACLS if hemodynamic compromise

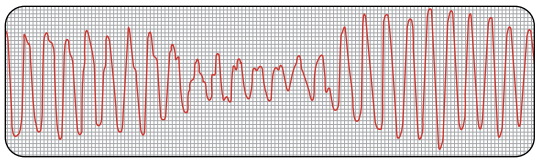

Figure 33. Torsades de pointes

Ventricular Fibrillation

- chaotic ventricular arrhythmia, with very rapid irregular ventricular fibrillatory waves of varying morphology without clear QRS complexes
- terminal event, unless advanced cardiac life-support (ACLS) procedures are promptly initiated to maintain ventilation and CO, and electrical defibrillation is carried out
- most frequent cause of sudden death
- refer to ACLS algorithm for complete therapeutic guidelines

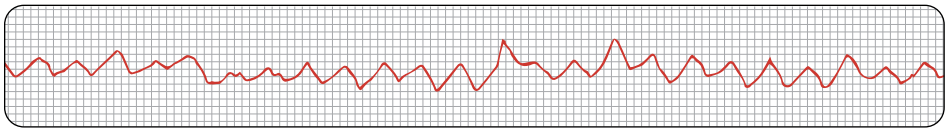

Figure 34. VFib

Sudden Cardiac Arrest

Definition
- cessation of cardiac electrical activity with circulatory collapse (loss of pulses) and gasping respirations or lack of spontaneous breathing
- patient becomes suddenly unresponsive
- VFib and pulseless VT were the predominant presenting rhythms in the past
- currently, the most common presenting rhythms are PEA (pulseless electrical activity) and asystole

Etiology
- the likelihood of an underlying cardiac cause is proportional to age at time of arrest
  - cardiac causes (especially CAD) are more likely in older adults
  - non-cardiac causes are more likely in children and young adults (<35 yr)

Table 8. Etiology of Cardiac Arrest

Cardiac Causes		Non-Cardiac Causes	
myocardial Ischemia	STEMI NSTEMI Coronary spasm coronary dissection Anomalous coronary artery	**Vascular**	Pulmonary embolism Aortic dissection Aortic rupture Stroke
Ischemic Cardiomyopathy	HF Scar	**Neurologic**	Sudden unexplained death in epilepsy Neurogenic
Non-Ischemic Cardiomyopathy	Dilated CM Hypertrophic CM Infiltrative CM Arrhythmogenic RV CM Hypertensive CM VHD with LV failure	**Hemorrhagic**	Subarachnoid Intracranial Gastrointestinal
Valvular Heart Disease	AS MR	**Infection**	Sepsis Pneumonia
Genetic	Long QT syndrome Brugada syndrome	**Respiratory**	Respiratory arrest Tension pneumothorax
Primary Arrhythmogenic	Electrolyte abnormality QT prolongation Idiopathic Complete heart block WPW	**Other**	Substance overdose Ketoacidosis Trauma
Congenital Heart Disease	Tetralogy of Fallot VSD Post-Surgical scar		

Management
- acute: resuscitate according to ACLS guidelines (see Anesthesia, A32)
  - resuscitation can be grouped into those with and without shockable rhythms
  - activation of emergency systems and high-quality chest compressions are essential for any bystander
- investigate underlying causes using cardiac catheterization, electrophysiologic studies, echocardiography
  - patients with ST-elevation require emergent coronary angiography and revascularization
  - patients without ST-elevation can still have clinically relevant coronary lesions and therefore benefit from coronary angiography on a non-emergent basis
- initiate targeted temperature management to optimize neurologic recovery regardless of presenting rhythm
- treat underlying cause
- antiarrhythmic drug therapy: amiodarone, lidocaine, β-blockers
- implantable cardioverter defibrillator (ICD) for secondary prevention

See Landmark Cardiac Trials for more information on COACT, which details the 1-yr clinical outcomes of angiography timing on survival in resuscitated cardiac arrest patients without STEMI.

Electrophysiologic Studies

- invasive test for the investigation and treatment of cardiac rhythm disorders using intracardiac catheters
- provide detailed analysis of the arrhythmia mechanism and precise site of origin when ECG data are nondiagnostic or unobtainable
- bradyarrhythmias: define the mechanisms of SA node dysfunction and localize site of AV conduction block (rarely performed)
- tachyarrhythmias: map for possible ablation, assess inducibility of VT prior to ICD implant

Electrical Pacing

- the decision to implant a pacemaker usually is based on symptoms of a bradyarrhythmia or tachyarrhythmia with intermittent bradycardia precluding rate limiting medications

Pacemaker Indications
- SA node dysfunction (most common): symptomatic bradycardia ± hemodynamic instability
- common manifestations include: syncope, presyncope, or severe fatigue
- SA node dysfunction is commonly caused by: intrinsic disease within the SA node (e.g. idiopathic degeneration, fibrosis, ischemia, or surgical trauma), abnormalities in autonomic nervous system function, and drug effects
- AV nodal-infranodal block: Mobitz II, complete heart block

Pacemaker Complications
- complications related to surgical implantation include venous access (pneumothorax, hemothorax, air embolism), pacemaker leads (perforation, malposition), pocket hematomas, and infection; rarer complications include venous stenosis or thrombosis, and tricuspid regurgitation
- complications specific to the pacemaker include a failure to pace, failure to sense, pulse generator failure, pacemaker syndrome, lead fractures, and pacemaker-mediated tachycardia

Pacing Techniques
- temporary: transvenous (jugular, subclavian, femoral) or external (transcutaneous) pacing
- permanent: transvenous into RA, apex of RV, or both
- single or dual chamber: can sense and pace atrium, ventricle, or both
- rate responsive, able to respond to physiologic demand
- biventricular pacing (cardiac resynchronization therapy): leads are guided to RV and LV to stimulate both ventricles

Implantable Cardioverter Defibrillators

- SCD usually results from VFib, sometimes preceded by monomorphic or polymorphic VT
- ICDs detect ventricular tachyarrhythmias and are highly effective in terminating VT/VFib and in aborting SCD
- mortality benefit vs. antiarrhythmics in secondary prevention
- CRT-D may be of benefit in patients with LBBB, prolonged QRS, and LVEF <35%
- see *Heart Failure*, C40 for current treatment recommendations

Catheter Ablation

Modalities
- radiofrequency (RF) ablation: a low-voltage high-frequency form of electrical energy (similar to cautery); RF ablation produces small, homogeneous, necrotic lesions approximately 5-7 mm in diameter and 3-5 mm in depth
- cryoablation: technology which uses a probe with a tip that decreases in temperature to -20˚C and -70˚C; small necrotic lesions are produced in a similar fashion to RF ablation; when brought to -20˚C, the catheter tip reversibly freezes the area; when brought to -70˚C for 5 min, it permanently scars the tissue
  - advantage: can "test" areas before committing to an ablation
  - disadvantage: takes much longer than RF (5 min per cryoablation vs. 1 min per RF ablation)
  - cryoablation is most commonly used for AFib

Indications
- paroxysmal SVT
  - AVNRT: accounts for more than half of all cases; slow AV nodal pathway is targeted for ablation in these cases
- accessory pathway (orthodromic reciprocating tachycardia): 30% of SVT
  - re-entrant rhythm with an accessory AV connection as one of the limbs
  - corrected by targeting the accessory pathway
- atrial flutter: re-entry circuit in RA
- AFib: primarily isolation of pulmonary vein triggers, usually with additional ablation in the atrial chambers
- idiopathic VT: focus arises from the right ventricular outflow tract or left ventricular outflow tract and less commonly originates in the inferoseptal LV near the apex
  - scar mediated VT most commonly due to scarring from previous MI or other cardiomyopathies; ablation less often successful and not first line therapy
  - significant benefit was seen with catheter ablation vs. antiarrhythmic drug escalation among patient with amiodarone-resistant VT, in contrast to non-amiodarone resistant VT

Major Complications
- cardiac: high grade AV block requiring permanent pacemaker (less risk with cryoablation), new or worsening arrhythmia, tamponade, pericarditis
- vascular: hematoma, vascular injury, thromboembolism, TIA/stroke
- pulmonary: PE

Ischemic Heart Disease

Epidemiology
- refer to CCS guidelines - 2014 Stable Ischemic Heart Disease Guidelines for Diagnosis and Management for more information
- most common cause of cardiovascular morbidity and mortality
- patients may have asymptomatic or symptomatic disease
- silent myocardial ischemia may be a predictor of adverse coronary events and cardiac mortality
  - needs to be monitored via intracardiac monitoring of physiological and hemodynamic parameters, metabolic indicators of ischemia in the coronary sinus, and hemodynamic factors
  - optimal medical therapy (reduction of HR and BP) and myocardial revascularization
- atherosclerosis and thrombosis are the most important pathogenetic mechanisms
- M:F=2:1 with all age groups included (Framingham study), 8:1 for age <40, 1:1 for age >70
  - CHD incidence in women triples shortly after menopause
- peak incidence of symptomatic IHD is age 50-60 (men) and 60-70 (women)
- for primary prevention of ischemic heart disease see Family Medicine, FM8

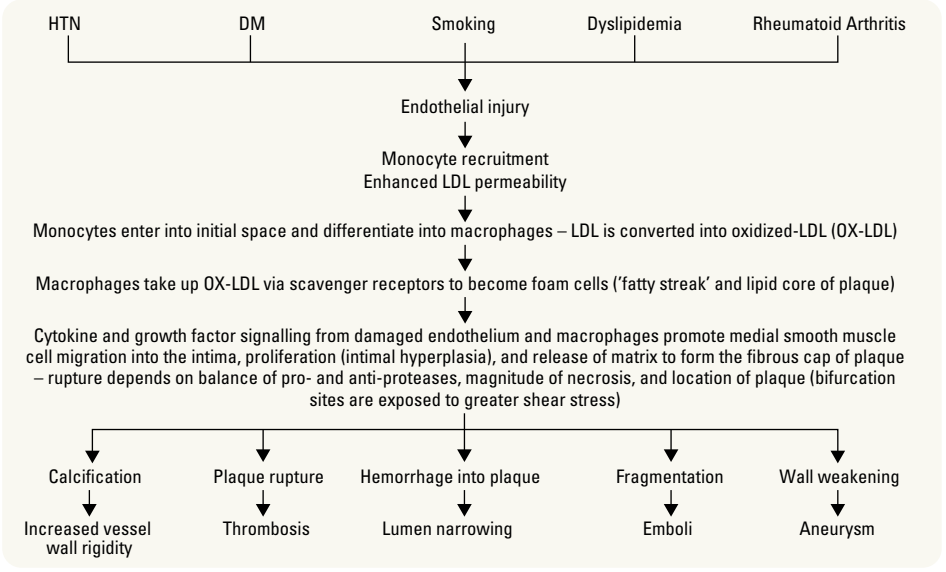

Figure 35. Pathophysiology of atherosclerosis

Table 9. Risk Factors and Markers for Atherosclerotic Heart Disease

Non-Modifiable Risk Factors	Modifiable Risk Factors §	Markers of Disease
Age	Hyperlipidemia*	Elevated high-sensitivity C-reactive protein (hsCRP)
Male, postmenopausal female	HTN*	Coronary artery calcification
Family history (FHx) of MI*	DM*	Carotid IMT/plaque
First degree male relative <55 yr	Cigarette smoking*	Ankle-brachial index
First degree female relative <65 yr	Psychosocial stress	
	Abdominal obesity	
	Sedentary lifestyle	
	Heavy alcohol intake	
	Not consuming fruits and vegetables daily	
	Elevated lipoprotein(a)	
	Hyperhomocysteinemia	

* Major risk factors
§ Modifiable risk factors account for >90% of MIs

Chronic Stable Angina

Definition
- symptom complex resulting from an imbalance between oxygen supply and myocardial oxygen demand in the myocardium

Etiology and Pathophysiology
- factors that decrease myocardial oxygen supply:
  - decreased luminal diameter: atherosclerosis, vasospasm
  - decreased duration of diastole: tachycardia (decreased duration of diastolic coronary perfusion)
  - decreased hemoglobin: anemia
  - decreased SaO_2: hypoxemia
  - congenital anomalies
- factors that increase myocardial oxygen demand:
  - increased HR: hyperthyroidism
  - increased contractility: hyperthyroidism
  - increased wall stress: myocardial hypertrophy, AS

Signs and Symptoms
- typical
  1. retrosternal chest pain, tightness or discomfort radiating to left (± right) shoulder/arm/neck/jaw, associated with diaphoresis, nausea, anxiety
  2. predictably precipitated by the "3 Es": exertion, emotion, eating
  3. brief duration, lasting <10-15 min and typically relieved by rest and nitrates
- atypical/probable angina (meets 2 of the above)
- non-cardiac chest pain (meets none or 1 of the above)
- Levine's sign: clutching fist over sternum when describing chest pain
- anginal equivalents: dyspnea, acute LV failure, flash pulmonary edema
- ischemia may present differently in understudied populations

Clinical Assessment
- history including directed risk factor assessment and physical exam
- labs: Hb, fasting glucose, fasting lipid profile, HbA1c, renal function tests, liver function tests, and thyroid function test
- 12-lead ECG (at rest and during episode of chest pain if possible)
- CXR (suspected HF, valvular disease, pericardial disease, aortic dissection/aneurysm, or signs/symptoms of pulmonary disease)
- stress testing (see *Stress Testing*, C15) or angiography
- echo for other causes of chest pain:
  - aortic dissection
  - valvular heart disease
  - HCM
  - LV dysfunction and/or wall motion abnormality
  - Pericardial disease/effusion

Differential Diagnosis
- see *Differential Diagnoses of Common Presentations*, C5

Treatment of Chronic Stable Angina
- refer to 2019 European Society of Cardiology guidelines for more information

1. General Measures
- goals: to reduce myocardial oxygen demand and/or increase oxygen supply
- lifestyle modification (diet, exercise, smoking cessation)
- treatment of risk factors: e.g. statins (see Endocrinology, E6, Family Medicine, FM11 for target lipid guidelines), antihypertensives
- pharmacological therapy to stabilize the coronary plaque which will prevent rupture and thrombosis

2. Antiplatelet Therapy (first-line therapy)
- ASA
- clopidogrel when ASA contraindicated
- low dose rivaroxaban in combination with ASA (based on COMPASS trial)

3. β-blockers (first-line therapy improves survival in patients with HTN)
- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- cardioselective agents preferred (e.g. metoprolol, atenolol) to avoid peripheral effects (inhibition of vasodilation and bronchodilation via β2 receptors)
- avoid intrinsic sympathomimetics (e.g. acebutolol) which increase demand

Chronic stable angina is most often due to a fixed stenosis caused by an atheroma
ACSs are the result of plaque rupture which causes a cascade resulting in thrombosis

Canadian Cardiovascular Society (CCS) Functional Classification of Angina
- **Class I**: ordinary physical activity (walking, climbing stairs) does not cause angina; angina with strenuous, rapid, or prolonged activity
- **Class II**: slight limitation of ordinary activity: angina brought on at >2 blocks on level or climbing >1 flight of stairs, or by emotional stress
- **Class III**: marked limitation of ordinary activity: angina brought on at <2 blocks on level or climbing <1 flight of stairs
- **Class IV**: inability to carry out any physical activity without discomfort; angina may be present at rest

Initial Invasive or Conservative Strategy for Stable Coronary Disease (ISCHEMIA)
NEJM 2020;382:1395-1407
Purpose: Assess clinical outcomes in stable coronary disease treated with invasive plus medical therapy vs. medical therapy alone.
Methods: 5179 patients were randomized to invasive therapy (angiography and revascularization) plus medical therapy or medical therapy alone plus angiography upon failure of initial conservative approach. The primary outcome was a composite of mortality from CV causes, MI, hospitalization for UA, HF or resuscitated cardiac arrest.
Results: Over a median of 3.2 yr, 318 and 352 primary outcome events occurred in the invasive-strategy and conservative-strategy groups, respectively. At 5 yr, the cumulative event rate was 16.4% and 18.2% in the invasive-strategy and conservative-strategy groups, respectively.
Conclusion: In patients with chronic stable coronary disease, there was no evidence that an initial invasive strategy reduced ischemic CV events or death from any cause over a median of 3.2 yr, compared with initial conservative medical therapy.

4. Nitrates (symptomatic control, no clear impact on survival)
- decrease preload (venous dilatation) and afterload (arteriolar dilatation), and increase coronary perfusion
- maintain daily nitrate-free intervals to prevent tolerance (tachyphylaxis)

5. Calcium Channel Blockers (CCBs, second-line or combination)
- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- caution: verapamil/diltiazem combined with β-blockers may cause symptomatic sinus bradycardia or AV block
- contraindicated in patients with LV systolic dysfunction

6. Renin-Angiotensin-Aldosterone System Blockade
- angina patients tend to have risk factors for CV disease which warrant use of an ACEI (e.g. HTN, DM, proteinuric renal disease, previous MI with LV dysfunction)
- ARB can be considered in patients intolerant to ACEI
- benefit in all patients at high-risk for CV disease (e.g. those with concomitant DM, renal dysfunction, or LV systolic dysfunction)

7. Invasive Strategies
- revascularization (see *Coronary Revascularization*, C37)

VARIANT ANGINA (PRINZMETAL'S ANGINA)
- myocardial ischemia secondary to coronary artery vasospasm with or without atherosclerosis
- uncommonly associated with infarction or LV dysfunction
- typically occurs between midnight and 8 am, unrelated to exercise, relieved by nitrates
- typically ST elevation is observed on ECG
- diagnosed by provocative testing with ergot vasoconstrictors (rarely done)
- treat with nitrates and CCBs
- strongly recommend patient to stop smoking

SYNDROME X
- typical symptoms of angina but normal angiogram
- may show definite signs of ischemia with exercise testing
- thought to be due to inadequate vasodilator reserve of coronary resistance vessels
- better prognosis than overt epicardial atherosclerosis

Acute Coronary Syndromes

Definition
- ACS includes the spectrum of UA, NSTEMI, and STEMI; this distinction aids in providing the appropriate therapeutic intervention
  - **UA** is clinically defined by any of the following:
    - accelerating pattern of pain: increased frequency, increased duration, decreased threshold of exertion, decreased response to treatment
    - angina at rest
    - new-onset angina
    - angina post-MI or post-procedure (e.g. PCI, CABG)
  - **MI** (STEMI/NSTEMI) is defined by evidence of myocardial necrosis and is diagnosed by a rise/fall of serum markers plus any one of:
    - symptoms of ischemia (chest/upper extremity/mandibular/epigastric discomfort; dyspnea)
    - ECG changes (ST-T changes, new BBB, or pathological Q waves)
    - imaging evidence (myocardial loss of viability, wall motion abnormality, or intracoronary thrombus)
    - if biomarker changes are unattainable, cardiac symptoms combined with new ECG changes is sufficient
  - **NSTEMI** meets criteria for MI without ST elevation or BBB
  - **STEMI** meets criteria for MI characterized by ST elevation or new BBB
- possible ACS in women, diabetics, and older adults is more likely to present with "atypical" symptoms such as dyspnea or weakness even in the presence of acute coronary-related ischemia

Efficacy and Safety of Low-Dose Colchicine after Myocardial Infarction (COLCOT)
NEJM 2019;381:2497-2505
Purpose: To determine if colchicine lowers risk of future CV events following MI.
Methods: Patients (n=4745) who had an MI within the last 30 d were randomized to colchicine once daily or placebo. The primary efficacy endpoint was a composite of death from CV causes, resuscitated cardiac arrest, MI, stroke, or urgent hospitalization for angina.
Results: Median follow-up was 22.6 mo. The primary endpoint occurred in 5.5% and 7.1% of patients in the colchicine and placebo groups, respectively (P=0.02). Pneumonia was observed in 0.9% of the patients in the colchicine group and in 0.4% of patients in the placebo group (P=0.03).
Conclusion: In patients with recent MI, colchicine lowered the risk of subsequent CV events as compared to placebo.

Investigations
- history and physical
  - note that up to 30% of MIs are unrecognized or "silent" due to atypical symptoms more common in women, patients with DM, elderly, post-heart transplant (because of denervation)
- ECG
- CXR

- labs
  - serum cardiac biomarkers for myocardial damage (use of high-sensitive cardiac troponin (hs-cTn) with a validated 0 h/2 h algorithm recommended blood sampling at 0 h and 2 h) (see *Cardiac Biomarkers*, C13)
  - CBC, International Normalized Ratio (INR)/prothrombin time test (PTT), electrolytes, magnesium, creatinine, urea, glucose, and serum lipids
  - draw serum lipids within 24-48 h because values are unreliable from 2-48 d post-MI

MANAGEMENT OF ACUTE CORONARY SYNDROMES

1. General Measures

- ABCs: assess and correct hemodynamic status first
- bed rest, cardiac monitoring, oxygen
- nitroglycerin sublingual (SL) followed by IV
- morphine IV

2. Antiplatelet and Anticoagulation Therapy

- see also 2018 CCS/CAIC Antiplatelet Guidelines, 2012 and 2010 CCS Antiplatelet Guidelines, and 2009 CCS Position Statement on Dual Antiplatelet Therapy in Patients Requiring Urgent CABG for details (free mobile apps available on iOS and Android platforms in the CCS app stores). Also see 2020 ESC guidelines on ACS management in patients without persistent ST-segment elevation, 2017 ESC guidelines on STEMI management, and 2019 CCS guidelines on acute STEMI management (focused update on regionalization and reperfusion)
- ASA chewed
- NSTEMI
  - Ticagrelor + ASA + LMWH/IV unfractionated heparin (UFH), unless contraindications
    - LMWH, except in renal failure or if CABG is planned, within 24 h. Fondaparinux also commonly used in Canada for initial medical management of NSTEMI/UA based on OASIS-5 results
  - clopidogrel used if patient ineligible for ticagrelor
- if PCI is planned: ticagrelor or prasugrel and consider IV glycoprotein IIb/IIIa inhibitor (e.g. abciximab)
  - clopidogrel used if patient ineligible for ticagrelor and prasugrel
  - prasugrel contraindicated in those with a history of stroke/TIA, and its avoidance or lower dose is recommended for those >75 yr or weighing <60 kg (TRITON-TIMI 38)
- anticoagulation options depend on reperfusion strategy:
  - primary PCI: UFH during procedure; bivalirudin is a possible alternative
  - thrombolysis: LMWH (enoxaparin) until discharge from hospital; can use UFH as alternative because of possible rescue PCI
  - no reperfusion: LMWH (enoxaparin) until discharge from hospital
- continue LMWH or UFH followed by oral anticoagulation at discharge if at high-risk for thromboembolic event (large anterior MI, severe LV dysfunction, CHF, previous DVT or PE, or echo evidence of mural thrombus)
  - in patients with AFib (CHA2DS2-VASc score ≥1 in men and ≥2 in women), use triple antithrombotic therapy for up to 1 week and then transition to dual antithrombotic therapy (using a NOAC and an antiplatelet agent (preferably clopidogrel))

3. β-blockers

- STEMI: contraindications include signs of HF, low output states, risk of cardiogenic shock, heart block, asthma, or airway disease; initiate orally within 24 h of diagnosis when indicated
- if β-blockers are contraindicated or if β-blockers/nitrates fail to relieve ischemia, non-dihydropyridine CCB (e.g. diltiazem, verapamil) may be used as second-line therapy in the absence of severe LV dysfunction or pulmonary vascular congestion (CCB do not prevent MI or decrease mortality)

4. Invasive Strategies and Reperfusion Options

- UA/NSTEMI: early coronary angiography ± revascularization if possible is recommended with any of the following high-risk indicators:
  - diagnosis of NSTEMI
  - recurrent angina/ischemia at rest despite intensive anti-ischemic therapy
  - CHF or LV dysfunction
  - hemodynamic instability
  - high (≥3) Thrombolysis in Myocardial Infarction (TIMI) risk score (tool used to estimate mortality following an ACS)
  - GRACE risk score >140
  - sustained ventricular tachycardia
  - dynamic ECG changes, transient ST-elevation
  - high-risk findings on non-invasive stress testing
  - PCI within the previous 6 mo
  - repeated presentations for ACS despite treatment and without evidence of ongoing ischemia or high-risk features
  - note: thrombolysis is NOT administered for UA/NSTEMI

Complete Revascularization with Multivessel PCI for Myocardial Infarction (COMPLETE)
NEJM 2019;381:1411-1421
Purpose: To determine if PCI of non-culprit lesions, in addition to culprit lesions, further reduces the risk of CV events or MI in patients with STEMI.
Methods: Patients with STEMI and multivessel CAD who had undergone culprit-lesion PCI (n=4041) were randomized to either complete revascularization with PCI (of significant non-culprit lesions) or no further revascularization. The two main outcomes measured included: 1) the composite of CV death or MI, and 2) the composite of CV death, MI, or ischemia-driven revascularization.
Results: The first outcome was observed in 7.8% of the complete revascularization group and 10.5% of the culprit-lesion-only PCI group (P=0.004). The second outcome was observed in 8.9% of the complete revascularization group and 16.7% of the culprit-lesion-only PCI group (P<0.001).
Conclusions: In patients with STEMI and multivessel CAD, complete revascularization by PCI further reduced the risk of CV death or MI as compared to culprit-lesion-only PCI.

TIMI Risk Score for UA/NSTEMI

Characteristics	Points
Historical	
Age ≥65 yr	1
≥3 risk factors for CAD	1
Known CAD (stenosis ≥50%)	1
Aspirin ® use in past 7 d	1
Presentation	
Recent (≤24 h) severe angina	1
ST-segment deviation ≥0.5 mm	1
Increased cardiac marker	1

Risk Score = Total Points
If TIMI risk score ≥3 , consider early LMWH and angiography
TIMI = thrombolysis in myocardial infarction
UA = unstable angina
JAMA 2000;284:835-842

- STEMI
  - after diagnosis of STEMI is made, do not wait for results of further investigations before implementing reperfusion therapy
  - goal is to re-perfuse artery: thrombolysis ("EMS-to-needle") within 30 min or primary PCI ("EMS-to-balloon") within 90 min (if available)
  - PCI
    - early PCI (≤12 h after symptom onset and <90 min after presentation) improves mortality vs. thrombolysis with fewer intracranial hemorrhages and recurrent MIs
    - primary PCI: without prior thrombolytic therapy method of choice for reperfusion in experienced centres
    - rescue PCI: following failed thrombolytic therapy (diagnosed when ST segment elevation fails to resolve below half its initial magnitude after thrombolysis and patient still has chest pain)
  - thrombolysis
    - assuming no contraindications, use if <12 h since symptom onset and primary PCI cannot be conducted within 120 minutes of STEMI diagnosis
    - note: benefit of thrombolysis is inversely proportional to time from symptom onset; in patients meeting the above criteria, the later the presentation (>3 h), the more one should consider using primary PCI instead (depending on clinical circumstances)

Newer, more accurate risk quantification scores for UA/NSTEMI exist, such as the GRACE Risk Score; however, TIMI is still used most often

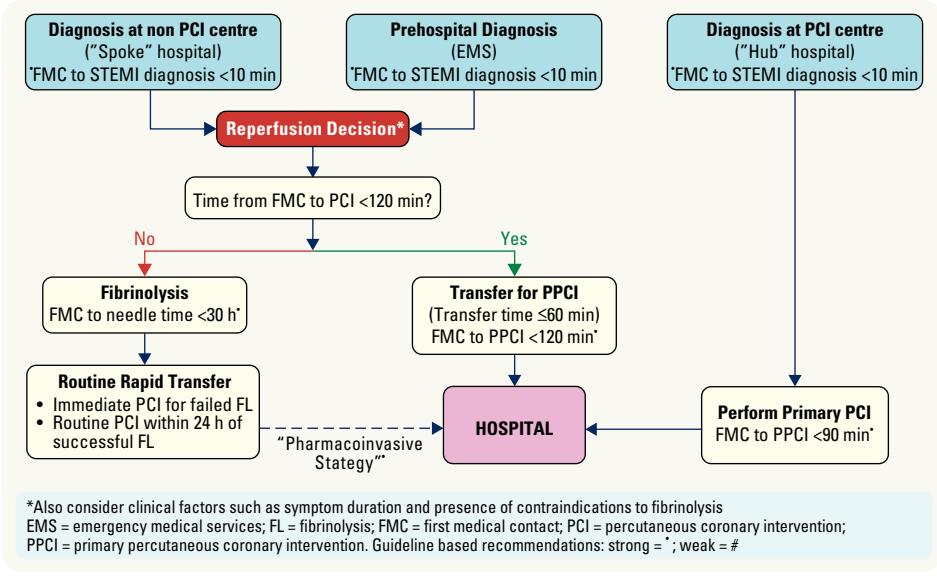

Figure 36. Reperfusion strategy in STEMI

Table 10. Contraindications for Thrombolysis in STEMI

Absolute	Relative
Prior intracranial hemorrhage	Chronic, severe, poorly controlled HTN
Known structural cerebral vascular lesion	Uncontrolled HTN (sBP >180, dBP >110)
Known malignant intracranial neoplasm	Current anticoagulation
Significant closed-head or facial trauma (≤3 mo)	Noncompressible vascular punctures
Ischemic stroke (≤3 mo)	Ischemic stroke (≥3 mo)
Active bleeding	Recent internal bleeding (≤2-4 wk)
Suspected aortic dissection	Prolonged CPR or major surgery (≤3 wk)
	Pregnancy
	Active peptic ulcer disease

Long-Term Management of ACS

- risk of progression to MI, or recurrence of MI, or death is highest within 1 mo
- at 1-3 mo after the acute phase, most patients resume a clinical course similar to that in patients with chronic stable coronary disease
- pre-discharge workup: ECG and echo to assess residual LV systolic function
- drugs required in hospital to control ischemia should be continued after discharge in all patients
- other medications for long-term management of ACS are summarized below

1. General Measures

- education
- risk factor modification

2. Antiplatelet and Anticoagulation Therapy
- see also CCS Antiplatelet Guidelines 2012 for details (free mobile apps available on iOS and Android platforms in the CCS app stores)
- ECASA 81 mg daily
- ticagrelor 90 mg BID or prasugrel 10 mg daily (at least 1 mo, up to 9-12 mo; if stent placed at least 12 mo)
- clopidogrel 75 mg daily can be used as alternatives to ticagrelor and prasugrel when indicated
- ± warfarin x 3 mo if high-risk (high-risk patients include those with large anterior MI, LV thrombus, LVEF <30%, history of VTE, chronic AFib)
- rivaroxaban 2.5 mg BID (based on COMPASS trial)

3. β-Blockers (e.g. metoprolol 25-50 mg BID or atenolol 50-100 mg daily)

4. Nitrates
- alleviate ischemia but do not improve outcome
- use with caution in right-sided MI patients who have become preload dependent

5. Calcium Channel Blockers (NOT recommended as first line treatment, consider as alternative to β-blockers)

6. ACEIs
- prevent adverse ventricular remodelling
- recommended for asymptomatic high-risk patients (e.g. diabetics), even if LVEF >40%
- recommended for symptomatic CHF, reduced LVEF (<40%), anterior MI
- use ARBs in patients who are intolerant of ACEI; avoid combining ACEI and ARB

7. ± Aldosterone Antagonists
- if already on ACEI and β-blockers, with and LVEF <40% and CHF or DM
- significant mortality benefit shown with eplerenone by 30 d

8. Lipid Lowering Therapy Statins (early, intensive, irrespective of cholesterol level; e.g. atorvastatin 80 mg daily)
- atorvastatin 80 mg daily (ezetimibe or PCSK9 inhibitor if LDL <2 mmol/L)

9. Invasive Cardiac Catheterization if indicated (risk stratification)

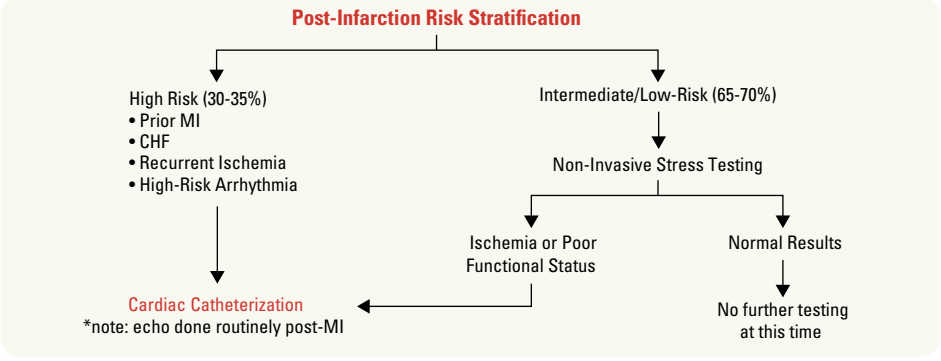

Figure 37. Post-MI risk stratification

Is this Patient having a MI?
From The Rational Clinical Examination
JAMA 1998;381(14):1256-1263
Study: Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of an acute MI.
Results: In patients with normal or non-diagnostic ECG, no established CAD, and prolonged or recurrent chest pain typical of their usual discomfort, radiation of pain to the shoulder OR both arms had the highest positive likelihood ratio (+LR) of 4.1 and a negative likelihood ratio (-LR) of 0.68. Radiation to the right arm had a +LR of 3.8 and –LR of 0.86, vomiting had a +LR of 3.5 and –LR of 0.87, while radiation to the left arm only had a +LR of 1.3 and a –LR of 0.9.
Conclusions: The most compelling features that increase likelihood of an MI are ST-segment and cardiac enzyme elevation, new Q-wave, and presence of an S3 heart sound. In patients where the diagnosis of MI is uncertain, radiation of pain to the shoulder OR both arms, radiation to the right arm, and vomiting had the best predictive values, while radiation to the left arm is relatively non-diagnostic.

Prognosis following STEMI
- 5-15% of hospitalized patients will die
  - risk factors
    - infarct size/severity
    - age
    - comorbid conditions
    - development of HF or hypotension
- post-discharge mortality rates
  - 6-8% within first year, half of these within first 3 mo
  - 4% per year following first yr
  - risk factors
    - LV dysfunction
    - residual myocardial ischemia
    - ventricular arrhythmias
    - history of prior MI

Complications of MI

CRASH PAD
Cardiac Rupture
Arrhythmia
Shock
Hypertension/Heart failure
Pericarditis/Pulmonary embolism
Aneurysm
DVT

Resting LVEF is a useful prognostic factor

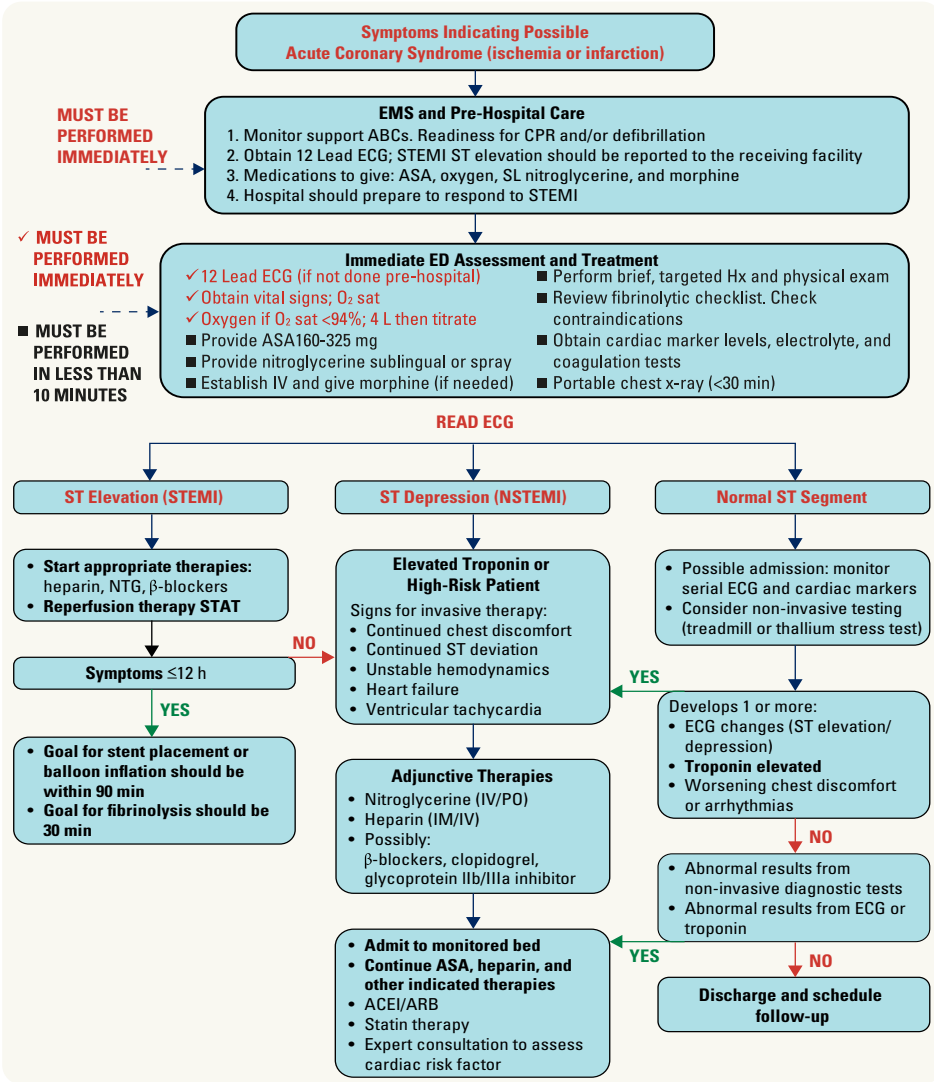
Table 11. Complications of MI

Complication	Etiology	Presentation	Therapy
Arrhythmia			See *Arrhythmias*, C19
1. Tachycardia	Sinus, AFib, VT, VFib	First 48 h	
2. Bradycardia	Sinus, AV block	First 48 h	
Myocardial Rupture			
1. LV free wall	Transmural infarction	1-7 d	Surgery
2. Papillary muscle (→ MR)	Inferior infarction	1-7 d	Surgery
3. Ventricular septum (→ VSD)	Septal infarction	1-7 d	Surgery
Shock/CHF	Infarction or aneurysm	Within 48 h	Inotropes, intra-aortic balloon pump
Post-Infarct Angina	Persistent coronary stenosis	Anytime	Aggressive medical therapy
	Multivessel disease		PCI or CABG
Recurrent MI	Reocclusion	Anytime	Aggressive medical therapy
			PCI or CABG
Thromboembolism	Mural/apical thrombus DVT	7-10 d, up to 6 mo	Anticoagulation
Pericarditis	Inflammatory	1-7 d	ASA
Dressler's Syndrome	Autoimmune	2-8 wk	

Treatment of NSTEMI

BEMOAN
β-blocker
Enoxaparin
Morphine
O$_2$
ASA
Nitrates

Treatment Algorithm for Acute Coronary Syndrome



Contraindications to nitrates: severe aortic stenosis, hypertrophic cardiomyopathy, suspected right ventricular infarct, hypotension, marked bradycardia or tachycardia, and recent use of phosphodiesterase 5 inhibitors.

Figure 38. AHA ACLS acute coronary syndrome algorithm
Adapted from: Jeffery Media Productions 2016. Amsterdam EA, Wenger NK, Brindis RG, et al. 2014 AHA/ACC guideline for the management of patients with non-ST-elevation acute coronary syndromes. Circulation. 2014 Jan 1:CIR-0000000000000134

Coronary Revascularization

PERCUTANEOUS CORONARY INTERVENTION

- interventional cardiology technique aimed at relieving significant coronary artery stenosis
- main techniques: balloon angioplasty, stenting
- less common techniques: rotational/directional/extraction atherectomy

Indications

- medically refractory angina
- NSTEMI/UA with high-risk features (e.g. high TIMI risk score)
- primary/rescue PCI for STEMI
  - UA/NSTEMI if not a CABG candidate
  - STEMI when PCI can be performed more rapidly and safely than CABG

Balloon Angioplasty and Intracoronary Stenting

- coronary lesions dilated with balloon inflation
- major complication is restenosis (approximately 15% at 6 mo), thought to be due to elastic recoil and neointimal hyperplasia
- majority of patients receive intracoronary stent(s) to prevent restenosis
  - bare metal stent (BMS) vs. drug-eluting stents: PRAMI trial demonstrated stenting non-culprit lesions results in 14% absolute risk reduction of cardiac death, nonfatal MI, or refractory angina
  - coated with antiproliferative drugs (sirolimus, paclitaxel, everolimus, zotarolimus)
  - reduced rate of neointimal hyperplasia and restenosis compared to BMS (5% vs. 20%)
  - complication: late stent thrombosis (5 events per 1000 stents implanted)

Adjunctive Therapies

- ASA and heparin decrease post-procedural complications
- further reduction in ischemic complications has been demonstrated using GPIIb/IIIa inhibitors (abciximab, eptifibatide, tirofiban) in coronary angiography and stenting
- following stent implantation
  - dual antiplatelet therapy (ASA and clopidogrel) for 6 mo (and up to 1 yr)
  - consider short-duration DAPT for 1 mo with BMS or 3 mo with DES followed by monotherapy for 12 mo among patients with high ischemic or bleeding risk
  - ASA and prasugrel can be considered for those at increased risk of stent thrombosis

Procedural Complications

- mortality and emergency bypass rates <1%
- nonfatal MI: approximately 2-3%

CORONARY ARTERY BYPASS GRAFT SURGERY

- objective of CABG is complete revascularization of the myocardium

Indications

- ≥50% diameter stenosis in the left main coronary artery
- ≥70% diameter stenosis in three major coronary arteries
- ≥70% diameter stenosis in the proximal LAD artery plus one other major coronary artery
- survivors of sudden cardiac arrest with presumed ischemia-mediated VT caused by significant (≥70% diameter) stenosis in a major coronary artery
- ≥70% diameter stenosis in two major coronary arteries (without proximal LAD disease) and evidence of extensive ischemia
- ≥70% diameter stenosis in the proximal LAD artery and evidence of extensive ischemia
- multivessel CAD in patients with diabetes
- LV systolic dysfunction (LVEF 35% to 50%) and with significant multivessel CAD or proximal LAD stenosis where viable myocardium is present in the region of intended revascularization
- one or more significant (≥70% diameter) coronary artery stenosis amenable to revascularization and unacceptable angina despite medical therapy

Contraindications

- CABG may be contraindicated in patients who are: elderly/frail, have multiple comorbidities or, for any other reason, may not survive surgery
- CABG may be contraindicated in patients who do not have myocardial viability
- CABG is contraindicated in patients that lack bypassable vessels

Results

- perioperative and in-hospital mortality rate after CABG: ~1% for the lowest risk elective patients, and 2-5% for all patients (depends on hospital and surgeon experience and patient characteristics)
- postoperative mortality: 3.2% at 30 days, 6.4% at 180 days, 8.1% at 1 year, and 23.3% at 3 years of follow-up
- predictive variables for early hospital mortality include older age (>80 yr), female sex, urgency of operation, left main stem disease, increasing extent of CAD, increasing LV dysfunctions, redo CABG

See Landmark Cardiac Trials for more information on EXCEL which details the long-term efficacy profile of CABG vs. PCI in patients with left main CAD.

Ticagrelor with or without Aspirin® in High-Risk Patients after PCI
NEJM 2019;381:2032-2042
Purpose: To determine if monotherapy with ticagrelor, a P2Y12 inhibitor, after a period of dual antiplatelet therapy reduces the risk of bleeding following PCI.
Methods: Patients who were at high-risk for bleeding or an ischemic event underwent PCI and 3 mo of treatment with ASA plus ticagrelor. Patients (n=7119) were then randomized to receive either ticagrelor plus ASA or ticagrelor plus placebo for a year. The primary endpoint was Bleeding Academic Research Consortium (BARC) type 2, 3, or 5 bleeding.
Results: The primary endpoint was observed in 4.0% of patients in the ticagrelor plus placebo group and 7.1% of patients in the ticagrelor plus ASA group (P<0.001). The incidence of death from any cause, nonfatal MI, or nonfatal stroke was 3.9% in both groups (P<0.001 for noninferiority).
Conclusion: Among high-risk bleed patients who received PCI and 3 mo of dual antiplatelet therapy, additional ticagrelor monotherapy was associated with lower incidence of bleeding and the same risk of death, as compared to ticagrelor plus ASA therapy.

Safety and Efficacy Outcomes of Double vs. Triple Antithrombotic Therapy in Patients with Atrial Fibrillation Following Percutaneous Coronary Intervention
Eur Heart J 2019; 40:3757-3767
Purpose: To evaluate the safety and efficacy of double vs. triple antithrombotic therapy (DAT vs. TAT) in patients with AFib and ACS following PCI.
Methods: Systematic review and meta-analysis of 4 trials with a total of 10234 patients.
Conclusions: DAT was associated with lower risk of bleeding, but higher risk of stent thrombosis and MI compared to TAT. There was no significant difference in all-cause and cardiovascular death, stroke, and major adverse cardiovascular events.

See Landmark Cardiac Trials for more information on SYNTAX, which details all-cause mortality, stroke, MI or repeat revascularization 12 mo following PCI vs. CABG

Skeletonized Approach

- alternative approach to traditional pedicled approach for isolation of the LIMA/LITA, RIMA/RITA, and BIMA/BITA
- skeletonized arteries have been dissociated from the accompanying veins, fascia, and lymphatics present in pedicled arterial grafts
- the use of skeletonized BIMA/BITA is associated with a lower rate of sternal wound complications including mediastinitis and sternal dehiscence particularly in diabetic patients
- skeletonized BIMA/BITA has been found to reduce postoperative pain and improve sternal perfusion but does not differ in conduit length or arterial flow and has been shown to have reduced long-term patency compared to pedicled BIMA/BITA conduits
- skeletonization requires more time and technical proficiency with the potential for increased endothelial damage and vasoreactivity

Table 12. Choice of Revascularization Procedure

	PCI	CABG
Advantages	Less invasive technique Decreased periprocedural morbidity and mortality Shorter periprocedural hospitalization	Greater ability to achieve complete revascularization Decreased need for repeated revascularization procedures
Factors favouring Revascularization Procedure	**Clinical characteristics** Severe comorbidity Advanced age/frailty/reduced life expectancy Restricted mobility and conditions that affect rehabilitation **Anatomical and technical aspects** MVD with SYNTAX score <23 Anatomy likely resulting in incomplete revascularization with CABG due to poor quality or missing conduits Severe chest deformation or scoliosis Sequelae of chest radiation Porcelain aorta	**Clinical characteristics** Diabetes Reduced LV function (EF ≤35%) Contraindications to DAPT Recurrent diffuse in-stent restenosis **Anatomical and technical aspects** MVD with SYNTAX score ≥23 Anatomy likely resulting in incomplete revascularization with PCI Severely calcified coronary artery lesions limiting lesion expansion Need for concomitant interventions Ascending aortic pathology with indication for surgery Concomitant cardiac surgery

Note: Table reflects guidelines from the European Society of Cardiology that have been taught to Canadian cardiac surgery residents

Table 13. Conduits for CABG

Graft	Occlusion/Patency Rate	Considerations
Saphenous Vein Grafts (SVG)	At 10 yr: 50% occluded, 25% stenotic, 25% angiographically normal	Used to be commonly used, but arterial conduits have proven to be superior
Left Internal Thoracic/Mammary Artery (LITA/ LIMA to LAD)	90-95% patency at 15 yr	Considered the standard conduit for CABG Excellent patency Almost always used to bypass LAD Improved event-free survival (angina, MI) Decreased late cardiac events
Right Internal Thoracic/Mammary Artery (RITA/RIMA)	Pedicled RIMA patency comparable to LIMA Lower rate of free RIMA patency	Used in bilateral ITA/IMA grafting Patients receiving bilateral ITAs/IMAs have less risk of recurrent angina, late MI, angioplasty
Radial Artery (free graft)	85-95% patency at 5 yr	Prone to severe vasospasm postoperatively due to vascular muscular wall
Right Gastroepiploic Artery	80-90% patency at 5 yr	Primarily used as an *in situ* graft to bypass the RCA Use limited because of the fragile quality of the artery, technical issues, increased operative time (laparotomy incision), and incisional discomfort with associated ileus
Complete Arterial Revascularization		For younger patients (<60 y/o) Preferred due to longer term graft patency
Redo Bypass Grafting		Indications for redo CABG: symptomatic patients (disabling angina) who have failed medical therapy, have stenotic vessels, have viable myocardium, have suitable distal targets Risk factors for redo CABG: poor control of HTN/ hypercholesterolemia/smoking, normal LV, 1 or 2 vessel disease, no use of IMA/ITA in initial CABG, incomplete revascularization in initial CABG, young age Operative mortality 2-3 times higher than first operation 10% perioperative MI rate Reoperation undertaken only in symptomatic patients who have failed medical therapy and in whom angiography has documented progression of the disease Increased risk with redo-sternotomy secondary to adhesions which may result in laceration to aorta, RV, IMA/ITA, and other bypass grafts, uncontrollable hemorrhage, arterial bleeding and VFib, venous bleeding, or failure to arrest heart

Adapted from: Chikwe J, Beddow E, Glenville B. Cardiothoracic Surgery, 1st ed. Oxford, UK: Oxford UP. 2006.

Percutaneous Coronary Intervention Versus Coronary Artery Bypass Grafting in Patients with Three-vessel or Left Main Coronary Artery Disease
Lancet 2019;394:1325-34
Purpose: Report 10-yr all-cause mortality results as a 10-yr follow-up to the 2009 SYNTAX trial.
Methods: Adult patients with established left main CAD or three-vessel coronary disease were randomized to receive either PCI or CABG in a 1:1 ratio. Patients with a prior history of MI, PCI or CABG were excluded. The primary study endpoint was 10-yr all-cause mortality.
Results: 10-yr all-cause mortality rates were 28% and 24% for PCI- and CABG-treated patients, respectively (hazard ratio 1.19; 95% CI 0.99 to 1.43; p=0.066). In subgroup analysis, 10-yr all-cause mortality was 28% and 21% in PCI and CABG patients with three-vessel disease, respectively (hazard ratio 1.42; 95% CI 1.11 to 1.81). The same primary endpoint occurred in patients with left main coronary disease at a rate of 27% and 28% in PCI and CABG patients, respectively (hazard ratio 0.92; 0.69 to 1.22; P=0.023).
Conclusions: CABG provided a significant all-cause survival benefit in patients with three-vessel disease, compared to PCI in the same population. This effect was not observed in patients with left main CAD or in the pooled study sample.

Duration of Dual Antiplatelet Therapy Following Drug-eluting Stent Implantation: A Systematic Review and Meta-Analysis of Randomized Controlled Trials with Longer Follow up
Catheter Cardiovasc. Interv. 2017; 90:31-7
Purpose: Conduct an updated meta-analysis to compare the efficacy and safety of short-term dual antiplatelet therapy (S-DAPT) vs. long-term DAPT (L-DAPT) in patients who underwent drug-eluting stent (DES) implantation.
Methods: RCTs comparing efficacy and/or safety outcomes for different DAPT durations after coronary DES implantation were searched in PubMed, CINAH, Cochrane CENTRAL, EMBASE, Scopus, and Web of Science. S-DAPT was defined as ≤12 mo duration of aspirin plus P2Y12 receptor inhibitor, while L-DAPT was defined as the same combination for >12 mo duration after DES implantation.
Results: 5 RCTs met all eligibility criteria and were included in the final meta-analysis. Outcomes of interest included all-cause mortality, cardiac mortality, myocardial infarction, stent thrombosis, target vessel revascularization, stroke, or major bleeding. Compared with L-DAPT, S-DAPT did not significantly increase the rate of stent thrombosis (OR 1.59; 95% CI 0.77 to 3.27). All-cause mortality, cardiac mortality, target vessel revascularization and stroke were also not significantly different between groups. However, S-DAPT was associated with an increased risk of MI (OR 1.48; 95% CI 1.04 to 2.10) and a lowered risk of major bleeding (OR 0.64; 95% CI 0.41 to 0.99).
Conclusions: In this meta-analysis with a longer follow-up time of ≥24 months, S-DAPT compared to L-DAPT was associated with increased risk of MI but lower rates of major bleeding. No significant differences were found for all-cause mortality, cardiac mortality, stent thrombosis, target vessel revascularization, or stroke.

Operative Issues
- LV function is an important determinant of outcome for all heart diseases
- patients with severe LV dysfunction usually have poor prognosis, but surgery can sometimes dramatically improve LV function
- assess viability of non-functioning myocardial segments in patients with significant LV dysfunction using delayed thallium myocardial imaging, stress echo, positron emission tomography (PET) scanning, or MRI

CABG and Antiplatelet Regimens
- refer to CCS guidelines 2018 update on antiplatelet therapy for more information
- prior to CABG, clopidogrel and ticagrelor should be discontinued for 5 d, and prasugrel for 7 d before surgery
- dual antiplatelet therapy should be continued for 12 mo in patients with ACS within 48-72 h after CABG
- ASA (81 mg) continued indefinitely (can be started 6 h after surgery)
- patients requiring CABG after PCI should continue their dual antiplatelet therapy as recommended in the post-PCI guidelines

Table 14. Risk Factors for CABG Mortality and Morbidity

Risk Factors for CABG Mortality	Risk Factors for CABG Postoperative Morbidity or Increased Length of Stay
Urgency of surgery (emergent or urgent)	Reoperation
Reoperation	Emergent procedure
Older age	Preoperative intra-aortic balloon pump (IABP)
Poor LV function (see below)	CHF
Female gender	CABG + valve surgery
Left main disease	Older age
Others include catastrophic conditions (cardiogenic shock, ventricular septal rupture, ongoing CPR), dialysis-dependent renal failure, end-stage COPD, DM, cerebrovascular disease, and peripheral vascular disease	Renal dysfunction COPD DM Cerebrovascular disease

Note: risk factors are listed in decreasing order of significance

Procedural Complications
- CABG using CPB (see *Cardiopulmonary Bypass*, C68)
  - stroke and neurocognitive defects (microembolization of gaseous and particulate matter)
  - immunosuppression
  - deep sternal wound infection
  - bleeding
  - systemic inflammatory response leading to:
    - myocardial dysfunction
    - renal dysfunction
    - neurological injury
    - respiratory dysfunction
    - coagulopathies

OFF-PUMP CORONARY ARTERY BYPASS SURGERY

Procedure
- avoids the use of CPB by allowing surgeons to operate on a beating heart
  - stabilization devices (e.g. Genzyme Immobilizer®) hold heart in place allowing operation while positioning devices (Medtronic Octopus® and Starfish® system) allow the surgeon to lift the beating heart to access the lateral and posterior vessels
  - procedure is safe and well tolerated by most patients; however, this surgery remains technically more demanding

Indications/Contraindications
- used in poor candidates for CPB who have: calcified aorta, poor LVEF, severe PVD, severe COPD, chronic renal failure, coagulopathy, transfusion objections (e.g. Jehovah's Witness), good target vessels, anterior/lateral wall revascularization, target revascularization in older, sicker patients
- absolute contraindications: hemodynamic instability, poor quality target vessels including intramyocardial vessels, diffusely diseased vessels, and calcified coronary vessels
- relative contraindications: cardiomegaly/CHF, critical left main disease, small distal targets, recent or current acute MI, cardiogenic shock, LVEF <35%

Outcomes
- OPCAB surgery decreases in-hospital morbidity (decreased incidence of chest infection, inotropic requirement, supraventricular arrhythmia), blood product transfusion, ICU stay, length of hospitalization, and CK-MB and troponin I levels
  - OPCAB has been associated with lower graft patency

See Landmark Cardiac Trials for more information on ROOBY, which details the 5-year clinical outcomes in patients undergoing on-pump vs. off-pump CABG

Dichotomies of HF
- Forward vs. backward
- Left-sided vs. right-sided
- Systolic vs. diastolic dysfunction
- Low output vs. high output

Use EF to Grade LV Dysfunction
- Grade I (EF >60%) (Normal)
- Grade II (EF = 40-59%)
- Grade III (EF = 21-39%)
- Grade IV (EF ≤20%)

Table 15. Signs and Symptoms of Left vs. Right HF

	Left Failure	Right Failure
Low CO (Forward)	Fatigue Syncope Systemic hypotension Cool extremities Slow capillary refill Peripheral cyanosis Pulsus alternans MR S3	Left failure symptoms if decreased RV output leads to LV underfilling TR S3 (right-sided)
Venous Congestion (Backward)	Dyspnea, orthopnea, PND Cough Crackles	Peripheral edema Elevated JVP with abdominojugular reflux, and ± Kussmaul's sign Hepatomegaly Pulsatile liver

Pathophysiology

- most common causes are ischemic heart disease, HTN, valvular heart disease
- myocardial insult causes pump dysfunction/impaired filling leading to myocardial remodeling and the following maladaptive changes:
  - pressure overload (e.g. AS or HTN) leads to compensatory hypertrophy (i.e. concentric remodeling) and eventually interstitial fibrosis
  - volume overload (e.g. aortic insufficiency) leads to dilatation (i.e. eccentric remodeling)
- remodeling results in decreased forward CO resulting in activation of the SNS and RAAS
- SNS causes tachycardia
- RAAS causes Na^+ and water retention to increase preload and afterload
- net result is increased cardiac demand leading to eventual decompensation

Heart Failure with Reduced Ejection Fraction (HFrEF: LVEF ≤40%)

- impaired myocardial contractile function ➔ decreased LVEF and SV ➔ decreased CO
- volume overload is the typical phenotype
- findings: apex beat displaced, S3, cardiothoracic ratio >0.5, decreased LVEF, LV dilatation
- causes
  - ischemic (e.g. extensive CAD, previous MI)
  - non-ischemic
    - HTN
    - DM
    - EtOH (and other toxins)
    - myocarditis
    - DCM (multiple causes see *Dilated Cardiomyopathy*, C47)
    - tachycardia-induced

Heart Failure with Mid-Range Ejection Fraction (HF-mrEF: LVEF 41-49%)

- includes patients who are recovering from HFrEF, declining from HFpEF, and transitioning to HFpEF
- characterization of HFmEF ongoing; guideline management does not currently exist

Heart Failure with Preserved Ejection Fraction (HFpEF: LVEF ≥50%)

- previously known as "diastolic HF"
- concentric remodelling with a "stiff" LV is the typical phenotype
- 50% of patients with HF have preserved EF; confers similar prognosis to HFrEF; more common in the elderly and females
- reduced LV compliance causes increased LV filling pressures, increased LA pressure/volume, and pulmonary congestion
- findings: HTN, apex beat sustained, S4, normal-sized heart on CXR, LVH on ECG/echo, normal EF
- causes
  - transient: ischemia (e.g. CAD, MI)
  - permanent: severe hypertrophy (HTN, AS, HCM), RCM (e.g. amyloid), MI

High-Output Heart Failure

- caused by demand for increased CO
- often exacerbates existing HF or decompensates a patient with other cardiac pathology
- DDx: anemia, thiamine deficiency (beriberi), hyperthyroidism, arteriovenous (A-V) fistula or left to right (L-R) shunting, Paget's disease, renal disease, hepatic disease

Precipitants of Symptomatic Exacerbations

- consider natural progression of disease vs. new precipitant
- always search for reversible cause

See Landmark Cardiac Trials for more information on **DAPA-HF** which details the efficacy of SGLT2 inhibition in patients with HFrEF and without T2DM.

See Landmark Cardiac Trials for more information on **PARADIGM-HF** which details the survival outcomes of HFrEF patients treated with an ACEI or an angiotensin-neprilysin inhibitor.

A Validated Clinical and Biochemical Score for the Diagnosis of Acute Heart Failure: the ProBNP Investigation of Dyspnea in the Emergency Department (PRIDE) Acute Heart Failure Score
Am Heart J 2006;151:48-54

Predictor	Possible Score
Age >75 yr	1
Orthopnea present	2
Lack of cough	1
Current loop diuretic use (before presentation)	1
Rales on lung exam	1
Lack of fever	2
Elevated NT-proBNP (>450 pg/mL if <50 yr, >900 pg/mL if >50 yr)	4
Interstitial edema on CXR	2
Total	/14

Likelihood of HF
Low = 0-5
Intermediate = 6-8
High = 9-14

BNP is secreted by Vs due to LV stretch and wall tension. Cardiomyocytes secrete BNP precursor that is cleaved into proBNP. After secretion into Vs, proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP. The above scoring algorithm developed by Baggish et al. is commonly used. A score of <6 has a negative predictive value of 98%, while scores ≥6 had a sensitivity of 96% and specificity of 84% (P<0.001) for the diagnosis of acute HF

NYHA Functional Classification of HF

- **Class I**: ordinary physical activity does not cause symptoms of HF
- **Class II**: comfortable at rest; ordinary physical activity results in symptoms
- **Class III**: marked limitation of ordinary activity; less than ordinary physical activity results in symptoms
- **Class IV**: inability to carry out any physical activity without discomfort; symptoms may be present at rest

- DDx can also be organized as follows:
  - new cardiac insult/disease: MI, arrhythmia, valvular disease, cardiotoxic chemotherapy
  - new demand on CV system: HTN, anemia, thyrotoxicosis, infection
  - medication non-compliance
  - dietary indiscretion (e.g. salt intake)
  - obstructive sleep apnea

Investigations
- identify and assess precipitating factors and treatable causes of CHF
- blood work: CBC, electrolytes (including calcium and magnesium), blood urea nitrogen (BUN), Cr, fasting blood glucose, hemoglobin A1c, lipid profile, LFTs, serum TSH ± ferritin, BNP, uric acid
- ECG: look for chamber enlargement, arrhythmia, ischemia/infarction
- CXR: cardiomegaly, pleural effusion, redistribution, Kerley B lines, bronchiolar-alveolar cuffing
- echo: systolic function (LVEF), diastolic function (E/A ratio, E/e'), cardiac dimensions, wall motion abnormalities, RV systolic pressure (from TR jet), valvular disease, pericardial effusion
- radionuclide angiography: LVEF
- myocardial perfusion scintigraphy (thallium or sestamibi SPECT)

Acute Treatment of Pulmonary Edema
- treat acute precipitating factors (e.g. ischemia, arrhythmias)
  - **L** Lasix® (furosemide) 40-500 mg IV
  - **M** morphine 2-4 mg IV: decreases anxiety and preload (venodilation)
  - **N** nitroglycerin: topical/IV/SL - use with caution in preload-dependent patients (e.g. right HF or RV infarction) as it may precipitate CV collapse
  - **O** oxygen: in hypoxemic patients
  - **P** positive airway pressure (continuous positive airway pressure (CPAP)/bilevel positive airway pressure (BiPAP)): decreases preload and need for ventilation when appropriate
  - **P** position: sit patient up with legs hanging down unless patient is hypotensive
- in ICU setting or failure of LMNOPP: other interventions may be necessary
  - nitroprusside IV
  - hydralazine PO
  - sympathomimetics
    - dopamine
      - low dose: selective renal vasodilation (high potency D1 agonist)
      - medium dose: inotropic support (medium potency β1 agonist)
      - high dose: increases SVR (low potency β1 agonist), which is undesirable
    - dobutamine
      - β1-selective agonist causing inotropy, tachycardia, hypotension (low dose) or HTN (high dose); most serious side effect is arrhythmia, especially AFib
    - phosphodiesterase inhibitors (milrinone)
      - inotropic effect and vascular smooth muscle relaxation (decreased SVR), similar to dobutamine
- consider pulmonary artery catheter to monitor PCWP if patient is unstable or a cardiac etiology is uncertain (PCWP >18 indicates likely cardiac etiology)
- mechanical ventilation as needed
- rarely used, but potentially life-saving measures:
  - IABP - reduces afterload via systolic unloading and improves coronary perfusion via diastolic augmentation
  - LVAD/RVAD
  - cardiac transplant

Long-Term Management
- overwhelming majority of evidence-based management applies to HFrEF
- currently no proven pharmacologic therapies shown to reduce mortality in HFpEF; control risk factors for HFpEF (e.g. HTN)
- prevent fluid overload with appropriate diuretic strategies

Conservative Measures
- symptomatic measures: oxygen in hospital, bedrest, elevate the head of bed
- lifestyle measures: diet, exercise, DM control, smoking cessation, decrease EtOH consumption, patient education, sodium, and fluid restriction
- multidisciplinary HF clinics: for management of individuals at higher risk, or with recent hospitalization

Non-Pharmacological Management
- from CCS guidelines (2020 update)
- cardiac rehabilitation: participation in a structured exercise program for NYHA class I-III after clinical status assessment to improve quality of life (HF-ACTION trial)

Five Most Common Causes of CHF
- CAD (60-70%)
- HTN
- Idiopathic (often DCM)
- Valvular (e.g. AS, AR, and MR)
- EtOH (DCM)

Precipitants of HF

HEART FAILED
HTN (common)
Endocarditis/environment (e.g. heat wave)
Anemia
Rheumatic heart disease and other valvular disease
Thyrotoxicosis
Failure to take medications (very common)
Arrhythmia (common)
Infection/Ischemia/Infarction (common)
Lung problems (PE, pneumonia, COPD)
Endocrine (pheochromocytoma, **h**yperaldosteronism)
Dietary indiscretions (common)

The most common cause of right HF is left HF

Measuring NT-proBNP
BNP is secreted by Vs due to LV stretch and wall tension
Cardiomyocytes secrete BNP precursor that is cleaved into proBNP
After secretion into Vs, proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP portion

	NT-proBNP levels (pg/mL)
Age	HF very likely
<50	>450
50-75	>900
>75	>1800

Limitations: Age, body habitus, renal function, PE

Features of HF on CXR

HERB-B
Heart enlargement (cardiothoracic ratio >0.50)
Pleural Effusion
Re-distribution (alveolar edema)
Kerley **B** lines
Bronchiolar-alveolar cuffing

Patients on β-blocker therapy who have acute decompensated HF should continue β-blockers where possible (provided they are not in cardiogenic shock or in severe pulmonary edema)

Pharmacological Therapy

- **ACEI/ARB**: RAAS blockade
  - ACEI: slows progression of LV dysfunction and improves survival
    - all symptomatic patients functional class II-IV
    - all asymptomatic patients with LVEF <40%
    - post-MI
  - angiotensin II receptor blockers
    - second-line to ACEI (if ACEI not tolerated), or as adjunct to ACEI if β-blockers not tolerated
    - combination of β-blockers with ACEI is not routinely recommended and should be used with caution as it may precipitate hyperkalemia, renal failure, and the need for dialysis (CHARM, ONTARGET)

- **antiarrhythmic drugs**: for use in CHF with arrhythmia
  - can use amiodarone, β-blocker, or digoxin

- **anticoagulants**: DOACs or vitamin K antagonist (warfarin) for prevention of thromboembolic events
  - prophylactic indications:
    - AFib
    - LV thrombus
    - Prior thromboembolic event

- **ARNI**: combination angiotensin receptor-neprilysin inhibitors - slows down progression of LV dysfunction and improves survival
  - RAAS inhibitor prevents volume overload and neprilysin inhibitor enhances effects of brain natriuretic peptide
  - first line therapy or if switching from an ACEI or ARB among patients with residual NYHA II-IV symptoms and LVEF <40%

- **β-blockers**: slow progression and improve survival
  - β-adrenergic blocking agents blocks effects of epinephrine to reduce rate and force of myocardial contraction
  - indicated for class I-III with LVEF <40% and stable class IV patients
  - carvedilol improves survival in class IV HF (COMET)
  - caution: should be used cautiously; titrate slowly because may initially worsen CHF

- **diuretics**: management of fluid overload and symptom control (e.g. dyspnea and PND)
  - furosemide (40-500 mg once daily) for potent diuresis
  - metolazone once weekly may be used with furosemide to increase diuresis if patient becomes refractory to furosemide
  - furosemide, metolazone, and thiazides oppose the hyperkalemia that can be induced by β-blockers, ACEI, ARBs, and aldosterone antagonists

- **digoxin and cardiac glycosides**: increase myocardial contractility but decrease rate
  - improves symptoms and decreases hospitalizations; no effect on mortality
  - indications: patient in sinus rhythm and symptomatic on ACEI or CHF and AFib
  - caution: patients on digitalis glycosides may worsen if these are withdrawn

- **hydralazine plus isosorbide dinitrate**: combination antihypertensive and vasodilator
  - consider for symptom control and mortality benefit in Black patients with symptomatic HFrEF despite guideline-directed medical therapy (GDMT)
  - also consider for HFrEF patients with drug intolerance to ACEIs, ARBs, or ARNI

- **ivabradine**: selective inhibition of the If current
  - recommended for CV death and hospitalization prevention in patients with HFrEF and symptomatic despite:
    - treatment with appropriate doses of GDMT, resting HR >70 bpm, and in sinus rhythm
  - weaker level of evidence than either ARNI or SGLT2 inhibitor

- **mineralocorticoid receptor (aldosterone) antagonists**: spironolactone or eplerenone
  - mortality benefit in symptomatic HF and severely depressed EF
  - for symptomatic HF in patients already on ACEI, β-blocker, and loop diuretic
  - caution: potential for life threatening hyperkalemia
    - monitor K+ after initiation and avoid if Cr >220 μmol/L or K^+ >5.2 mmol/L

- **SGLT2 inhibitor**: empagliflozin, canagliflozin, dapagliflozin
  - recommended for treatment of patients with stable HFrEF, irrespective of comorbid DM
  - recommended in mild to moderate HFrEF with concomitant T2DM to improve symptoms and reduce mortality

CCS/CHFS Heart Failure Guidelines Update: Defining a New Pharmacologic Standard of Care for Heart Failure with Reduced Ejection Fraction
Can J Cardiol 2021;37:531-46
Management of HFrEF: It is recommended that, in the absence of contraindications, HFrEF patients be treated with combination therapy including 1 drug from each of the following categories: ARNI (or ACEI/ARB), β-blocker, mineralocorticoid receptor antagonist (MRA) and SGLT2 inhibitor. It is recommended that patients admitted with acute decompensated HFrEF should be switched to an ARNI, from an ACEI/ARB when stabilized. It is recommended that β-blockers be initiated as soon as possible after HF diagnosis, not waiting until hospital discharge to initiate treatment in stabilized patients. MRA treatment is recommended for patients with acute MI and LVEF <40%, and HF symptoms or DM, to reduce CV mortality and hospitalization for CV events. SGLT2 inhibitors should be used in patients with HFrEF, with or without concomitant T2DM, to improve symptoms and reduce hospitalizations.

See Landmark Cardiac Trials for more information on DAPA-HF which details the efficacy of SGLT2 inhibition in patients with HFrEF and without T2DM.

See Landmark Cardiac Trials for more information on PARADIGM-HF which details the survival outcomes of HFrEF patients treated with an ACEI or an angiotensin-neprilysin inhibitor.

HFrEF Management
1. ARNI (or if on ACEI/ARB substitute to ARNI)
2. β-blockers
3. MRA
4. SGLT2 inhibitor

HFpEF Management
1. ARB
2. Systolic/Diastolic Hypertension Management according to CHEP Guidelines (2017)
3. MRA (if serum K^+ <5.0 mmol/L and eGFR >30 mL/min)

Surgical Management
- revascularization is the most frequently performed operation in HF patients with the aim to restore blood flow to hibernating myocardium (<10% operative mortality in some patient groups)
- mitral valve surgery for the treatment of MR secondary to ischemic LV dilation
- LV remodeling (Batista procedure - partial left ventriculectomy; Dor procedure - left ventricular restoration) improves ventricular function by reducing ventricular radial dimensions and thus decreasing wall tension via Laplace's law
- VADs (see *Cardiac Transplantation*, C50)
- heart transplantation (see *Cardiac Transplantation*, C50)

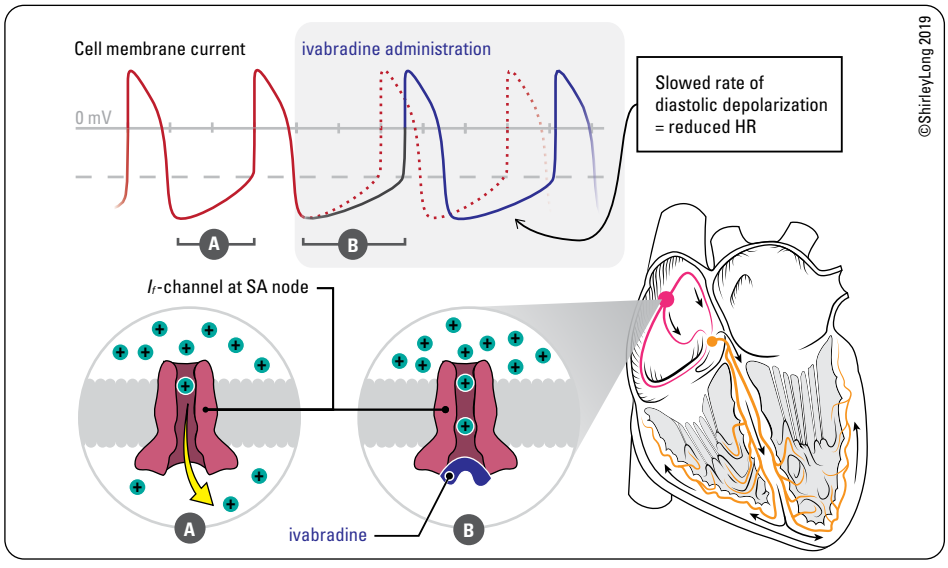

Figure 42. Ivabradine mechanism of action

Procedural Interventions
- resynchronization therapy: symptomatic improvement with CRT-P or CRT-D
  - consider if QRS >130 msec with LBBB morphology, LVEF <35%, and persistent symptoms despite OMT
  - greatest benefit likely with marked LV enlargement, MR, QRS >150 msec
  - CRT-P is indicated for patients eligible for resynchronization therapy but not ICD; if the patient is also eligible for an ICD the decision for CRT-D is individualized in accordance with overall goals of care
- ICD: mortality benefit in 1° prevention of SCD
  - consider if: prior MI, OMT, LVEF <30%, clinically stable
  - consider if: prior MI, non-sustained VT, LVEF 30-40%, EPS inducible VT
- LVAD/RVAD (see *Ventricular Assist Devices*, C52)
- cardiac transplantation (see *Cardiac Transplantation*, C50)
- valve repair if patient is surgical candidate and has significant valve disease contributing to CHF (see *Valvular Heart Disease*, C54)

Chronic Treatment of CHF
- ACEI*
- β-blockers*
- ± Mineralocorticoid receptor antagonists*
- Diuretic
- ARNI
- ± Inotrope
- ± Antiarrhythmic
- ± Anticoagulant

*Mortality benefit

Ivabradine and Outcomes in Chronic Heart Failure (SHIFT): A Randomized Placebo-Controlled Study
Lancet 2010;376:11-17
Study: Randomised, double-blind, placebo-controlled, parallel-group trial.
Population: Patients with symptomatic HF and LVEF of 35% or lower, in sinus rhythm with HR greater than or equal to 70 bpm, had been admitted to hospital for HF within previous year, on stable background treatment including β-blocker if tolerated.
Intervention: Ivabradine titrated to a maximum of 7.5 mg BID vs. placebo.
Outcome: Primary endpoint was composite of CV death or hospital admission for worsening HF.
Results: 793 (24%) patients in the ivabradine group and 937 (29%) of those taking placebo had a primary endpoint event (HR 0.82, 95% CI 0.75–0.90, P<0.0001). Fewer serious adverse events occurred in the ivabradine group (3388 events) than in the placebo group (3847; P=0.025). 150 (5%) of ivabradine patients had symptomatic bradycardia vs. 32 (1%) of the placebo group (P<0.0001). Median follow-up was 22.9 mo (interquartile range 18–28).
Conclusions: Results support the importance of HR reduction with ivabradine for improvement of clinical outcomes in HF and confirm the important role of HR in the pathophysiology of this disorder. Note: Limitation of this study was that only 26% of patients were on target β-blocker doses. Ivabradine currently recommended in these patients when HR is not controlled on maximum tolerated β-blocker dose or there is a contraindication to β-blocker use.

Higher New York Heart Association Classes and Increased Mortality and Hospitalization in Patients with Heart Failure and Preserved Left Ventricular Function
Am Heart J 2006;151:444-450
Purpose: To establish the association between NYHA class and outcomes with HF and preserved systolic function.
Methods: Retrospective follow-up study (median 38.5 mo) of 988 patients with HF with EF >45%. Estimated risks of various outcomes using Cox proportional hazard models.
Results: Adjusted HR for all-cause mortality for NYHA class II, III, IV patients was 1.54, 2.56, and 8.46, respectively. Adjusted HR for all-cause hospitalization for NYHA class II, III, IV patients was 1.23, 1.71, and 3.4, respectively.
Conclusions: Higher NYHA classes were associated with poorer outcomes in patients with HF and preserved systolic function.
Proportions of NYHA I, II, III, and IV patients who died of all causes during the study were 14.3%.

NYHA	Proportion of All-Cause Hospitalization	Proportion of All-Cause Mortality
I	60.7%	14.3%
II	65.2%	21.3%
III	77.7%	35.9%
IV	75.0%	58.3%

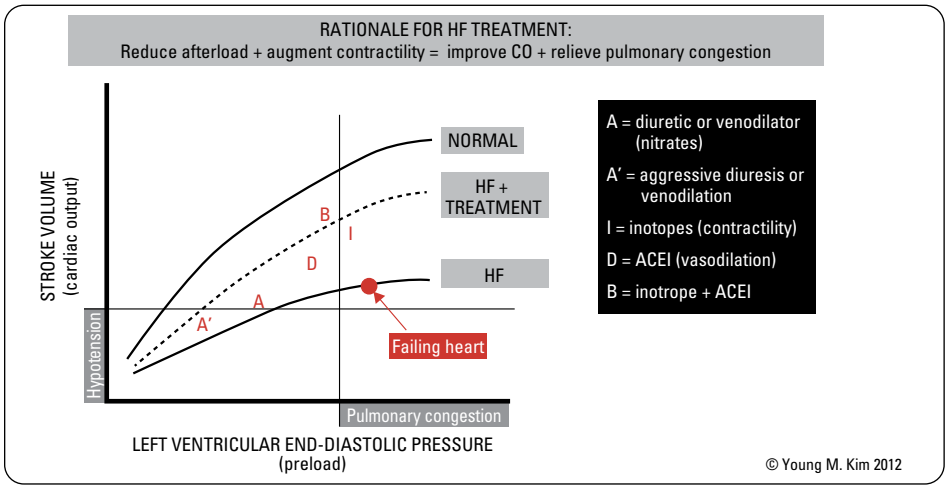

Figure 43. Effect of HF treatment on the Frank-Starling curve

Sleep-Disordered Breathing

- patients with CHF can have sleep disturbances; 40% of patients have central sleep apnea with Cheyne-Stokes breathing and 11% of patients have obstructive sleep apnea
- associated with a worse prognosis and greater LV dysfunction
- nasal CPAP may be effective to treat symptoms of sleep apnea with secondary benefits to cardiac function

Cardio-oncology

- cardiotoxicity of chemotherapeutic agents is a leading cause of long-term morbidity and mortality among cancer survivors
- dose-dependent LV systolic dysfunction with anthracyclines and potentially reversible decline in LVEF with trastuzumab
- evaluate CV risk factors and optimize treatment of pre-existing CV disease before, during, and after receiving cardiotoxic cancer therapy
- follow patient using same imaging modality and methods (e.g. echo with contrast, echocardiographic global longitudinal strain (GLS), 3 dimensional echo, or multiple-gated acquisition (MUGA) scan) to assess LV function before, during, and upon completion of chemotherapy
- recommended that clinical HF or an asymptomatic decline in LVEF (>10% decrease in LVEF from baseline or LVEF <53%) during or after treatment is managed according to CCS guidelines

Myocardial Disease

Definition of Cardiomyopathy

- intrinsic or primary myocardial disease not secondary to congenital, hypertensive, coronary, valvular, or pericardial disease
  - results in both morphologic and functional abnormalities
- functional classification: dilated, hypertrophic, or restrictive
- LV dysfunction secondary to MI, often termed "ischemic cardiomyopathy," is not a true cardiomyopathy (i.e. primary myocardial disorder) since the primary pathology is obstructive CAD

Cardiomyopathy

HARD
Hypertrophic cardiomyopathy (HCM)
Arrhythmogenic right ventricular cardiomyopathy
Restrictive cardiomyopathy (RCM)
Dilated cardiomyopathy (DCM)

Table 16. Comparison of Cardiomyopathies, Secondary Causes, and Consequent HF Phenotypes

Heart Failure Reduced Ejection Fraction (HFrEF)		Heart Failure Preserved Ejection Fraction (HFpEF)		
Dilated Cardiomyopathy (DCM)	**Secondary Causes**	**Hypertrophic Cardiomyopathy (HCM)**	**Restrictive Cardiomyopathy (RCM)**	**Secondary Causes**
Idiopathic, infectious (e.g. myocarditis), EtOH, familial, collagen vascular disease	CAD, MI, DM, valvular (e.g. AR, MR)	Genetic disorder affecting cardiac sarcomeres (most common cause of SCD in young athletes)	Amyloidosis, sarcoidosis, scleroderma, hemochromatosis, Fabry's, Pompe's Disease, Loeffler's	HTN, DM, valvular (e.g. AS), post-MI, transiently by ischemia

Myocarditis

Definition
- inflammatory process involving the myocardium ranging from acute to chronic
- important cause of DCM
- spectrum of severity ranging from non-specific symptoms such as fatigue to cardiogenic shock

Etiology
- idiopathic
- infectious
  - viral (most common overall cause): coxsackie A and B, parvovirus B19, adenoviruses, influenza, coxsackie B, echovirus, poliovirus, HIV, mumps, coronavirus disease 2019 (COVID-19)
  - bacterial: *S. aureus, Streptococcus, C. perfringens, C. diphtheriae, Mycoplasma, Rickettsia*
  - fungi
    - spirochetal (Lyme disease *Borrelia burgdorferi*)
  - Chagas disease (*Trypanosoma cruzi*), *Toxoplasma gondii*
- toxic: catecholamines, chemotherapy, cocaine
- hypersensitivity/eosinophilic: drugs (e.g. antibiotics, diuretics, lithium, clozapine), insect/snake bites
- systemic diseases: collagen vascular diseases (e.g. SLE, rheumatoid arthritis), sarcoidosis, autoimmune
- other: giant cell myocarditis, acute rheumatic fever

Signs and Symptoms
- constitutional symptoms
- acute CHF: dyspnea, tachycardia, elevated JVP
- cardiogenic shock
- chest pain: due to pericarditis or cardiac ischemia
- arrhythmias
- systemic or pulmonary emboli
- presyncope/syncope/sudden death

Investigations
- ECG: non-specific ST-T changes and/or conduction defects
- blood work
  - increased creatine kinase (CK), cardiac troponins (cTnI and cTnT), NT-proBNP (if LV dysfunction occurs), LDH, and AST with acute myocardial necrosis ± increased WBC, C-reactive protein (CRP), erythrocyte sedimentation rate (ESR), antinuclear antibody test (ANA), rheumatoid factor, complement levels
  - blood culture, viral titres, and cold agglutinins for Mycoplasma
- CXR: enlarged cardiac silhouette
- TTE: systolic dysfunction (dilated, hypokinetic chambers, segmental wall motion abnormalities) and/or diastolic dysfunction
- CMR: functional and morphological abnormalities as well as tissue pathology (gadolinium enhancement)
- endomyocardial biopsy: only done in certain clinical scenarios (e.g. on inotropic and/or mechanical circulatory support)
- coronary angiography: to exclude ischemic heart disease

Management
- supportive care
- mechanical circulatory support and inotropic support if cardiogenic shock
- restrict physical activity during early recovery
- treat CHF per current HF guidelines
  - guideline-directed medical therapy
  - advanced therapies such as ventricular assist and transplantation
- treat arrhythmias
- anticoagulation
- treat underlying cause if possible

Prognosis
- often unrecognized and may be self-limited
- myocarditis treatment trial showed 5 yr mortality between 25-50%
- giant cell myocarditis, although rare, can present with fulminant CHF and be rapidly fatal, with 5 yr mortality >80%
- sudden death in young adults
- may progress to DCM

Dilated Cardiomyopathy

Definition
- unexplained dilation and impaired systolic function of one or both ventricles
- if present, comorbid CAD is unable to fully account for extent of dysfunction observed

Major Risks Factors for DCM
FMHx, EtOH, cocaine,

Etiology
- familial/genetic ~60%
- EtOH ~20-30%
- myocarditis
- infectious: viral (coxsackie B, HIV, COVID-19), Chagas disease, Lyme disease, Rickettsial diseases, acute rheumatic fever, toxoplasmosis
- collagen vascular disease: SLE, polyarteritis nodosa, dermatomyositis, progressive systemic sclerosis
- idiopathic (presumed viral or idiopathic)
- uncontrolled tachycardia (e.g. persistent, rapid AFib)
- neuromuscular disease: Duchenne muscular dystrophy, myotonic dystrophy, Friedreich's ataxia
- metabolic: uremia, nutritional deficiency (thiamine, selenium, carnitine)
- endocrine: hyper/hypothyroidism, DM, pheochromocytoma
- peripartum
- toxic: cocaine, heroin, organic solvents
- drugs: chemotherapies (doxorubicin, cyclophosphamide), anti-retrovirals, chloroquine, clozapine, TCA
- radiation

Abnormal Labs in DCM
- High BNP
- High Cr
- High LFTs
- Low bicarbonate
- Low Na^+

Signs and Symptoms
- may present as:
  - systolic HF
  - systemic or pulmonary emboli
  - arrhythmias
  - sudden death (major cause of mortality due to fatal arrhythmia)

Investigations
- blood work: CBC, electrolytes, Cr, bicarbonate, BNP, CK, troponin, LFTs, TSH, total iron binding capacity (TIBC)
- ECG: variable ST-T wave abnormalities, poor R wave progression, conduction defects (e.g. BBB), arrhythmias (e.g. non-sustained VT)
- CXR: global cardiomegaly (i.e. globular heart), signs of CHF, pleural effusion
- echo: systolic dysfunction (chamber enlargement, global hypokinesis, depressed LVEF, MR and TR, mural thrombi)
- cardiac MRI: myocardial fibrosis
- endomyocardial biopsy: not routine, used to rule out a treatable cause
- coronary angiography: in select patients to exclude ischemic heart disease

Management
- treat underlying disease: e.g. abstinence from EtOH
- treat CHF as per current guidelines (see *Heart Failure*, C40)
  - includes medical management and devices (ICD and CRT)
- advanced therapies considered for medication-refractory disease
  - e.g. LVAD, transplant, and volume reduction surgery
- thromboembolism prophylaxis: anticoagulation with warfarin
  - indicated for: AFib, history of thromboembolism or documented thrombus
- treat symptomatic or serious arrhythmias
- immunize against influenza and S. pneumoniae
- indication to screen first-degree relatives when unclear etiology

Prognosis
- depends on etiology, often parallels prognosis of systolic HF
- better with reversible underlying cause; worst with infiltrative diseases, HIV, drug-induced
- early reverse remodelling with optimal HF management (i.e. medications and devices) improves prognosis
- myocardial fibrosis increases SCD risk
- cause of death usually CHF (due to pump failure) or sudden death secondary to ventricular arrhythmias
- systemic emboli are significant source of morbidity
- 20% mortality in first yr, 10% per year thereafter

Hypertrophic Cardiomyopathy

- see 2020 American Heart Association (AHA)/American College of Cardiology (ACC) Guideline for the Diagnosis and Treatment of Patients With Hypertrophic Cardiomyopathy for details

Definition

- unexplained left ventricular hypertrophy (LVH)
- LVH can occur in any distribution
  - asymmetric septal hypertrophy is most common
- systolic anterior motion of mitral valve and hyperdynamic LV are common but non-diagnostic

Etiology

- cause is felt to be a genetic defect involving one of the cardiac sarcomeric proteins
  - >400 mutations associated with autosomal dominant inheritance, incomplete penetrance, variable age of onset
  - 70% of pathogenic variants occur within 2 genes: beta myosin heavy chain 7 (MYH7) and myosin-binding protein C3 (MYBPC3)
- prevalence of 1 in 500 to 1 in 1000 in general population
  - equally prevalent in men and women although women are diagnosed less often
- generally presents in early adulthood

Pathophysiology

- histopathologic features include myocyte disarray, myocyte hypertrophy, dysplastic arterioles and interstitial fibrosis
- dynamic obstruction of LVOT (LVOTO) due to both septal hypertrophy and systolic anterior motion (SAM) of mitral leaflets
- diastolic dysfunction due to LVH, ischemia, and interstitial fibrosis
- myocardial ischemia due to supply-demand mismatch
- autonomic dysfunction inappropriate vasodilation during exercise and abnormal HR recovery

Hemodynamic Classification

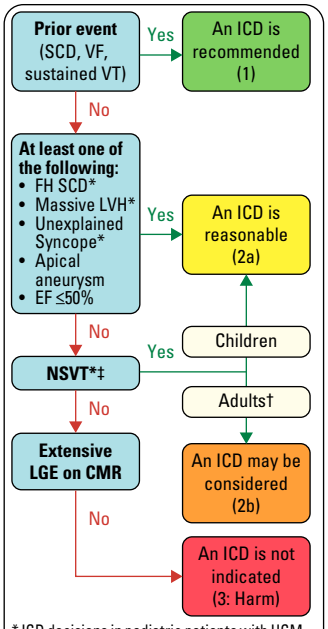
- HOCM (hypertrophic obstructive cardiomyopathy): defined as peak LVOT gradient of at least 30 mmHg either at rest or with provocation
  - peak LVOT gradient of at least 50 mmHg at rest or provoked is the typical threshold for considering invasive septal reduction in patients with insufficient response to medical management
- non-obstructive HCM (one-third): no LVOT obstruction

Signs and Symptoms

- clinical manifestations: asymptomatic (common, therefore screening is important), SOBOE, angina, presyncope/syncope (due to LV outflow obstruction or arrhythmia), CHF, arrhythmias, SCD
- pulses: rapid upstroke, "spike and dome" pattern in carotid pulse (in HCM with outflow tract obstruction)
- precordial palpation: PMI localized, sustained, double impulse, 'triple ripple' (triple apical impulse in HOCM), LV lift
- precordial auscultation: normal or paradoxically split S2, S4, harsh systolic diamond-shaped murmur at LLSB or apex, enhanced by squat to standing or Valsalva (murmur secondary to LVOTO as compared to AS); often with pansystolic murmur due to MR

Investigations

- 3-generation family history
  - first-degree relatives receive directed cascade genetic testing and routine TTE and ECG screening
  - first-degree relatives are screened every 1-3 years as children and every 3-5 years as adults provided they are asymptomatic and initial assessment is negative
- TTE for initial diagnosis, monitoring every 1-2 years and evaluating clinical concerns
  - for patients not meeting LVOTO criteria (LVOT gradient of at least 50mmHg) at rest, a provocative maneuver and/or exercise stress test is performed to assess for dynamic LVOTO development
- TEE for preoperative planning of septal reduction, assessment of MR etiology, SAM and LVOTO
- cardiac MRI to clarify inconclusive echocardiogram results or determine method of septal reduction
- ECG/holter monitor for initial workup, regular follow-up, and assessment of SCD risk
  - LVH, high voltages across precordium, prominent Q waves (lead I, aVL, V5, V6), tall R wave in V1, P wave abnormalities
- cardiac catheterization (only when patient being considered for invasive therapy)
- genetic studies to clarify uncertain diagnoses and facilitate screening of family members



* ICD decisions in pediatric patients with HCM are based on ≥1 of these major risk factors: family history of HCM SCD, NSVT on ambulatory monitor, massive LVH, and unexplained syncope
† In patients >16 yr of age, 5-yr risk estimates can be considered to fully inform patients during shared decision-making discussions
‡ It would seem most appropriate to place greater weight on frequent, longer, and faster runs of NSVT
CMR = cardiovascular magnetic resonance; EF = ejection fraction; HCM = hypertrophic cardiomyopathy; ICD = implantable cardioverter-defibrillator; LGE = late gadolinium enhancement; LVH = left ventricular hypertrophy; NSVT = nonsustained ventricular tachycardia; SCD = sudden cardiac death

Figure 44. ICD implantation in HCM

Management
- avoid factors which increase obstruction (e.g. volume depletion)
  - avoidance of high-intensity competitive sports unless exceptional circumstances
  - mild-to-moderate-intensity exercise is safe
- treatment of HOCM
  - medical agents: β-blockers, verapamil or diltiazem (started only in monitored settings), disopyramide, phenylephrine (in setting of cardiogenic shock)
  - avoid digoxin and vasodilators (e.g. nitrates, dihydropyridine calcium channel blockers, and ACEi/ARB) as they are inotropic and afterload reducing, respectively
- patients with HOCM and drug-refractory symptoms require septal reduction therapy at experienced centres
  - surgical myectomy
  - alcohol septal ablation - percutaneous intervention that ablates the hypertrophic septum with 100% ethanol via the septal artery
  - dual chamber pacing (rarely done)
- treatment of non-obstructive HCM
  - symptomatic: β-blockers or non-dihydropyridine calcium channel blockers and diuretics if refractory symptoms
- comorbid atrial fibrillation: direct oral anticoagulant or warfarin regardless of CHA2DS2-VASc score
- consequent systolic dysfunction: consider candidacy for transplant
- treatment of patients at high-risk of sudden death: ICD (see Figure 44, *ICD implantation in HCM*)
  - history of survived cardiac arrest/sustained VT
  - FMHx of premature sudden death
  - other factors associated with increased risk of SCD
    - syncope (presumed to be arrhythmic in origin)
    - LVEF <50%
    - LV apical aneurysm
    - non-sustained VT on ambulatory monitoring
    - marked LVH (maximum wall thickness ≥30 mm)

Prognosis
- life expectancy may or may not be reduced
  - the majority of those with HCM do not experience severe symptoms or require aggressive treatments
- potential complications: AFib, stroke, CHF (diastolic and systolic), VT, SCD (1% risk/yr; most common cause of SCD in young athletes)

Restrictive Cardiomyopathy

Definition
- impaired ventricular filling with preserved systolic function in a non-dilated, non-hypertrophied ventricle secondary to factors that decrease myocardial compliance (fibrosis and/or infiltration)
- biatrial enlargement is often present despite normal AV valve functioning

Etiology
- most commonly: amyloidosis, sarcoidosis, and hemochromatosis
- infiltrative: amyloidosis, sarcoidosis
- non-infiltrative: scleroderma, idiopathic myocardial fibrosis, diabetic cardiomyopathy
- storage diseases: hemochromatosis, Fabry's disease, Gaucher's disease, glycogen storage diseases
- endomyocardial
  - endomyocardial fibrosis (late presentation), Loeffler's endocarditis, or eosinophilic endomyocardial disease
  - radiation heart disease
  - carcinoid syndrome (may have associated tricuspid valve or pulmonary valve dysfunction)

Clinical Manifestations
- CHF (usually with preserved LV systolic function), arrhythmias
- elevated JVP with prominent x and y descents, Kussmaul's sign
- S3, S4, MR, TR
- thromboembolic events

Investigations
- ECG: low voltage, non-specific, diffuse ST-T wave changes ± non-ischemic Q waves
- CXR: mild cardiomegaly due to biatrial enlargement
- echo: LAE, RAE; specific Doppler findings with no significant respiratory variation
- cardiac MRI: assessment of myocardial fibrosis, determination of etiology and exclusion of constrictive pericarditis
- cardiac catheterization: increased end-diastolic ventricular pressures
- endomyocardial biopsy: to determine etiology (especially for infiltrative RCM)

Mavacamten for Treatment of Symptomatic Obstructive Hypertrophic Cardiomyopathy (EXPLORER-HCM): A Randomized, Double Blind, Placebo-Controlled, Phase 3 Trial
The Lancet 2020 Sep 12;396(10253):759-69.
Purpose: Assess the safety and efficacy of mavacamten, a cardiac myosin inhibitor, in symptomatic HOCM.
Methods: Patients with HOCM (LVOT>50mmHg, NYHA II-III) from 68 clinical centers in 13 countries were randomized to mavacamten or placebo for 30 wk. The primary endpoint was a >1.5mL/kg/min increase in peak O_2 consumption and at least one NYHA class reduction, or >3.0mL/kg/min increase in peak O_2 consumption with no NYHA class reduction.
Results: 45 (37%) of 123 patients on mavacamten vs. 22 (17%) of 128 on placebo met the primary endpoint. Patients on mavacamten had greater reductions in post-exercise LVOT gradient and greater increase in peak O_2 consumption.34% more patients in the mavacamten group improved by at least 1 NYHA class. Safety and tolerability were comparable to placebo.
Conclusion: Mavacamten improved exercise capacity, LVOT obstruction, NYHA functional class, and health status in patients with HOCM.

RCM vs. Constrictive Pericarditis
Present similarly but constrictive pericarditis is treatable with surgery

RCM	Constrictive Pericarditis
• family history • no pulsus paradoxus • systolic murmurs • LVH • normal pericardium (intracardiac pathology) • myo- and endocardial later gadolinium enhancement (LGE) • elevated BNP	• prior surgical history in some cases • pulsus paradoxus may be present • pericardial rub • no LVH • pericardial calcification and pericardial thickening • pericardial late gadolinium enhancement (LGE) • reduced BNP

Management
- exclude constrictive pericarditis
- control HR, anticoagulate if AFib
- treat underlying disease: (e.g. cardiac amyloidosis, cardiac sarcoidosis, hemochromatosis)
- supportive care and treatment for CHF, arrhythmias, and prevention of SCD when indicated
  - judicious use of diuretics (excess volume reduction reduces filling pressures versus pathologic requirements triggering hypoperfusion)
- cardiac transplant: might be considered for CHF refractory to medical therapy

Prognosis
- depends on etiology

Key Investigations
- **Echo:** may show respiratory variation in blood flow in constrictive pericarditis
- **CT:** may show very thickened pericardium and calcification in constrictive pericarditis
- **MRI:** best modality to directly visualize pericardium and myocardium

Left Ventricular Noncompaction Cardiomyopathy

Definition
- failure of LV compaction leading to endomyocardial trabeculations that increase in number and prominence
- characterized by abnormal trabeculations in the LV, most frequently at the apex

Etiology
- genetics are incompletely understood
- can occur in healthy individuals (e.g. athletes and pregnancy) as well as concomitantly with congenital heart diseases and other cardiomyopathies (i.e. HCM, RCM, DCM, ARVC)
- can be reversible

Clinical Manifestations
- if occurring in absence of concomitant cardiomyopathy and congenital heart disease, LV non-compaction can be benign
- symptoms range from SOBOE to rest symptoms
  - many patients are asymptomatic
- ventricular arrhythmias or complete AV block (presents as syncope and sudden death)
- thromboembolic events
  - more likely when systolic dysfunction and LV dilatation are present

Investigations
- directed by primary pathology when LV non-compaction is comorbid with congenital disease or other cardiomyopathies
- TTE and cardiac MRI
  - most common diagnostic method is the ratio of the thickness of the non-compacted layer to that of the compacted layer (greater than 2:1 at the end of diastole)
- role of routine genetic screening remains in question
  - typically performed in the setting of LV non-compaction with comorbid cardiomyopathy

Management
- at-risk first-degree relatives are recommended to undergo screening
- therapy is largely driven by concomitant myocardial dysfunction, arrhythmias, and congenital heart disease
- ICD is an option if patients have syncope or documented VT
- antiplatelets or systemic anticoagulation should be considered in adults, especially when the LV or atria are dilated

Prognosis
- dependent on LV function and presence of comorbid conditions (e.g. congenital heart disease and cardiomyopathy)

Cardiac Transplantation

- treatment for end-stage heart failure
- median survival is 11.6 years and median survival conditional on survival to 1-year is 13.9 years
- matching is according to blood type, body size and weight (should be within 25%), HLA tissue matching, and geographical considerations (to minimize ischemic time)

Indications for Surgery
- severe cardiac disability despite maximal medical therapy (e.g. recurrent hospitalizations for CHF, NYHA III or IV, peak metabolic oxygen consumption <14 mL/kg/min in absence of β-blocker) with a life expectancy of 12-18 mo
- symptomatic cardiac ischemia refractory to conventional treatment (e.g. unstable angina not amenable to CABG or PCI with LVEF <20-25%; recurrent, symptomatic ventricular arrhythmias)

- high-risk HFSS
  - HFSS is an algorithm that incorporates the patient's HR, serum sodium, ischemic cardiomyopathy, LVEF, peak myocardial oxygen consumption, MAP, interventricular conduction delay
  - patients with medium-risk (HFSS 7.2-8.1, 73% 1-yr survival) and high-risk (HFSS <7.2, 43% 1-yr survival) benefit from cardiac transplant
- cardiogenic shock requiring IV inotropic agents or mechanical circulatory support to sustain organ perfusion
- exclusion of all surgical alternatives to cardiac transplantation

Absolute Contraindications
- active alcohol use disorder or substance use disorder
- actively smoking
- coagulopathy
- incurable malignancy
- irreversible major organ disease
- irreversible pulmonary HTN (i.e. >5 Wood units, transpulmonary gradient <18 mmHg, or systolic pulmonary artery pressure >60 mmHG)
- major systemic illness
- mental illness or other cognitive factors likely to affect ability to adhere to post-transplant regimens
- repeated non-adherence to medications
- severe COPD (i.e. FEV_1 <1L)

Relative Contraindications
- active systemic infection
- acute PUD
- age >70 years
- DM with end-organ disease
- lack of family/social support
- obesity (>35 kg/m^2)
- significant symptomatic carotid disease or PVD

Prerequisites
- psychosocial stability
- medically compliant and motivated

Complications
- rejection
  - declining incidence with improved post-transplant immunosuppression regimens: <13% experience an episode that needs to be treated and <5% have serious hemodynamic compromise
  - gold standard to detect rejection: endomyocardial biopsy
  - risk of acute rejection is greatest during the first 3 mo after transplant
  - hyperacute rejection (minutes to hours after transplant) due to ABO mismatch, acute rejection (days to months after transplant), or chronic rejection (years after transplant)
- infection
  - leading cause of morbidity and mortality after cardiac transplantation
  - risk peaks early during the first few months after transplantation and then declines to a low persistent rate
- allograft vasculopathy
  - approximately 50% develop graft vasculopathy within 10 yr of transplantation
  - most common cause of late death following transplantation
- malignancy
  - develops in 15% of cardiac transplant recipients due to immunosuppressive medication
  - second most common cause of late death following transplantation
  - cutaneous neoplasms most common, followed by non-Hodgkin lymphoma and lung cancer
- medication side effects
  - immunosuppressives (e.g. prednisone, cyclosporine nephrotoxicity, tacrolimus) may have nephrotoxic effects
- cardiac denervation
  - as the donor heart is completely denervated, it does not receive parasympathetic vagal stimulation or intrinsic postganglionic sympathetic stimulation so it will not respond to anticholinergics like atropine
- RV dysfunction
  - RV dysfunction with TR, particularly in patients with preoperative pulmonary HTN, due to myocardial dysfunction caused by long ischemic time and/or reperfusion injury
  - requires aggressive management for treatment using agents that dilate the pulmonary vasculature or, rarely, RVAD support

Effects of Donor Pre-Treatment with Dopamine on Survival after Heart Transplantation: A Cohort Study of Heart Transplant Recipients Nested in a Randomized Controlled Multicentre Trial
J Am Coll Cardiol 2010;58:1768-1777
Treatment of brain-dead donors with dopamine of 4 µg/kg/min will not harm cardiac allografts but appears to improve the clinical course of the heart allograft recipient.

Long-Term Use of a Left Ventricular Assist Device for End-Stage Heart Failure
NEJM 2001;345:1435-1443
Increased survival of 23% vs. 8% with LVAD vs. medical management of HF after 2 yr.
Heartmate VAD has a biologic surface and, therefore, does not require long-term anticoagulation but confers a higher risk of infection.

Canadian Cardiovascular Society Focused Position Statement Update on Assessment of the Cardiac Patient for Fitness to Drive: Fitness following Left Ventricular Assist Device Implantation
Can J Cardiol 2012;28:137-140
Patients with a continuous flow LVAD (NYHA class I-III) who are stable 2 mo post-LVAD implantation qualify for private driving (only) and are disqualified from commercial driving.

Canadian Cardiovascular Society/ Canadian Cardiac Transplant Network Position Statement on Heart Transplantation: Patient Eligibility, Selection, and Post-Transplantation Care
Can J Cardiol 2020;36:335-56
Selection Criteria: Cardiac transplantation is recommended for consideration in HF patients ≤70 yr old. For all patients being considered, an assessment of frailty with a validated tool is recommended. Caution is recommended for patients with BMI >35. LVAD implantation is recommended for eligible patients with pulmonary hypertension on right heart catheterization. Finally, cardiac transplantation is not recommended for patients who show repeated nonadherence to medications, alcohol or illicit drug use, mental illness, and/or cognitive concerns that will render patients unlikely to adhere to post-transplantation regimens.

Ventricular Assist Devices

- work to unload the ventricle while maintaining output; also results in decreased myocardial oxygen consumption permitting recovery of the myocardium that is not irreversibly injured
- can support the left (LVAD), right (RVAD), or both ventricles (BiVAD); typical circuit is comprised of a pump, an outflow graft, and a driveline to connect to an external power source and controller (see Figure 45)
- indications:
  - bridge to transplantation, bridge to decision (for transplant), or long term permanent therapy ("destination therapy")
  - postoperative mechanical support when unable to separate from CPB despite inotropic and IABP support
    - IABP is a catheter-based device inserted into the femoral artery and advanced to the descending aorta that decreases myocardial O_2 demand and increases blood flow to coronary arteries
    - inflation of the balloon occurs during diastole to increase ascending aorta and coronary artery perfusion pressure; deflation occurs at systole to reduce intra-aortic pressure thus reducing afterload
  - cardiogenic shock

Extracorporeal Membrane Oxygenation

- composed of a circuit that includes: centrifugal pump, membrane oxygenator, venous and arterial cannulas (see Figure 46)
- Venoatrial (VA) ECMO is treatment of choice for cardiogenic shock due to broad availability, technical simplicity, and rapid deployment
- hospital discharge outcomes for ECMO use remain poor with collective survival approximating 35%
- indications: postcardiotomy shock, allograft failure, fulminant myocarditis, decompensated HF
- extracorporeal life support through ECMO use is an effective method of resuscitation in moribund patients

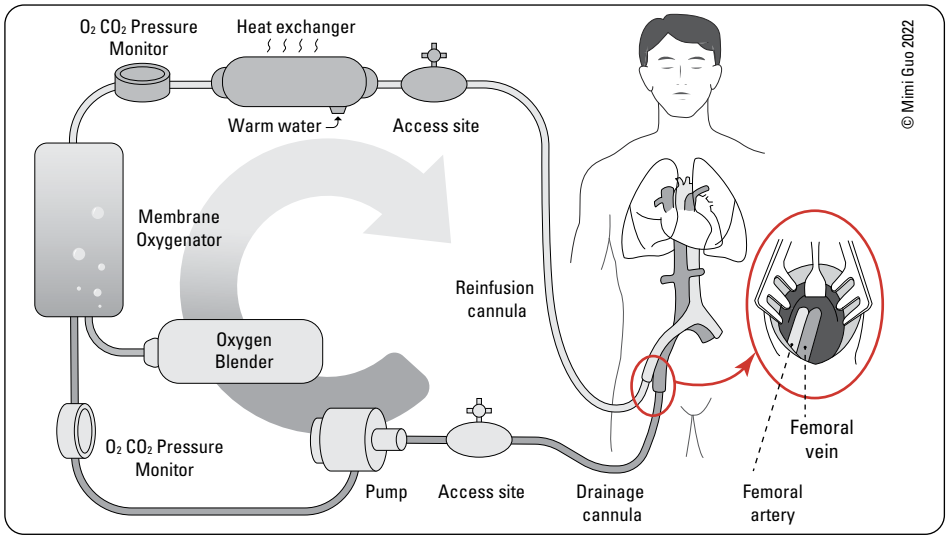


Figure 46. ECMO

Advanced Heart Failure Treated with Continuous-Flow Left Ventricular Assist Device
NEJM 2009;361:2241-51
Purpose: Assess quality of life in patients with advanced HF treated with implanted pulsatile-flow LVAD or new continuous-flow devices.
Methods: Patients with advanced medically-refractory HF were randomized (in a 2:1 ratio) to implantation of a continuous-flow LVAD or a pulsatile-flow LVAD. Quality-of-life tests and 6-min walk test data were collected at baseline, 1 month, 3 mo, 6 mo, then every 6 mo until study completion. The primary endpoint was a composite of 2-yr survival free of disabling stroke (Rankin score >3), or device reoperation for replacement.
Results: 86% of patients with the continuous-flow device and 76% of patients with the pulsatile-flow device were discharged from the hospital with the device in-place. The primary endpoint was achieved in 46% of patients implanted with the continuous-flow device, compared to 11% with the pulsatile-flow device (hazard ratio 0.38; 95% CI 0.27 to 0.54; P<0.001). The Kaplan-Meier estimates of survival revealed significantly better outcomes for patients with the continuous-flow devices compared with the pulsatile-flow device (RR 0.54; 95% CI 0.34 to 0.86; P=0.008).
Conclusions: Implantation of a continuous-flow device, compared to a pulsatile-flow device improved stroke-free survival and quality of life in patients with advanced medically-refractory HF.

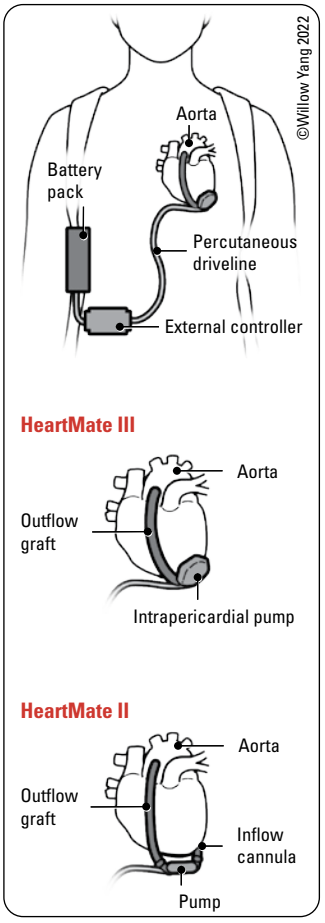

Figure 45. LVAD

Cardiac Tumours

Incidence

- cardiac tumours are more commonly derived from metastases than primary tumours
  - primary cardiac tumours have an estimated incidence of 1-30 in 100000 people per year
  - metastatic involvement of the heart is much more common and is present in 10-20% of autopsies of patients who die from cancer

Diagnosis

- TTE, TEE, MRI, PET and/or CT scan can typically detect cardiac tumours
  - transvenous and open biopsy offer definitive diagnosis when required
- once detected, CT or PET scans screen for distant metastasis while cardiac MRI helps determine suitability for surgery
  - coronary angiography determines presence of concomitant CAD and neoplastic involvement of coronary vasculature

Physiological Consequences of Cardiac Tumours
- systemic or pulmonic embolization
- symptoms of HF due to obstruction of circulation
- regurgitation due to interference with heart valves
- myocardial invasion causing impaired left ventricular function, arrhythmias, heart block, or pericardial effusion
- constitutional or systemic symptoms

Subtypes of Cardiac Tumours by Location
- right atrial tumours
  - may obstruct blood flow and present with symptoms similar to those of TS and right HF
  - fragments from right atrial tumours may be released into the pulmonary circulation and cause symptoms of pulmonary emboli
  - another consequence is right atrial HTN which, when combined with a PFO, can result in the shunting of venous blood into the systemic circulation, causing hypoxemia or systemic emboli
  - tumors affecting the AV node can cause heart block
  - myxomas are the most common form of this tumour, but sarcomas have also been reported
- right ventricular tumours
  - can induce right-sided HF by interfering with filling or outflow from the RV
  - may obstruct blood flow or beget TR and, as a result, simulate mitral valve disease and produce HF or secondary pulmonary HTN
- left atrial tumours
  - may release tumour fragments or thrombi into the systemic circulation
  - benign myxomas are the most common tumours arising in the LA
- left ventricular tumours
  - intramural left ventricular tumours may induce arrhythmias or conduction defects
  - intracavitary tumours can present with systemic embolization or outflow obstruction
  - may ultimately result in left ventricular failure
- valvular tumors
  - papillary fibroelastomas are most common, equal incidence at AV and semilunar valves
  - asymptomatic until sentinel events such as distal embolization and coronary ostial obstruction
  - resection and repair of the valvular tissue is preferred over valve replacement
- pericardial tumors
  - includes lipomas and metastatic tumors
  - external compression of the heart as a result of both mass effect and propensity to generate pericardial effusions

Subtypes of Cardiac Tumours by Histopathology
- benign tumours
  - roughly 75% of cardiac tumours are benign
  - myxomas make up the majority of benign cardiac tumours and they most commonly arise in the LA
  - in patients over age 16, the three most common primary tumours are myxomas (50%), lipomatous tumours (21%), and papillary fibroelastomas (16%)
  - in patients under age 16, the four most common tumours are rhabdomyomas (55%), teratomas (16%), fibromas (10%), and myxomas (10%)
  - myxomas should be surgically resected to minimize the risk of cardiovascular complications, including embolization
- primary malignant cardiac tumours
  - sarcomas are the most common form of primary malignant cardiac tumours (75%)
  - these tumours progress rapidly and can infiltrate the myocardium, obstruct circulation, and release metastatic cells
  - prognosis dictated by anatomic location as opposed to histopathology
  - right-sided tumors are more invasive and metastasize earlier than left-sided ones
  - although the recommended treatment strategy is surgical resection when possible, these tumours are likely to recur
  - a combination of chemotherapy and surgical resection for primary cardiac sarcomas prolongs survival as compared with either surgery or chemotherapy alone
- metastatic involvement of the heart
  - metastatic cancer cells may reach the heart through hematogenous spread, direct invasion, or tumour growth through the venae cavae into the RA
  - incidence is highest in external layers of heart and reduced towards luminal layers, reflects seeding through the coronary arteries and direct extension of adjacent thoracic tumors
  - when a cancer patient develops cardiovascular symptoms, cardiac or pericardial metastases should be suspected
  - although most metastases are asymptomatic, the most common symptom is pericardial effusion with or without tamponade

Valvular Heart Disease

- see the 2020 American College of Cardiology (ACC)/American Heart Association (AHA) Guideline for the Management of Patients with Valvular Heart disease and the 2017 AHA/ACC Focused Update of the 2014 AHA/ACC Guidelines for the Management of Patients with Valvular Heart disease for details

Infective Endocarditis

- see Infectious Diseases, ID15
- American Heart Association (AHA) 2007 guidelines recommend IE prophylaxis
  - only for patients with:
    - prosthetic valve material
    - past history of IE
    - cyanotic CHD
    - cardiac transplant recipients who develop valvulopathy
  - only for the following procedures:
    - dental
    - respiratory tract
    - procedures on infected skin/skin structures/MSK structures
    - not GI/GU procedures specifically

Rheumatic Fever

- see Paediatrics, P65

Prognosis

- acute complications: myocarditis (DCM/CHF), conduction abnormalities (sinus tachycardia, AFib), valvulitis (acute MR), acute pericarditis (not constrictive pericarditis)
- chronic complications: rheumatic valvular heart disease fibrous thickening, adhesion, calcification of valve leaflets resulting in stenosis/regurgitation, increased risk of IE ± thromboembolism
- onset of symptoms usually after 10-20 yr latency from acute carditis of rheumatic fever
- mitral valve most commonly affected

Valve Repair and Valve Replacement

- indication for valve repair or replacement depends on the severity of the pathology; typically recommended when medical management has failed to adequately improve the symptoms or reduce the risk of morbidity and mortality
- pathologies that may require surgical intervention include congenital defects, infections, rheumatic heart disease as well as a variety of valve diseases associated with aging (i.e. degenerative valve lesions)
- surgical valve repair: surgical valvuloplasty (commissurotomy, annuloplasty), chordae tendineae repair, tissue patch
- surgical valve replacement: typically for aortic or mitral valves only; mitral valve repair is favoured in younger individuals (and patients with MVP with severe MR)
- percutaneous techniques are being established to replace or repair valves
- surgical decision between mechanical vs. bioprosthetic prosthesis for patients 50-70 y/o remains uncertain as valve techniques evolve

Twenty-Year Outcome After Mitral Repair Versus Replacement for Severe Degenerative Mitral Regurgitation: Analysis of a Large, Prospective, Multicenter, International Registry
Circulation 2017;135:410-22
Purpose: Analyze very-long term outcomes after MV repair and replacement for degenerative MR with a flail leaflet.
Methods: Employing the Mitral Regurgitation International Database, outcomes after MV repair and replacement were analyzed by propensity score matching and by inverse probability-of-treatment weighting.
Results: Operative mortality was lower after MV repair than replacement in the propensity-matched population (0.2% vs. 4.4%; P<0.001) and 20-yr survival was better after MV repair than replacement in the same population (41% vs. 24%; P<0.001). MV repair was also associated with a reduced rate of valvular complications.
Conclusions: MV repair was associated with lower operative mortality, better 20-yr survival and lower complication rates than MV replacement, in patients with degenerative mitral regurgitation with a flail leaflet.

Choice of Valve Prosthesis

Table 17. Mechanical Valve vs. Bioprosthetic Valve vs. Pulmonary Autograft-Ross Procedure

Mechanical Valve	Bioprosthetic Valve	Pulmonary Autograft in Aortic Position (Ross Procedure*)
Good durability	Limited long-term durability (mitral<aortic)	only aortic valve replacement that restores life expectancy to the age- and sex-matched general population
Less preferred in small aortic root sizes	Good flow in small aortic root sizes	closest flow profile to native aortic roots
Increased risk of thromboembolism (1-3%/yr): requires long-term anticoagulation with coumadin	Decreased risk of thromboembolism: long-term anticoagulation not needed for aortic valves	low risk of thromboembolism
Target INR - aortic valves: 2.0-3.0 (mean 2.5); mitral valves: 2.5-3.5 (mean 3.0)	Some recommendation for limited anticoagulation for mitral valves	no anticoagulation required, enables higher activity and straightforward pregnancies
Increased risk of hemorrhage: 1-2%/yr	Decreased risk of hemorrhage	low risk of hemorrhage
<50 yr for aortic valves and <65 for mitral valves	>65 yr for both aortic and mitral valves	classically in children and young adults <50 yr

*should only be performed in high volume centers with extensive experience in aortic root procedures and the Ross operation

Ross Operation

- En bloc removal of a patient's native pulmonary root with valve (autograft) and transposition of the autograft into the aortic position to a replace a diseased aortic valve that cannot be spared
- The RVOT is then reconstructed with a prosthetic valve, most commonly a cryopreserved pulmonary homograft (human donor)
- With proper technique, mitigation of risk factors for early graft failure, and strict post-operative blood pressure control, the pulmonary autograft adapts to the hemodynamics of the LVOT and left heart with low rates of reintervention
- Despite being more complex than isolated aortic valve replacement, morbidity and mortality are comparable to AVR with bioprosthesis or mechanical valves when done in expert centres

Prosthetic Valve Management

Management and Follow-Up

- follow-up: multiple factors involved in determining the appropriate interval between routine visits including valve type, residual heart disease, and clinical factors
  - TTE after prosthetic valve implantation to assess hemodynamics and ventricular function
    - if/when clinical symptoms or signs of prosthetic valve dysfunction arise, repeat TTE; additional investigations may be warranted if high clinical suspicion is present
    - TTE at 5 yr, 10 yr, and then annually thereafter is reasonable in otherwise asymptomatic patients with a surgically implanted bioprosthetic valve (if transcatheter implantation was used, annual TTE following the procedure is reasonable)
  - optimal dental care and endocarditis prophylaxis are required
- antithrombotic therapy: risk of bleeding must be considered and balanced whenever using/increasing any antithrombotic therapy
  - for patients with a mechanical valve, use anticoagulation with a vitamin K antagonist and INR monitoring
  - for patients with a bioprosthetic TAVI, bioprosthetic SAVR, or mitral valve replacement, other antithrombotic therapies may be indicated

Mechanical or Biological Prostheses for Aortic-Valve and Mitral-Valve Replacement
NEJM 2017;377:1847-57
Purpose: To elucidate differences in mechanical vs. biological prostheses in aortic- and mitral-valve replacements.
Methods: Patients who underwent primary aortic-valve or mitral-valve replacement in California in the period from 1996-2013 were analyzed. Outcomes included long-term mortality and rates of re-operation, stroke, and bleeding.
Results: In aortic-valve replacement, biologic prosthesis was associated with higher 15-yr mortality than mechanical prosthesis among patients aged 45-54 (30.6% vs. 26.4%), but not among patients aged 55-64. In mitral-valve replacement, biologic prosthesis was associated with higher mortality than mechanical prosthesis among patients aged 40-49 (44% vs. 21%), and among those aged 50-69 (50.0% vs. 45.3%).
Conclusion: The long term mortality benefit from mechanical versus biologic prosthesis persisted until 70 yr of age among mitral-valve replacement patients, and until 55 yr of age among aortic-valve replacement patients.

Prosthetic Valve-Related Complications

- bioprosthetic valve dysfunction
  - no known medical therapies to prevent bioprosthetic valve degeneration
  - etiology: tissue degeneration, pannus formation, IE, thrombosis
  - presentation: SOBOE, louder systolic murmur, new diastolic murmur
  - investigations and treatment: depend on the type/severity of pathology, as well as patient characteristics (see below)
- mechanical valve dysfunction
  - etiology: thrombosis, pannus formation, IE, suture disruption
  - presentation: symptoms of HF, systemic thromboembolism, hemolysis, new murmur
  - investigations and treatment: depend on the type/severity of pathology, as well as patient characteristics (see below)
- thromboembolic events
  - ensure to assess anticoagulation adequacy, time spent in therapeutic range; rule out infective endocarditis; screen for new-onset AF; consider other sources of a potentially underlying hypercoagulable state
  - patients with a mechanical aortic/mitral valve that were in therapeutic INR range on a vitamin K antagonist at the time of event: consider increasing INR goal or adding low-dose daily aspirin
  - patients with a bioprosthetic aortic/mitral valve that were on antiplatelet therapy at time of event: consider switching to vitamin K antagonist anticoagulation
- valve thrombosis
  - mechanical valve thrombosis (generally a subacute-acute event):
    - often associated with inadequate anticoagulation; leads to rapid valve dysfunction
      - recurrent thrombosis can be associated with pannus ingrowth
    - symptoms/signs/presentation: rapid onset of symptoms, acute pulmonary edema, stenotic murmur, muffled closing clicks
    - investigations: urgent multimodal imaging (TTE, TEE, fluoroscopy and/or multidetector CT imaging)
    - treatment: if thrombosed valve is left-sided and symptoms of valve obstruction are present, treat urgently with either fibrinolytic therapy or emergency surgery

    - bioprosthetic valve thrombosis
        - most common in first 3 months post-implantation; bioprosthetic valves are less thrombogenic than mechanical valves
        - investigations: 3D TEE or 4D CT imaging in suspected patients (suspicion based on echo and/or CMR findings)
        - treatment: if suspected or confirmed, treatment with a vitamin K antagonist is reasonable (assuming hemodynamically stable and no contraindications)
- prosthetic valve stenosis
    - diagnosis: TTE and TEE
        - if mechanical valve stenosis, cine-CT or fluoroscopy also recommended
        - if bioprosthetic valve stenosis, 3D TEE or 4D CT may be used for the purpose of ensuring there is no leaflet thrombosis
    - intervention: if symptomatic severe stenosis, repeat surgical intervention unless high/prohibitive surgical risk; if surgical risk is high, transcatheter valve-in-valve procedure may be used for patients with bioprosthetic valve stenosis
        - if significant stenosis is in the context of potential or confirmed bioprosthetic valve thrombosis, treatment with a vitamin K antagonist can be considered (see above)
- prosthetic valve regurgitation
    - diagnosis: TTE and TEE
    - intervention: surgery if intractable hemolysis or heart failure related to regurgitation; surgery may also be considered in asymptomatic patients with severe regurgitation
- graft dysfunction after Ross operation
    - etiology: autograft dilatation and RVOT conduit stenosis and/or regurgitation
        - autograft within LVOT requires reintervention more often than pulmonary homograft within RVOT
    - presentation: aortic regurgitation, pulmonary stenosis, pulmonary regurgitation, aortic root aneurysm
    - investigations: echocardiography, MRI if aneurysmal root
    - treatment: when done in expert centers reintervention results in low mortality
        - autograft dilatation: reoperation (autograft is spareable in majority of cases and survival advantage is still preserved)
        - RVOT graft dysfunction: transcatheter pulmonary valve replacement or surgical pulmonary valve replacement (transcatheter is preferred)

Summary of Valvular Disease

General Principles for Evaluating Valvular Heart Disease

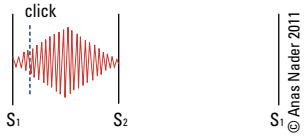
- initial evaluation
    - history and physical: symptom severity, valve disease, comorbidities, HF presence and severity
    - TTE (standard initial investigation): chamber size/function, valve morphology, severity of valvular heart disease, impacts to pulmonary/systemic circulations
    - ECG: rhythm, LVH, LV function
- further testing if indicated/needed
    - CXR: particularly useful for symptomatic patient; assesses for aortic and pericardial calcification, intrinsic pulmonary disease, heart size and congestion of the pulmonary vessels
    - TEE: assessment of mitral and prosthetic valve
    - CMR: LV volume/function, aortic disease, severity of valvular disease
    - PET CT: identification of infection/inflammation
    - stress testing: exercise capacity
    - catheterization: exercise- and drug-related hemodynamic responses, severity of valvular disease, pressures within the heart and pulmonary circulation
- future risk stratification
    - biomarkers: surrogate measure for myocardial damage and filling pressures
    - TTE strain: myocardial function
    - CMR: fibrosis
    - stress testing
    - procedural risk: The Society of Thoracic Surgeons (STS) and TAVI scores
    - frailty score
- preprocedural testing
    - dental exam: rule out sources of infection
    - invasive coronary angiogram or CT coronary angiogram
    - CT peripheral and cardiac (for transcatheter procedures)

Stages of Valvular Heart Disease

- stage A: at-risk (asymptomatic)
- stage B: progressive (mild-moderate severity; asymptomatic)
- stage C: asymptomatic, severe
    - C1: compensated LV or RV
    - C2: decompensated LV or RV
- stage D: symptomatic severe

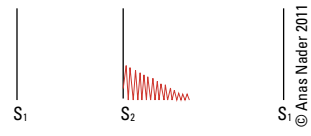
Table 18. Valvular Heart Disease

Aortic Stenosis



Etiology
Congenital (bicuspid, unicuspid valve), calcification (wear and tear), rheumatic disease
Definition/Stages
Stage A: asymptomatic; congenital abnormality, bicuspid or sclerotic valve; aortic Vmax <2 m/s
Stage B: asymptomatic; can be mild AS (Vmax 2.0-2.9 m/s or mean pressure gradient <20 mm Hg) or moderate AS (Vmax 3.0-3.9 m/s or mean pressure gradient 20-39 mm Hg)
Stage C: asymptomatic; can be severe AS (Vmax ≥4 m/s or mean pressure gradient ≥40 mm Hg) or very severe AS (Vmax ≥5 m/s or mean pressure gradient ≥60 mm Hg) ± LV dysfunction
Stage D: symptomatic; can be severe AS or very severe AS; criteria also exist for low-flow, low-gradient AS with reduced LVEF and for low-gradient AS with either normal LVEF or paradoxical low-flow severe AS
Pathophysiology
Outflow obstruction ➔ increased EDP ➔ concentric LVH ➔ LV failure ➔ CHF, subendocardial ischemia
Symptoms
Exertional angina, syncope, dyspnea, PND, orthopnea, peripheral edema, exertional dyspnea, decreased exercise tolerance, HF symptoms, presyncope, syncope
Physical Exam
Narrow pulse pressure, brachial-radial delay, pulsus parvus et tardus, sustained PMI
Auscultation: crescendo-decrescendo SEM radiating to right clavicle and carotid, musical quality at apex (Gallavardin phenomenon), S4, soft S2 with paradoxical splitting, S3 (late)
Investigations
ECG: LVH and strain, LBBB, LAE, AFib
CXR: post-stenotic aortic root dilatation, calcified valve, LVH, LAE, CHF
echo: etiology, valve area, valve morphology, hemodynamics, LV size, systolic function, prognosis, timing of intervention
Other: low-dose dobutamine stress testing, CT imaging/aortic valve calcium score, and exercise testing (contraindicated if symptomatic)
Treatment
Calcific AS: statin based on standard risk score for atherosclerotic prevention
Stages A-C: treat HTN
Asymptomatic: serial echos (repeated based on severity), avoid exertion
Symptomatic: avoid nitrates/arterial dilators and ACEI in severe AS
Procedural intervention considered in stage D, stage C, and other specific situations
Procedural Options
SAVR: if <65 yrs old and >20 yr life expectancy, or if TAVR contraindication
- Conduct prior to pregnancy (if AS significant)
TAVR: if >80 yrs old, if <10 yr life expectancy, or if high/prohibitive surgical risk
If patient between 65-80 yrs old, decision between SAVR or TAVR is catered to specific patient
Percutaneous aortic balloon dilation: bridge to AVR in critical patients

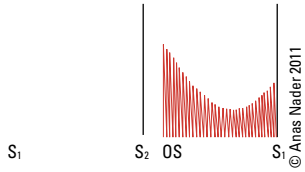
Aortic Regurgitation



Definition
Leakage of blood across the aortic valve into the LV (i.e. aortic insufficiency). May be primary or secondary AR
Etiology
Supravalvular: aortic root disease (Marfan syndrome, atherosclerosis and dissecting aneurysm, connective tissue disease)
Valvular: congenital (bicuspid aortic valve, large VSD), IE
Acute Onset: IE, aortic dissection, trauma, failed prosthetic valve
Pathophysiology
Volume overload ➔ LV dilatation ➔ increased SV, high sBP and low dBP ➔ increased wall tension ➔ pressure overload ➔ LVH (low dBP ➔ decreased coronary perfusion)
Symptoms
Usually only becomes symptomatic late in disease when HF symptoms, SOBOE, dyspnea, orthopnea, PND, syncope, and/or angina develop as a result of LV failure
Physical Exam
Waterhammer pulse, bisferiens pulse, femoral-brachial sBP >20 mmHg (Hill's test: wide pulse pressure), hyperdynamic apex, displaced PMI, heaving apex
Auscultation: early decrescendo diastolic murmur at LLSB (cusp pathology) or RLSB (aortic root pathology); best heard sitting, leaning forward, on full expiration; soft S1, absent S2, present S3 (late)
Investigations
ECG: LVH, LAE
CXR: LVH, LAE, aortic root dilatation
echo/TTE: etiology/severity, quantify AR, leaflet or aortic root anomalies, LV size, systolic function, prognosis, timing of intervention
TEE, CMR, or cardiac catheterization if ≥ moderate AR, suboptimal/inconsistent TTE: systolic function, heart volumes, aortic size, AR severity
Cardiac catheterization lab (Cath lab): if >40 yr and surgical candidate – to assess for ischemic heart disease
Exercise testing: hypotension with exercise
Treatment
Asymptomatic: serial echos, afterload reduction (e.g. ACEI, nifedipine, hydralazine)
Symptomatic: avoid exertion, treat CHF
Surgery if: symptomatic severe AR; chronic, severe AR with LVEF ≤55%; severe AR and otherwise undergoing cardiac surgery; other specific situations
Surgical Options
Valve replacement
Valve repair
Bentall procedure: replacement of aortic root and valve

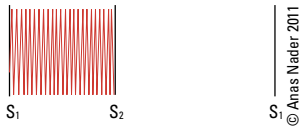
Table 18. Valvular Heart Disease

Mitral Stenosis



Etiology
rheumatic disease (most common), non-rheumatic calcification, congenital
Definition
Severe MS: mitral valve area (MVA) <1.5cm², diastolic pressure half-time ≥150 ms
Pathophysiology
MS → fixed CO and LAE → increased LA pressure → PVR and CHF; worse with AFib (no atrial kick), tachycardia (decreased atrial emptying time) and pregnancy (increased preload)
Symptoms
SOBOE, orthopnea, fatigue, decreased exercise tolerance, palpitations, peripheral edema, malar flush, pinched and blue facies (severe MS)
Physical Exam
AFib, left parasternal lift, palpable diastolic thrill at apex; if AFib, no "a" wave on JVP; if sinus, prominent "a" wave may be found on JVP
Auscultation: mid-diastolic rumble at apex; best heard with bell in left lateral decubitus position following exertion; loud S1, OS following loud P2 (heard best during expiration), long diastolic murmur, and short A2-OS interval correlate with worse MS
Investigations
ECG: NSR/AFib, LAE (P mitrale), RVH, RAD
CXR: LAE, CHF, mitral valve calcification
echo/TTE: diagnosis/severity, hemodynamics, valvular lesions, valve anatomy/morphology, LA thrombus if percutaneous mitral balloon commissurotomy being considered
Exercise testing: rheumatic MS and resting echo inconsistent with symptoms
Cath lab: if concurrent CAD and patient >40 yr (male) or >50 yr (female)
Treatment
Avoid exertion, fever (increased LA pressure); treat AFib and CHF; increase diastolic filling time (β-blockers, digitalis)
Vitamin K antagonist anticoagulation: in rheumatic MS if AF, previous embolism, or LA thrombus
Heart rate control (for some patients)
Intervention if: symptomatic, severe MS
Invasive Options
Percutaneous mitral balloon commissurotomy (PMBC): symptomatic, severe rheumatic MS with acceptable morphology, < moderate MR, and no LA thrombus (may be reasonable in other specific situations)
Mitral valve surgery (repair, commissurotomy, or replacement): symptomatic, severe rheumatic MS with contraindication/limited access for PMBC, previous failure of PMBC, or otherwise undergoing cardiac surgery (note: restenosis in 50% of patients in 8 yr after open mitral commissurotomy)
Nonrheumatic, calcific MS: if severe MS and severe symptoms, valve intervention can be contemplated pending discussion with patient about high procedural risk

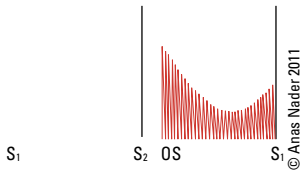
Mitral Regurgitation



Etiology
MVP, congenital cleft leaflets, LV dilatation/aneurysm (CHF, DCM, myocarditis), IE abscess, Marfan's syndrome, HOCM, acute MI, myxoma, mitral valve annulus calcification, chordae/papillary muscle trauma/ischemia/rupture (acute), rheumatic disease, leaflet perforation
Definition
Leakage of blood across the mitral valve from the LV into the LA; can be primary or secondary. Can use Carpentier's classification
Pathophysiology
Reduced CO → increased LV and LA pressure → LV and LA dilatation → and pulmonary HTN
Symptoms
Dyspnea, PND, orthopnea, palpitations, peripheral edema, decreased exercise tolerance, SOBOE
Physical Exam
Displaced hyperdynamic apex, left parasternal lift, apical thrill
Auscultation: holosystolic murmur at apex radiating to axilla ± mid-diastolic rumble, loud S2 (if pulmonary HTN), S3
Acute MR: sudden acute and hemodynamic instability (possibility during/post MI)
Investigations
ECG: LAE, left atrial delay (bifid P waves), ± LVH
CXR: LVH, LAE, pulmonary venous HTN
echo/TTE: etiology and severity of MR, LV/RV function, leaflets, pulmonary artery pressure, vegetations/abscesses, papillary muscle/chordal rupture, LA size, mitral valve apparatus, extent of remodelling
TEE: can be helpful with acute MR or if considering transcatheter interventions; also used when TTE findings are insufficient/inconsistent; assess for MR severity/mechanism and LV function
Swan-Ganz Catheter: prominent LA "v" wave
Other: CMR, exercise testing, stress nuclear/PET, stress echo. and serum biomarkers/novel measurement of LV function
Treatment
Acute MR: vasodilator therapy (use limited by systemic hypotension); intra-aortic balloon counter pulsation or percutaneous circulatory assist device may be employed
Asymptomatic: serial echos
Guideline-directed management and therapy for patients with severe MR and LV systolic dysfunction or HFrEF (e.g. ACEi, ARBs, beta blockers, aldosterone antagonists, ARNIs, biventricular pacing)
Intervention if: acute MR with CHF, papillary muscle rupture; severe MR with symptoms or LV systolic dysfunction; AFib; increasing LV size/presence of LV dilatation; pulmonary hypertension; decreasing exercise tolerance; can be reasonable in other situations if low mortality risk (<1%) and high probability of successful/durable repair (>95%) or if otherwise undergoing CABG
Procedural Options
Mitral valve surgery (preferably repair) is indicated and lifesaving in acute, severe, symptomatic, primary MR
Valve repair (preferred over replacement if degenerative disease is the etiology): >75% of patients with MR and myxomatous MVP – annuloplasty rings, leaflet repair, chordae transfers/shortening/replacement
Valve replacement if: failure of repair, heavily calcified annulus
Advantage of repair: low rate of endocarditis, no anticoagulation, less chance of re-operation
Transcatheter edge-to-edge repair (TEER): reasonable in patients with severe, symptomatic primary MR with high/prohibitive surgical risk or in severe, symptomatic secondary MR if associated with LV dysfunction

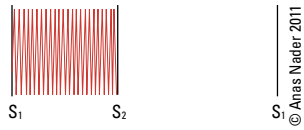
Table 18. Valvular Heart Disease

Tricuspid Stenosis



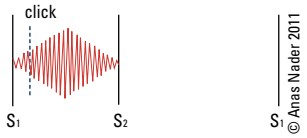
Etiology
Rheumatic disease, congenital, carcinoid syndrome, fibroelastosis; usually accompanied by MS (in rheumatic heart disease), autoimmune disorders, atrial myxomas, blunt trauma, metastases, congenital, drug-associated valvulopathy
Definition
Tricuspid orifice narrowing; blood flow from the RA into the RV is obstructed
Pathophysiology
Increased RA pressure → right HF → CO decreased and fixed on exertion
Symptoms
Peripheral edema, fatigue, palpitations
Physical Exam
Prominent "a" waves in JVP, positive abdominojugular reflux, Kussmaul's sign, diastolic rumble 4th left intercostal space
Investigations
ECG: RAE
CXR: dilatation of RA without pulmonary artery enlargement
echo: diagnostic
Cardiac catheterization: large RA "a" wave (12-20 mm Hg); diastolic, mean pressure gradient of 4-8 mm Hg (Increased RA pressure with a slow decrease in early diastole + diastolic pressure gradient is classic for TS)
CMR: RV size/function
Treatment
Preload reduction (diuretics) for severe, symptomatic TS (caution: may exacerbate low output)
Treat underlying etiology
Slow HR
Surgery: usually performed at time of other cardiac surgery (e.g. mitral valve surgery for rheumatic MS)
Surgical Options
Valvotomy using 1-3 balloons
Valve surgery: repair or replacement (open or transcatheter options for replacement)
Usually tricuspid surgery favoured over percutaneous balloon tricuspid commissurotomy or valvuloplasty

Tricuspid Regurgitation



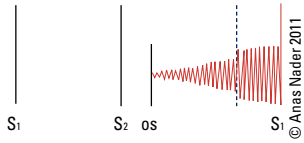
Etiology
RV dilatation, IE (particularly due to IV drug use), rheumatic disease, iatrogenic (device leads, endomyocardial biopsy), congenital (Ebstein's anomaly), pulmonary HTN, RV overload, DCM, annular dilation, leaflet tethering, RA dilatation, ischemic heart diseases, other (trauma, carcinoid, drugs, irradiation)
Definition
Leakage of blood across the tricuspid valve (i.e. tricuspid insufficiency); can be primary or secondary
Pathophysiology
RV dilatation → TR (and further RV dilatation)→ right HF
Symptoms
Peripheral edema, fatigue, palpitations, SOBOE, ascites
Physical Exam
elevated JVP, "cv" waves in JVP, positive abdominojugular reflux, holosystolic murmur at LLSB accentuated by inspiration, left parasternal lift,
Investigations
ECG: RAE, RVH, AFib
CXR: RAE, RV enlargement
echo/TTE: diagnostic – assess for etiology/severity of TR, IVC and right heart size, RV systolic function, left-sided disease and pulmonary artery systolic pressure
Invasive measurements (to address inconsistencies): cardiac index, right-sided diastolic pressure, pulmonary artery pressures, pulmonary vascular resistance, ventriculography
Treatment
Preload reduction (diuretics): reasonable if right-sided HF related to severe TR
Therapies to treat HF etiology reasonable if right-sided HF related to severe secondary TR
Surgery if: severe TR (stages C and D) and undergoing cardiac surgery for a left-sided valve; can be reasonable in other specific situations.
Surgical Options
Annuloplasty (i.e. repair; rarely replacement)

Pulmonary Stenosis



Etiology
Usually congenital, rheumatic disease (rare), carcinoid syndrome
Definition
Stiffening/narrowing of the pulmonic valve; blood flow into the pulmonary artery from the RV is obstructed
Pathophysiology
Increased RV pressure → RVH → right HF
Symptoms
Chest pain, syncope, fatigue, peripheral edema
Physical Exam
Systolic murmur at 2nd left intercostal space accentuated by inspiration; pulmonary ejection click; right-sided S4
Investigations
ECG: RVH
CXR: prominent pulmonary arteries, enlarged RV
echo: diagnostic
Treatment
Balloon valvuloplasty if severe symptoms
Surgical Options
Percutaneous or open balloon valvuloplasty

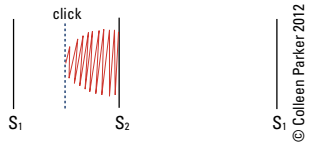
Pulmonary Regurgitation



Etiology
Pulmonary HTN, IE, rheumatic disease, tetrology of Fallot (post-repair), defective valvular coaptation, annular dilatation, fibrinoid deposits
Definition
Insufficient closure of the pulmonic valve during diastole; reversal of flow into the RV
Pathophysiology
Increased RV volume → increased wall tension → RVH → right HF
Symptoms
Chest pain, syncope, fatigue, peripheral edema
Physical Exam
Early diastolic murmur at LLSB; Graham Steell (diastolic) murmur at 2nd and 3rd left intercostal space (increasing with inspiration)
Investigations
ECG: RVH
CXR: prominent pulmonary arteries if pulmonary HTN; enlarged RV
echo: diagnostic
Treatment
Rarely requires treatment; valve replacement (rarely done)
Surgical Options
Pulmonary valve replacement

Table 18. Valvular Heart Disease

Mitral Valve Prolapse



Etiology
Myxomatous degeneration of chordae; thick, bulky leaflets that crowd orifice; associated with connective tissue disorders; pectus excavatum; straight back syndrome, other MSK abnormalities; <3% of population
Definition
Valve leaflet(s) prolapse into the LA; common cause of MR. (i.e. click-murmur syndrome, Barlow's syndrome, billowing mitral valve leaflets, or floppy valve syndrome)
Pathophysiology
Mitral valve displaced into LA during systole; no causal mechanisms found for symptoms. Generally benign; however, presentation may be with sudden cardiac death, infective endocarditis, or cerebrovascular accident
Symptoms
Can be asymptomatic. May have prolonged, stabbing chest pain or atypical chest discomfort; dyspnea; anxiety/panic attacks; palpitations; fatigue; presyncope, SOBOE, exercise intolerance; low blood pressure; syncope; orthostasis; mood changes; syncope
Physical Exam
Auscultation: mid-systolic click (diagnostic - due to billowing of mitral leaflet into LA and tensing of redundant valve tissue); followed by a mid to late systolic murmur at apex (murmur accentuated by Valsalva and diminished when patient squatting)
Investigations
ECG: non-specific ST-T wave changes, paroxysmal SVT, ventricular ectopy
echo: diagnostic – systolic displacement of mitral valve leaflets above mitral annulus into LA; assess mitral valve leaflet thickness
Cardiac catheterization/left ventriculography: if inconsistent clinical and echo findings; sometimes picks up MVP incidentally
Treatment
Asymptomatic: often no treatment; reassurance. If MR associated, follow-up annually; if not, follow-up q3-5 yr
Sinus rhythm and high-risk MVP: aspirin may be considered
Systemic embolism, recurrent TIAs despite aspirin, ischemic stroke, or AFib: anticoagulation
Symptomatic: β-blockers and avoidance of stimulants (e.g. caffeine) of significant palpitations; anticoagulation if AFib
Surgical Options
Mitral valve surgery (repair favoured over placement): if symptomatic and significant MR; may be reasonable if asymptomatic with MR and systolic HF
Transcatheter mitral valve repair considered if high/prohibitive surgical risk

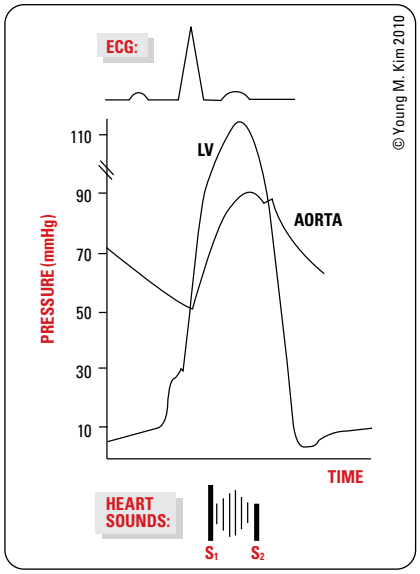


Figure 47. Hemodynamics of aortic stenosis
Stenosis across the aortic valve results in the generation of a significant pressure gradient between the LV and the aorta, as well as a crescendo-decrescendo murmur during systolic contraction. The stenosis decreases the intensity of aortic valve closure, hence diminishing S2

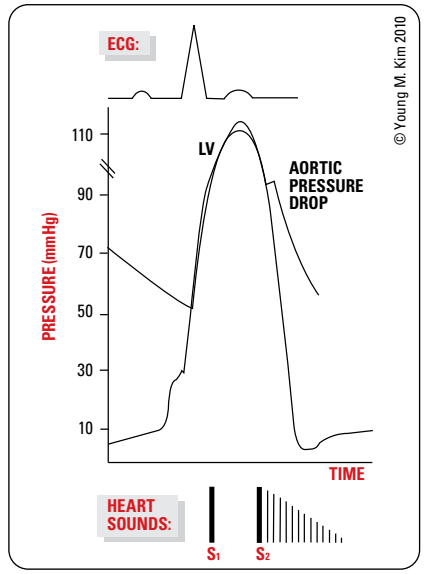

Figure 48. Hemodynamics of aortic regurgitation
Regurgitation across the aortic valve during diastole causes the aortic pressure to rapidly decrease and a decrescendo murmur can be heard at the onset of diastole (after S2). The presence of regurgitant blood from the aorta increases LV end diastolic volume

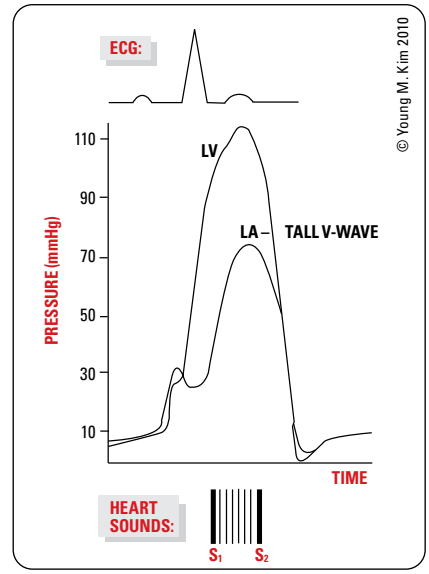

Figure 49. Hemodynamics of acute mitral regurgitation
During systolic contraction, blood regurgitates from the LV into the LA across the incompetent mitral valve resulting in a short but audible holosystolic murmur between S1 and S2. The portion of left ventricular end diastolic volume that regurgitates into the LA myocardium increases left atrial pressures resulting in a tall V-wave (in the JVP). Severe, acute MR usually results in acute hemodynamic decompensation

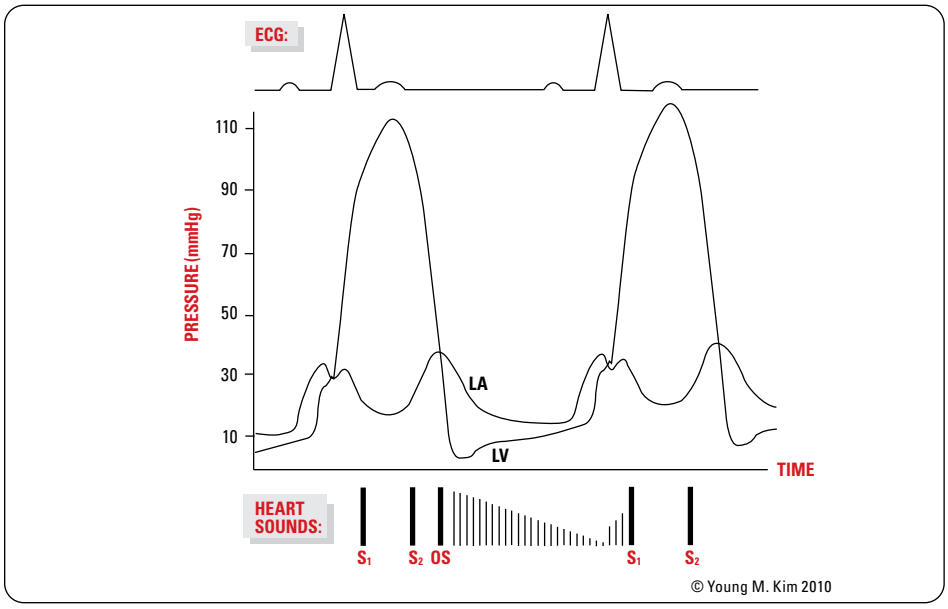

Figure 50. Hemodynamics of mitral stenosis
First note that the left atrial pressure exceeds the left ventricular pressure during diastole due to MS and there is a consequent generation of a pressure gradient across the LA and LV. In diastole, the stenotic mitral valve opens (which corresponds to the OS) and the passage of blood across the MS results in an audible decrescendo murmur. Left atrial contraction prior to S1 increases the pressure gradient resulting in accentuation of the murmur before S1 is audible

Transcatheter (TAVR) or Surgical (SAVR) Aortic-Valve Replacement in Intermediate-Risk Patients (PARTNER II Trial)
NEJM 2016;374:1609-1620
Purpose: To determine if TAVR and SAVR result in different survival rates among intermediate-risk patients with AS.
Methods: Patients with AS were randomized to either TAVR (N=1011) or to SAVR (n=1021). The primary endpoint was death from any cause or disabling stroke at 2 yr.
Results: The death rate from any cause or disabling stroke was similar in the TAVR and SAVR groups (P=0.001 for noninferiority). In the transfemoral-access cohort, TAVR resulted in a lower rate of death or disabling stroke than SAVR did (P=0.05). In the transthoracic-access cohort, similar outcomes were observed in the TAVR and SAVR groups. TAVR resulted in larger aortic valve areas and lower rates of AKI, severe bleeding, and new onset AFib. Fewer major vascular complications and less paravalvular AR were observed in patients who underwent SAVR.
Conclusion: In intermediate-risk patients with AS, TAVR and SAVR resulted in similar rates of all-cause mortality and disabling stroke.

See Landmark Cardiac Trials for more information on PARTNER III which details the outcomes of low-risk patients who underwent TAVR or surgical aortic-valve replacement.

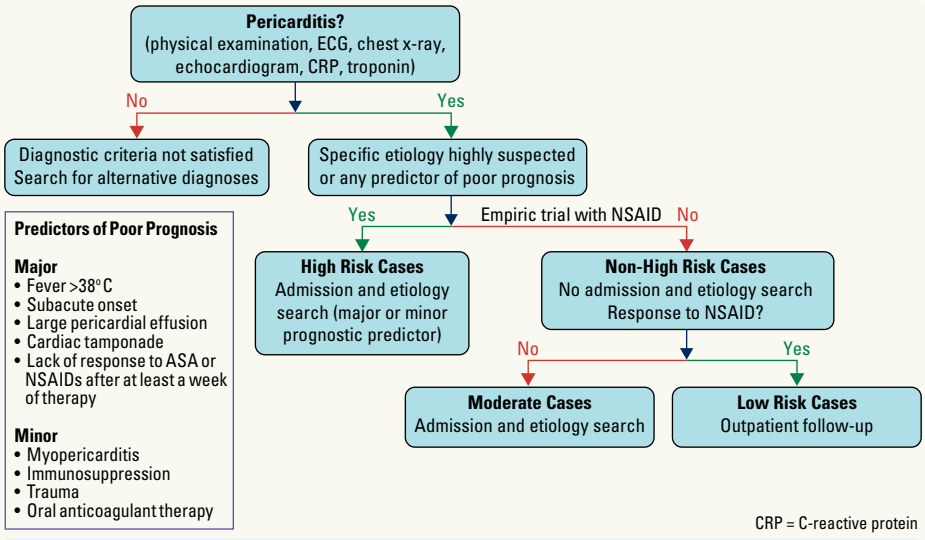
Pericardial Disease

Acute Pericarditis

Definition
- syndrome involving the inflammation of the pericardium that may present with or without a pericardial effusion
- pericarditis can be divided into:
  - acute (event lasting <4-6 wk)
  - incessant (event lasting >4-6 wk with no remission)
  - recurrent (symptom-free remission period of 4-6 wk followed by new onset of pericarditis-associated signs and symptoms)
  - chronic (>3 mo)

Etiology of Pericarditis/Pericardial Effusion
- idiopathic is most common (presumed to be viral)
  - searching for and identifying the etiology is not required in all patients; in nations with low TB prevalence, the most common causes of pericarditis are generally benign
    - infectious only approximately 14%
  - viral: Coxsackie virus A, B (most common), echovirus, Parvovirus B19, Epstein-Barr virus
  - bacterial: *S. pneumoniae, S. aureus, B. burgdorferi, M. tuberculosis*
  - HIV
- fungal: histoplasmosis, blastomycosis
- post-MI: acute (direct extension of myocardial inflammation, 1-7 d post-MI), Dressler's syndrome (autoimmune reaction, 2-8 wk post-MI)
- post-cardiac surgery (e.g. CABG), other cardiac procedures (e.g pacemaker insertion or TAVR), or other trauma
- metabolic: uremia (common), hypothyroidism
- neoplasm: Hodgkin's, breast, lung, renal cell carcinoma, melanoma, lymphoma
- collagen vascular disease: SLE, polyarteritis, rheumatoid arthritis, scleroderma
- vascular: dissecting aneurysm
- other: drugs (e.g. hydralazine), radiation, infiltrative disease (e.g. sarcoidosis), vaccination (e.g. smallpox)
- autoimmune diseases
- immune checkpoint-inhibitor-associated pericarditis (severe; requires immunosuppressive therapy)
- see Figure 51 for a proposed approach to triaging pericarditis

Anterior Leaflet Laceration to Prevent Ventricular Outflow Tract Obstruction During Transcatheter Mitral Valve Replacement (LAMPOON)
J Am Coll Cardiol. 2019 Jul 30;74(4):595
Background: Transcathether mitral valve replacement (TMVR) is routinely employed in patients with valvular disease who are unsuitable for open surgical interventions. The primary complication of this procedure is LVOT obstruction as a result of the anterior mitral leaflet impinging on the interventricular septum.
Purpose: To study intentional laceration of the anterior mitral valve leaflet (LAMPOON) alongside TMVR to prevent the complication of LVOT obstruction.
Methods: Between June 2017 and June 2018, 30 patients with severe MR/MS, high surgical risk, and prohibitive risk of LVOT obstruction, underwent TMVR with LAMPOON. The primary outcomes were technical success for TMVR and LAMPOON (successful laceration) procedures, LVOT gradient <30 mmHg, freedom from emergent re-intervention, and procedural mortality.
Results: The LAMPOON laceration was deemed successful in 100% of enrolled patients. 100% of patients survived immediately post-procedure, with 93% surviving 30-d after discharge. 90% of patients had an LVOT gradient <30 mmHg (optimal range) after TMVR, with 100% of patients showing LVOT gradient <50 mmHg (acceptable range). The procedural success rate was 73% from the remaining 22 subjects.
Conclusions: In the studied population, LAMPOON mitigates the risk of LVOT obstruction with TMVR. LAMPOON is technically feasible and serves to enable TMVR in patients otherwise deemed ineligible due to prohibitive risk of LVOT obstruction.



Proposed triage of acute pericaditis accordint to epidemiological background and predictors of poor prognosis at presentation. At least one predictor of poor prognosis is sufficient to identify a high risk case. Major criteria have been validated by multivariate analysis, minor criteria are based on expert opinion and literature review. Cases with moderate risk are defined as cases without negative prognostic predictors but incomplete or lacking response to non-steroidal anti-inflammatory drug (NSAID) therapy. Low risk cases include those without negative prognostic predictors and good response to anti-inflammatory therapy. Specific etiology is intended as non-ideopathic etiology

Figure 51. Proposed triage of pericarditis

Phase 3 Trial of Interleukin-1 Trap Rilonacept in Recurrent Pericarditis (RHAPSODY)
NEJM 2021;384:31-41
Purpose: Evaluate the efficacy and safety of rilonacept, an interleukin-1a and 1b cytokine trap, as a mediator of recurrent pericarditis.
Methods: Patients with acute symptoms of recurrent pericarditis and systemic inflammation (elevated CRP level) were enrolled in a 12-wk run-in period, during which rilonacept was initiated and background medications discontinued. Patients were randomized (1:1 ratio) to receive continued rilonacept monotherapy or placebo, administered SQ once weekly. The primary endpoint was recurrence of pericarditis symptoms.
Results: During the randomized-withdrawal period, there were too few recurrences in the rilonacept group to calculate median recurrence time. In the placebo group, median recurrence time was 8.6 wk (95% CI 4.0 to 11.7; hazard ratio 0.04; 95% CI 0.01 to 0.18; P<0.001). During this period, 2 of 30 patients (7%) in the rilonacept group had a pericarditis recurrence, as compared to 23 of 32 patients (74%) in the placebo group.
Conclusion: Among patients with recurrent pericarditis, rilonacept led to faster resolution of the current episode and lower recurrence.

Clinical Presentation, Investigations, and Diagnosis

- 2 of the following 4 needed for diagnosis
  1. chest pain
     - sharp, rapid onset (may be dull or throbbing)
     - pain commonly radiates to the trapezius ridge
     - pleuritic; pain related to inspiration, coughing, and potentially hiccoughs
     - improves with sitting up/leaning forward
  2. pericardial friction rub
     - with patient leaning forward or on elbows and knees, friction rub heard on left sternal border
     - classically triphasic; may be mono- or biphasic
     - varies in intensity over time; repeated examinations necessary
     - highly specific finding
  3. ECG changes (only about 60% of patients have sequential changes)
     - stage 1: PR depression and generalized ST elevation (a generally specific finding but up to 40% have nondiagnostic and atypical changes)
     - stage 2: stage 1 findings reversed; J points on baseline prior to flattening of T waves
     - stage 3: inversion of T-waves
     - stage 4: all changes normalized
     - changes noted on ECG can be localized or diffuse; PR depression may be the only sign
  4. pericardial effusion (new or worsening)
- other physical exam findings: +/- malaise, +/- sinus tachycardia, +/- low-grade fever, +/- non-cardiac findings if the acute pericarditis is related with a systemic condition (e.g. rash, arthritis, weight loss, night sweats)
- other investigations may aid in diagnosis/monitoring
  - biomarkers/inflammatory markers
    - cardiac-specific troponin I or T elevation (≥30% of patients) –evidence of myocardial involvement (could be myopericarditis or perimyocarditis). Imaging modalities such as echo or CMR may also provide evidence of myocardial involvement
    - elevated CRP, ESR, and/or WBC count found in majority of patients, but not sensitive or specific (elevated high-sensitivity CRP can predict recurrence risk)
  - imaging
    - CXR
      - usually normal heart size (effusion >300 mL needed to increase cardiothoracic index)
        - patients with a new/unexplained increase in heart size should be worked up for acute pericarditis (especially when lung fields are clear)
      - may demonstrate evidence of pleuropericardial involvement in the setting of pleuropulmonary disease
      - cause of pericarditis can sometimes be identified

- echo: often the only necessary modality for imaging (TEE > TTE) → normal in 40%
  - applications include:
    - identifying pericarditis-associated complications (e.g. cardiac tamponade, constrictive pericarditis) or components of myocarditis (e.g. ventricular dysfunction)
    - monitoring pericardial effusion and efficacy of therapy
    - providing real-time evaluation during pericardial drainage
- CMR, CT may also have applications in the setting of pericarditis; assess for inflammation of pericardium

- differential diagnosis includes: Takotsubo syndrome, MI, myocarditis

Prognosis

- based on etiology (e.g. overall good prognosis = idiopathic/viral pericarditis (although significant recurrence risk), pericarditis with myocardial involvement; purulent and neoplastic pericarditis have a reported mortality rate between 20-30%)
  - negative prognostic factors: subacute onset, fever ≥38°C, >20mm pericardial effusion on echo, tamponade, lack of response following 1 week of anti-inflammatory treatment → hospitalize patients with these factors and those with an elevated tamponade and/or constriction risk
    - minor negative prognostic factors: oral anticoagulation, trauma, immunosuppression

Treatment

- treat the underlying disease
- anti-inflammatory agents remain the mainstay for treatment (e.g. NSAIDs/ASA)
  - ketorolac may be employed in patients with severe pain or patients unable to take oral medication; use should be limited to 5 days
- colchicine may reduce symptom persistence and recurrent rates
- corticosteroid use is controversial but may be indicated in patients with incomplete response, failure of other anti-inflammatory medications, and/or other indicated situations (e.g. autoimmune disease-associated or immune checkpoint inhibitor-associated pericarditis)
- purulent pericarditis (rare but life-threatening): antimicrobial therapy catered to the culprit etiologic agent and/or local fibrinolytic therapy
- tuberculous pericarditis: multidrug regimen for several months (corticosteroids and pericardiectomy sometimes considered)
- pericarditis in the setting of viremia (particularly in immunocompromised patients): antiviral treatment
  - physical activity restriction until symptom resolution

Complications

- recurrent episodes of pericarditis, atrial arrhythmia, pericardial effusion, tamponade, constrictive pericarditis

Pericardial Effusion

Definition

- fluid accumulation in the pericardial sac (note: the pericardial sac normally hosts 10-50 mL of lubricating pericardial fluid). The composition of the fluid can include exudate, transudate, blood, and rarely air/gas

Etiology and Classification

- effusion is found incidentally on X-ray or echo for a significant proportion of patients
  - for these patients in developed countries, etiologies include:
    - idiopathic (up to 50%)
    - cancer (10-25%)
    - infections (15-30%)
    - iatrogenic causes (15-20%)
    - connective tissue diseases (5-15%)
  - in developing countries, TB is the predominant cause (>60%)
- for pericardial effusion with pericarditis, the prevalence of malignant/infectious etiologies is 15-50%
- transudative causes
  - CHF or pulmonary HTN → increase in systemic venous pressure → decreased reabsorption of pericardial fluid
  - hypoalbuminemia/hypoproteinemia, hypothyroidism
- exudative causes (serosanguinous or bloody)
  - pathologic process → inflammation → possible increased production of pericardial fluid
  - causes similar to the causes of acute pericarditis
  - may develop acute effusion secondary to hemopericardium (trauma, post-MI myocardial rupture, aortic dissection)
- can be classified according to onset, distribution, hemodynamic impact, composition, and size
- physiologic consequences depend on type and volume of effusion, rate of effusion development, and underlying cardiac disease

Signs and Symptoms

- rate of development of pericardial effusion determines clinical presentation
- may be asymptomatic or similar to acute pericarditis
- classic symptoms: dyspnea on exertion (progressing to orthopnea), chest pain and/or fullness
- symptoms related to local compression of extracardiac structures may include: nausea, dysphagia, hoarseness, hiccoughs; may cause esophageal/recurrent laryngeal nerve/trachea-bronchial/phrenic nerve irritation
- non-specific symptoms related to compression of related structures or reduced blood pressure and secondary sinus tachycardia: cough, weakness, fatigue, anorexia, palpitations, fever (may be associated with pericarditis)
- physical exam findings:
  - JVP increased with dominant "x" descent
  - arterial pulse normal-to-decreased volume; decreased pulse pressure
  - auscultation: distant heart sounds ± rub
  - Ewart's sign
  - often normal in patients without compromise to hemodynamic status; if tamponade present, findings can include fatigue, dyspnea, elevated JVP, neck vein distension, edema, pulsus paradoxus, muffled heart sounds (in moderate-large effusions). Rarely friction rubs heard (usually appreciated with concomitant pericarditis)

Ewart's Sign
Egophony, bronchial breathing, and dullness to percussion at the lower angle of the left scapula in pericardial effusion due to effusion compressing left lower lobe of lung

Investigations

- ECG: sinus tachycardia, low voltage (should raise concern for effusion with tamponade when present with sinus tachycardia; however, not specific for pericardial effusion), flat T waves, electrical alternans (highly specific for pericardial effusion (generally with tamponade), but not a sensitive sign to exclude effusion/tamponade)
  - be cautious in diagnosing STEMI in a patient with pericarditis and an effusion antiplatelets may precipitate hemorrhagic effusion
- CXR: ± cardiomegaly with clear lung fields, ± rounded cardiac contour
- emergency room: bedside U/S with subxiphoid view showing fluid in pericardial sac
- echo/TTE (procedure of choice): fluid in pericardial sac; assess effusion size and hemodynamic effects
- pericardiocentesis: definitive method of determining transudate vs. exudate, identify infectious agents, and investigating neoplastic involvement
- CT/CMR: compared with echo, provide greater field of view ➔ enable loculated effusion detection, identification of masses or thickening associated with the pericardium, assessment for chest abnormalities (however, echo still preferred due to availability/portability/low cost)
- biomarkers: assessment of inflammation markers (e.g. CRP) recommended

Treatment (see Figure 52)

- triage: based on size, hemodynamic effects (particularly assess for tamponade), inflammatory markers, concomitant pathologies ➔ high risk patients should be admitted
- treat underlying etiology (60% of effusions associated with known disease)
- if inflammatory signs are present, or if associated with pericarditis, treat as if pericarditis; if elevated markers of inflammation, can try NSAIDs/colchicine/low-dose corticosteroids; if associated with systemic inflammation, aspirin/NSAIDs/colchicine recommended
- pericardiocentesis or cardiac surgery if: cardiac tamponade, symptomatic moderate-large effusion and unresponsive to medical therapy, or unknown bacterial/neoplastic etiology suspected
  - prolonged drainage using pericardiocentesis should also be considered if symptomatic effusion without evidence of inflammation or unresponsive to anti-inflammatory agents
  - if no inflammation and large, isolated effusion, pericardiocentesis alone may be required (no evidence for medical therapy), but recurrences are common
  - consider pericardiectomy or pericardial window (subxiphoid or video assisted thoracoscopic) if: re-accumulation of fluid, loculated effusion, biopsy required
- follow-up/frequent observation if no evidence/suspicion of:
  - tamponade
  - bacterial/neoplastic etiology
  - elevated inflammatory markers
  - associated pathology
  - large effusion (>20 mm)
    - Note: follow-up based on symptoms, effusion size and evolution, inflammatory markers, etc.

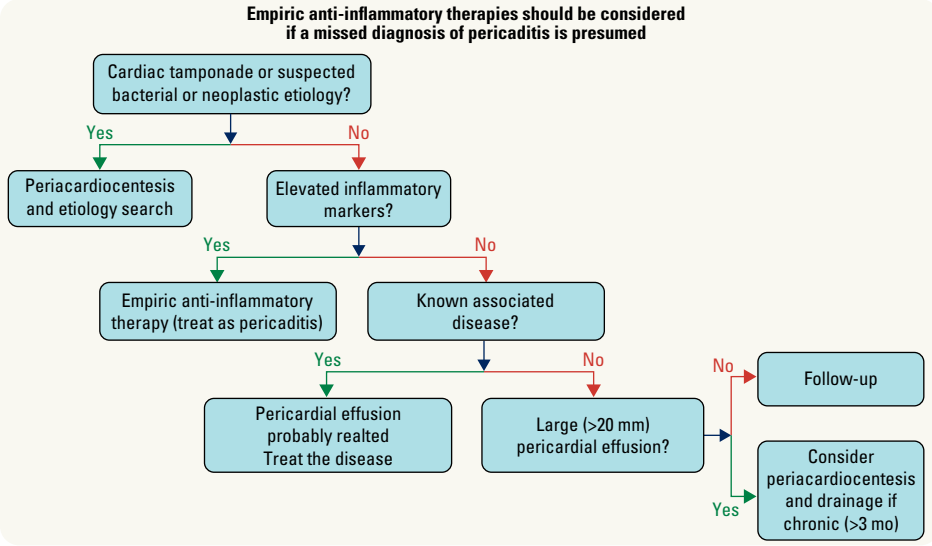


Figure 52. Triage/management algorithm for pericardial effusion

Cardiac Tamponade

Definition
- accumulation of fluid, pus, blood, clots or gas in the pericardium leading to life-threatening, slow or rapid compression of the heart

Classic Quartet of Tamponade
- Hypotension
- Increased JVP
- Tachycardia
- Pulsus paradoxus

Beck's Triad
- Hypotension
- Increased JVP
- Muffled heart sounds

Etiology
- can be caused by inflammation, trauma, rupture of the heart or aortic dissection
- major complication of rapidly accumulating pericardial effusion
- cardiac tamponade is a clinical diagnosis
- common causes: pericarditis, tuberculosis, iatrogenic, trauma, neoplasm/malignancy
- uncommon causes: collagen vascular diseases (e.g. SLE, rheumatoid arthritis, scleroderma), radiation, post-MI, uremia, aortic dissection, bacterial infection, pneumopericardium

Pathophysiology
- high intra-pericardial pressure ➔ decreased venous return ➔ decreased diastolic ventricular filling ➔ decreased CO ➔ hypotension and venous congestion

Signs and Symptoms
- tachycardia, hypotension, increased JVP
- tachypnea, dyspnea, shock, muffled heart sounds
- pulsus paradoxus (inspiratory fall in sBP >10 mmHg during quiet breathing)
- JVP "x" descent only, blunted "y" descent
- hepatic congestion/peripheral edema
- severity of signs/symptoms depend on rate of accumulation, volume of pericardial contents, pericardial distensibility, cardiac filling pressures, and chamber compliance

Investigations
- ECG: electrical alternans (pathognomonic variation in R wave amplitude), low voltage
- CXR: enlarged cardiac silhouette; slow-accumulating effusions
- CT/CMR: less available; usually only necessary if Doppler echo is infeasible
- echo (diagnostic modality of choice): pericardial effusion (size, location, hemodynamic impact), swinging of the heart, compression of cardiac chambers (RA and RV) in diastole, etc. ➔ echo also used for the purpose of guiding pericardiocentesis
- cardiac catheterization (rare)

Treatment
- urgent drainage: needle pericardiocentesis recommended (with echo or fluoroscopic guidance); surgery (i.e. pericardiotomy) is an alternative drainage approach (e.g. with purulent pericarditis or in an urgent situation involving bleeding into the pericardium)
- avoid diuretics and vasodilators (these decrease venous return to already under-filled RV ➔ decrease LV preload ➔ decrease CO) as well as mechanical ventilation
- IV fluid may increase CO
- treat underlying cause

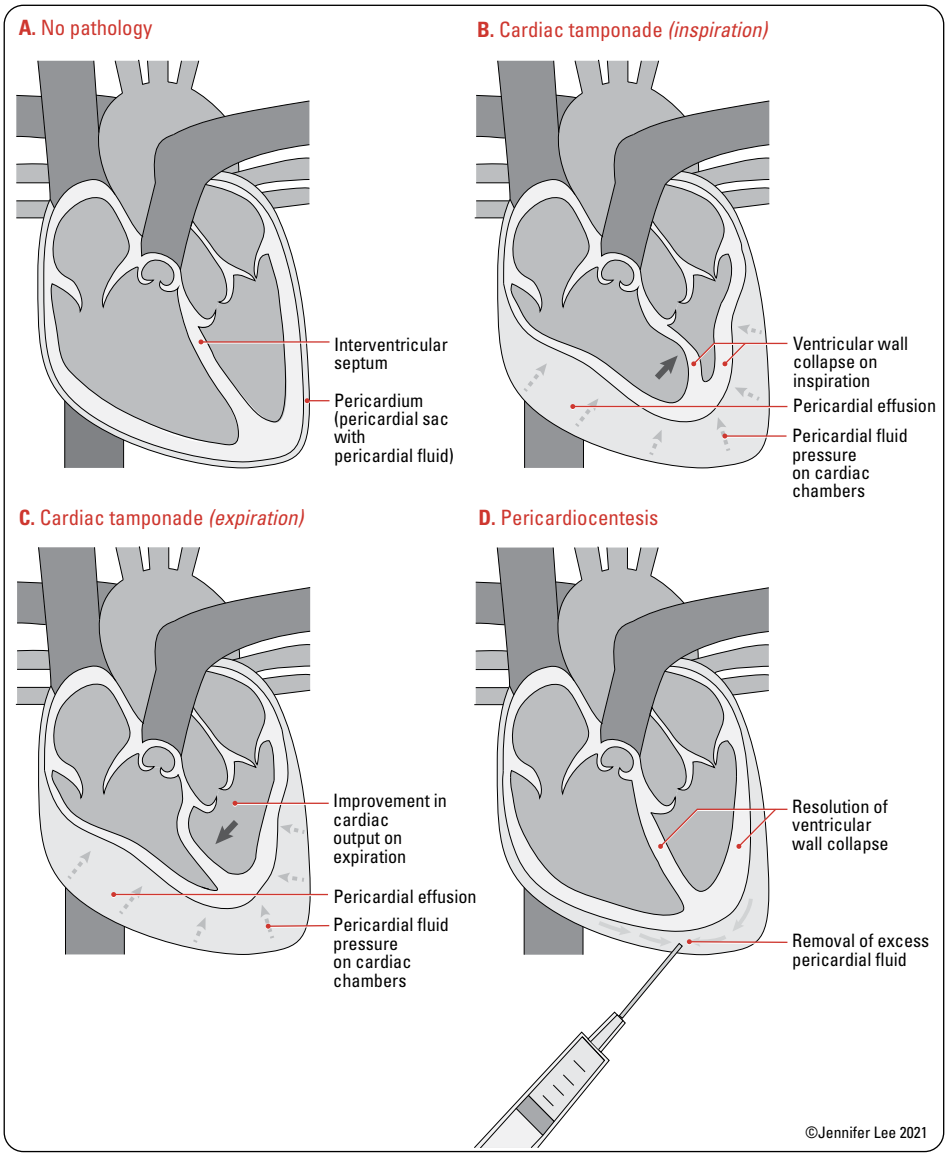

Figure 53. Cardiac tamponade pathophysiology

Constrictive Pericarditis

Definition

- loss of pericardial elasticity caused by granulation tissue formation; leads to restricted ventricular filling

Etiology

- chronic pericarditis resulting in fibrosed, thickened, adherent, and/or calcified pericardium
- any cause of acute pericarditis may result in chronic pericarditis
- major causes are idiopathic, post-infectious (viral, bacterial pericarditis/purulent pericarditis, TB), radiation, post-cardiac surgery, uremia, MI, collagen vascular disease
- any pericardial disease process can cause constrictive pericarditis; risk of progression to constrictive pericarditis is based on the etiology of the pericardial disease

Signs and Symptoms

- impaired ventricular filling during diastole is characteristic; classic presentation related to right HF with preserved ventricular function and otherwise no myocardial disease
  - in advanced cases, there can be systolic dysfunction if myocardial fibrosis or atrophy present
- dyspnea, fatigue, palpitations
- abdominal pain
- may mimic CHF (especially right-sided HF)
  - venous congestion, ascites, hepatosplenomegaly, edema, pleural effusions
- increased JVP, Kussmaul's sign (paradoxical increase in JVP with inspiration), Friedreich's sign (prominent "y" descent)

DDx Pulsus Paradoxus

- Most etiologies of RV failure except restrictive cardiomyopathy (e.g. acute RV MI)
- Constrictive pericarditis (rarely)
- Severe obstructive pulmonary disease (e.g. asthma)
- Pneumothorax
- PE
- Cardiogenic shock
- Cardiac tamponade
- Effusive-Constrictive pericarditis

- BP usually normal (and usually no pulsus paradoxus)
- precordial examination: ± pericardial knock (early diastolic sound)
- see Table 19 for differentiation from cardiac tamponade

Investigations
- ECG: non-specific findings low voltage, flat T wave, ± AFib
- CXR: pericardial calcification, effusions
- echo/CT/CMR: pericardial thickening, calcification ± characteristic echo-Doppler findings (Note: CMR is discouraged if patient is hemodynamically impaired)
- cardiac catheterization: indicated if other, non-invasive imaging modalities are insufficient to make diagnosis; assess for equalization of end-diastolic chamber pressures
- diagnosis: right HF symptoms + diastolic filling impairment caused by constriction (documented on ≥1 imaging modality including echo, CT, CMR, and/or catheterization)
- note: in up to 20% of patients, constriction can occur even with normal thickness of the pericardium (pericardiectomy equally efficacious in these patients)

Treatment
- surgery (pericardiectomy): mainstay treatment for chronic, permanent constrictive pericarditis
- medical therapy: can be used in 3 situations
  1. for specific pathologies/etiologies (e.g. TB)
  2. for transient constriction that is temporarily caused by pericarditis, or new constriction diagnosis with evidence of inflammation of the pericardium (use anti-inflammatories)
  3. supportive when high/prohibitive surgical risk (goal is to relieve congestive symptoms diuretics, salt restriction)
- prognosis best with idiopathic or infectious cause and worst in post-radiation
- death may result from HF

Table 19. Differentiation of Constrictive Pericarditis vs. Cardiac Tamponade

Characteristic	Constrictive Pericarditis	Cardiac Tamponade
JVP	"y" > "x"	"x" > "y"
Kussmaul's sign	Present	Absent
Pulsus paradoxus	Uncommon	Always
Pericardial knock	Present	Absent
Hypotension	Variable	Severe

Extracorporeal Circulation

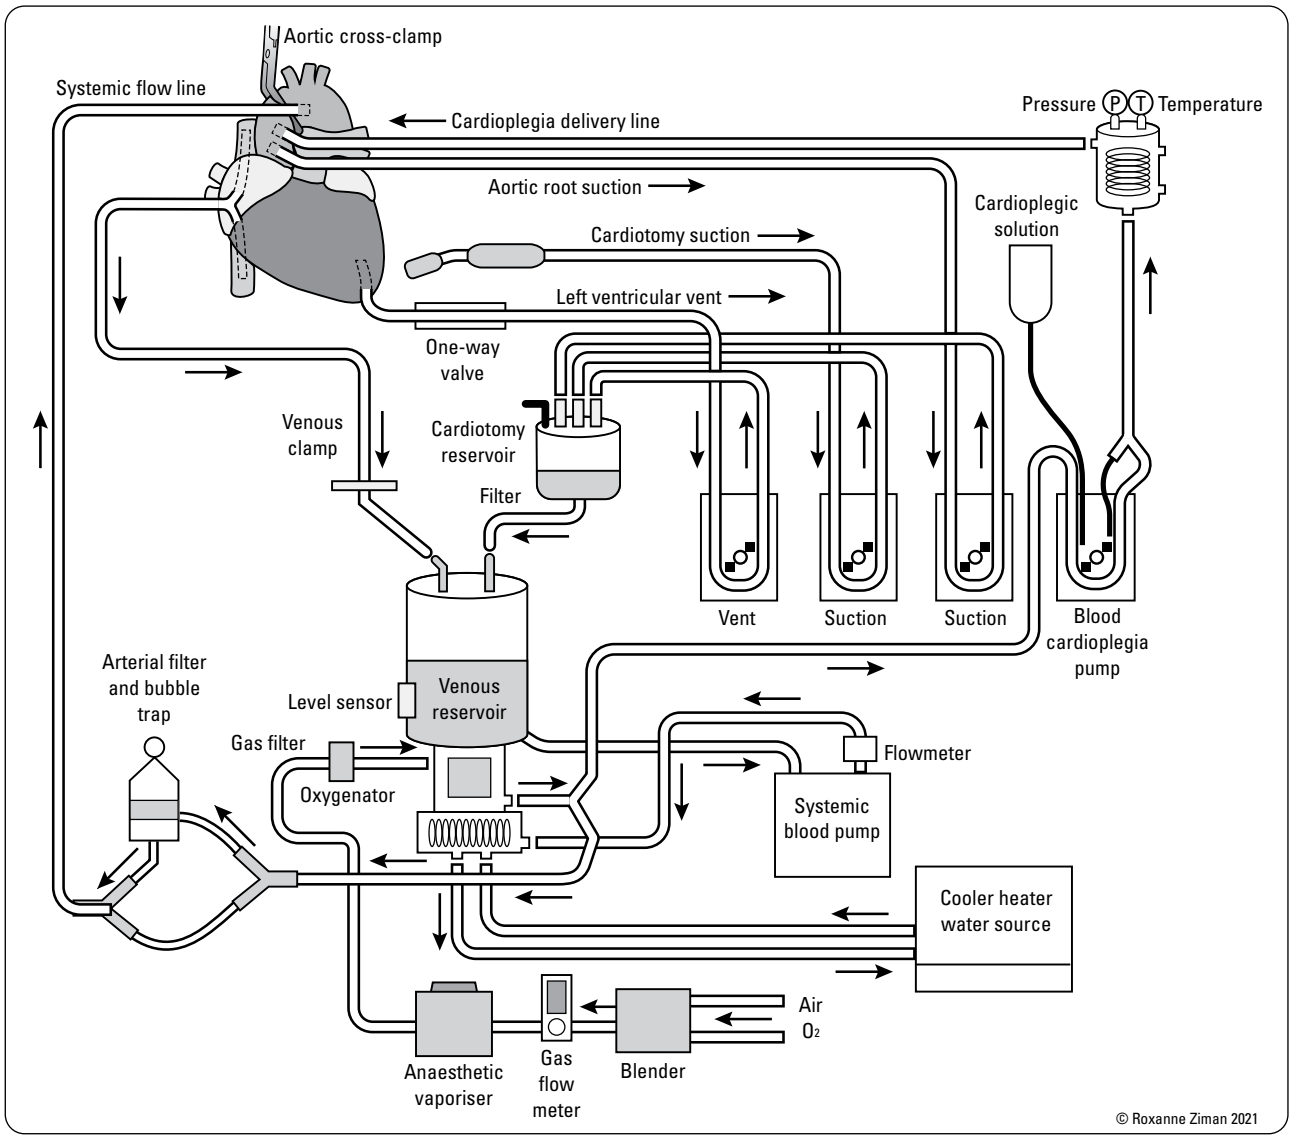

Figure 54. Cardiopulmonary bypass schematic
Modified from Cardiac Surgery in the Adult, second edition, Robert A.E Dion, p. 729, Copyright (2020), with permission from Elsevier

Cardiopulmonary Bypass

- CPB is commonly used in cardiac and thoracic aortic surgeries to obtain a still, bloodless surgical field by circumventing the heart and lungs while supplying blood to the systemic circulation
- essential functions of CPB: oxygenation, ventilation, circulation, temperature control
- the standard components of a CPB circuit:
  - arterial cannula (aortic, femoral, or axillary)
  - arterial filter and bubble trap
  - arterial line (3/8" heparin-coated tubing)
  - oxygenator (membrane oxygenator, defoamer, and heat exchanger)
  - pump (peristaltic/roller or centrifugal)
  - venous cannula (RA, SVC and inferior vena cava (IVC), or femoral)
  - venous line (1/2" heparin-coated tubing)
  - venous reservoir (rigid high capacitance reservoir or closed soft reservoir)
- venous blood is drained into venous reservoir, filtered. The blood is oxygenated and CO_2 is eliminated, heated or cooled (if applicable) and returned to the systemic circulation via the arterial cannula
  - heparin is first administered so that pump suckers can be turned on when the patient's ACT is >400 s and CPB initiated when ACT is >480 s
    - ACT is measured every 30 min while on CPB and additional heparin boluses are administered to maintain ACT >480 s
    - anticoagulation is reversed following separation of CPB by administering protamine which neutralizes heparin

  - the rate of blood draining into the venous reservoir is determined by the: CVP, height differential between venous cannula and venous reservoir, luminal radius of venous cannula and tubing, presence of air within the tubing
  - arterial cannulation is typically performed at the distal ascending aorta, distal to the aortic cross clamp, with alternative sites for cannulation including the aortic arch, innominate artery, subclavian artery, axillary artery, femoral artery, and LV apex
  - optimal flow rate is calculated to achieve a cardiac index of 2.4 L/min/m^2
  - patient parameters measured during CPB: ECG, BP, CVP, SaO_2, $ETCO_2$, peripheral and core temperature, urine output, ABG
  - CPB pump parameters measured during CPB: blood flow rate, roller pump/centrifugal speed, gas flow, pump blood temperature, heat exchanger water temperature, arterial line pressure, arterial and venous line O_2 saturations, delivered O_2 concentration
- complications of CPB:
  - reaction to non-endothelialized foreign surfaces: systemic inflammatory response, hemolysis, coagulopathy
  - vessel injury from cannulation: aortic dissection and embolization of aortic debris (e.g. porcelain aorta)
  - heparin-related: heparin-associated thrombocytopenia, heparin-induced thrombocytopenia (HIT)
  - systemic embolization: cerebrovascular accident, renal and splanchnic hypoperfusion,
    - includes biologic and nonbiologic microemboli as well as air/gas/bubble emboli
    - cardiotomy reservoir must be filtered to reduce risk of microemboli
- adjuncts to the CPB circuit include: venous occlusion (adjustable clamp on the venous line), ports for drug and fluid infusion to the venous reservoir, temperature monitors, bypass line around arterial filter (if filter obstructs), ultrafiltration, cell salvage circuits, suction tubing leading to a cardiotomy reserve by vents (pumps for removing blood from chambers) or pump suckers (remove blood from surgical field)
- minimally invasive surgical exposures (e.g. right thoracotomy and left thoracotomy) necessitate modifications to cannula placement compared to CPB with median sternotomy

Protection during Cardiopulmonary Bypass

Myocardial Protection Techniques

- myocardial protection reduces myocardial ischemia during CPB by reducing myocardial oxygen consumption and maintaining oxygenated myocardial perfusion
- methods of myocardial protection to reduce oxygen demands include: unloading the heart (CPB), stopping the heart (cardioplegic diastolic arrest), cooling the heart (core hypothermia, cold saline external washing, hypothermic cardioplegia solutions)
- cardioplegia (given continuously or intermittently) induces diastolic arrest by altering myocytes' resting potential and ionic gradients via concentrated K^+ solutions
  - crystalloid cardioplegia
    - extracellular solutions (high sodium) (e.g. St. Thomas' solution, del Nido solution) increase extracellular K^+ concentration to prevent cardiomyocyte repolarization
    - intracellular solutions (low sodium) lower extracellular Na^+ concentration thereby blocking depolarization
  - blood cardioplegia: autologous cold blood combined with tailored crystalloid solutions in various ratios
    - blood typically comprises majority of overall solution (e.g. 8:1, 4:1, 2:1)
- antegrade cardioplegia (preferred) is delivered via the aortic root (contraindicated in severe AR) or directly into coronary ostia (when aortic valve is incompetent)
- retrograde cardioplegia is delivered via the coronary sinus but it has a less predictable distribution than antegrade cardioplegia and may not fully protect the RV when used alone
- protection during OPCAB: reduce myocardial oxygen demand
  - afterload reduction via calcium channel blockers, reduced heart rate and contractility via beta blockers
- inadequate myocardial protection results in low cardiac output syndrome, which complicates the postoperative course with inotrope dependence and potential mechanical circulatory support
  - high risk patients: elderly, extensive CAD, preoperative LV dysfunction, DM

Cerebral Protection

- cerebral protection techniques are required when CPB cannot supply the head vessels, such as during surgery on the aortic arch
- methods of cerebral protection to reduce oxygen demands include: hypothermia (most important) and anterograde/retrograde cerebral perfusion
  - antegrade cerebral perfusion (ACP) allows oxygenated blood to be delivered to brain by left common carotid artery or innominate artery
  - retrograde cerebral perfusion (used infrequently) allows oxygenated blood to be delivered to brain by SVC

Special Consideration of Blood Conservation for Jehovah's Witness Patients

- Preoperatively:
  - Administer erythropoietin
  - Stop all anticoagulant and antiplatelet medications for 7 d, if possible
- Intraoperatively:
  - Continuous cell salvage circuit
  - Meticulous hemostasis
  - OPCAB
  - Pharmacological adjuncts (tranexamic acid or aprotinin)
- Postoperatively:
  - Low threshold for resternotomy due to bleeding

Deep Hypothermic Circulatory Arrest

- deep hypothermic circulatory arrest reduces cerebral metabolism and oxygen consumption to the point that CPB can be discontinued
  - (30-40 min safe circulatory arrest at 20°C; 45-60 min safe circulatory arrest at 16°C)
    - concurrent ACP enables circulatory arrest at higher temperatures than DHCA alone
  - EEG monitoring occurs throughout to confirm adequate cerebral protection
  - mannitol (reduces cerebral edema) and steroids (decrease cerebral inflammation) are used adjunctively
  - blood can be cooled via CPB at approximately 1°C/min and rewarmed at approximately 0.5°C/min
    - quicker warming linked to increased neurological injury (mechanisms include cerebral edema and bubble emboli due to large temperature gradients)
  - complications related to deep hypothermic circulatory arrest include: coagulopathy and platelet dysfunction, systemic inflammatory response, neurological injury secondary to ischemia in watershed areas (neurologic dysfunction may be persistent or transient depending on etiology)

Common Medications

Table 20. Commonly Used Cardiac Therapeutics

Drug Class	Examples	Mechanism of Action	Indications	Contraindications	Side Effects
ANGIOTENSIN CONVERTING ENZYME INHIBITORS (ACEI)					
	enalapril (Vasotec®), perindopril (Coversyl®), ramipril (Altace®), lisinopril (Zestril®)	Inhibit ACE-mediated conversion of angiotensin I to angiotensin II (AT II), causing peripheral vasodilation and decreased aldosterone synthesis	HTN, CAD, CHF, post-MI, DM	Bilateral renal artery stenosis, pregnancy, caution in decreased GFR	Dry cough (10%), hypotension, fatigue, hyperkalemia, renal insufficiency, angioedema
ANGIOTENSIN II RECEPTOR BLOCKERS (ARBs)					
	candesartan, irbesartan, losartan, olmesartan, telmisartan, valsartan	Block AT II receptors, causing similar effects as ACEI	Same as ACEI, although evidence is generally less for ARBs; often used when ACEI are not tolerated	Same as ACEI	Similar to ACEI, but do not cause dry cough
ANGIOTENSIN RECEPTOR-NEPRILYSIN INHIBITOR (ARNI)					
	sacubitril/valsartan	Sacubitril inhibits neprilysin which leads to vasodilation and natriuresis Valsartan (ARB) - see above	HFrEF	Angioedema, pregnancy	Angioedema, hyperkalemia, hypotension, renal insufficiency
DIRECT RENIN INHIBITORS (DRIs)					
	aliskiren	Directly blocks renin thus inhibiting the conversion of angiotensinogen to angiotensin I; this also causes a decrease in AT II	HTN (exact role of this drug remains unclear) Not recommended as initial therapy	Pregnancy, severe renal impairment	Diarrhea, hyperkalemia (higher risk if used with an ACEI), rash, cough, angioedema, reflux, hypotension, rhabdomyolysis, seizure
β-BLOCKERS					
β1 antagonists β1/β2 antagonists α1/β1/β2 antagonists β1 antagonists with intrinsic sympathomimetic activity	atenolol, metoprolol, bisoprolol, propranolol, labetalol, carvedilol, acebutolol	Block β-adrenergic receptors, decreasing HR, BP, contractility, and myocardial oxygen demand; also slow conduction through the AV node	HTN, CAD, acute MI, post-MI, CHF (start low and go slow), AFib, SVT	Sinus bradycardia, 2nd or 3rd degree heart block, hypotension Caution in asthma, claudication, Raynaud's phenomenon, and decompensated CHF	Hypotension, fatigue, light-headedness, depression, bradycardia, hyperkalemia, bronchospasm, impotence, depression of counterregulatory response to hypoglycemia, exacerbation of Raynaud's phenomenon, and claudication
β-BLOCKERS					
Benzothiazepines Phenylalkylamines (non-dihydropyridines)	diltiazem verapamil	Block smooth muscle and myocardial calcium channels causing effects similar to β-blockers Also vasodilate	HTN, CAD, SVT, AFib, diastolic dysfunction	Sinus bradycardia, 2nd or 3rd degree heart block, hypotension, CHF	Hypotension, bradycardia, edema
Dihydropyridines	amlodipine (Norvasc®), nifedipine (Adalat®), felodipine (Plendil®)	Block smooth muscle calcium channels causing peripheral vasodilation	Negative inotrope	Severe AS and liver failure	Hypotension, edema, flushing, headache, light-headedness

Table 20. Commonly Used Cardiac Therapeutics

Drug Class	Examples	Mechanism of Action	Indications	Contraindications	Side Effects
SODIUM-GLUCOSE COTRANSPORTER-2 (SGLT2) INHIBITORS					
	canagliflozin dapagliflozin empagliflozin ertugliflozin	Proposed mechanisms include: osmotic diuresis and natriuresis reducing preload; vasodilation leading to reduced afterload; myocardial metabolic stabilization	Dapagliflozin trial (DAPA-HF) indicates potential use in HFrEF with DM/non-DM, with multiple other SGLT2 Inhibitors trials underway. Although dapagliflozin has received guideline recommendations in Canada, US and EU for use in HFrEF, no SGLT2 Inhibitors have formal approval for HFrEF without DM by Health Canada	Severe CKD (dapagliflozin contraindicated in patients with eGFR <30 mL/min/1.73m^2), T1DM, history of DKA, advise holding during sick days	Yeast infections, Urinary tract infections, hypoglycemic episodes, diabetic ketoacidosis, decreased bone mineral density
DIURETICS					
Thiazides	hydrochlorothiazide, chlorthalidone, metolazone	Reduce Na^+ reabsorption in the distal convoluted tubule (DCT)	HTN (drugs of choice for uncomplicated HTN)	Sulfa allergy, pregnancy	Hypotension, hypokalemia, polyuria
Loop diuretics	furosemide (Lasix®)	Blocks Na^+/K^+-ATPase in thick ascending limb of the loop of Henle	CHF, pulmonary or peripheral edema	Hypovolemia, hypokalemia	Hypovolemia, hypokalemic metabolic alkalosis
Aldosterone receptor antagonists	spironolactone, eplenerone	Antagonize aldosterone receptors	HTN, CHF, hypokalemia	Renal insufficiency, hyperkalemia, pregnancy	Edema, hyperkalemia, gynecomastia
INOTROPES					
	digoxin (Lanoxin®)	Inhibit Na^+/K^+-ATPase, leading to increased intracellular Na^+ and Ca^{2+} concentration, and increased myocardial contractility Also slows conduction through the AV node	CHF, AFib	2nd or 3rd degree AV block, hypokalemia	AV block, junctional tachycardia, bidirectional VT, bradyarrhythmias, blurred or yellow vision (van Gogh syndrome), anorexia, N/V
ANTICOAGULANTS					
Coumarins	warfarin (Coumadin®)	Antagonizes vitamin K, leading to decreased synthesis of clotting factors II, VII, IX, and X	AFib, LV dysfunction, prosthetic valves, venous thrombosis	Recent surgery or bleeding, bleeding diathesis, pregnancy	Bleeding (by far the most important side effect), paradoxical thrombosis, skin necrosis
Heparins	Unfractionated heparin LMWHs: dalteparin, enoxaparin, tinzaparin	Antithrombin III agonist, leading to decreased clotting factor activity	Acute MI/ACS; (when immediate anticoagulant effect needed), PE, venous thrombosis	Recent surgery or bleeding, bleeding diathesis, thrombocytopenia, renal insufficiency (for LMWHs)	Bleeding, osteoporosis, heparin-induced thrombocytopenia (less in LMWHs)
Direct thrombin inhibitors	dabigatran	Competitive, direct thrombin inhibitor, thrombin enables fibrinogen conversion to fibrin during the coagulation cascade	AFib, venous thrombosis, PE	Severe renal impairment, recent surgery, active bleeding Idarucizumab: FDA approved agent for reversal of dabigatran for bleeding	Bleeding, GI upset
Direct factor Xa inhibitors	rivaroxaban apixaban edoxaban	Direct, selective and reversible inhibition of factor Xa in both the intrinsic and extrinsic coagulation pathways	AFib, venous thrombosis, PE	Hepatic disease, active bleeding, bleeding diathesis, pregnancy, lactation Andexanet alfa FDA approved agent for reversal of apixaban and rivaroxaban for bleeding	Bleeding, elevated liver enzymes
ANTIPLATELETS					
Salicylates	ASA (Aspirin®)	Irreversibly acetylates platelet COX-1, preventing thromboxane A2-mediated platelet aggregation	CAD, acute MI, post-MI, post-PCI, CABG	Active bleeding or PUD	Bleeding, GI upset, GI ulceration, impaired renal perfusion
Thienopyridines	clopidogrel (Plavix®), ticlopidine (Ticlid®)	P2Y12 antagonist (block platelet ADP receptors	Acute MI, post-MI, post-PCI, CABG	Active bleeding or PUD	Bleeding, thrombotic thrombocytopenic purpura, neutropenia (ticlopidine)
Nucleoside analogues	ticagrelor (Brillinta®)	P2Y12 antagonist (but different binding site than thienopyridines)			
Glycoprotein IIb/IIIa inhibitors	eptifibatide, tirofiban, abciximab	Block binding of fibrinogen to Gp IIb/IIIa	Acute MI, particularly if PCI is planned	Recent surgery or bleeding, bleeding diathesis	Bleeding
THROMBOLYTICS					
	alteplase, reteplase, tenecteplase, streptokinase	Convert circulating plasminogen to plasmin, which lyses cross-linked fibrin	Acute STEMI	See Table 10, C34	Bleeding
NITRATES					
	nitroglycerin	Relax vascular smooth muscle, producing venous and arteriolar dilation	CAD, MI, CHF (isosorbide dinitrate plus hydralazine)	Concurrent use of cyclic guanosine monophosphate phosphodiesterase inhibitors, angle closure glaucoma, increased intracranial pressure	Headache, dizziness, weakness, postural hypotension

Table 20. Commonly Used Cardiac Therapeutics

Drug Class	Examples	Mechanism of Action	Indications	Contraindications	Side Effects
LIPID LOWERING AGENTS					
Statins	atorvastatin (Lipitor®), pravastatin (Pravachol®), rosuvastatin (Crestor®), simvastatin (Zocor®), lovastatin (Meracor®)	Inhibit hydroxy β-methylglutaryl-CoA (HMG-CoA) reductase, an enzyme which catalyzes the rate-limiting step in cholesterol synthesis	Dyslipidemia (1° prevention of CAD), CAD, post-MI (2° prevention of CV events)	Liver or muscle disease	Myalgia, rhabdomyolysis, abdominal pain
Cholesterol absorption inhibitor	ezetimibe (Ezetrol®)	Inhibits gut absorption of cholesterol	Decreases low-density lipoprotein but does not reduce mortality	Liver or renal impairment	Myalgia, rhabdomyolysis, abdominal pain
Miscellaneous	fibrates, bile acid sequestrates, nicotinic acid		Primarily in familial hypercholesterolemia		GI side effects common
PCSK9 inhibitor	evolocumab alirocumab	Monoclonal antibody	Hypercholesterolemia	Hypersensitivity reaction to drug	Mild reactions to site of injection, nasopharyngitis

Antiarrhythmics

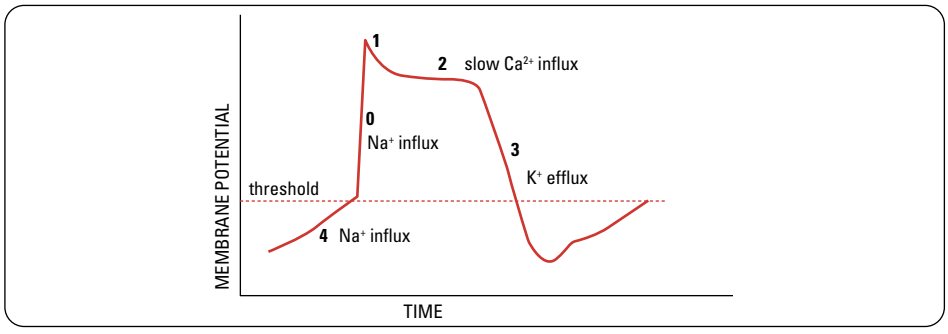

Figure 55. Representative cardiac action potential

Table 21. Antiarrhythmic* Drugs (Vaughan-Williams Classification)

Class	Agent	Indications	Side Effects	Mechanism of Action
Ia	quinidine procainamide disopyramide	SVT, VT	Torsades de Pointes (all Ia), diarrhea Lupus-like syndrome Anticholinergic effects	Moderate Na^+ channel blockade Slows phase 0 upstroke Prolongs repolarization, slowing conduction
Ib	lidocaine mexiletine	VT	Confusion, stupor, seizures GI upset, tremor	Mild Na^+ channel blockade Shortens phase 3 repolarization
Ic	propafenone flecainide encainide	SVT, VT AFib	Exacerbation of VT (all Ic) Negative inotropy (all Ic) Bradycardia and heart block (all Ic)	Upstroke
II	propranolol metoprolol, etc.	SVT, AFib	Bronchospasm, negative inotropy, bradycardia, AV block, impotence, fatigue	β-blocker Decreases phase 4 depolarization
III	amiodarone** sotalol	SVT, VT AFib SVT, VT	Amiodarone: photosensitivity, pulmonary toxicity, hepatotoxicity, thyroid disease, increased INR Amiodarone and sotalol: Torsades de Pointes, bradycardia, heart block, β-blocker side effects	Blocks K^+ channel Prolongs phase 3 repolarization, which prolongs refractory period
IV	verapamil diltiazem	SVT AFib	Bradycardia, AV block Hypotension	CCB Slows phase 4 spontaneous depolarization, slowing AV node conduction

*All antiarrhythmics have potential to be proarrhythmic
**Amiodarone has class I, II, III, and IV properties

Table 22. Actions of α and β Adrenergic Receptors

	α RECEPTORS		β RECEPTORS	
Target System	α1	α2	β1	β2
Cardiovascular	Constriction of vascular smooth muscle Constriction of skin, skeletal muscle, and splanchnic vessels Increase myocardial contractility Decrease HR	Same as α1 Same as α1 Peripherally act to modulate vessel tone Vasoconstrict and dilate; oppose α1 vasoconstrictor activity	Increased myocardial contractility Accelerate SA node conduction Accelerate ectopic pacemakers	Decreased vascular smooth muscle tone
Respiratory				Bronchodilation
Dermal	Pilomotor smooth muscle contraction Apocrine constriction			
Ocular	Radial muscle contraction		Ciliary muscle relaxation	
Gastrointestinal	Inhibition of myenteric plexus Anal sphincter contraction			
Genitourinary	Pregnant uterine contraction Penile and seminal vesicle ejaculation Urinary bladder contraction	Smooth muscle wall relaxation	Stimulation of renal renin release	Bladder wall relaxation Uterine relaxation
Metabolic	Stimulate liver gluconeogenesis and glycogenolysis at the liver	Same as α1 Fat cell lipolysis	Fat cell lipolysis Glycogenolysis	Gluconeogenesis Fat cell lipolysis

Adapted from the Family Practice Notebook (https://fpnotebook.com/)

Table 23. Commonly Used Drugs that Act on α and β Adrenergic Receptors

	α RECEPTORS			β RECEPTORS		
Mechanism of Action	α1	α1 and α2	α2	β1	β1 and β2	β2
Agonist	Phenylephrine Methoxamine	Epinephrine Norepinephrine	Clonidine Methyldopa	Norepinephrine Dobutamine	Isoproterenol Epinephrine	Albuterol Terbutaline
Antagonist	Prazosin Phenoxybenzamine	Phentolamine	Yohimbine Mirtazapine	Metoprolol Acebutolol Alprenolol Atenolol Esmolol	Propranolol Timolol Nadolol Pindolol Carvedilol	Butoxamine

Landmark Cardiac Trials

Trial Name	Reference	Clinical Trial Details
ISCHEMIC HEART DISEASE		
ACME	NEJM 1992;326:10-16	**Title:** A Comparison of Angioplasty with Medical Therapy in the Treatment of Single-Vessel Coronary Artery Disease **Purpose:** Compare the effects of percutaneous transluminal coronary angioplasty (PTCA) on angina and exercise tolerance in patients with stable single-vessel disease. **Methods:** Patients with exercise-induced myocardial ischemia and epicardial artery stenosis were randomized to PTCA or medical therapy, and repeat exercise testing performed at 6 mo. **Results:** PTCA was successful in 80% of patients, reducing mean % stenosis from 76% to 36%. At 6 mo, 64% PTCA patients were angina-free, compared with 46% medically treated patients. PTCA-treated patients had longer exercise durations (2.1 vs 0.5 min, P<0.0001) than medically treated patients. **Conclusions:** PTCA offers earlier and better relief of angina than medical therapy in patients with single-vessel disease.
ARRIVE	Lancet 2018;392:1036-46	**Title:** Use of Aspirin to Reduce Risk of Initial Vascular Events in Patients at Moderate Risk of Cardiovascular Disease (ARRIVE): A Randomised, Double-blind, Placebo-controlled Trial **Purpose:** Assess efficacy and safety of ASA versus placebo in patients with moderate risk of a first CV event. **Methods:** Patients with moderate CV risk were randomized to receive ECASA or placebo tablets, once daily. The primary endpoint was a composite of time to CV death, MI, UA, stroke, or TIA. **Results:** The primary endpoint occurred in 4.29% of ASA-treated patients versus 4.48% of placebo-treated patients (hazard ratio 0.96; 95% CI 0.81-1.13; p=0.6). The overall incidence of adverse events was similar between groups (82.01% in ASA group versus 81.72% in placebo group). **Conclusions:** Among patients at moderate risk of CHD, the use of ASA was not beneficial. ASA was not associated with a reduction in adverse CV events.
ASCOT-LLA	Lancet 2003;361:1149-58	**Title:** Prevention of Coronary and Stroke Events with Atorvastatin in Hypertensive Patients Who Have Average or Lower-than-Average Cholesterol Concentrations, in the Anglo-Scandinavian Cardiac Outcomes Trial-Lipid Lowering Arm (ASCOT-lla): A Multicentre Randomised Controlled Trial **Purpose:** Assess benefits of cholesterol lowering in primary prevention of CHD in hypertensive patients. **Methods:** Hypertensive patients aged 40-79 were randomized to atorvastatin 10 mg or placebo. The primary endpoint was non-fatal MI and fatal CHD after 5-yr follow-up. **Results:** 100 primary events occurred in the atorvastatin group compared to 154 events in the placebo group at a median follow-up of 3.3 yr (hazard ratio 0.64; 95% CI 0.50-0.83; p=0.0005). Fatal and non-fatal stroke, total CV events and total coronary events were also lowered in the atorvastatin group. **Conclusions:** In hypertensive patients with risk factors for CHD and average cholesterol levels. atorvastatin reduced non-fatal MI, fatal CHD, fatal/non-fatal stroke, coronary events but not all-cause mortality
BARI 2D	NEJM 2009;360:2503-15	**Title:** A Randomized Trial of Therapies for Type 2 Diabetes and Coronary Artery Disease **Purpose:** Determine optimal treatment for patients with T2DM and stable ischemic heart disease. **Methods:** Patients with T2DM and heart disease were randomized to prompt revascularization with intensive medical therapy, or intensive medical therapy alone. Primary endpoints were mortality, MI, or stroke. **Results:** 5-yr survival did not differ significantly between groups (88.3% in revascularization group vs. 87.8% in the medical therapy group; p=0.97). In the PCI group, there were no significant differences in primary endpoints, while in the CABG group, rates of CV events were significantly lower with revascularization than medical therapy (22.4% vs. 30.5%; P=0.01). **Conclusions:** There was no significant difference in the rates of death and major CV events between prompt revascularization and medical therapy.
CAPRIE	Lancet 1996;348:1329-39	**Title:** A Randomised, Blinded, Trial of Clopidogrel Versus Aspirin in Patients at Risk of Ischaemic Events (CAPRIE) **Purpose:** Assess the relative efficacy of clopidogrel and ASA in reducing risk of clinical thrombotic events. **Methods:** Patients with atherosclerotic vascular disease were randomized to clopidogrel 75 mg once daily or ASA 325 mg once daily. Primary endpoints were a composite of ischemic stroke, MI, or vascular death. **Results:** Patients treated with clopidogrel had a 5.32% annual risk of stroke, MI or death, compared with 5.83% of ASA patients (p.0.043). There were no major differences in terms of safety. **Conclusions:** In atherosclerotic vascular disease, clopidogrel reduced the rates of stroke, MI, or vascular death compared to ASA.
CARE	NEJM 1996;335:1001-09	**Title:** The Effect of Pravastatin on Coronary Events after Myocardial Infarction in Patients with Average Cholesterol Levels **Purpose:** Determine the effects of cholesterol-lowering in patients with coronary disease and average cholesterol levels. **Methods:** Patients with MI who had plasma cholesterol levels <240 mg were administered either 40 mg pravastatin or placebo. The primary endpoint was a fatal coronary event or fatal MI. **Results:** The primary endpoint occurred in 10.2% of the pravastatin-treated patients and 13.2% of placebo-treated patients (95% CI 9% to 36%; P=0.003). There were no significant differences in overall mortality or mortality from nonvascular causes. Pravastatin lowered the rate of coronary events more among men than women. **Conclusions:** Pravastatin reduced MI and stroke in patients with previous MI and average cholesterol.
COURAGE	NEJM 2007;356:1503-16	**Title:** Optimal Medical Therapy with or without PCI for Stable Coronary Disease **Purpose:** Compare initial strategy of PCI plus intensive pharmacological therapy and lifestyle intervention against optimal medical therapy alone, in patients with stable coronary disease. **Methods:** 2287 patients with myocardial ischemia and significant CAD were randomized to PCI with optimal medical therapy, or optimal medical therapy alone. The primary outcome was all-cause mortality and non-fatal MI. **Results:** There were 211 primary events in the PCI group and 202 in the optimal medical therapy group (hazard ratio for PCI, 1.05; 95% CI 0.87 to 1.27; P=0.62). There were no significant differences between groups in the composite of death, MI, stroke, or hospitalizations for ACS. **Conclusions:** Compared with optimal medical therapy alone, PCI + medical therapy did not reduce all-cause mortality and non-fatal MI, and it did not reduce the incidence of major CV events.
CURE	NEJM 2001;345:494-502	**Title:** Effects of Clopidogrel in Addition to Aspirin in Patients with Acute Coronary Syndromes without ST-Segment Elevation **Purpose:** Evaluate efficacy and safety of clopidogrel with ASA in patients with ACS without ST-elevation. **Methods:** 12562 patients who presented within 24 hr of symptom onset were randomized to clopidogrel or placebo in addition to ASA for 3-12 mo. The primary endpoint was a composite of CV mortality, non-fatal MI, or stroke. **Results:** The primary endpoint occurred in 9.3% of clopidogrel patients and 11.4% of patients in the placebo group (RR 0.80; 95% CI 0.72 to 0.90; P<0.001). There were significantly more patients with bleeding in the clopidogrel group than the placebo group (3.7% vs 2.7%; RR 1.38; P=0.001). **Conclusions:** Clopidogrel plus ASA reduced death from CV causes, non-fatal MI, or stroke but increased bleeding complications.

Trial Name	Reference	Clinical Trial Details
EUROPA	Lancet 2003;362:782-88	**Title:** Efficacy of Perindopril in Reduction of Cardiovascular Events Among Patients with Stable Coronary Artery Disease: Randomised, Double-blind, Placebo-controlled, Multicentre Trial (The EUROPA Study) **Purpose:** Assess whether ACEI reduced CV risk in a low-risk population with stable coronary disease. **Methods:** After a run-in of 4 wk, in which all patients received perindopril, 12218 patients were randomized to perindopril 8 mg OD or matching placebo. The primary endpoint was CV death, MI, or cardiac arrest. **Results:** 8% of perindopril patients experienced a primary endpoint, compared with 10% of placebo patients. These benefits were consistent in all subgroups and secondary endpoints. **Conclusions:** With stable CAD and no CHF, perindopril reduced CV death, MI, and total mortality.
European Coronary Surgery Study	NEJM 1988;319:332-37	**Title:** Twelve-Year Follow-up of Survival in the Randomized European Coronary Surgery Study **Purpose:** Evaluate survival rates in men with good LVEF after CABG or medical therapy. **Methods:** 767 men were randomized to early CABG or medical therapy. **Results:** At the projected 5-yr follow-up period, there was a significantly higher survival rate in the surgical group than in the medical treatment group (92.4% vs 83.1%, P=0.0001). **Conclusions:** CABG resulted in higher survival than medical therapy at 5-yr follow-up but no at 12-yr follow-up Five-Year Outcomes after PCI or CABG for Left Main Coronary Disease. **Purpose:** Assess long-term outcomes after PCI with contemporary drug-eluting stents, as compared with CABG, in patients with left main CAD. **Methods:** 1905 patients with left main CAD of low/intermediate anatomical complexity were randomized to PCI or CABG. The primary outcome was a composite of death, stroke or MI. **Results:** At 5 yr, the primary outcome occurred in 22.0% of PCI patients and 19.2% of CABG patients (2.8% difference; 95% CI -0.9 to 6.5; P=0.13). Rates of CV death and MI were not significantly different between groups. All cerebrovascular events were less frequent after PCI than CABG (3.3% vs. 5.2%; 95% CI -3.8 to 0). **Conclusions:** Among patients with left main CAD, there was no significant difference between PCI and CABG in terms of the composite outcome of death, stroke, or MI at 5 yr.
EXCEL	NEJM 2019;381:1820-30	**Title:** Five-Year Outcomes after PCI or CABG for Left Main Coronary Disease **Purpose:** Assess long-term outcomes after PCI with contemporary drug-eluting stents, as compared with CABG, in patients with left main CAD. **Methods:** 1905 patients with left main CAD of low/intermediate anatomical complexity were randomized to PCI or CABG. The primary outcome was a composite of death, stroke or MI. **Results:** At 5 yr, the primary outcome occurred in 22.0% of PCI patients and 19.2% of CABG patients (2.8% difference; 95% CI -0.9 to 6.5; P=0.13). Rates of CV death and MI were not significantly different between groups. All cerebrovascular events were less frequent after PCI than CABG (3.3% vs. 5.2%; 95% CI -3.8 to 0). **Conclusions:** Among patients with left main CAD, there was no significant difference between PCI and CABG in terms of the composite outcome of death, stroke, or MI at 5 yr.
HPS	Lancet 2002;360:7-22	**Title:** MRC/BHF Heart Protection Study of Cholesterol Lowering with Simvastatin in 20,536 High-risk Individuals: A Randomised Placebo-controlled Trial **Purpose:** Assess effect of LDL-lowering with simvastatin on vascular disease, in patients of normal LDL-C. **Methods:** 20 536 adults with coronary disease or DM were randomized to simvastatin 40 mg daily or placebo. Primary outcomes were mortality, and fatal or non-fatal vascular events. **Results:** All-cause mortality was significantly reduced (12.9% in simvastatin patients vs. 14.7% in placebo). There were significant reductions in the first event-rate for non-fatal MI (8.7% vs. 11.8%; p<0.0001). There were no significant effects on cancer incidence or hospitalization for a non-vascular cause. **Conclusions:** In high-risk patients with ranging LDL-C values, simvastatin reduced all-cause mortality, coronary deaths, and major vascular events.
IMPROVE-IT	NEJM 2015;372:2387-97	**Title:** Ezetimibe Added to Statin Therapy after Acute Coronary Syndromes **Purpose:** Assess the effects of adding ezetimibe to statin therapy in reducing the rate of CV events. **Methods:** 18 144 patients who were hospitalized with ACS were randomized to combination (simvastatin 40 mg plus ezetimibe 10 mg), simvastatin 40 mg alone, or placebo. Primary endpoint was a composite of CV death, non-fatal MI, UA, or non-fatal stroke. **Results:** The Kaplan-Meier event-rates for the primary endpoint were 32.7% in the combination group and 34.7% in the statin monotherapy group (P<0.001). Rates of pre-specified muscle, gallbladder, and hepatic adverse effects were similar. **Conclusions:** Ezetimibe added to statin reduces mortality in ACS patients.
JUPITER	NEJM 2008;359:2195-207	**Title:** Rosuvastatin to Prevent Vascular Events in Men and Women with Elevated C-Reactive Protein **Purpose:** Evaluate the effects of statin treatment on CV events in patients with elevated CRP without hyperlipidemia. **Methods:** 17802 apparently healthy patients with LDL levels <130 mg/dL and CRP levels >2.0 mg were randomized to rosuvastatin 20 mg daily or placebo. The primary endpoint was a composite of MI, stroke, revascularization, hospitalization for UA, or CV death. **Results:** The rates of the primary endpoint were 0.77 and 1.36 per 100 person-years in the statin and placebo groups respectively (hazard ratio 0.56; 95% CI 0.46 to 0.69; p<0.00001). The rosuvastatin group did not have a significant increase in myopathy or cancer, but a higher rate of diabetes. **Conclusions:** With low to normal LDL and elevated high CRP, treatment with rosuvastatin significantly reduced major CV events.
MASS II	Circulation 2010;122(10):949-57	**Title:** Ten-Year Follow-Up survival of the Medicine, Angioplasty, or Surgery Study (MASS II) **Purpose:** Compare 10-yr follow-up of PCI, CABG, and medical treatment in patients with multivessel coronary disease, UA, and preserved ventricular function. **Methods:** 611 patients were randomized to CABG, PCI, or medical treatment. The primary endpoints were overall mortality, Q-wave MI, or refractory angina requiring revascularization. **Results:** 10-yr survival was 74.9% with CABG, 75.1% with PCI, and 13.3% with medical treatment (P=0.089). 10-yr rates of MI were 10.3% with CABG, 13.3% with PCI, and 20.7% with medical treatment (P<0.010). 10-yr freedom from angina was 64% with CABG, 59% with PCI, and 43% with medical treatment (P<0.001). **Conclusions:** Compared to medical therapy, CABG resulted in greater relief of angina symptoms and lower rates of subsequent MI, additional revascularization, and cardiac death. Compared to PCI, CABG resulted in decreased need for further revascularization, a lower incidence of MI, and lower risk of combined events.
ODYSSEY OUTCOMES	NEJM 2018;379:2097-107	**Title:** Alirocumab and Cardiovascular Outcomes after Acute Coronary Syndrome **Purpose:** Determine whether alirocumab would improve CV events after ACS in patients receiving high-intensity statin therapy. **Methods:** 18924 patients receiving high-intensity statins for ACS 1-12 prior were randomized to alirocumab SQ at 75 mg or placebo, every 2 wk. The primary endpoint was a composite of death from CHD, non-fatal MI, fatal or non-fatal stroke, or UA. **Results:** The primary endpoint occurred in 9.5% of patients in the alirocumab group and in 11.1% of patients in the placebo group (hazard ratio 0.85; 95% CI 0.78 to 0.93; P<0.001). The incidence of adverse events was similar in the two groups. **Conclusions:** Among patients with ACS in the preceding 1-12 mo, use of alirocurumab significantly reduces all-cause mortality and MI.

Trial Name	Reference	Clinical Trial Details
ROOBY	NEJM 2017;377(7);623-32	**Title:** Five-Year Outcomes after On-Pump and Off-Pump Coronary-Artery Bypass **Purpose:** Reporting of 5-yr outcomes in patients included in the Veterans Trial of on-pump vs. off-pump CABG. **Methods:** 2203 patients were randomly assigned to undergo either on-pump or off-pump CABG. The primary 5-yr outcomes were all-cause mortality and a composite of major CV events or non-fatal MI. **Results:** 5-yr mortality was 15.2% in the off-pump group, compared with 11.9% in the on-pump group (RR 1.28; 95% CI 1.03 to 1.58; P=0.02). The rate of major CV events in the off-pump group was 31.0% compared to 27.1% in the on-pump group (RR 1.14; 95% CI 1.00 to 1.30; P=0.046). **Conclusions:** Off-pump CABG led to lower rates of 5-yr survival and event-free survival when compared to on-pump CABG.
SYNTAX	NEJM 2009;360:961-72	**Title:** Percutaneous Coronary Intervention versus Coronary-Artery Bypass Grafting for Severe Coronary Artery Disease **Purpose:** Compare PCI and CABG for treating patients with previously untreated three-vessel or left main CAD. **Methods:** 1800 patients with three-vessel or left main coronary disease were randomized to CABG or PCI (1:1 ratio). The primary outcomes were a major adverse cardiac or cerebrovascular event. **Results:** Rates of primary outcomes at 12 mo were significantly higher in the PCI group (17.8% vs 12.4%; P=0.002). At 12 mo, rates of death and MI were similar between groups and stroke was significantly more likely with CABG. **Conclusions:** CABG had a lower rate of major cardiac or cerebrovascular events, however the rate of stroke was increased with CABG whereas the rate of repeat revascularization was increased with PCI.
TNT	NEJM 2005;352:1425-35	**Title:** Intensive Lipid Lowering with Atorvastatin in Patients with Stable Coronary Disease **Purpose:** Assess the efficacy and safety of LDL-lowering below 100 mg/dL in patients with stable CHD. **Methods:** 10001 patients with stable CHD and LDL <130 mg/dL were randomized to double blind therapy of atorvastatin 10 mg or 80 mg daily. The primary endpoint was the occurrence of a first major CV event. **Results:** A primary endpoint occurred in 8.7% of patients treated with atorvastatin 80 mg, as compared with 10.9% in patients receiving atorvastatin 10 mg. There was no difference in overall mortality between groups. **Conclusions:** Lipid-lowering therapy with atorvastatin 80 mg/d in patients with stable CHD provides clinical benefit beyond atorvastatin 10 mg/d.
MYOCARDIAL INFARCTION		
BHAT	JAMA 1982;247:1707-14	**Title:** A Randomized Trial of Propranolol in Patients With Acute Myocardial Infarction **Purpose:** Study the effects on mortality of administering propranolol hydrochloride in patients who experienced at least one MI. **Methods:** 3387 patients were randomized to either propranolol or placebo for 21 d post-infarction. The primary outcome was all-cause mortality. **Results:** Total mortality during the average 25-month follow-up was 7.2% in the propranolol group and 9.2% in the placebo group. **Conclusions:** In acute MI, propranolol reduced all-cause mortality, CV death, and sudden death from atherosclerotic heart disease.
COLCOT	NEJM 2019;381:2497-505	**Title:** Efficacy and Safety of Low-Dose Colchicine after Myocardial Infarction **Purpose:** Assess the efficacy and safety of low-dose colchicine after MI. **Methods:** Patients were randomized to receive 0.5 mg colchicine once daily or placebo. The primary endpoint was a composite of CV death, resuscitated cardiac arrest, MI, stroke, or UA leading to revascularization. **Results:** The primary endpoint occurred in 5.5% of colchicine-treated patients and 7.1% in the placebo group (hazard ratio 0.77; 95% CI 0.61 to 0.96; P=0.02). The hazard ratios were 0.84 for CV death, 0.83 for resuscitated cardiac arrest, 0.91 for MI, 0.26 for stroke, and 0.50 for UA. **Conclusions:** In patients with recent MI, colchicine lowered the risk of subsequent CV events as compared to placebo.
COMPLETE	NEJM 2019;381:1411-21	**Title:** Complete Revascularization with Multivessel PCI for Myocardial Infarction **Purpose:** To assess whether PCI of nonculprit lesions reduced rates of CV death or MI in STEMI patients. **Methods:** Patients with STEMI and successful PCI of culprit lesions were randomized to complete revascularization with PCI or no further revascularization. The primary outcome was a composite of CV death or MI. **Results:** At 3 yr, the primary outcome occurred in 7.8% of patients in the complete-revascularization group, compared with 10.5% in the culprit-lesion PCI only group (hazard ratio 0.74; 95% CI 0.60 to 0.91; P=0.004). The benefit was observed regardless of the intended timing of nonculprit lesion PCI. **Conclusions:** In patients with STEMI and multivessel CAD, complete revascularization by PCI further reduced the risk of CV death or MI as compared to culprit-lesion-only PCI.
DAPT	NEJM 2014;371:2155-66	**Title:** Twelve or 30 Months of Dual Antiplatelet Therapy after Drug-Eluting Stents **Purpose:** Study the effects of dual antiplatelet therapy beyond 1 yr, to prevent thrombotic complications after drug-eluting stents. **Methods:** After 12 mo treatment with clopidogrel or prasugrel, patients were randomized to continuing this therapy or receiving placebo. The primary endpoints were stent thrombosis and major adverse CV events from 12 – 30 mo. **Results:** Continued treatment reduced the rates of stent thrombosis (0.4% vs 1.4%; 95% CI 0.17 to 0.48; P<0.001), and major CV and cerebrovascular events (4.3% vs. 5.9%; 95% CI 0.59 to 0.85; P<0.001). The rate of moderate-severe bleeding was increased in the continued treatment group (2.5% vs 1.65%; P=0.001). **Conclusions:** Dual antiplatelet therapy beyond 1 yr confers additional benefit.
OASIS-5	NEJM 2006;354:1464-76	**Title:** Comparison of Fondaparinux and Enoxaparin in Acute Coronary Syndromes **Purpose:** Assess whether fondaparinux would reduce bleeding risk while retaining the anti-ischemic benefits of enoxaparin. **Methods:** 20 078 patients were randomized to receive either fondaparinux 2.5 mg daily, or enoxaparin 1 mg/kg twice daily. The primary outcomes were death, MI, refractory ischemia at 9 d, or bleeding. **Results:** The primary outcome rates were similar between the two groups (hazard ratio 1.01; 95% CI 0.90 to 1.13). The rate of 9-d major bleeding was lower in the fondaparinux group than the enoxaparin group (2.2% vs. 4.1%; hazard ratio 0.52; P<0.001). **Conclusions:** Compared to enoxaparin, fondaparinux reduced mortality rates, major bleeds at 9 d and MI at 30 and 180 d.
PEGASUS-TIMI 54	NEJM 2015; 372:1791-800	**Title:** Long-Term Use of Ticagrelor in Patients with Prior Myocardial Infarction **Purpose:** Investigate the safety and efficacy of ticagrelor after an ACS. **Methods:** 21162 patients who had a prior MI were randomized to ticagrelor 90 mg BID, or placebo. The primary endpoints were a composite of CV death, MI, or stroke. The primary safety endpoint was thrombolysis in MI and major bleeding. **Results:** Kaplan-Meier event rates showed that ticagrelor reduced event rates at 3 yr, at 7.77% for the treatment group and 9.04% in the placebo group (hazard ratio 0.85; 95% CI 0.75 to 0.96; P=0.008). Rates of major bleeding were higher with ticagrelor than with placebo (P<0.001). **Conclusions:** Ticagrelor on top of ASA reduces CV events in patients with a history of MI.

Trial Name	Reference	Clinical Trial Details
PLATO	NEJM 2009;361:1045-57	**Title:** Ticagrelor vs. Clopidogrel in Patients with Acute Coronary Syndromes **Purpose:** Evaluate the efficacy of ticagrelor vs. clopidogrel in patients with an ACS. **Methods:** 18624 patients admitted to hospital with ACS, with or without ST-elevation, were randomized to ticagrelor (180 mg loading, 90 mg twice daily after) or clopidogrel (300-600 mg loading; 75 mg daily after). The primary endpoint was a composite of vascular death, MI, or stroke. **Results:** The primary endpoint occurred in 9.8% of patients receiving ticagrelor, compared with 11.7% of patients receiving clopidogrel (hazard ratio 0.84; 95% CI 0.77 to 0.92; P<0.001). The rate of death was also reduced with ticagrelor (4.5% vs 5.9%; P<0.001). There were no significant differences in the rates of major bleeding. **Conclusions:** In ACS patients with either STEMI or NSTEMI, regardless of reperfusion strategy, ticagrelor reduced mortality, MI, and stroke without increased bleeding compared to clopidogrel.
PROVE IT – TIMI 22	NEJM 2004;350:1495-504	**Title:** Intensive vs. Moderate Lipid Lowering with Statins after Acute Coronary Syndromes **Purpose:** Determine the optimal LDL-C level in patients undergoing statin therapy for reduction in risk of CV events. **Methods:** 4162 patients hospitalized with ACS in the preceding 10 d were assigned to pravastatin 40 mg daily or atorvastatin 80 mg daily. The primary end point was a composite of all-cause mortality MI, UA, revascularization, and stroke. **Results:** Event rates were 26.3% in the pravastatin group and 22.4% in the atorvastatin group (P=0.005; 95% CI 5 to 26%). The study established the superiority of the more intensive regimen. **Conclusions:** In patients hospitalized for ACS, high-dose atorvastatin reduced all-cause mortality, MI, unstable angina, revascularization, and stroke compared with pravastatin.
TRITON-TIMI 38	NEJM 2007;357:2001-15	**Title:** Prasugrel vs. Clopidogrel in Patients with Acute Coronary Syndromes **Purpose:** Compare clopidogrel and prasugrel in preventing thrombotic complications of ACS and PCI. **Methods:** 13608 patients with ACS and scheduled PCI were randomized to prasugrel (60 mg loading, 10 mg maintenance) or clopidogrel (300 mg loading, 75 mg maintenance). The primary endpoint was CV death, non-fatal MI, or non-fatal stroke. The safety endpoint was major bleeding. **Results:** The primary endpoint occurred in 12.1% of clopidogrel patients and 9.9% of prasugrel patients (hazard ratio 0.81; 95% CI 0.73 to 0.90; P<0.001). Major bleeding was observed in 2.4% of prasugrel patients and 1.8% of clopidogrel patients (hazard ratio 1.32; 95% CI 1.03 to 1.68; P=0.03). **Conclusions:** In ACS patients scheduled for PCI, prasugrel reduced ischemic events but increased major bleeding compared to clopidogrel.
TRANSCATHETER AORTIC VALVE REPLACEMENT		
PARTNER II	NEJM 2016;374:1609-20	**Title:** Transcatheter or Surgical Aortic-Valve Replacement in Intermediate-Risk Patients **Purpose:** Evaluate survival rates between TAVR and surgical aortic valve replacement, in intermediate risk patients. **Methods:** 2032 intermediate risk patients were randomized to TAVR or surgical replacement. The primary endpoint was all-cause mortality or disabling stroke at 2 yr. **Results:** The rates of primary outcomes were similar between TAVR and surgical replacement groups (P=0.001). At 2 yr, the Kaplan-Meier event rates were 19.3% in the TAVR group and 21.1% in the surgical group (hazard ratio 0.89; 95% CI 0.73 to 1.09; P=0.25). Surgery resulted in fewer major vascular complications and less paravalvular aortic regurgitation. **Conclusions:** In intermediate-risk patients with AS, TAVR and SAVR resulted in similar rates of all-cause mortality and disabling stroke.
PARTNER III	NEJM 2019;380:1695-705	**Title:** Transcatheter Aortic-Valve Replacement with a Balloon-Expandable Valve in Low-Risk Patients **Purpose:** Compare major outcomes in low-risk patients between TAVR and surgical aortic-valve replacement. **Methods:** 1000 patients with severe aortic stenosis and low surgical risk were randomized to TAVR or surgical aortic valve replacement. The primary endpoint was a composite of death, stroke, or rehospitalization at 1 yr. **Results:** The Kaplan-Meier event rates were significantly lower in the TAVR group than the surgery group (8.5% vs. 15.1%; 95% CI -10.8 to -2.5; P<0.001). At 30 d, TAVR resulted in lower stroke rates and new-onset atrial fibrillation. There were no significant differences in major vascular complications, new pacemaker insertion, or paravalvular regurgitation. **Conclusions:** Among low-surgical risk patients with severe AS, the rate of the composite of death, stroke, or rehospitalization was significantly lower with TAVR compared to surgical aortic-valve replacement.
HEART FAILURE		
COAPT	NEJM 2018;379:2307-18	**Title:** Transcatheter Mitral-Valve Repair in Patients with Heart Failure **Purpose:** Assess improvement in outcomes in patients with MR due to LV dysfunction, from transcatheter mitral valve repair. **Methods:** Patients with HF and secondary mitral regurgitation were randomized to transcatheter mitral-valve repair plus medical therapy, or to medical therapy alone. The primary endpoint was hospitalization for HF at 24 mo. **Results:** The primary endpoint was 35.8% in the intervention group, compared to 67.9% in the control group (hazard ratio 0.53; 95% CI 0.40 to 0.70; P<0.001). Death from any cause occurred at 29.1% in the intervention group compared with 46.1% in the control group (hazard ratio 0.62; 95% CI 0.46 to 0.82; P<0.001). **Conclusions:** Among patients with HF and secondary MR who remained symptomatic despite medical therapy, transcatheter mitral-valve repair resulted in a lower rate of hospitalization for HF and lower mortality than medical therapy alone.
CHARM	Lancet 2003;362:759-66	**Title:** Effects of Candesartan on Mortality and Morbidity in Patients with Chronic Heart Failure: The Charm-Overall Programme **Purpose:** Determine whether ACEI use could reduce mortality and morbidity in patients with CHF. **Methods:** Patients with LVEF < 40% not receiving ACEi were randomized to candesartan or placebo. The primary outcome was all-cause mortality, CV death, or hospital admission for CHF. **Results:** Mortality was 23% in the candesartan group and 25% in the placebo group (hazard ratio 0.91; 95% CI 0.83 – 1.00; p=0.055), with fewer CV deaths (18% vs 20%; p=0.012). **Conclusions:** Candesartan reduced overall mortality, CV death, and CHF hospitalizations.
CIBIS II	Lancet 1999;353:9-13	**Title:** The Cardiac Insufficiency Bisoprolol Study II (CIBIS-II): A Randomised Trial **Purpose:** Investigate the efficacy of bisoprolol in decreasing all-cause mortality in CHF. **Methods:** 2647 patients with LVEF <35% receiving standard therapy were randomized to bisoprolol or placebo. The primary outcome was all-cause mortality. **Results:** All-cause mortality was significantly lower with bisoprolol than placebo (11.8% vs 17.3%, hazard ratio 0.66; 95% CI 0.54 to 0.81; p<0.0001). Treatment effects were independent of etiology or severity of HF. **Conclusions:** Bisoprolol reduced all-cause mortality, CV death, all-cause hospitalization, and CHF hospitalization.
COMET	Lancet 2003;362:7-13	**Title:** Comparison of Carvedilol and Metoprolol on Clinical Outcomes in Patients with Chronic Heart Failure in the Carvedilol or Metoprolol European Trial (Comet): Randomised Controlled Trial **Purpose:** Compare outcomes of chronic HFrEF patients on carvedilol or metoprolol. **Methods:** 1511 patients with CHF were randomized to carvedilol 25 mg twice daily, and 1518 randomized to metoprolol 50 mg twice daily. The primary endpoints were all-cause mortality, and the composite of all-cause mortality or all-cause admission. **Results:** The all-cause mortality was 34% for carvedilol patients and 40% for metoprolol patients (hazard ratio 0.83; 95% CI 0.74 to 0.93; p=0.0017). Incidence of side-effects and withdrawal did not differ significantly between groups. **Conclusions:** Carvedilol was associated with a reduction in all-cause mortality compared with metoprolol.

Trial Name	Reference	Clinical Trial Details
COPERNICUS	NEJM 2001;344:1651-58	**Title:** Effect of Carvedilol on Survival in Severe Chronic Heart Failure **Purpose:** Assess the effects of β-blockade on hospitalization and mortality in patients with severe HF. **Methods:** 2289 patients with HF symptoms at rest and an EF < 25% were randomized to carvedilol or placebo. Primary endpoints were rates of hospitalization and mortality. **Results:** There was a 35% reduction in mortality risk in patients treated with carvedilol than placebo (95% CI 19% to 48%; P=0.0018). **Conclusions:** Carvedilol in addition to standard treatment significantly reduced the risk of death or hospitalization in patients with severe CHF.
DAPA-HF	NEJM 2019;381:1995-2008	**Title:** Effect of Carvedilol on Survival in Severe Chronic Heart Failure **Purpose:** Assess the efficacy of SGLT2 inhibitor dapagliflozin in patients with HFrEF, independent of T2DM status. **Methods:** 4744 patients with HF and EF<40% were randomized to receive dapagliflozin 10 mg once daily, or placebo, in addition to recommended therapy. The primary outcome was worsening HF or CV death. **Results:** The primary outcome occurred in 16.3% of dapagliflozin-treated patients and 21.2% of placebo patients (hazard ratio 0.74; 95% CI 0.65 to 0.85; P<0.001). A worsening of HF occurred at 10.0% in the dapagliflozin group and 13.7% in the placebo group (hazard ratio 0.70; 95% CI 0.59 to 0.83). Findings in patients with DM were comparable to those in patients without DM. **Conclusions:** In patients with HFrEF, the risk of worsening HF or death from CV causes was lower among those who received dapagliflozin than those who received placebo.
I-PRESERVE	NEJM 2008;359:2456-67	**Title:** Irbesartan in Patients with Heart Failure and Preserved Ejection Fraction **Purpose:** Study the effects of irbesartan in patients with HF and EF>45%. **Methods:** 4128 patients with HF and EF>45% were randomized to irbesartan 300 mg daily, or matching placebo. The primary outcome was a composite of all-cause mortality or CV hospitalization. **Results:** The primary outcome occurred in 742 patients in the irbesartan group and 763 placebo patients (hazard ratio 0.95; 95% CI 0.86 to 1.05; P=0.35). Overall, rates of death were 52.6 and 52.3 per 1000-patient-years, respectively. **Conclusions:** In patients with CHF and normal LVEF, treatment with ARB (irbesartan) did not improve mortality or CV morbidity compared to placebo.
PARADIGM-HF	NEJM 2014;371:993-1004	**Title:** Angiotensin–Neprilysin Inhibition vs. Enalapril in Heart Failure **Purpose:** Compare survival in HFrEF patients treated with enalapril or an angiotensin-neprilysin inhibitor. **Methods:** 8442 patients with HF and EF<40% were randomized to LCZ696 200 mg twice daily, or enalapril 10 mg twice daily. The primary endpoint was a composite of CV death and HF hospitalization. **Results:** The primary outcome occurred in 21.8% of LCZ696-treated patients and 26.5% of enalapril patients (hazard ratio 0.80; 95% CI 0.73 to 0.87; P<0.001). 13.3% and 16.5% of patients treated with LCZ696 and enalapril, respectively, died of CV causes (hazard ratio 0.80; 95% CI 0.71 to 0.89; P<0.001). **Conclusions:** Novel drug (LCZ696) containing valsartan and a neprilysin inhibitor (prevents degradation of natriuretic peptides) reduces hospitalization and mortality.
RALES	NEJM 1999;341:709-17	**Title:** The Effect of Spironolactone on Morbidity and Mortality in Patients with Severe Heart Failure **Purpose:** Assess the efficacy of spironolactone on morbidity and mortality in patients with severe HF. **Methods:** 1663 patients with severe HF and LVEF <35% who were being treated with ACEI, loop diuretic and digoxin, were randomized to spironolactone 25 mg daily or placebo. The primary endpoint was all-cause mortality. **Results:** There was a mortality rate of 46% in the placebo group, compared to 35% in the spironolactone group (RR 0.70; 95% CI 0.60 to 0.82; P<0.001). The frequency of hospitalization for worsening HF was 35% less in the intervention group (RR 0.65l 95% CI 0.54 to 0.77, P<0.001). **Conclusions:** In severe CHF (class III/IV) and LVEF <35%, spironolactone reduced all-cause mortality, sudden death, and death due to progression of HF.
SCD-HeFT	NEJM 2005;352:225-37	**Title:** Amiodarone or an Implantable Cardioverter–Defibrillator for Congestive Heart Failure **Purpose:** Study prognosis differences in CHF patients treated with amiodarone or ICD. **Methods:** 2521 patients with CHF and LVEF <35% were randomized to conventional therapy plus placebo, conventional therapy plus amiodarone, or conventional therapy plus shock-only single-lead ICD. The primary endpoint was death from any cause. **Results:** Mortality rates were 29% in placebo patients, 28% in the amiodarone group, and 22% in the ICD group (hazard ratio 1.06; 97.5% CI 0.86 to 1.30; p=0.53). ICD was associated with a decreased risk of death of 23% compared to placebo (hazard ratio 0.77; 97.5% CI 0.62 to 0.96; p=0.007). **Results** did not vary based on ischemic or nonischemic causes of CHF. **Conclusions:** In mild-to-moderate CHF, shock-only ICD significantly reduces risk of death; amiodarone had no benefit compared with placebo in treating patients with mild-to-moderate CHF.
TRACE	NEJM 1995;333:1670-76	**Title:** A Clinical Trial of the Angiotensin-Converting–Enzyme Inhibitor Trandolapril in Patients with Left Ventricular Dysfunction after Myocardial Infarction **Purpose:** Determine whether the mortality benefit of ACEI post-MI extends to all patients, or only selected patients. **Methods:** On d 3-7 post-MI, 1749 patients were randomized to receive oral trandolapril or placebo. The primary endpoint was all-cause mortality. **Results:** The mortality rate was 34.7% in the trandolapril group, compared with 42.3% in the placebo group (P=0.001; RR 0.78; 95% CI 0.67 to 0.91). Trandolapril reduced rates of sudden death (RR 0.75; 95% CI 0.59 to 0.98; P=0.03) and CV death (RR 0.75; 0.62 to 0.89; P=0.001). **Conclusions:** In patients with LV dysfunction post-MI, long-term trandolapril reduced the risk of death or progression to severe CHF and reduced risk of sudden death.
ARRHYTHMIA		
AFFIRM	NEJM 2002;347:1825-33	**Title:** A Comparison of Rate Control and Rhythm Control in Patients with Atrial Fibrillation **Purpose:** Compare rate and rhythm control in patients with AFib and high risk of stroke or death. **Methods:** 4060 patients with AFib were randomized to rhythm-control therapy with antiarrhythmic drugs, or rate-control therapy. **Results:** The mortality rate was 23.8% in rhythm-controlled patients and 21.3% in rate-controlled patients (hazard ratio 1.15; 95% CI 0.99 to 1.34; P=0.08). More patients were hospitalized in the rhythm-control group, with higher rates of adverse drug events **Conclusions:** No significant difference in mortality rates between rate or rhythm control of AFib.
ARISTOTLE	NEJM 2011;365:981-92	**Title:** Apixaban vs. Warfarin in Patients with Atrial Fibrillation **Purpose:** Assess the efficacy of apixaban for stroke prevention in patients with AF, in comparison with warfarin. **Methods:** 18201 patients with AFib and one additional RF for stroke were randomized to apixaban 5 mg twice daily or warfarin. The primary outcome was stroke or systemic embolism. **Results:** The rate of primary outcome was 1.27% per year in the apixaban group and 1.60% per year in the warfarin group (hazard ratio 0.79; 95% CI 0.66 to 0.95; P<0.001). The rate of major bleeding was 2.13% per year with apixaban and 3.09% per year with warfarin (hazard ratio 0.69; 95% CI 0.69 to 0.80; P<0.001). The rate of hemorrhagic stroke was 0.24% per year in the apixaban group and 0.47% per year in the warfarin group. **Conclusions:** AFib patients treated with apixaban had a lower incidence of stroke, major bleeding and mortality compared to warfarin.

Trial Name	Reference	Clinical Trial Details
AUGUSTUS	NEJM 2019;380:1509-24	**Title:** Antithrombotic Therapy after Acute Coronary Syndrome or PCI in Atrial Fibrillation **Purpose:** Elucidate benefits of antithrombotic regimens for patients with AFib and either ACS or previous PCI. **Methods:** Patients with AFib and a prior ACS or PCI were randomized to apixaban or a vitamin K antagonist, and to ASA or placebo for 6 mo. The primary outcome was major or clinically relevant non-major bleeding. **Results:** The primary outcome occurred in 10.5% of apixaban patients and 14.7% of vitamin K antagonist-patients (hazard ratio 0.69; 95% CI 1.59 to 2.25; P<0.001). Patients in the apixaban group had a lower incidence of death or hospitalization compared to the vitamin K antagonist group (23.5% vs 27.4%; hazard ratio 0.83; 95% CI 0.74 to 0.93; P=0.002). **Conclusions:** In patients with AFib and recent ACS or PCI, apixaban reduced bleeding compared to regimens that included a vitamin K antagonist, ASA, or both.
COACT	JAMA Cardiol. 2020;5:1358-65	**Title:** Coronary Angiography after Cardiac Arrest without ST Segment Elevation: One-Year Outcomes of the COACT Randomized Clinical Trial **Purpose:** Compare 1-yr clinical outcomes of immediate angiography and PCI versus delayed angiography in resuscitated cardiac arrest patients without STEMI. **Methods:** 552 patients who had undergone cardiac arrest in the absence of STEMI were randomized to immediate coronary angiography, or angiography after recovery of neurological function. PCI was carried out as indicated by angiography, in keeping with the time allotments between groups. The primary endpoints were survival, MI, revascularization, hospitalization for HF, and the composite of death and MI, at 1 yr follow-up time. **Results:** Survival at 1-yr followup were 61.4% and 64.0% in the immediate angiography and delayed angiography groups, respectively (OR 0.90; 95% CI 0.63 to 1.28; P=0.51). Similar to 90-d outcomes, this represents a statistically insignificant difference. Myocardial infarction rates were 0.8% and 0.4% in the immediate and delayed groups, respectively (OR 1.96; 95% CI 0.18 to 21.8). The composite outcome of death, revascularization, or MI occured at a rate of 42.9% and 40.6% in the immediate and delayed groups, respectively (OR 1.10; 95% CI 0.77 to 1.56). **Conclusions:** Similar to the previous 90-d followup, immediate angiography did not significantly improve 1-yr clinical outcomes compared to delayed angiography in resuscitated cardiac arrest patients without evidence of STEMI.
ENGAGE AF-TIMI48	NEJM 2013;369:2093-104	**Title:** Edoxaban vs. Warfarin in Patients with Atrial Fibrillation **Purpose:** Compare the long-term efficacy and safety of edoxaban and warfarin in AFib patients. **Methods:** 21105 patients with moderate-high risk AFib were randomized to two once-daily regimens of edoxaban or warfarin. The primary endpoint was stroke or systemic embolism. **Results:** The primary endpoint rate was 1.50% with warfarin and 1.18% in the edoxaban group (hazard ratio 0.79; 97.5% CI 0.63 to 0.99; P<0.001). The annualized rate of major bleeding was 3.43% with warfarin and 2.75% with high-dose edoxaban (hazard ratio 0.80; 95% CI 0.71 to 0.91; P<0.001). **Conclusions:** AFib patients treated with edoxaban had similar rates of stroke and lower rates of major bleeding compared to warfarin.
ETOH-AFib	NEJM 2020;382:20-28	**Title:** vAlcohol Abstinence in Drinkers with Atrial Fibrillation **Purpose:** Study the effects of alcohol abstinence on secondary prevention of atrial fibrillation. **Methods:** Adults who consumed >10 standardized drinks/wk with AFib were randomized to abstinence or continuation of current practices. The two primary endpoints were freedom from AFib recurrence and total AFib burden. **Results:** After a 2-wk blanking period, AFib recurred in 53% of patients in the abstinence group and 73% of patients in the control group (hazard ratio 0.55; 95% CI 0.36 to 0.84; P=0.005). The AFib burden after 6 mo was lower in the abstinence group than the control group. **Conclusions:** Abstinence from alcohol reduced arrhythmia recurrences in regular drinkers with AFib.
RE-LY	NEJM 2009;361:1139-51	**Title:** Dabigatran vs. Warfarin in Patients with Atrial Fibrillation **Purpose:** Compare the reduction of stroke risk in AFib patients with warfarin versus dabigatran. **Methods:** 18113 patients with AFib and stroke risk were randomized to fixed doses of dabigatran (110 mg or 150 mg twice daily) or warfarin. The primary outcome was systemic embolism. **Results:** Rates of primary outcomes were 1.69% per year with warfarin, compared with 1.53% per year with 110 mg dabigatran (RR 0.91; 95% CI 0.74 to 1.11; P<0.001) and 1.11% per year with 150 mg dabigatran (RR 0.66; 95% CI 0.53 to 0.82; P<0.001). The rate of major bleeding was 3.36% in the warfarin group, compared to 2.71% in the dabigatran 110 mg group and 3.11% in the dabigatran 150 mg group. **Conclusions:** AFib patients treated with dabigatran had a lower incidence of stroke compared to warfarin, with similar rates of major bleeding.
ROCKET-AFib	NEJM 2011;365:883-91	**Title:** Rivaroxaban vs. Warfarin in Nonvalvular Atrial Fibrillation **Purpose:** Compare rivaroxaban with warfarin in reducing stroke risk in AFib patients. **Methods:** 14264 patients with nonvalvular AFib were randomized to rivaroxaban 20 mg daily or dose-adjusted warfarin. The primary endpoint was stroke or systemic embolism. **Results:** The primary endpoint occurred in 1.7% of patients in the rivaroxaban group and 2.2% of patients on warfarin (hazard ratio 0.79; 95% CI 0.66 to 0.96; P<0.001). Major and non-major bleeding occurred in 14.9% of patients in the rivaroxaban group and 14.5% of warfarin patients (hazard ratio 1.03; 95% CI 0.96 to 1.11; P=0.44). **Conclusions:** In patients with AFib, rivaroxaban is non-inferior to warfarin for stroke prevention without an excess of major bleeding.
HYPERTENSION		
HYVET	NEJM 2008;358:1887-98	**Title:** Treatment of Hypertension in Patients 80 Years of Age or Older **Purpose:** Assess antihypertensive therapy for stroke risk reduction, in patients >80 yrs with hypertension. **Methods:** 3845 patients with sBP>160 mmHg and >80 yr old were randomized to indapamide SR 2.5 mg or placebo. Perindopril 2 mg or 4 mg was added if needed to achieve target BP 150/80 mmHg. The primary endpoint was fatal or non-fatal stroke. **Results:** Active treatment was associated with a 30% reduction in fatal or non-fatal stroke (95% CI -1 to 51; P=0.06), a 39% reduction in death from stroke (95% CI 1 to 62; P=0.05) and a 21% reduction in all-cause mortality (95% CI 4 to 35; P=0.02). **Conclusions:** In hypertensive patients >80 yr, treatment with indapamide, with or without perindopril, showed a trend towards reduced relative risk of fatal or non-fatal stroke.
SPRINT	NEJM 2015;373:2103-16	**Title:** A Randomized Trial of Intensive vs. Standard Blood-Pressure Control **Purpose:** Determine appropriate targets for sBP to reduce CV morbidity and mortality among patients without DM. **Methods:** 9361 patients with an sBP 130 mmHg or greater and increased CV risk, without diabetes, were randomized to sBP target <120 mmHg or <140 mmHg. The primary outcome was a composite of MI, other ACS, stroke, HF, or CV death. **Results:** There was a significant reduction in the rates of primary outcome in the intensive group compared to the conservative group (1.65% vs 2.19%; hazard ratio 0.75; 95% CI 0.64 to 0.89; P<0.001). All-cause mortality was significantly lowered in the intensive group (hazard ratio 0.73; 95% CI 0.60 to 0.90; P=0.003). **Conclusions:** In patients with high-risk of CV events excluding DM, strict sBP control (<120 mmHg) is associated with fewer CV events and lower all-cause mortality.

Trial Name	Reference	Clinical Trial Details
VALUE	Lancet 2004;363:2022-31	**Title:** Outcomes in Hypertensive Patients at High Cardiovascular Risk Treated with Regimens Based on Valsartan or Amlodipine: The Value Randomised Trial **Purpose:** Determine whether valsartan would reduce cardiac morbidity more than amlodipine in hypertensive patients with high CV risk. **Methods:** 15245 patients with hypertension and high CV risk were randomized to valsartan or amlodipine. The primary endpoint was a composite of cardiac morbidity and mortality. **Results:** The primary composite endpoints occurred in 10.6% of patients in the valsartan group and 10.4% of patients in the amlodipine group (hazard ratio 1.04; 95% CI 0.94 to 1.15; P=0.49). **Conclusions:** Valsartan group had higher incidence of MI than amlodipine group.

Acronyms

ACE	angiotensin converting enzyme	Cl	clearance rate	NE	norepinephrine (NPN)	TBW	total body water
ACh	acetylcholine	COMT	catechol-O-methyltransferase	NPO	nothing by mouth	TDM	therapeutic drug monitoring
ADE	adverse drug event	CYP	cytochrome P450 enzyme	NS	nervous system	TI	therapeutic index
ADR	adverse drug reaction	DIN	drug identification number	Po/w	partition coefficient of a drug	Vd	volume of distribution
ARB	angiotensin receptor blocker	FDA	Food and Drug Administration	PD	pharmacodynamics		
AUC	area under the concentration-time curve	GFR	glomerular filtration rate	PDE	phosphodiesterase		
		HH	Henderson-Hasselbalch	P-gp	P-glycoprotein		
BBB	blood-brain barrier	INR	international normalized ratio	PK	pharmacokinetics		
cGMP	cyclic guanosine monophosphate	MME	milligram morphine equivalents	SSRI	selective serotonin reuptake inhibitor		
		NDC	National Drug Code				

General Principles

Drug Nomenclature

- **DIN or NDC**: Drug Identification Number assigned to each drug approved by Health Canada; National Drug Code assigned by FDA (US), equivalent to the DIN in Canada
- **DIN-HM**: number assigned to registered homeopathic products in Canada
- **NPN**: natural product number; refers to natural health products (excluding homeopathic medicines) regulated by the Natural and Non-Prescription Health Products Directorate within Health Canada
- **chemical name**: describes chemical structure; consistent in all countries via International Union of Pure and Applied Chemistry (e.g. N-(4-hydroxyphenyl)acetamide = acetaminophen)
- **non-proprietary (generic) name**: approved name (requires approval from nomenclature committee), official name (listed in pharmacopeia), often referred to as the generic name; may contain an ending similar to drugs in its class (e.g. atorvastatin, pravastatin, simvastatin)
- **proprietary (trade) name:** the brand name or registered trademark (e.g. Lipitor®)

Phases of Clinical Drug Testing

- pre-clinical: assessments of the drug before it is given to humans (e.g. laboratory studies in cells or animals) to examine PK and PD properties and potential toxicities
- phase I: first administration to healthy human volunteers, following animal studies; to determine PK and PD
- phase II: first administration to patients, small sample sizes; to determine initial safety and efficacy, dose range, PK (and sometimes PD)
- phase III: comparative studies (new drug vs. placebo or standard of care) to establish safety and efficacy in a larger group of patients; generally involves double-blinded and randomized clinical trials (RCTs)
- phase IV: post-marketing surveillance, wide distribution; to determine effectiveness (in contrast to efficacy) and monitor long-term drug effects, and previously unappreciated ADRs

See Landmark Clinical Pharmacology Trials table for more information on results from the BNT162b2 trial, one of the first phase III global trials utilizing BNT162b2 mRNA vaccine in preventing COVID-19 in persons 16 yr and older.

Drug Administration

- choice of route of administration depends on: drug properties, local and systemic effects, desired time to onset and/or duration of action, adherence, and other patient characteristics

Table 1. Routes of Drug Administration

Route	Advantage	Potential Disadvantages
Oral (PO)	Convenient, easy to administer Large surface area for absorption Inexpensive relative to parenteral administration Longer expiry date	Incomplete absorption Hepatic and intestinal first-pass effect Adverse GI effects Higher likelihood of drug-drug/drug-food interactions Affected by dietary factors Requires an intact GI system Affected by GI motility
Buccal/Sublingual (SL)	Rapid onset of action No hepatic first-pass effect	Must be lipid-soluble, non-irritating
Rectal (PR)	Small hepatic first-pass effect Use when NPO, vomiting, or unconscious	Inconvenient, irritation at site of application Erratic absorption
Intravenous (IV)	No hepatic first-pass effect Provides rapid onset of action Easy to titrate dose	Little ability to undo inappropriate drug administration Risk of infection, bleeding, vascular injury, and extravasation Expensive Requires sterile conditions and trained professionals
Intramuscular (IM)	Depot storage if oil-based = slow release of drug Aqueous solution = rapid onset of action (e.g. epinephrine for serious allergic reactions)	Pain/hematoma at site of injection
Subcutaneous (SC)	Constant, even absorption Alternative to IV Easier administration (can be self-administered)	Pain at site of injection Smaller volumes than IM Possible tissue damage from multiple injections
Intrathecal	Direct into CSF Bypass BBB and blood-CSF barrier	Risk of infection and CSF leak Invasive procedure
Inhalation	Immediate action in lungs Rapid delivery to blood No hepatic first-pass effect and generally less presystemic clearance	Must be gas, vapour, or aerosol
Topical (skin, mucous membranes, eyes)	Easy to administer Localized (limited systemic absorption)	Effects are generally limited to site of application
Transdermal	Drug absorption through intact skin No hepatic first-pass effect	Irritation at site of application Delayed onset of action
Others (Intraperitoneal, Intra-articular)	Local effect	Risk of infection and hemorrhage

See Landmark Clinical Pharmacology Trials table for more information on results from the ATLAS trial, which is the first trial utilizing long-acting cabotegravir and rilpivirine intramuscular injections for maintenance of HIV-1 suppression vs standard daily oral antiretroviral therapy. The trial is expected to improve long term HIV-1 suppression medication adherence.

Pharmacokinetics

- "what the body does to a drug" – i.e. the fate of a drug in the body following administration
- **definition**: the time-course of drug absorption, distribution, metabolism, and excretion from the body (ADME) following drug administration

Absorption

- **definition**: movement of the drug from the site of administration into blood

Mechanisms of Drug Absorption

- most drug absorption involves passive diffusion
- other mechanisms include active transport, facilitated diffusion, and pinocytosis/phagocytosis

Factors Affecting the Rate and Extent of Drug Absorption

- **lipophilicity** ($P_{o/w}$)
- **local blood flow at the site of administration** (e.g. sublingual vessels facilitate rapid absorption of sublingually-administered medications)
- **molecular size** (e.g. drugs with smaller molecular weights are absorbed faster; drugs with large molecular weights (i.e. >1000 Da) are not as easily absorbed by passive diffusion and very large molecules are often administered intravenously)
- **pH and drug ionization**
  - drugs are usually weak acids (e.g. ASA) or weak bases (e.g. ketoconazole) and thus exist in ionized and non-ionized forms in the body
  - non-ionized (uncharged) forms cross cell membranes more readily by passive diffusion than ionized (charged) forms
  - the ratio of ionized to non-ionized forms is determined by body compartment pH and drug pKa (as per the Henderson-Hasselbalch equation)
- **total surface area for absorption** (small intestinal villi are the primary site of absorption for most orally-administered drugs) drug transporters

Bioavailability (F)
- **definition**: proportion of dose that reaches systemic circulation in an unchanged state and available to access the site of action
- lower F usually reflects limited drug absorption or significant first-pass effect
- IV dose has 100% bioavailability (F=1)

First-Pass Effect
- **definition**: metabolism of the drug by the liver and/or the gut before it reaches systemic circulation, resulting in reduced F
- occurs with PO administration of a drug: GI tract (possible metabolism and/or absorption) ➔ portal vein to liver (possible first-pass metabolism) ➔ systemic circulation
- with rectal administration, 50% of drug absorbed in the colon goes through the portal system

Drug Transporters
- there are a number of drug transporters that affect the uptake or efflux of drugs from cells and organelles and affect drug absorption (as well as drug distribution and excretion)
- P-glycoprotein (P-gp) is a transport protein with particular clinical relevance as it is found in a wide variety of body tissues (including the small intestinal epithelium, proximal tubule, and BBB) where it acts as a multidrug efflux pump and provides a natural defense mechanism against drugs and xenobiotics
- P-gp reduces the absorption and enhances the elimination of its many P-gp substrates (e.g. digoxin, etoposide, paclitaxel, tacrolimus, cyclosporine, apixaban)
- some drugs (e.g. most macrolide antibiotics) inhibit P-gp, leading to increased serum concentrations of P-gp substrate drugs; P-gp inducers (e.g. rifampin, St. John's wort) do the opposite
- some tumours overexpress P-gp leading to multidrug resistance to chemotherapeutic agents
- other members of the ATP Binding Cassette (ABC) superfamily and the Solute Carrier Superfamily of drug transporters also affect drug absorption

Distribution
- **definition**: movement of drugs between different body compartments and to their sites of action
- major body fluid compartments include plasma, interstitial fluid, intracellular fluid, and transcellular fluid (e.g. CSF, peritoneal, pleural)
- tissue compartments include fat, muscle, and brain

Factors Affecting the Rate and Extent of Drug Distribution
- physiochemical properties of the drug (e.g. $P_{o/w}$, pKa, and size)
- pH of fluid
- plasma protein binding
- binding within compartments (i.e. depots)
- regional blood flow
- drug transporters

Plasma Protein Binding
- drug molecules in the blood can exist in an equilibrium of two forms:
  1. bound to plasma protein: acidic drugs bind to albumin, basic drugs bind to α1-acid glycoprotein
  2. free (unbound): can leave the circulation to distribute into tissues and exert an effect, subject to metabolism and elimination
- bound fraction is determined by drug concentration, binding affinity, and plasma protein concentration (number of binding sites)
- reduced number of binding sites (e.g. hypoalbuminemia) or saturation of binding sites (e.g. competition/displacement) may result in increased concentration of free drug, which is often cleared with no harmful effects, although toxicity is possible

Volume of Distribution
- V_d: the apparent volume of fluid into which a drug distributes
- a calculated value (V_d) = amount of drug in body ÷ initial plasma drug concentration
- a theoretical value that does not correspond to an actual physiologic volume; V_d often greatly exceeds TBW
  - Total Body Water (TBW) represents the maximal anatomical fluid volume thought to be accessible to a drug (~40 L for average adult)
- small V_d (<0.5 L/kg) generally corresponds to a drug that concentrates in plasma and/or binds plasma proteins to a high degree
- large Vd corresponds to a drug that distributes into tissues (fat, muscle, etc.); since most of the drug is not located in blood (measured), the drug concentration in blood is low; thus, when dividing the dose by the blood/plasma drug concentration, it "appears" to distribute in a large volume
- V_d of drugs that are highly bound to plasma proteins can be altered by liver and kidney disease due to changes in plasma protein binding

- V_d of drugs change with age
  - in geriatric populations, there is a reduction in total body water and total muscle mass, but an increase in total body fat resulting in an increase in the V_d of hydrophobic drugs
  - V_d of drugs may change in the geriatric population based on the drug $P_{o/w}$

Depots
- a body compartment in which drug molecules tend to be stored and released slowly over a long period of time
- fat is a depot for very lipid soluble drugs (e.g. diazepam, THC)
- some oil-based medications are injected IM for slow release (e.g. depot medroxyprogesterone acetate dosed q3 mo; depot risperidone dosed q2 wk)

Barriers (Relative)
- anatomical body structures that limit or prevent diffusion of drug molecules, such as the placenta or BBB (a barrier composed of tight junctions between capillary endothelial cells and astrocytes)
- physiological barriers such as drug transporters (e.g. P-gp), often serve as a natural defense mechanism against drugs and xenobiotics
- need to consider dosing route and/or drug interactions for drug penetration across these barriers
- barriers are important in determining sites of action and side effect profiles of drugs (e.g. risk of CNS depression if drug crosses BBB, risk of harm to a fetus if drug crosses placenta)

Metabolism (Biotransformation)

- **definition**: chemical transformation of a drug in vivo
- sites of biotransformation include the liver (main), GI tract, lung, plasma, kidney, and most other tissues
- as a result of the process of biotransformation:
  - an inactive prodrug may be activated (e.g. tamoxifen to endoxifen; codeine to morphine)
  - a drug may be changed to another active metabolite (e.g. diazepam to oxazepam and others)
  - a drug may be changed to a toxic metabolite (e.g. acetaminophen to NAPQI)
  - a drug may be inactivated, as with most drugs (e.g., acetaminophen to acetaminophen glucuronide)

Drug Metabolizing Pathways
- phase I (P450) reactions
  - oxidation, reduction, or hydrolysis reactions that introduce or unmask polar groups on a parent compound to increase water solubility (e.g. hydroxylation, demethylation)
  - the change in $P_{o/w}$ is typically minimal compared to phase II, and often phase I places a polar "handle" on a hydrophobic drug to permit conjugation in phase II
  - mediated by CYPs enzymes found in the endoplasmic reticulum (primarily in hepatocytes)
  - products of the reaction can be excreted or undergo further phase II reactions
- phase II (conjugation) reactions
  - conjugation with large endogenous substrates that are often polar (e.g. glucuronic acid, glutathione, sulfate, acetyl group, methyl groups, or amino acids)
  - often substantially increases water solubility and renal elimination
  - can result in biologically active metabolites (e.g. morphine glucuronide)
  - can occur independently of phase I reactions (e.g. morphine to morphine glucuronides)

Examples of CYP Substrates, Inhibitors, and Inducers
https://drug-interactions.medicine.iu.edu/MainTable.aspx

Factors Affecting Drug Biotransformation
- **genetic polymorphisms** of metabolizing enzymes
  - for some enzymes, individual genotypes may alter the rate of drug metabolism (e.g. poor, intermediate, extensive, or ultra-rapid metabolizers)
  - may lead to toxicity or ineffectiveness of a drug at a normal dose
  - tamoxifen, tramadol, and codeine are prodrugs activated by CYP2D6 (nonfunctional alleles reduce effectiveness, whereas hypermorphic alleles impart "ultra-rapid metabolizer" phenotype)
  - warfarin is metabolized by CYP2C9 (nonfunctional alleles lead to higher drug concentrations, greater effect and lower dose requirements)
- **enzyme inhibition** may result from other chemical exposures including drugs and foods
  - CYP inhibition leads to an increased concentration and bioavailability of the substrate drug (e.g. erythromycin (CYP3A4 inhibitor) can predispose patients to simvastatin toxicity (metabolized by CYP3A4))
  - grapefruit juice is a potent inhibitor of intestinal CYP3A4, resulting in numerous drug interactions (e.g. saquinavir AUC increased 3-fold, simvastatin AUC increased 17-fold)
- **enzyme induction** may be due to the same or other medications
  - certain medications enhance gene transcription or act by other mechanisms to increase the activity of metabolizing enzymes
  - a drug may induce its own metabolism (e.g. carbamazepine) or that of other drugs (e.g. phenobarbital can induce the metabolism of oral contraceptive pills) by inducing the CYP system
- **liver dysfunction** (e.g. hepatitis, alcoholic liver, biliary cirrhosis, or hepatocellular carcinoma) may decrease drug metabolism but it is not always clinically significant due to the liver's reserve capacity
- **renal disease** often results in decreased drug clearance

- **extremes of age** (neonates or elderly) have reduced biotransformation capacity, but toddlers often have increased capacity, and doses should be adjusted accordingly
- **nutrition** may be involved, as insufficient protein and fatty acid intake decreases biotransformation, and vitamin/mineral deficiencies may also impact metabolizing enzymes
- **alcohol** has varying effects; while acute alcohol ingestion inhibits CYP2E1, chronic consumption can induce CYP2E1, increasing the risk of hepatocellular damage from acetaminophen by increasing the production of the toxic metabolite (NAPQI)
- **smoking** can induce CYP1A2, thus increasing the metabolism of some drugs (e.g. theophylline, clozapine)

Elimination

- **definition**: removal of drug from the body

Routes of Drug Elimination

- kidney (main organ of elimination)
  - renal drug clearance = (glomerular filtration + tubular secretion) – (tubular reabsorption)
  - renal function (assessed using serum Cr levels) decreases with age (7.5 mL/min per decade) and is affected by many disease states (e.g. diabetes)
  - processes affecting renal elimination:
    1. glomerular filtration
       - a passive process, thus only the free drug fraction can be eliminated
       - drug filtration rate depends on GFR, degree of protein binding of drug, and size of drug
    2. tubular secretion
       - a saturable transport process allowing both protein-bound and free drug fractions to be excreted
       - distinct transport mechanisms for weak acids (e.g. penicillin, salicylic acid, probenecid, chlorothiazide) and weak bases (e.g. quinine, metformin, quaternary ammonium compounds such as choline)
       - drugs may block the secretion of other drugs if one or more share or inhibit the same drug transporter (e.g. probenecid can inhibit the excretion of penicillin via organic anion transporters)
    3. tubular reabsorption: some drugs can be actively or passively reabsorbed back into the systemic circulation, reducing their excretion
- stool: some drugs and metabolites are actively secreted into the bile or directly into the GI tract
  - enterohepatic recirculation occurs when drugs are reabsorbed from the intestine and returned to the liver to cycle between the intestine and liver, which can prolong the drug's duration in the body (e.g. some glucuronic acid conjugates that are excreted in bile may be hydrolyzed in the intestines by bacteria back to their original form and can be systemically reabsorbed)
- lungs: elimination of anesthetic gases and vapours by exhalation
- other routes: sweat, saliva, and breast milk are generally less significant routes, but saliva concentrations of some drugs parallel their plasma concentrations (e.g. rifampin) and drug excretion into breast milk is a concern for some drugs

Pharmacokinetic Considerations

- **definition**: the term "pharmacokinetics" is used to describe given aspects of drug disposition (i.e. the fate of drugs in the body) and encompasses absorption, distribution, metabolism, and elimination (ADME)
- absorption, distribution, and elimination can be graphically represented (e.g. a graph of concentration vs. time)

Time Course of Drug Action

- many kinetic parameters are measured after IV dosing, because it avoids incomplete absorption, and distribution for most drugs is rapid
- when drug doses or concentrations are plotted vs. time, the dose or concentration plotted on the x-axis is often converted to a logarithmic scale (commonly log10) to allow for easier mathematical calculations
- the shape of the elimination phase of a concentration (or dose) or log-concentration (or log-dose) vs. time curve indicates whether the drug undergoes a first-order rate of elimination (visualized as a straight line on a log-dose or log concentration vs. time curve) or a zero-order rate of elimination (curvilinear on a log-dose or log-concentration vs. time curve)
- drugs such as warfarin can exhibit hysteresis (for a single drug concentration, there may be two different response levels)

Half-Life
- **definition**: time taken for the serum drug concentration to decrease by 50%; usually refers to the elimination half-life
- drugs with first-order kinetics require approximately four to five half-lives to reach steady state with repeated dosing, or for complete drug elimination once dosing is stopped

Steady-State Drug Concentration
- drug concentration remains constant when the amount of drug entering the system is equivalent to the amount eliminated from the system
- determination of drug levels in therapeutic drug monitoring is of greatest utility when steady state concentration has been reached
- special dosing situations
  - use a loading dose for drugs with a long half-life and when there is clinical need to rapidly achieve therapeutic levels (e.g. amiodarone, digoxin, phenytoin)
  - use continuous infusion for drugs with a very short half-life and when there is need for a long-term effect and multiple or frequently repeated doses are too inconvenient (e.g. nitroprusside, unfractionated heparin, naloxone)

Clearance Rate
- a quantitative measurement of the volume of body fluid from which a substance is removed per unit time
- Cl = rate of elimination of drug ÷ plasma drug concentration
- may be determined for a particular organ (e.g. liver or kidney), but if not specified, represents the total body clearance rate determined from the sum of individual clearance rates or by determining k_e x Vd, where k_e is the elimination rate constant equal to ln 2/half-life

Elimination Kinetics
- first-order kinetics (most common type)
  - constant fraction of drug eliminated per unit time
  - some drugs can follow first-order kinetics until elimination is saturated (usually at large doses) at which point the Cl is less than would be predicted for a given concentration
  - shows linear relationship when plotted on a graph of concentration (log) vs. time (linear)
  - the concentration axis is converted to a log scale to allow for easier mathematical calculations
- zero-order kinetics (less common, applies to a few drugs in the therapeutic range (e.g. alcohol, Aspirin®) and is more commonly associated with overdose)
  - constant amount of drug eliminated per unit time, regardless of concentration; the concept of half-life does not apply
- non-linear kinetics (much less common)
  - unlike first-order kinetics which assumes no change in PK parameters with drug dose, non-linear kinetics is considered dose-dependent
  - saturation of various ADME processes creates non-linear kinetics, with first-order exhibited at lower concentrations and zero order exhibited at higher concentrations after saturation
  - the complexity of dosing drugs with non-linear kinetics has resulted in creation of drug-specific nomograms to aid clinicians in dosing, with these drugs often being the target of TDM (e.g. phenytoin, theophylline)

Loading and Maintenance Doses
- loading doses are used when an immediate effect is needed, with parenteral administration being the most common way of giving a large dose to "fill up" the volume of distribution
- maintenance doses can be given after a loading dose, but are most commonly initiated without a loading dose
  - steady state levels are achieved after approximately five half-lives
  - can be given as either a continuous infusion (rare) or more commonly as intermittent oral doses

Pharmacodynamics

- study of "what the drug does to the body"
- **definition**: study of the effects of the drug on the body

Dose-Response Relationship
- graded dose-response relationship: relates dose to intensity of effect

Efficacy
- the maximum biological response produced by a drug
- measured by Emax (the maximal response that a drug can elicit or under optimal circumstances)

Potency
- measured by EC50 (the concentration of a drug needed to produce 50% of E_{max})
- a drug that reaches its EC50 at a lower dose is more potent

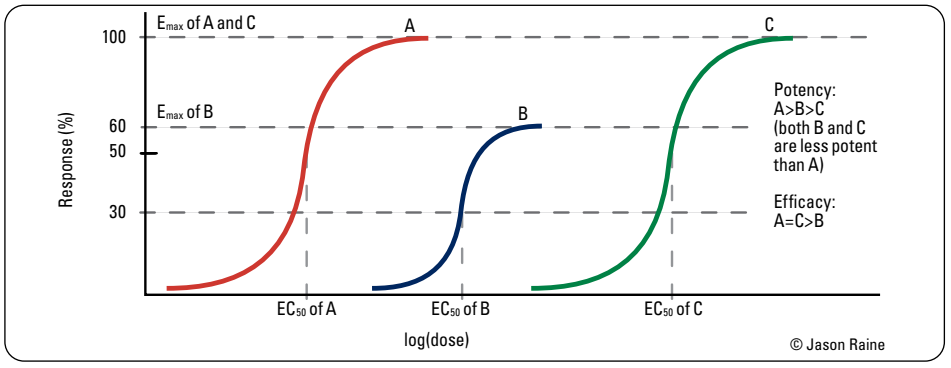

Figure 1. Log(dose)-response curve illustrating efficacy and potency

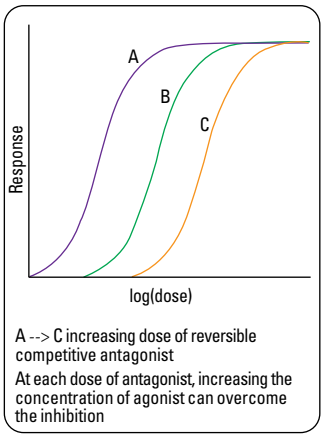

Figure 2. The log(dose)-response curve for reversible competitive antagonism

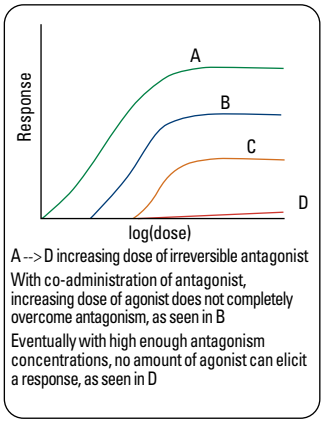

Figure 3. The log(dose)-response curve for irreversible antagonism

Effects of Drugs on Receptors

Agonists

- drugs that mimic the effects of the endogenous ligand and evoke a response when bound to the receptor
  - **affinity**: the ability and strength of the agonist to bind to the receptor (e.g. the β2-agonist salbutamol has greater affinity for β2-receptors than β1-receptors, thus it binds preferentially to β2-receptors)
  - **efficacy**: the ability to replicate endogenous response via the receptor interaction (e.g. binding of salbutamol to β2-receptors results in smooth muscle relaxation)
    - drug efficacy is often determined under ideal conditions whereas drug effectiveness is a better measure of how the drug works in real-world situations
- **full agonists**: can elicit a maximal effect at a receptor (e.g. methadone and morphine on the μ opioid receptor system)
- **partial agonists**: can only elicit a partial effect, irrespective of the concentration at the receptor; also known as a ceiling effect (i.e. reduced efficacy compared to full agonists) (e.g. buprenorphine on the μ opioid receptor system)

Antagonists

- drugs that bind to receptors without activating them; they reduce the action of an agonist drug or of an endogenous ligand
- **chemical antagonism**: direct chemical interaction between agonist and antagonist prevents agonist-receptor binding (e.g. chelating agents for removal of heavy metals)
- **physiological/functional antagonism**: drugs that produce opposite physiological effects (e.g. insulin decreases blood glucose levels through its action at insulin receptors vs. glucagon raises blood glucose levels through its action at glucagon receptors)
- **pharmacological antagonism**: antagonist inhibits agonist through acting on the receptor or an alternative effector site
- **competitive antagonism**: antagonist binds directly to the active site on a given receptor, without activating it (i.e. zero efficacy) and blocks or displaces the agonist from the active site
  - **reversible competitive antagonists**: bind non-covalently to the receptor, thus increasing concentrations of agonist may overcome the antagonist (e.g. naloxone is a competitive antagonist to morphine or heroin)
  - **irreversible competitive antagonists**: form a covalent bond with the receptor and cannot be displaced, thus irreversibly blocking other substrates from binding (e.g. phenoxybenzamine forms a covalent bond with adrenergic receptors preventing adrenaline and NE from binding)
- **non-competitive antagonism**: antagonist binds to an alternate site on the receptor which is distinct from the active site, producing allosteric effects that alter the ability of the agonist to bind (e.g. organophosphates irreversibly bind to acetylcholinesterase, causing a conformational change that prevents acetylcholine from binding to the enzyme)

See Landmark Clinical Pharmacology Trials table for more information on results from the EPIC trial, which evaluates the effect of chimeric monoclonal antibody Fab fragment (c7E3 Fab) directed against the platelet glycoprotein IIb/IIIa receptor, to treat ischemic complications of coronary angioplasty and atherectomy.

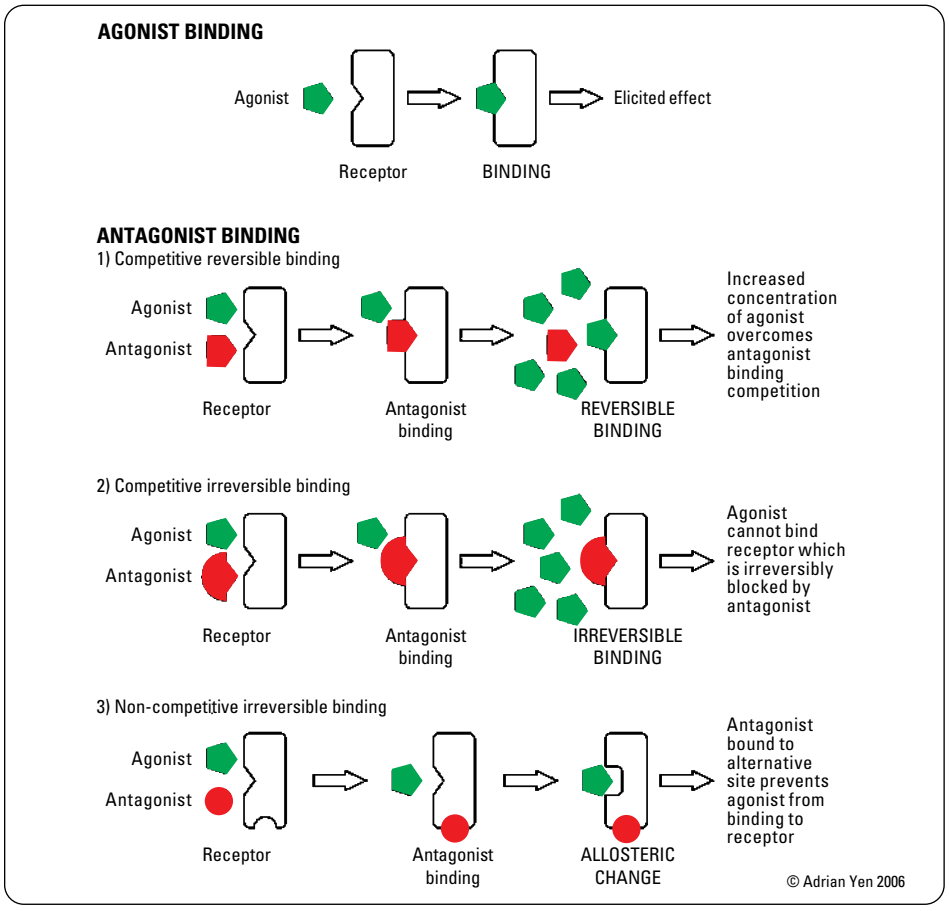

Figure 4. Mechanism of agonists and antagonists

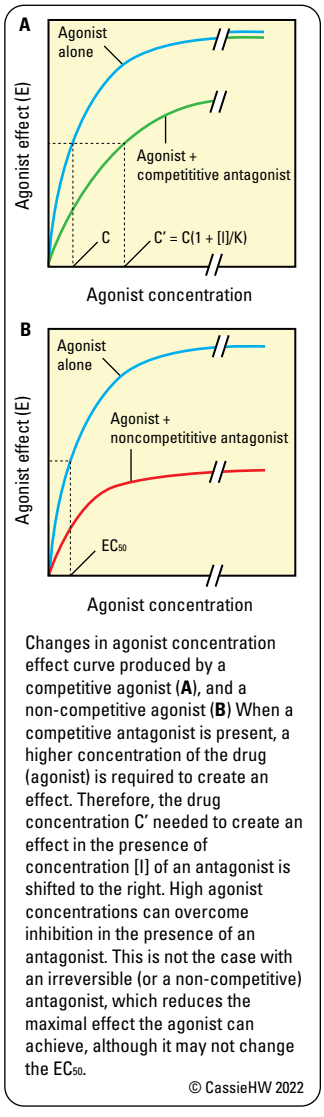

Changes in agonist concentration effect curve produced by a competitive agonist (**A**), and a non-competitive agonist (**B**) When a competitive antagonist is present, a higher concentration of the drug (agonist) is required to create an effect. Therefore, the drug concentration C' needed to create an effect in the presence of concentration [I] of an antagonist is shifted to the right. High agonist concentrations can overcome inhibition in the presence of an antagonist. This is not the case with an irreversible (or a non-competitive) antagonist, which reduces the maximal effect the agonist can achieve, although it may not change the EC_{50}.

© CassieHW 2022

Figure 5. Agonist concentration

Effectiveness and Safety

Effectiveness

- ED_{50} (effective dose): the dose of a drug needed to cause a therapeutic effect in 50% of a test population of subjects

Safety

- LD_{50} (lethal dose): the dose of a drug needed to cause death in 50% of a test population of subjects
- TD_{50} (toxic dose): the dose of a drug needed to cause a harmful effect in 50% of a test population of subjects

Therapeutic Indices

Therapeutic Index: TD_{50}/ED_{50}

- a measure of relative drug safety often used when comparing drugs that examines the likelihood of a therapeutic dose to cause serious toxicity or death
- the larger the TI, the safer the drug
- common drugs with a narrow therapeutic window or low TI that sometimes require TDM include digoxin, theophylline, warfarin, lithium, and cyclosporine
- factors that can change the TI include presence of interacting drugs, changes in drug ADME, and patient characteristics (e.g. age, pregnancy, and organ functioning)

Certain Safety Factor: TD_1/ED_{99}

- a comparison of the dose that is effective in at least 99% of the population and toxic in less than 1% of the population
- regulatory agencies often like to see a certain safety factor or margin of safety above 100

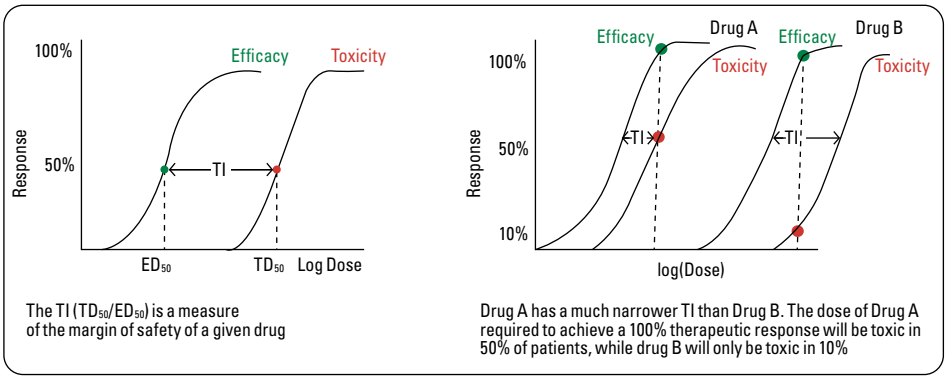

Figure 6. ED50, TD50, and the TI

Therapeutic Drug Monitoring

- **definition**: using serum drug concentration data to optimize drug therapy (e.g. dose adjustment, monitor compliance). Serum drug samples are usually taken when the drug has reached steady state (i.e. after approximately 5 half-lives)
- TDM is often used for drugs that have low TIs, unpredictable dose-response relationships, significant consequences associated with therapeutic failure or toxicity, and/or wide interpatient PK variability
- nomograms are often used for low TI drugs, particularly in the setting of patients with complex clinical factors such as renal insufficiency, hepatic failure, dialysis, and hypoalbuminemia
- examples of drugs that sometimes require TDM include:
  - vancomycin
  - aminoglycosides (gentamicin, tobramycin)
  - digoxin
  - phenytoin and other anticonvulsants
  - warfarin
  - lithium

Adverse Drug Reactions

- **definition**: ADEs are events that occur while a patient is on a drug at either appropriate or inappropriate dosage. A causal relationship is not required
- **definition**: ADRs are reactions to drugs that occur when a drug is used for the appropriate indication at normal therapeutic doses

Table 2. Characteristics of Type A-F Adverse Drug Reactions

Classification	Definition	Characteristics
A (Augmented)	Dose-related	Predictable extension of drug's pharmacologic effect (e.g. β-blockers causing bradycardia) >80% of all ADRs
B (Bizarre)	Not dose-related	Reactions unrelated to the known pharmacological actions of the drug, generally with a genetic basis E.g. drug hypersensitivity syndromes, immunologic reactions (e.g. penicillin hypersensitivity), and idiosyncratic reactions (e.g. malignant hyperthermia)
C (Chronic)	Dose- and time-related	Related to cumulative doses Effects are well-known and can be anticipated (e.g. atypical femoral fracture from bisphosphonates, retinal toxicity from hydroxychloroquine)
D (Delayed)	Time-related	Occurs some time after use of drug (e.g. cardiovascular toxicity following doxorubicin therapy) May also be dose-related
E (End of use)	Withdrawal	Occurs after cessation of drug use (e.g. opioid dependence resulting in opioid withdrawal)
F (Failure)	Unexpected failure of therapy	The expected effect is not produced. This is often due to pharmacogenetic variants (e.g. failure to bioactivate a prodrug such as clopidogrel)

Tips to Reduce Drug-Related Adverse Events in the Elderly

- Be mindful of longstanding medications that have never been adjusted for patient age or renal or hepatic function
- Consider whether medications initiated during hospital admission are needed long-term (and whether the discharge dose is appropriate for maintenance)
- Avoid polypharmacy by decreasing the dose of or discontinuing medications that are causing side effects or are no longer indicated
- Verify adherence to medications before automatically increasing the dose of subtherapeutic treatment
- When prescribing medications, preferentially use those with a high TI
- Review the patient's problem list and reconcile current medications to avoid duplication or inappropriate dosing/frequency

Antibiotic Allergies - What is the Risk of Cross-Reactivity?

- In clinical practice, cross-reactivity between drugs presents a problem for both patients and physicians
- In the case of penicillin allergy, cross-reactivity to cephalosporins is less than 2%. However, in patients who have a history of true anaphylactic reaction, cross-reactivity is closer to 40% depending on the side chain
- Cross-reactivity between penicillins and carbapenems is <1%
- The term "sulfa allergy" is often misused and has no formal definition. Current evidence suggests cross-reactivity between sulfonamide antibiotics (e.g. sulfamethoxazole-trimethoprim) and non-antibiotic sulfonamides, including loop diuretics (e.g. furosemide), thiazide diuretics (e.g. hydrochlorothiazide), protease inhibitors containing an arylamine group (e.g. darunavir), carbonic anhydrase inhibitors (e.g. acetazolamide), and sulfonylureas (e.g. glipizide)

Approach to Suspected Adverse Drug Reactions

- history and physical exam: signs and symptoms of reaction (e.g. rash, fever, hepatitis, anaphylaxis), timing, risk factors, detailed medication history including all drugs and timing, de-challenge (response when drug is removed), and re-challenge (response when drug is given again, if applicable)
  - medication history should include prescription, non-prescription and over-the-counter, natural health products/samples, supplements, creams, ear/eye drops, inhalers, and nasal sprays
  - dosage, frequency, route of administration, and duration of use should be recorded for each
- differentiate between drug therapy vs. disease pathophysiology
- treatment: stop the drug, supportive care, and symptomatic relief. Specific interventions (e.g. steroids, immunosuppressants) used for some ADRs
- resources: check recent literature, Health Canada, and FDA; contact the pharmaceutical company; call Poison Control (1-800-268-9017) if overdose or poisoning suspected; check with MotherToBaby (https://mothertobaby.org/) in cases involving pregnant or breastfeeding women
- report all suspected ADRs that are: 1) unexpected, 2) serious, or 3) reactions to recently marketed drugs (on the market <5 yr) regardless of nature or severity
  - Canadian Adverse Drug Reaction Monitoring Program available for online reporting
    - https://www.canada.ca/en/health-canada/services/drugs-health-products/medeffect-canada/adverse-reaction-reporting/drug/health-care-providers.html

Variability in Drug Response

- recommended patient dosing is based on clinical research and represents mean values for a select population, but each person may be unique in their dosing requirements due to age, genetics, disease states, drug interactions, diet, environmental factors, etc.
- possible causes of individual variability in drug response include problems with:
  - intake: medication adherence
  - absorption: vomiting, diarrhea, or steatorrhea; first pass effect increased due to enzyme induction or decreased due to enzyme inhibition or liver disease
  - drug interactions (e.g. calcium carbonate complexes with iron, thyroxine, and fluoroquinolones, impairing absorption)
  - distribution: very high or low percentage body fat, intact or disrupted BBB, patient is elderly or a neonate, or has liver dysfunction
  - biotransformation and excretion: certain genetic polymorphisms or enzyme deficiencies related to drug metabolism (e.g. acetylcholinesterase deficiency, CYP polymorphism), kidney or liver dysfunction
  - PD: genetic variability in drug response (e.g. immune-mediated reactions), diseases that affect drug PD, drug tolerance or cross-tolerance

Drug Interactions

- concomitant medications or foods (including natural health products): one drug alters the effect of one or more drugs by changing PK and/or PD
- PK interactions involve changes in drug concentration when a new drug is added
  - absorption: alterations in gastrointestinal pH, gastric mucosa and/or emptying, intestinal motility, and/or transporter function
  - distribution: alterations in blood flow, plasma protein binding, anatomical and/or functional barriers (e.g. drug transporters)
  - metabolism: alterations in drug metabolizing enzymes (e.g. CYPs)
  - excretion: alterations in renal or hepatic elimination
- PD interactions are due to two drugs that exert similar effects (additive or synergistic) or opposing effects (antagonistic)
- drug interactions can also involve herbal medications (e.g. St. John's wort) and foods (e.g. grapefruit juice)

Examples of Clinically Relevant Drug Interactions

Interaction	Potential Effect	Mechanism of Interaction
Warfarin plus ciprofloxacin, clarithromycin, erythromycin, metronidazole, or trimethoprim-sulfamethoxazole	Increased effect of warfarin	Multiple proposed PK and PD mechanisms (including antibiotic interference with enteric flora-mediated Vitamin K2 production and alterations in drug metabolism)
Warfarin plus acetaminophen. Note that this is not with typical use, but with more chronic and higher dose use	Acetaminophen (NAPQI) further increases INR	PD (reduction of Vitamin K-dependent clotting factors by NAPQI)
Oral contraceptive pills plus rifampin	Decreased effectiveness of oral contraception	PK (rifamycin induces CYP3A4, which increases hormone metabolism)
Sildenafil plus nitrates	Hypotension	PD (both PDE5 inhibitors and nitrates potentiate cGMP production)
SSRI plus St. John's wort	Serotonin syndrome	PD (concomitant use of serotonergic medications)
SSRI plus selegiline or non-selective MAOI	Serotonin syndrome	PD (all decrease metabolism of serotonin, so excess serotonin in synaptic cleft)
Some **HMG-CoA reductase inhibitors** plus niacin, gemfibrozil, erythromycin or itraconazole	Possible rhabdomyolysis	PK (various mechanisms based on drugs listed; CYP3A or OATP1B1, e.g. clarithromycin inhibits)
Sulfamethoxazole-trimethoprim and ACEIs/ARBs, or spironolactone	Increased risk of hyperkalemia	PD (reduced renal potassium excretion in the presence of trimethoprim resulting from decreased sodium reabsorption as a result of inhibition of sodium channels in the distal tubule)

Autonomic Pharmacology

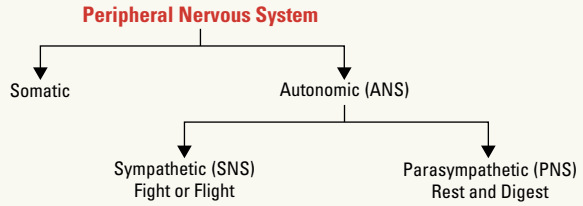

Figure 7. Subdivisions of the peripheral nervous system

- most organs are innervated by both sympathetic and parasympathetic nerves, which have opposing effects (see Neurology, N8)
- ACh and NE are the main neurotransmitters of the autonomic NS
- ACh binds to many cholinergic receptor subtypes, which include nicotinic and muscarinic receptors
- NE binds to adrenergic receptors, which principally include β1, β2, α1, and α2
- ACh action is terminated by metabolism in the synaptic cleft by acetylcholinesterase and in the plasma by pseudocholinesterase
- acetylcholinesterase inhibitors (pyridostigmine, donepezil, galantamine, and rivastigmine) can be used to increase ACh levels in conditions such as myasthenia gravis or Alzheimer's disease
- NE action is terminated by reuptake at the presynaptic membrane, diffusion from the synaptic cleft, and degradation by MAO and COMT

Parasympathetic Nervous System

- blood vessels, sweat glands, the spleen capsule, and adrenal medulla do NOT have parasympathetic innervation
- parasympathetic pre-ganglionic fibres originate in the lower brainstem from cranial nerves III, VII, IX, and X, and in the sacral spinal cord at levels S2-S4. They connect with post-ganglionic fibres via nicotinic receptors in ganglionic cells located near or within the target organ (e.g. ciliary ganglion)
- post-ganglionic fibres connect with effector tissues via:
  - M1 muscarinic receptors located in the CNS
  - M2 muscarinic receptors located in smooth muscle, cardiac muscle, and glandular epithelium

Sympathetic Nervous System

- sympathetic preganglionic fibres originate in the spinal cord at spinal levels T1-L2/L3
- preganglionic fibres connect with postganglionic fibres via nicotinic receptors located in one of two groups of ganglia:
  1. paravertebral ganglia (i.e. the sympathetic trunk) that lie in a chain close to the vertebral column
  2. prevertebral ganglia (i.e. celiac and mesenteric ganglia) that lie within the abdomen
- post-ganglionic fibres connect with effector tissues via:
  - β1 receptors in cardiac tissue
  - β2 receptors in smooth muscle of bronchi and GI tract
  - α1 receptors in vascular smooth muscle
  - α2 receptors in vascular smooth muscle
  - M3 muscarinic receptors located in sweat glands

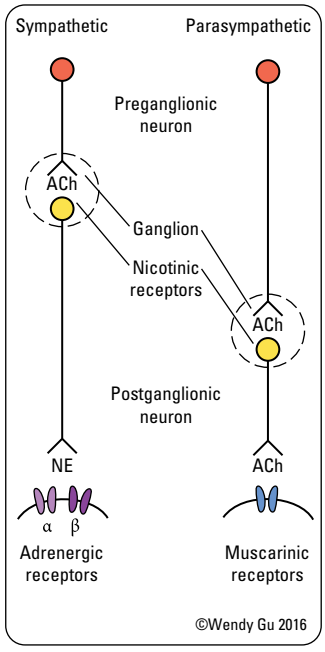

Figure 8. Autonomic nervous system efferent tracts

Table 3. Direct Effects of Autonomic Innervation on the Cardiorespiratory System

Organ	Sympathetic NS		Parasympathetic NS	
	Receptor	Action	Receptor	Action
Heart				
1. Sinoatrial	β1	Increased HR	M	Decreased conduction
2. Atrioventricular node	β1	Increased conduction	M	Decreased conduction
3. Atria	β1	Increased contractility	M	Decreased conduction
4. Ventricles	β1	Increased contractility	M	Decreased HR
Blood Vessels				
1. Skin, splanchnic	α1, β2	Constriction	M	Dilatation
2. Skeletal muscle	α	Constriction	M	Dilatation
3. Coronary	β2 (large muscles)	Dilatation	M	Dilatation
	α1, β2	Constriction	M	Dilatation
	β2	Dilatation	M	Dilatation
Lungs				Constriction
1. Bronchiolar smooth muscle	β2	Relaxation	M	Stimulation
2. Bronchiolar glands	α1, β2	Increased secretion	M	

Opioid Therapy and Chronic Non-Cancer Pain

General Management Principles

- when first considering therapy for patients with chronic non-cancer pain, optimize non-opioid pharmacotherapy and non-pharmacologic therapy rather than starting a trial of opioids (strong recommendation)
- general approaches to opioid use include avoiding high doses, and when possible, a slow, collaborative approach when tapering
- for patients with chronic non-cancer pain beginning opioid therapy, restrict the prescribed dose to <90 mg MME, and ideally <50 MME, especially at starting dose
  - for patients with chronic non-cancer pain who are currently using 90 mg MME or more, encourage a slow, collaborative taper of opioids to the lowest effective dose, potentially discontinuing
- for patients with chronic non-cancer pain who are using opioids and experiencing serious challenges in tapering, a formal multidisciplinary program is suggested
- please refer to national opioid guidelines for a comprehensive approach to opioid use (link: http://nationalpaincentre.mcmaster.ca/guidelines.html)

Does Opioid Tapering in Chronic Pain Patients Result in Improved Pain or Same Pain vs. Increased Pain at Taper Completion?
Pain Med 2019;20:2179-2197
Purpose: Support or refute the hypothesis that opioid tapering in chronic pain patients (CPPs) improves pain or maintains the same pain level by taper completion but does not increase pain levels.
Methods: Structured systematic review searching relevant subject headings. 20 studies met inclusion/exclusion criteria and were of type III/IV level evidence. Characteristics were abstracted for numerical analysis.
Results: Total of 2109 CPPs tapered in all studies combined. 8% of the studies showed that by taper completion, pain had improved. In 15% of the studies, pain remained the same.
Conclusions: There is consistent type 3 and 4 evidence that opioid tapering in CPPs reduces or maintains the same pain levels. Studies were marginal in quality and further controlled studies needed.

Common Drug Endings

Table 4. Common Drug Endings

Ending	Category	Example
-afil	PDE-5 inhibitor	sildenafil
-ane	Inhaled general anesthetic	halothane
-azepam	Benzodiazepine	lorazepam
-azole*	Antifungal	ketoconazole
-caine	Local anesthetic	lidocaine
-mab	Monoclonal antibody	adalimumab
-nib	Small molecular inhibitor	imatinib
-olol	β-blocker	propranolol
-prazole	Proton pump inhibitor	omeprazole
-pril	ACE inhibitor	captopril
-sartan	ARB	candesartan
-statin	HMG-CoA inhibitor	atorvastatin
-terol	β2 agonist	albuterol
-tidine	H2 antagonist	cimetidine
-tropin	Pituitary hormone	somatotropin
-vir	Antiviral	acyclovir
-zosin	α1 antagonist	prazosin

Note: This table provides the most common drug endings for which there are only a few exceptions (e.g. methimazole, an antithyroid; stanozolol is an anabolic steroid) and is not exhaustive
*Unless ending is -prazole

Landmark Pharmacology Trials

Trial Name	Reference	Clinical Trial Details
MONOCLONAL ANTIBODIES or DRUG EFFECTS ON RECEPTORS		
EPIC	NEJM 1994; 330:956-961	**Title**: Use of a Monoclonal Antibody (mab) Directed against the Platelet Glycoprotein IIb/IIIa Receptor in High-Risk Coronary Angioplasty **Purpose**: To evaluate the effect of chimeric mab Fab fragment (c7E3 Fab) directed against the platelet glycoprotein IIb/IIIa receptor, in patients undergoing angioplasty at high risk for ischemic complications. **Methods**: RCT involving 2,099 high-risk patients scheduled to undergo coronary angioplasty or directional atherectomy. Patients received 1 of 3 combinations of c7E3 Fab (bolus and an infusion of placebo, a bolus of c7E3 Fab and an infusion of placebo, or a bolus and an infusion of c7E3 Fab) or placebo. Primary endpoints included death, nonfatal MI, intra-aortic balloon pump insertion for refractory ischemia or unplanned surgical revascularization, repeat percutaneous procedure or implantation of a coronary stent. **Results**: c7E3 Fab bolus and infusion resulted in a 35% reduction in rate of the primary end point vs placebo. 10% reduction was observed with the c7E3 Fab bolus alone. Bleeding episodes and transfusions were more frequent in 7E3 Fab bolus and infusion group vs other two groups. **Conclusions**: Ischemic complications of coronary angioplasty and atherectomy were reduced with a mab directed against platelet IIb/IIIa glycoprotein receptor.
mRNA VACCINES		
BNT162b2 trial	NEJM 2020; 383:2603-2615	**Title**: Safety and Efficacy of the BNT162b2 mRNA Covid-19 Vaccine **Purpose**: To report safety and efficacy findings from the phase 2/3 of a global trial of BNT162b2 in preventing Covid-19 in persons 16 yr and older. **Methods**: Eligible participants were randomly assigned in a 1:1 ratio to receive two doses, 21 days apart, of either placebo or the BNT162b2 vaccine candidate (30 µg per dose). **Results**: Among those eligible 43,448 received injections. A total of 21,720 patients received BNT162b2 and the rest received placebo. BNT162b2 was 95% effective in preventing Covid-19 (95% credible interval, 90.3 to 97.6). Safety profile of BNT162b2 characterized by short-term, mild-to-moderate pain at the injection site, fatigue, and headache. Incidence of serious adverse events was low and similar in both groups. **Conclusions**: BNT162b2 conferred 95% protection against Covid-19 in persons 16 yr and older. Safety over a median of 2 mo was comparable to other viral vaccines.
INTRAMUSCULAR INJECTIONS or DRUG ADMINISTRATION		
ATLAS	NEJM 2020; 382:1112-1123	**Title**: Long-Acting Cabotegravir and Rilpivirine for Maintenance of HIV-1 Suppression **Purpose**: To establish whether switching to long-acting cabotegravir plus rilpivirine is noninferior to current oral therapy among adults with virologically suppressed HIV-1. **Methods**: Patients with plasma HIV-1 RNA levels <50 copies/ml for 6 mo were randomly assigned to either continue standard therapy (placebo) or receive monthly long-acting cabotegravir and rilpivirine. **Results**: Treatment was initiated in 308 participants/group. HIV-1 RNA levels >50 copies/ml were found in 5 participants in intervention vs 3 in placebo (0.6% points; 95% CI:1.2-2.5). HIV-1 RNA levels <50 copies/ml were found in 92.5% of participants in intervention vs 95.5% in placebo (−3.0% points; 95% CI: −6.7-0.7). Adverse events included injection-site pain (75%). Participants who received intervention reported greater satisfaction and preferred long-acting therapy over previous oral therapy. **Conclusions**: Monthly injections of long-acting cabotegravir and rilpivirine were noninferior to standard therapy for maintaining HIV-1 suppression. Adverse events were common but medication withdrawal infrequent.

Introduction to Skin

Normal Processes of Skin and Subcutaneous Tissue

Layers of the Epidermis
"**C**alifornians **L**ike **G**oing **S**un **B**athing"
OR
"**C**anadians **L**ike **G**ood **S**ushi **B**oxes"

Embryonic Development of the Skin

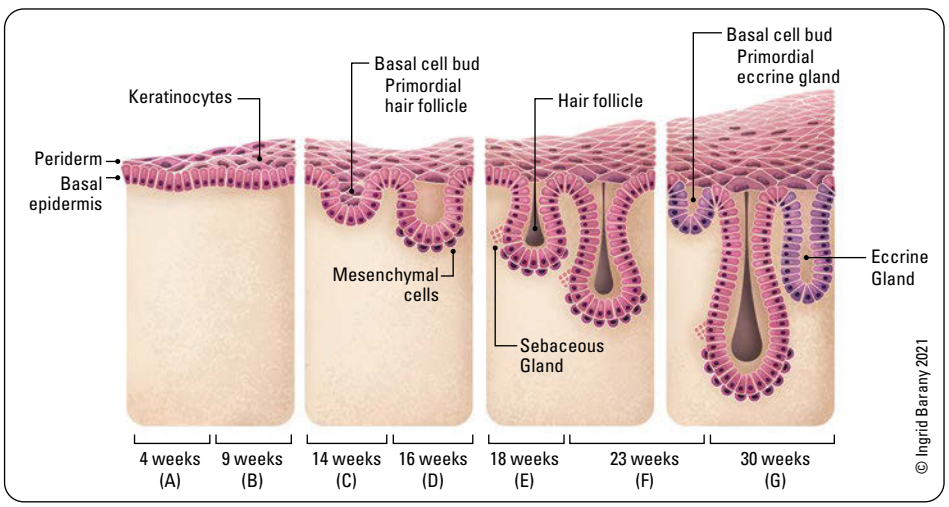

Figure 1. Fetal maturation of the skin
(A) 4 wk gestation: fetal skin has two distinct layers - the basal cell layer and outer layer (i.e. periderm). (B) 9 wk gestation: keratinization begins. (C) 14 wk gestation: stratification of epidermal layer; primordial hair follicle forms from the basal cell bud. (D) 16 wk gestation: local proliferation of mesenchymal cells associated with the epidermal buds as hair follicles develop and elongate. (E) 18 wk gestation: sebaceous gland develops; hair follicle elongates. (F) 23 wk gestation: continuous elongation of the hair follicle; primordial eccrine gland forms from the basal cell bud. (G) 30 wk gestation: continuous elongation and foiling coiling of the eccrine glands.
Modified from Facial Plastic Surgery Clinics of North America, 21(1), King A, Balaji S, Keswani SG, Biology and Function of Fetal and Pediatric Skin, 1-6, Copyright (2020), with permission from Elsevier

- **embryonic development and fetal maturation** (see Figure 1)
- **neonatal changes**
  - full-term infants have skin with all five layers, similar to adults
  - epidermal cells mature from columnar stratum basale to squamous keratinocytes of the stratum corneum
    - maturation occurs more rapidly in facial skin than trunk or limb skin
  - neonatal skin is coarser and develops into a more smooth texture homogeneously during the first 30 d of life
  - infants have smaller corneocytes and thinner stratum corneum until two yr old
  - from infancy to puberty, dermal thickness increases
- **repair, regeneration, and changes associated with stages of life**
  - regeneration relies on tissue-specific stem cells and restricted progenitor cells

- regenerative abilities decline with age as both cell types undergo:
  - a loss of self-renewing capacities
  - altered proliferative activity
  - functional decline
- with age, the skin becomes thinner and less able to withstand external stress because:
  - the epidermis attenuates with effacement of the rete ridges
  - keratinocytes lose proliferative abilities
  - the dermis loses volume
  - hyaluronic acid diminishes in the extracellular matrix of the dermis
- these changes lead to loss of skin and hair integrity, leading to conditions such as senile purpura and male pattern baldness (i.e. androgenic alopecia, see D44)
  - senile purpura (i.e. solar or actinic purpura): typically arise spontaneously; characterized by non-blanchable red-to-purple patches that resolve over 1 to 3 wk, leaving residual brown-yellow discolouration secondary to hemosiderin deposition
- the decline in regenerative ability can also be seen as postmenopausal hair changes (see D45)

Skin Anatomy

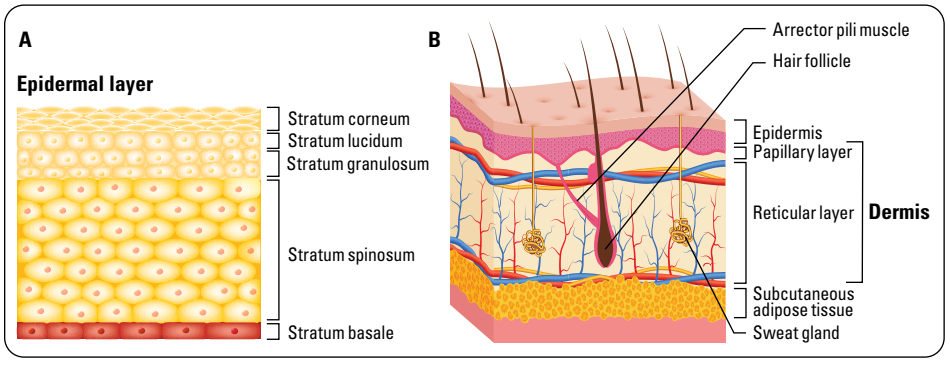

Figure 2. Histologic layers of the skin. A. epidermal layers of the skin. B. all layers of the skin

Skin

- divided anatomically into epidermis, dermis, and subcutaneous tissue
- **epidermis**
  - avascular: receives its nutrition from the dermal capillaries
  - derived from keratinocytes with the youngest presenting at the stratum basale
  - cells progress from stratum basale to stratum corneum in about 4 wk
    - stratum basale (i.e. germinativum): mitotic figures that give rise to keratinocytes
    - stratum spinosum (prickle cells): junctions in this layer (tonofilaments) give the epidermis its strength
    - stratum granulosum: flat cells containing basophilic granules
    - stratum lucidum: transparent layers of packed dead cells
    - stratum corneum: flat scales of the water-resistant protein keratin
  - cells of the epidermis:
    - keratinocytes: located in all layers of the epidermis except the stratum corneum; connected to each other by desmosomes
    - melanocytes: located in the stratum basale; keratinocyte:melanocyte ratio in the basal layer is 10:1; melanocyte number is equal among races; produce melanosomes containing melanin, which are transferred to keratinocytes
    - Langerhans cells: dendritic cells which are important for immune surveillance
    - Merkel cells: located in the stratum basale; involved in touch sensation
- **dermis**
  - comprised of connective tissue divided into two regions
    - papillary: contains numerous capillaries that supply nutrients to the dermis and epidermis
    - reticular: provides a strong structure for skin; consists of collagen bundles woven together along with elastic fibres, fibroblasts, and macrophages
  - cells of dermis
    - fibroblasts: produce collagen, elastin, and ground substance
    - mast cells: release histamines which mediate type I hypersensitivity
  - other components of dermis include: blood vessels, nerves, pilosebaceous units, and sweat glands
- **subcutaneous tissue** (i.e. hypodermis)
  - consists primarily of adipose cells, larger calibre vessels, nerves, and fascia

Epidermal Appendages

- epidermal in origin, can extend into the dermis; includes hair, nails, and cutaneous glands
- pilosebaceous unit = hair + hair follicle + sebaceous gland + arrector pili muscle

Cutaneous Glands

- **sebaceous gland:** part of pilosebaceous unit; produces sebum which is secreted into the hair follicle via the sebaceous duct, where it covers the skin surface (protective function)
  - sebum has some antifungal properties
  - these glands cover entire skin surface and are absent only in non-hair bearing areas (e.g. palms, soles, lips)
- **apocrine sweat gland:** apocrine duct empties into hair follicle above sebaceous gland
  - not part of pilosebaceous unit
  - found concentrated in axillae and perineum
  - likely a vestigial structure, functions in other species to produce scent (e.g. pheromones)
- **eccrine sweat gland:** not part of pilosebaceous unit
  - found over entire skin surface except lips, nail beds, and glans penis
  - important in temperature regulation via secretion of sweat to cool skin surface

Skin Function

- **protection**
  - due to continuous recycling and avascularity of epidermis, as well as normal skin flora
  - barrier to UV radiation (melanin), mechanical/chemical insults (sensory/mechanoreceptors), pathogens (immune cells), and dehydration (lipid rich barrier)
- **thermal regulation**
  - insulation to maintain body temperature in cool environments via peripheral vasoconstriction, hair, and subcutaneous adipose tissue
  - dissipation of heat in warm environments via increased activity of sweat glands and increased blood flow within dermal vascular networks
- **sensation**
  - touch, pain, and temperature sensation
- **metabolic function**
  - vitamin D synthesis
  - energy storage (mainly in the form of triglycerides)

Morphology

Primary Lesions

Definition

- a de-novo initial lesion that has not been altered by trauma or manipulation, and has not regressed

Table 1. Types of Primary Morphological Lesions

Profile	<1 cm Diameter	≥1 cm Diameter
Flat Lesion	Macule (e.g. freckle)	Patch (e.g. vitiligo)
Raised Superficial Lesion	Papule (e.g. wart)	Plaque (e.g. psoriasis)
Deep Palpable (Dermal or Subcutaneous) Lesion	Nodule (e.g. dermatofibroma)	Tumour (e.g. lipoma)
Elevated Fluid-Filled Lesion	Vesicle (e.g. HSV)	Bulla (e.g. bullous pemphigoid)

Describe a Lesion with SCALDA

Size and Surface area
Colour (e.g. hyperpigmented, hypopigmented, erythematous)
Arrangement (e.g. solitary, linear, reticulated, grouped, herpetiform)
Lesion morphology
Distribution (e.g. dermatomal, intertriginous, symmetrical/asymmetrical, follicular)
Always check hair, nails, mucous membranes, and intertriginous areas

Secondary Lesions

Definition

- develop during the evolutionary process of skin disease, created by manipulation, or due to complication of primary lesion (e.g. rubbing, scratching, infection)

Types of Secondary Morphological Lesions

- **crust:** dried fluid (serum, blood, or purulent exudate) originating from a lesion (e.g. impetigo)
- **scale:** excess keratin (e.g. seborrheic dermatitis)
- **lichenification:** thickening of the skin and accentuation of normal skin markings (e.g. chronic AD)
- **fissure:** a linear slit-like cleavage of the skin
- **excoriation:** a scratch mark
- **erosion:** a disruption of the skin involving the epidermis alone; heals without scarring
- **ulcer:** a disruption of the skin that extends into the dermis or deeper; may heal with scarring
- **xerosis:** pathologic dryness of skin (xeroderma), conjunctiva (xerophthalmia), or mucous membranes (xerostomia)
- **atrophy**: histological decrease in size or number of cells or tissues, resulting in thinning or depression of the skin

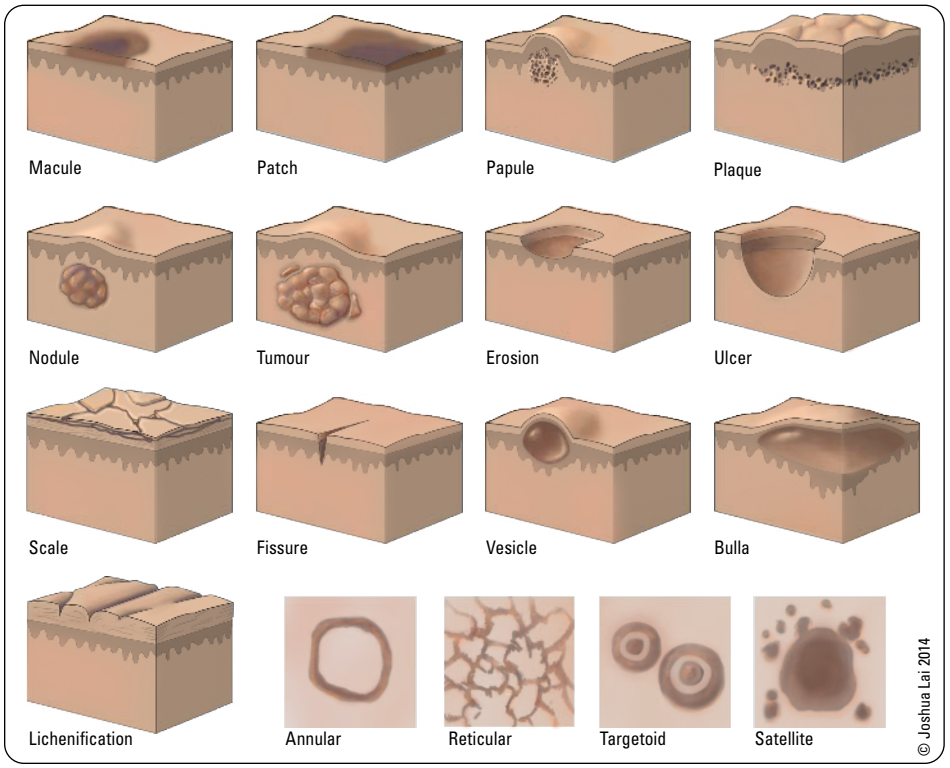

Figure 3. Examples of primary and secondary lesions

Other Morphological Terms

- **cyst:** an internally epithelial-lined structure containing semi-solid material or fluid
- **pustule:** an elevated lesion containing a collection of neutrophils (infectious or inflammatory in nature)
- **scar:** replacement fibrosis of dermis and subcutaneous tissue (hypertrophic or atrophic)
- **wheal:** a special form of papule or plaque that is transient (<24 h) and blanchable, often with a halo and central clearing, formed by edema in the dermis (e.g. urticaria)
- **comedone:** a special collection of sebum and keratin
  - open comedone (blackhead)
  - closed comedone (whitehead)
- **petechiae:** pinpoint extravasation of blood into dermis resulting in hemorrhagic lesions; non-blanchable, <3 mm in size
- **purpura:** larger than petechiae, 3 mm-1 cm in size
- **ecchymosis (i.e. bruise):** larger than purpura, >1 cm in size
- **telangiectasia:** dilated superficial blood vessels; blanchable, reticulated, and of small calibre, can be associated with benign or malignant entities

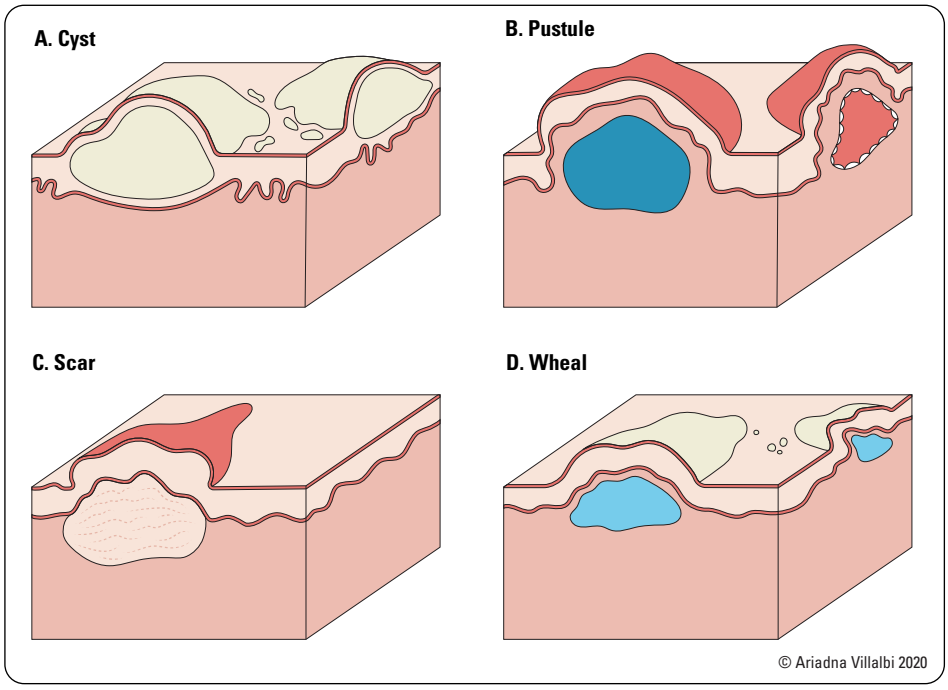

Figure 4. Examples of other morphological terms: cyst, pustule, scar, and wheal
Wolff K, Johnson R, Saavedra A, Fitzpatrick's Color Atlas and Synopsis of Clinical Dermatology, Seventh Edition, copyright © 2020, Modified by Permission of McGraw-Hill Education

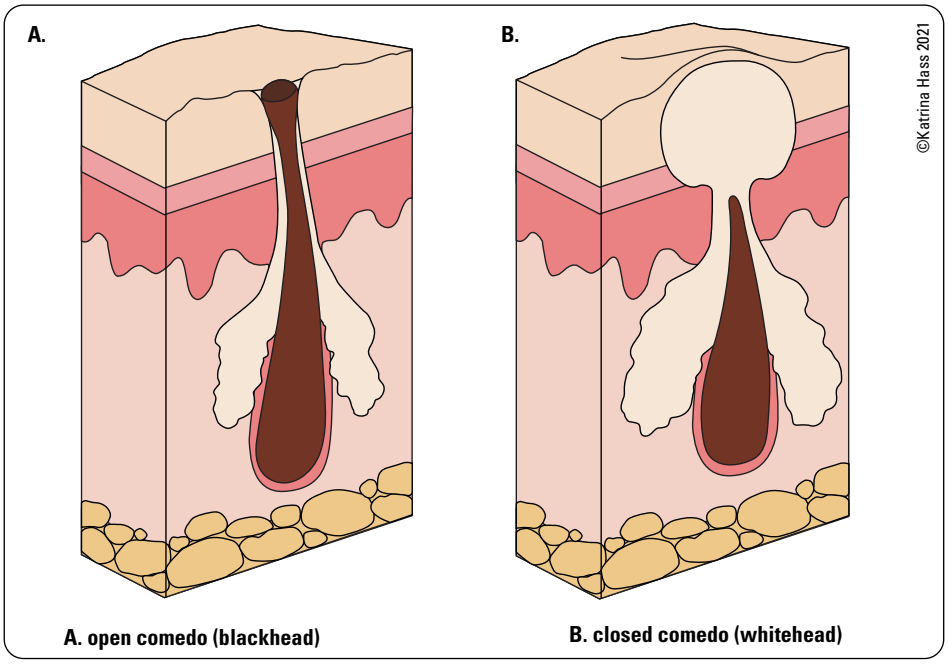

Figure 5. Examples of other morphological terms: open and closed comedone

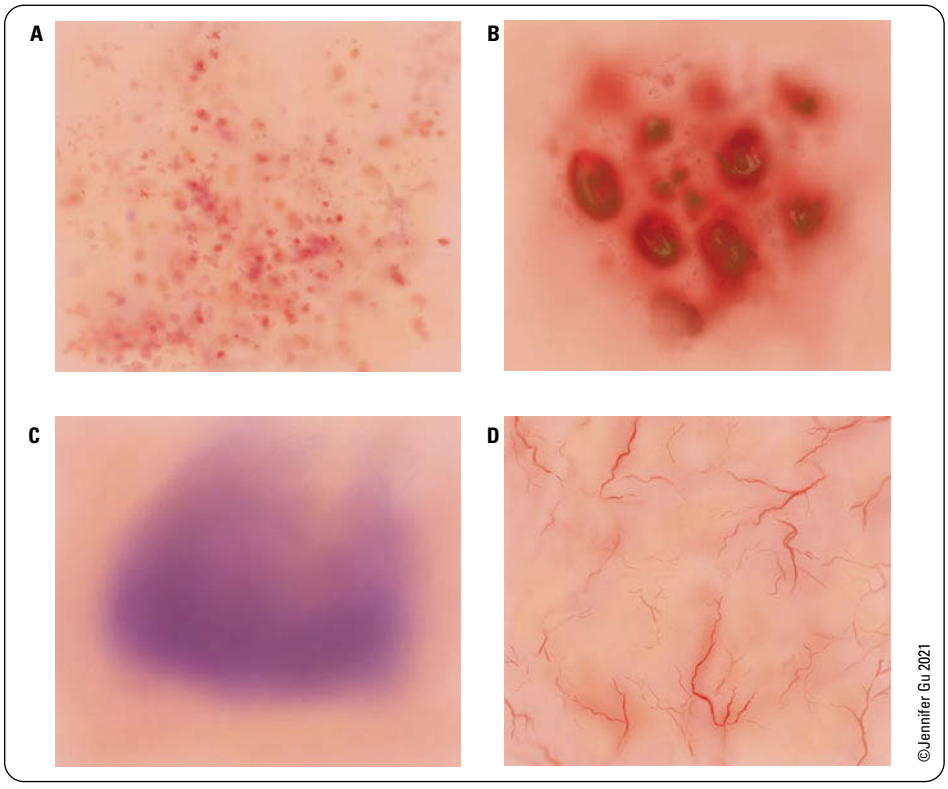

Figure 6. Examples of other morphological terms: A: petechiae, B: purpura, C: ecchymosis, and D: telangiectasia

Patterns and Distribution

Table 2. Patterns and Distribution of Morphological Lesions

Pattern or Distribution	Definition	Example
Acral	Relating to the hands and feet	Perniosis, secondary syphilis
Annular	Ring-shaped	Granuloma annulare
Follicular	Involving hair follicles	Folliculitis
Guttate	Lesions following a "drop-like" pattern	Guttate psoriasis
Koebner Phenomenon (i.e. isomorphic response)	Appearance of lesions at a site of skin injury	Lichen planus, psoriasis, vitiligo
Morbilliform	Literally means "measles-like", an eruption composed of macules and papules with truncal predominance	Morbilliform drug eruption
Reticular	Lesions following a net-like pattern	Livedo reticularis
Satellite	Small lesions scattered around the periphery of a larger lesion	Candida diaper dermatitis
Serpiginous	Lesions following a snake-like pattern	Cutaneous larva migrans
Target/Targetoid	Concentric ring lesions, like a bullseye	EM

Other descriptive terms: discrete, clustered, linear, confluent, dermatitic, indurated (i.e. hard or firm)

Differential Diagnoses for Common Presentations

Table 3. Differential Diagnoses for Common Presentations

Lesion	Infectious	Inflammatory	Drug/Toxin	Miscellaneous
Brown Macule		Post-inflammatory hyperpigmentation	UV radiation, actinic/ solar lentigo, freckle (i.e. ephelis)	Congenital: café-au-lait macule, congenital nevus, epidermal/junctional nevus Neoplasia: lentigo maligna, MM, pigmented BCC Other: melasma/chloasma (i.e. "mask of pregnancy")
Discrete Red Papule	Folliculitis Furuncle Scabies	Acne vulgaris Rosacea Psoriasis Urticaria	Bites/stings	Autoimmune: lichen planus Vascular: hemangioma, pyogenic granuloma Other: dermatofibroma, miliaria rubra

Table 3. Differential Diagnoses for Common Presentations

Lesion	Infectious	Inflammatory	Drug/Toxin	Miscellaneous
Red Scales	Pityriasis rosea Secondary syphilis Tinea	Dermatitis (atopic, contact, nummular, seborrheic) Discoid lupus Psoriasis	Gold	Autoimmune: lichen planus Neoplastic: mycosis fungoides
Vesicle	Cat scratch disease Impetigo Viral: HSV, HZV, VZV, Molluscum contagiosum virus, Coxsackie virus Scabies	Acute contact dermatitis Dyshidrotic eczema		Other: dermatitis herpetiformis, porphyria cutanea tarda
Bulla	Bullous impetigo	Acute dermatitis EM, SLE, SJS/TEN	Fixed drug eruption SJS/TEN	Autoimmune: bullous pemphigoid, pemphigus vulgaris Other: dermatitis herpetiformis, porphyria cutanea tarda
Pustule	Candida Dermatophyte Impetigo Sepsis Varicella	Acne vulgaris Rosacea Dyshidrotic dermatitis Pustular folliculitis Pustular psoriasis Hidradenitis suppurativa	Acute generalized exanthematous pustulosis (usually secondary to drug reaction)	
Oral Ulcer	Aspergillosis CMV Coxsackie virus Cryptococcosis HSV/HZV HIV, TB, Syphilis	Allergic stomatitis EM Lichen planus Seronegative arthropathies, SLE Recurrent aphthous stomatitis Behçet's disease	Chemotherapy Radiation therapy SJS/TEN	Autoimmune: pemphigus vulgaris Congenital: XXY Hematologic: sickle cell disease Neoplasia: BCC, SCC
Skin Ulcer	Plague Syphilis TB Tularemia	RA, SLE, vasculitis UC, pyoderma gangrenosum		Autoimmune: necrobiosis lipoidica diabeticorum (e.g. DM) Congenital: XXY Hematologic: sickle cell disease Neoplasia: SCC Vascular: arterial, neurotrophic, pressure, venous, aphthous, leukoplakia, traumatic

Common Skin Lesions

Cysts

Table 4. Cysts

	Clinical Features	Pathophysiology	Epidemiology	Clinical Course	Management
Epidermal Cyst	Round, yellow/flesh-coloured, slow growing, mobile, firm, fluctuant, nodule or tumour	Epithelial cells displaced into dermis, epidermal lining becomes filled with keratin and lipid-rich debris May be post-traumatic, rarely syndromic	Most common cutaneous cyst in youth – middle age	Central punctum may rupture (foul, cheesy odour, creamy colour) and produce inflammatory reaction Can increase in size and number over time	No treatment Elective excision
Pilar Cyst (i.e. Trichilemmal)	Multiple, hard, variable sized nodules under the scalp; lacks central punctum	Thick-walled cyst lined with stratified squamous epithelium and filled with dense keratin Idiopathic Post-trauma	2nd most common cutaneous cyst F>M, hereditary	Rupture causes pain and inflammation	No treatment Elective excision
Dermoid Cyst	Firm nodule most commonly found at lateral third of eyebrow or midline under nose	Rare, congenital hamartomas, which arise from inclusion of epidermis along embryonal cleft closure lines, creating a thick-walled cyst filled with dense keratin	Rare	If nasal midline, risk of extension into CNS	No treatment Elective excision
Ganglion Cyst	Usually solitary, rubbery, translucent; a clear gelatinous viscous fluid may be extruded	Cystic lesion that originates from joint or tendon sheath, called a digital mucous cyst when found on fingertip Associated with osteoarthritis	Older age	Stable	No treatment Incision and expression of contents Elective excision
Milium	1-2 mm superficial, white to yellow subepidermal papules occurring on eyelids, cheeks, and forehead	Small epidermoid cyst, primarily arising from pluripotential cells in epidermal or adnexal epithelium Can be secondary to blistering, ulceration, trauma, topical corticosteroid atrophy, or cosmetic procedures	Any age 40-50% of infants	In newborns, spontaneously resolves in first 4 wk of life	No treatment Incision and expression of contents Electrodessication Topical retinoid therapy

Fibrous Lesions

DERMATOFIBROMA

Clinical Features

- firm dermal papule or nodule, skin-coloured to red-brown
- majority are asymptomatic but may be pruritic and/or tender
- sites: legs > arms > trunk
- dimple sign (i.e. Fitzpatrick's sign): lateral compression causes dimpling of the lesion

Pathophysiology
- benign tumour due to fibroblast proliferation in the dermis

Etiology
- unknown; may be associated with history of minor trauma (e.g. shaving or insect bites)
- eruptive dermatofibroma can be associated with SLE

Epidemiology
- adults, F>M

Differential Diagnosis
- dermatofibrosarcoma protuberans, MM, Kaposi's sarcoma, blue nevus

Investigations
- biopsy if diagnosis is uncertain

Management
- no treatment required
- excision if bothersome

SKIN TAGS

Skin tags are also known as...
- Acrochordons
- Fibroepithelial polyps

Clinical Features
- small (1-10 mm), soft, skin-coloured or darker pedunculated papule, often polypoid
- sites: eyelids, neck, axillae, inframammary, and groin

Pathophysiology
- benign outgrowth of skin

Epidemiology
- middle-aged and elderly, F>M, obese, can increase in size and number during pregnancy

Differential Diagnosis
- pedunculated seborrheic keratosis, compound or dermal melanocytic nevus, neurofibroma, fibroepithelioma of Pinkus (rare variant of BCC), nevus lipomatosis superficialis

Management
- snip excision, electrodessication, cryosurgery

Hyperkeratotic Lesions

SEBORRHEIC KERATOSIS

Clinical Features
- i.e. 'wisdom spots,' 'age spots,' or 'barnacles of life'
- well-demarcated waxy papule/plaque with classic "stuck on" appearance
- occasionally pruritic
- over time lesions appear more warty, greasy, and pigmented
- sites: face, trunk, upper extremities (may occur at any site except palms or soles)

Pathophysiology
- very common benign epithelial tumour due to proliferation of keratinocytes and melanocytes

Epidemiology
- unusual <30 yr old
- M>F
- autosomal dominant inheritance
- Leser-Trelat sign: sudden appearance of seborrheic keratosis that can be associated with malignancy, commonly gastric adenocarcinomas

Differential Diagnosis
- MM (lentigo maligna, nodular melanoma), melanocytic nevi, pigmented BCC, solar lentigo, spreading pigmented AK

Investigations
- biopsy only if diagnosis uncertain

Management
- none required, for cosmetic purposes only
- cryotherapy, electrodessication, shave excision

ACTINIC KERATOSES (SOLAR KERATOSES)
- see *Pre-Malignant Skin Conditions*, D39

KERATOACANTHOMA
- see *Malignant Skin Tumours*, D40

CORNS (HELOMATA)

Clinical Features
- firm papule with a central, translucent, cone-shaped, hard keratin core
- painful with direct pressure
- sites: most commonly on dorsolateral fifth toe and dorsal aspects of other toes

Pathophysiology
- localized hyperkeratosis induced by pressure on hands and feet

Epidemiology
- F>M, can be caused by chronic microtrauma

Differential Diagnosis
- calluses, plantar warts

Management
- relieve pressure with padding or alternate footwear, orthotics
- paring, topical salicylic acid

Corns vs. Warts vs. Calluses
- Corns have a whitish yellow central translucent keratinous core; painful with direct pressure; interruption of dermatoglyphics
- Warts bleed with paring and have a black speckled central appearance due to thrombosed capillaries; plantar warts destroy dermatoglyphics (epidermal ridges)
- Calluses have layers of yellowish keratin revealed with paring; there are no thrombosed capillaries or interruption of epidermal ridges

Keloids

Clinical Features
- firm, shiny, skin-coloured or red-bluish papules/nodules that most often arise from cutaneous injury (e.g. piercing, surgical scar, acne), but may appear spontaneously
- extends beyond the margins of the original injury, and may continue to expand in size for yr with claw-like extensions
- can be pruritic and painful
- sites: earlobes, shoulders, sternum, scapular area, angle of mandible

Pathophysiology
- excessive deposition of randomly organized collagen fibres following trauma to skin

Epidemiology
- most common in Black patients, followed by those of Asian descent (predilection for darker skin)
- M=F, all age groups

Management
- intralesional corticosteroid injections
- silicone gel sheets

Keloids vs. Hypertrophic Scars
- **Keloids:** extend beyond margins of original injury with claw-like extensions
- **Hypertrophic scars:** confined to original margins of injury

DDx of Hyperpigmented Macules
- Purpura (e.g. solar, ASA, anticoagulants, steroids, hemosiderin stain)
- Post-inflammatory
- Melasma
- Melanoma
- Fixed drug eruption

Pigmented Lesions

CONGENITAL NEVOMELANOCYTIC NEVI (CNN)

Clinical Features
- i.e. congenital hairy nevi
- sharply demarcated pigmented papule or plaque with regular borders ± coarse hairs
- classified by size: small (<1.5 cm), medium (M1: 1.5-10 cm, M2: >10-20 cm), large (L1: >20-30 cm, L2: >30-40 cm), giant (G1: >40-60 cm, G2: >60 cm)
- may be surrounded by smaller satellite nevi

Pathophysiology
- nevomelanocytes in epidermis (clusters) and dermis (strands)

Epidemiology
- present at birth or develops in early infancy to childhood
- malignant transformation is rare (1-5%) and more correlated with size of the lesion
- neurocutaneous melanosis can occur in giant CNN (melanocytes in the CNS)

Management
- take a baseline photo and observe lesion for change in shape, colour, or size out of proportion with growth
- surgical excision if suspicious, due to increased risk of melanoma
- MRI if suspicious for neurological involvement

OTHER CONGENITAL PIGMENTED LESIONS

Table 5. Comparison of Other Congenital Pigmented Lesions

	Clinical Feature	Pathophysiology	Epidemiology	Differential Diagnosis	Clinical Course and Management
Café-au-lait Macule	Flat light-brown lesions with smooth or jagged borders	Areas of increased melanogenesis	Six or more is suggestive of neurofibromatosis type I Also associated with McCune-Albright syndrome	Flat congenital melanocytic nevus, speckled lentiginous nevus	Enlarge in proportion to the child No effective treatment
Speckled Lentiginous Nevus (i.e. nevus spilus)	Brown pigmented macular background (café-au-lait macule-like) with dark macular or papular speckles	Increased melanocyte concentration	Risk of melanoma similar to that of a CNN of the same size	Café-au-lait macule, agminated lentigines, Becker's nevus	Usually the light macular background is present at birth and speckles develop over time Management is similar to that of CNNs
Dermal Melanocytosis (historically known as Mongolian Spot)	Congenital grey-blue solitary or grouped macules commonly on lumbosacral area	Ectopic melanocytes in dermis	99% occurs in Asian and Indigenous infants	Ecchymosis	Usually fades in early childhood but may persist into adulthood
Xeroderma Pigmentosum	Extreme sensitivity to UV light, redness and blistering, xerosis, and changes in skin colour Typically affects the eyes and sun-exposed areas; may affect nervous system	Involves mutations in genes responsible for DNA repair (e.g. nucleotide excision repair genes)	More common in Japan, North Africa, and Middle East	Freckles, Rothmund-Thomson syndrome, and porphyrin disease	Prevention by avoiding sun exposure (damage is irreversible) Reduce incidence of cancer using anticancer drugs (e.g. isotretinoin, fluorouracil) in adults only

Other Nevi
- **Halo nevus:** often appears as a typical nevus surrounded by a ring of depigmentation; common in children; uncommonly associated with vitiligo; no treatment required unless irregular colour or borders
- **Blue nevus:** round to oval macule/papule with homogenous blue to blue-black colour; often appears in childhood and late adolescence; no treatment required unless atypical features are noted

ACQUIRED NEVOMELANOCYTIC NEVI (NMN)

Clinical Features
- common mole: well circumscribed, round, uniformly pigmented macules/papules <1.5 cm
- average number of moles per person: 18-40
- three stages of evolution: junctional NMN, compound NMN, and dermal NMN

Table 6. Evolution of Acquired Nevomelanocytic Nevi

Type	Age of Onset	Clinical Feature	Histology
Junctional	Childhood Majority progress to compound nevus	Flat, regularly bordered, uniformly tan-dark brown, sharply demarcated macule	Melanocytes at dermal-epidermal junction above basement membrane
Compound	Any age	Domed, regularly bordered, smooth, round, tan-dark brown papule Face, trunk, extremities, scalp NOT found on palms or soles	Melanocytes at dermal-epidermal junction; migration into dermis
Dermal	Adults	Soft, dome-shaped, skin-coloured to tan/brown papules or nodules Sites: face, neck	Melanocytes exclusively in dermis

Management
- new or changing pigmented lesions should be evaluated for atypical features which could indicate a melanoma
- excisional biopsy should be considered if the lesion demonstrates rapid change, asymmetry, varied colours, irregular borders, and persistent pruritus or bleeding

OTHER ACQUIRED PIGMENTED LESIONS

Table 7. Comparison of Other Acquired Pigmented Lesions

	Clinical Feature	Pathophysiology	Epidemiology	Differential Diagnosis	Clinical Course and Management
Atypical Nevus (Dysplastic Nevus)	Variegated macule/papule with irregular distinct melanocytes in the basal layer	Hyperplasia and proliferation of melanocytes extending beyond dermal compartment of the nevus Often with region of adjacent nests	Five atypical nevi increase risk for melanoma Numerous dysplastic nevi may be part of familial atypical mole and melanoma syndrome Risk factor: family history	Melanoma	Follow with baseline photographs for changes Excisional biopsy if lesion changing or highly atypical Close surveillance with whole body skin examination
Ephelides (i.e. Freckles)	Small (<5 mm) well-demarcated light brown macules Sites: sun-exposed skin	Increased melanin within basal layer keratinocytes secondary to sun exposure	Skin phototypes I-II most commonly	Junctional nevi Juvenile lentigines	Multiply and darken with sun exposure, fade in winter No treatment required Sunscreen and sun avoidance may prevent the appearance of new freckles
Solar Lentigo (i.e. Liver Spot)	Well-demarcated brown/black macules Sites: sun-exposed skin	Benign melanocytic proliferation in dermal-epidermal junction due to chronic sun exposure	Most common in Caucasians >40 yr Skin phototypes I-III most commonly	Lentigo maligna, seborrheic keratosis, pigmented AK	Laser therapy, shave excisions, cryotherapy
Becker's Nevus	Hairy, light brown macule/patch with a papular verrucous surface Sites: trunk and shoulders Onset in teen yr	Pigmented hamartoma with increased melanin in basal cells	M>F Often becomes noticeable at puberty	Hairy congenital melanocytic nevus	Hair growth follows onset of pigmentation Cosmetic management (usually too large to remove)
Melasma	Symmetrical hyperpigmentation on sun-exposed areas of face (forehead, upper lip, cheeks, chin)	Increase in number and activity of melanocytes Associated with estrogen and progesterone	F>M Common in pregnancy and women taking OCP or HRT Can occur with mild endocrine disturbances, antiepileptic medications, and other photosensitizing drugs Risk factors: sun exposure, dark skin tone	Post-inflammatory hyperpigmentation	Often fades over several mo after stopping hormone treatment or delivering baby Treatment: hydroquinone, azelaic acid, retinoic acid, topical steroid, combination creams, destructive modalities (chemical peels, laser treatment), camouflage make-up, sunscreen, sun avoidance

Vascular Lesions

Table 8. Vascular Tumours Compared to Vascular Malformations

	Vascular Tumours	Vascular Malformations
Definition	Endothelial hyperplasia	Congenital malformation with normal endothelial turnover
Presence at Birth	Usually postnatal	100% at birth (not always obvious)
M:F	1:3-5	1:1
Natural History	Phases Proliferating Involuting Involuted	Proportionate growth (can expand)

Pyogenic granuloma is a misnomer: it is neither pyogenic nor granulomatous

Venous Lake: benign blue or violaceous papular lesion occurring on the face, lips, and ears due to dilation of a venule. Distinguished from malignant pigmented lesions through diascopy, as compression blanches the lesion

A spider angioma will blanch when the tip of a paperclip is applied to the centre of the lesion

HEMANGIOMAS

Clinical Features

- red or blue subcutaneous mass that is soft/compressible, blanches with pressure; feels like a "bag of worms" when palpated

Pathophysiology

- benign vascular tumour
- includes: cavernous hemangioma, capillary/infantile hemangioma, spider hemangioma

Table 9. Vascular Tumours

	Clinical Feature	Pathophysiology	Epidemiology	Clinical Course	Management
Hemangioma of Infancy	Hot, firm, red to blue plaques or tumours	Benign vascular proliferation of endothelial lining	Appears shortly after birth; rarely congenital	Appears shortly after birth, increases in size over mo, then regresses 50% of lesions resolve spontaneously by 5 yr	10% require treatment due to functional impairment (visual compromise, airway obstruction, high output cardiac failure) or cosmesis Consider treatment if not gone by school age; topical timolol, propranolol; systemic corticosteroids; laser treatment; surgery Provide early specialist referral or treatment in infants with high-risk hemangiomas
Spider Angioma (i.e. Campbell Telangiectasia)	Central red arteriole with slender branches, blanchable	Can be associated with hyperestrogenic state (e.g. in liver disease, pregnancy, OCP) but more often is not	Any age	Increase in number over time	Reassurance Electrodesiccation or laser surgery if patient wishes
Cherry Angioma (i.e. Campbell De Morgan Spot)	Bright red to deep maroon, dome-shaped vascular papules, 1-5 mm Site: trunk Less friable compared to pyogenic granulomas	Benign vascular neoplasm	>30 yr old	Lesions do not fade in time Lesions bleed infrequently	Usually no treatment needed Laser or electrocautery for small lesions Excision of large lesions if necessary
Pyogenic Granuloma	Bright red, dome-shaped sessile or pedunculated friable nodule Sites: fingers, lips, mouth, trunk, toes DDx: glomus tumour, nodular MM, SCC, nodular BCC	Rapidly developing hemangioma Proliferation of capillaries with erosion of epidermis and neutrophilia	<30 yr old	Lesion grows rapidly over wk-mo, then stabilizes Lesion may persist indefinitely if untreated	Surgical excision with histologic examination Electrocautery; laser; cryotherapy

VASCULAR MALFORMATIONS

Table 10. Vascular Malformations

Type	Clinical Feature	Pathophysiology	Management
Nevus Flammeus (i.e. Port-wine Stain)	Red to blue macule present at birth that follows a dermatomal distribution, rarely crosses midline Most common site: nape of neck Never spontaneously regresses but grows in proportion to the child	Congenital vascular malformation of dermal capillaries; rarely associated with Sturge-Weber syndrome (V1, V2 distribution)	Laser or make-up
Nevus Simplex (i.e. Salmon Patch)	Pink-red irregular patches Midline macule on glabella known as "Angel Kiss"; in the nuchal region known as "Stork Bites" Present in 1/3 of newborns Majority regress spontaneously	Congenital dilation of dermal capillaries	No treatment required

Lipoma

Clinical Features
- single or multiple non-tender subcutaneous tumours that are soft and mobile
- occurs most frequently on the trunk and extremities, but can be anywhere on the body

Pathophysiology
- adipocytes enclosed in a fibrous capsule

Epidemiology
- often solitary or few in number, if multiple can be associated with rare syndromes

Differential Diagnosis
- angiolipoma, liposarcoma

Investigations
- biopsy only if atypical features (painful, rapid growth, firm)

Management
- reassurance
- excision or liposuction only if desired for cosmetic purposes

Xanthoma

Clinical Features
- localized lipid deposits that manifest as papules, plaques, or nodules in the skin
- several variants: eruptive xanthoma (1-5 mm erythematous-to-yellow papules); tuberous xanthoma (≤3 cm yellow-to-orange or erythematous papules or nodules); tendinous xanthoma (smooth, firm, mobile, skin-coloured nodules); plane xanthoma (soft, yellow, thin plaques)

Pathophysiology
- xanthoma associated with hyperlipidemia: formed from macrophages due to excessive uptake and oxidation of low density lipoprotein particles
- xanthoma not associated with hyperlipidemia (e.g. plane xanthoma): develop associated with monoclonal gammopathy, multiple myeloma, and other hematologic diseases; immune complexes form between antibodies and lipoproteins leading to lipid accumulation in macrophages
- xanthoma not associated with hyperlipidemia (e.g. verruciform xanthoma): may be response to immune reaction to local trauma or inflammation

Epidemiology
- often present in adulthood (except xanthoma associated with hypercholesterolemia, in which xanthoma develops before 10 y/o)
- occur in both males and females, no sex predilection

Differential Diagnosis
- xanthelasma: sebaceous hyperplasia, juvenile xanthogranuloma, syringoma, nodular BCC
- plane xanthoma: necrobiotic xanthogranuloma
- eruptive xanthoma: generalized granuloma annulare, xanthoma disseminatum
- tendinous xanthoma and tuberous xanthoma: other nodular eruptions over joints and tendons (e.g. rheumatoid nodules, gouty tophi, subcutaneous granuloma annulare, erythema elevatum diutinum)
- verrucous xanthoma: condylomata, oral papillomas, verrucous carcinoma, SCC

Investigations
- biopsy (shave, punch, or excisional)
- fasting lipid panel (except for xanthomas not associated with hyperlipidemia, e.g. verruciform xanthomas)

Management
- typically asymptomatic and therefore do not require treatment unless for cosmetic reasons
- options include surgical excision, cryotherapy, 70% trichloroacetic acid chemical peels, or Er:YAG or Nd-YAG lasers
- pharmacologic treatment of dyslipidemia usually indicated

Treatment of Acne Scars
- Tretinoin creams
- Glycolic acid
- Chemical peels for superficial scars
- Injectable fillers (collagen, hyaluronic acid) for pitted scars
- Fraxel laser
- CO_2 laser resurfacing

Topical Benzoyl Peroxide for Acne
Cochrane DB Syst Rev 2020:CD011154
Purpose: Systemically review the use of topical benzoyl peroxide for treating acne.
Methods: RCTs comparing the use of topical benzoyl peroxide, for the treatment of clinically diagnosed acne to either placebo, or other topical medication were eligible for inclusion. The primary outcome measures that were assessed were 'participant global self-assessment of acne improvement' and 'withdrawal due to adverse events in the whole course of the trial'. The secondary outcome measure that was assessed was 'Percentage of participants experiencing any adverse event in the whole course of the trial.'
Results: A total of 120 studies including 29592 people were included in this review. For 'participant global self-assessment of acne improvement' benzoyl peroxide was more effective than placebo or no treatment (risk ratio (RR) 1.27, 95% confidence interval (CI) 1.12 to 1.45; 3 RCTs; 2234 participants; treatment for 10 to 12 weeks; low-certainty evidence). Little to no difference existed between benzoyl peroxide and adapalene (RR 0.99, 95% CI 0.90 to 1.10; 5 RCTs; 1472 participants; treatment for 11 to 12 weeks) and clindamycin (RR 0.95, 95% CI 0.68 to 1.34; 1 RCT; 240 participants; treatment for 10 weeks). Withdrawal due to adverse effects was higher with benzoyl peroxide than with no treatment or placebo and the most common cited adverse effects included erythema, pruritus, and skin burning.
Low quality evidence suggests little to no difference in withdrawal due to adverse events between benzoyl peroxide and adapalene, clindamycin, erythromycin, or salicylic acid. Very low quality evidence exists comparing the incidence of any adverse events between benzoyl peroxide and other treatments, however most reported adverse events were mild.

Acneiform Eruptions

Acne Vulgaris/Common Acne

Clinical Features
- a common inflammatory pilosebaceous disease categorized with respect according to severity
  - Type I: comedonal, sparse, no scarring
  - Type II: comedonal, papular, moderate ± little scarring
  - Type III: comedonal, papular, and pustular, with scarring
  - Type IV: nodulocystic acne, risk of severe scarring
- sites of predilection: face, neck, upper chest, and back

Pathophysiology
- hyperkeratinization at the follicular ostia (opening) blocks the secretion of sebum leading to the formation of microcomedones
- androgens promote excess sebum production
- *Cutibacterium acnes* (*C. acnes*) metabolizes sebum to free fatty acids and produces pro-inflammatory mediators

Epidemiology
- age of onset typically in puberty (10-17 yr in females, 14-19 yr in males)
- in prepubertal children consider underlying hormonal abnormality (e.g. late onset congenital adrenal hyperplasia)
- incidence decreases in adulthood
- genetic predisposition: majority of individuals with cystic acne have parent(s) with history of severe acne

Differential Diagnosis
- folliculitis, keratosis pilaris (upper arms, face, thighs), perioral dermatitis, rosacea

Table 11. Management of Acne

Compound/Drug Class	Product Names	Notes
MILD ACNE: OTC Topical Therapies		
Benzoyl peroxide (BPO)	Solugel®, Benzac®, Desquam®, Fostex®	Helps prevent *Propionibacterium acnes* (*P. acnes*) resistance, is a bactericidal agent (targets *P. acnes*), and is comedolytic
Salicylic acid	Akurza® cream, DermaZone®	Used when patients cannot tolerate a topical retinoid due to skin irritation
MILD ACNE: Prescription Topical Therapies		
Antimicrobials	clindamycin (Dalacin T®), erythromycin	High rate of resistance when used as monotherapy
Retinoids	vitamin A acid (tretinoin, Stieva-A®, Retin A Micro®), adapalene (Differin®)	Backbone of topical acne therapy All regimens should include a retinoid unless patient cannot tolerate
Combination products	clindamycin and BPO (Clindoxyl®) clindamycin and BPO (Benzaclin®) TactuPump® (adapalene and BPO) clindamycin and tretinoin (Biacna®) erythromycin and BPO (Benzamycin®)	Allows for greater adherence and efficacy Combines different mechanisms of action to increase efficacy and maximize tolerability
MODERATE ACNE		
Tetracycline/Minocycline/ Doxycycline	Sumycin®/Minocin®/Vibramycin®	Use caution with regard to drug interactions: do not use with isotretinoin Sun sensitivity Antibiotics require 3 mo of use before assessing efficacy
Cyproterone acetate-ethinyl estradiol	Diane-35®	After 35 yr of age, estrogen/progesterone should only be considered in exceptional circumstances, carefully weighing the risk/benefit ratio with physician guidance
Spironolactone	Aldactone®	May cause hyperkalemia if concurrent renal dx Black box warning for breast cancer
SEVERE ACNE		
Isotretinoin	Accutane®, Clarus®, Epuris®	See Table 29, D53 for full side effect profile Most adverse effects are temporary and will resolve when the drug is discontinued Baseline lipid profile (risk of hypertriglyceridemia), LFTs and β-hCG before treatment May transiently exacerbate acne before patient sees improvement Refractory cases may require multiple courses of isotretinoin

Perioral Dermatitis

Clinical Features
- discrete erythematous micropapules that often become confluent, forming inflammatory plaques on perioral, perinasal, and/or periorbital skin
- commonly symmetrical, rim of sparing around vermillion border of lips

Epidemiology
- 15-40 y/o, occasionally in younger children
- predominantly females

Differential Diagnosis
- contact dermatitis, rosacea, acne vulgaris

Management
- avoid all topical steroids, avoid ointment/oil-based products, stop all cosmetic products
- topical: metronidazole 0.75% gel or 0.75-1% cream to affected area BID
- systemic: tetracycline family antibiotic (utilized for its anti-inflammatory properties)
- occasional use of a topical calcineurin inhibitor cream (i.e. tacrolimus or pimecrolimus)

Rosacea

Clinical Features
- dome-shaped inflammatory papules ± pustules
- flushing, non-transient erythema, and telangiectasia
- distribution: typically on central face including forehead, nose, cheeks, and chin; rarely on scalp, neck, and upper body
- characterized by remissions and exacerbations
- exacerbating factors: heat, cold, wind, sun, stress, drinking hot liquids, alcohol, spices
- all forms of rosacea can progress from mild to moderate to severe
- rarely in longstanding rosacea, signs of thickening, induration, and lymphedema in the skin can develop
- phyma: a distinct swelling caused by lymphedema and hypertrophy of subcutaneous tissue, particularly affecting the nose (rhinophyma)
- ocular manifestations: blepharoconjunctivitis, keratitis, iritis

Acne Myths Debunked
- Eating greasy food and chocolate does not cause or worsen acne
- Blackheads (comedones) are black because of oxidized fatty acids, not dirt
- Acne is not caused by poor hygiene; on the contrary, excessive washing of face can be an aggravator

Antibiotics are used in inflammatory skin conditions since they also have anti-inflammatory properties (e.g. macrolides in acne). Topical antibiotics may also be used to treat secondary bacterial superinfections (e.g. impetigo)

Acne Exacerbating Factors
- Systemic medications: lithium, phenytoin, steroids, halogens, androgens, iodides, bromides, danazol
- Topical agents: steroids, tars, ointments, oily cosmetics
- Mechanical pressure or occlusion, such as leaning face on hands
- Emotional stress

A combination of topical retinoids and topical erythromycin or clindamycin is more effective than either agent used alone

Intralesional Injections
Intralesional corticosteroid injections are effective in the treatment of individual acne nodules

Isotretinoin and Pregnancy
- Use of isotretinoin during pregnancy is associated with spontaneous abortion and major birth defects such as facial dysmorphism and cognitive impairment
- Pregnancy should be ruled out before starting isotretinoin
- Patients should use two forms of contraception while on isotretinoin

Important Controversies Associated with Isotretinoin Therapy for Acne
Am J Clin Dermatol 2013;14:71-76
Main Points:
1. The evidence on whether isotretinoin causes depression and suicide is inconsistent; however, numerous controlled studies have shown an improvement in anxiety and depression scores in those taking isotretinoin.
2. There is no association between IBD and isotretinoin use. Only one study showed a significantly increased risk of UC. When considering using isotretinoin in a patient with IBD or with a strong family history, consider involving a gastroenterologist.

Pathophysiology
- unknown

Epidemiology
- although found in all skin types, highest prevalence in fair-skinned people
- 30-50 y/o; F>M

Differential Diagnosis
- acne vulgaris, seborrheic dermatitis, perioral dermatitis, contact dermatitis

Management
- trigger avoidance and daily sunscreen use for long-term management
- avoid topical corticosteroids
- telangiectasia: treated by physical ablation; electrical hyfrecators, vascular lasers, and intense pulsed light therapies
- phymas: treated by physical ablation or removal; paring, electrosurgery, cryotherapy, laser therapy (CO_2, argon, Nd:YAG)

Table 12. Specific Rosacea Treatments

First Line	Second Line	Third Line
Oral tetracyclines Topical metronidazole Oral erythromycin (250-500 mg PO BID) Topical azelaic acid Topical ivermectin	Topical clindamycin Topical erythromycin 2% solution Oral metronidazole	Oral retinoids

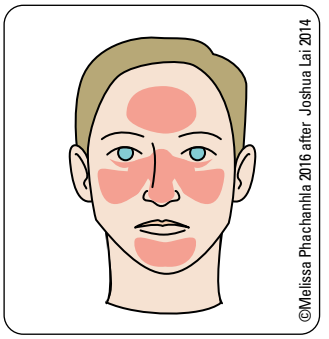

Figure 7. Rosacea distribution

Rosacea can be differentiated from acne by the absence of comedones, a predilection for the central face, and symptoms of flushing

Guidelines for the Diagnosis of Rosacea
J Drugs Dermatol 2012;11(6):725-730
- Presence of one or more of the following primary features:
- Flushing (transient erythema)
- Nontransient erythema
- Papules and pustules
- Telangiectasia

May include one or more of the following secondary features:
- Burning or stinging
- Dry appearance
- Edema
- Phymatous changes
- Ocular manifestations
- Peripheral location

Dermatitis (Eczema)

Definition
- inflammation of the skin

Clinical Features
- poorly demarcated erythematous patches or plaques
- symptoms include pruritus and pain
- acute dermatitis: papules, vesicles
- subacute dermatitis: scaling, crusting, excoriations
- chronic dermatitis: lichenification, xerosis, fissuring

Asteatotic Dermatitis

Clinical Features
- diffuse, mild pruritic dermatitis secondary to dry skin
- very common in elderly, especially in the winter (i.e. "winter itch") but starts in the fall
- shins predominate, looks like a "dried river bed"

Management
- skin rehydration with moisturizing routine ± corticosteroid creams

Emollients and Moisturisers for Eczema
Cochrane DB Syst Rev 2017:CD012119
Purpose: To review the effects of moisturizers for eczema.
Methods: This review included RCTs published prior to December 2015 on the effects of moisturizer on eczema.
Results: 77 studies with a total of 6603 participants were included in this review. Moisturizers showed beneficial effects on eczema symptoms and severity. Key benefits included prolonging time to flares, reducing the number of flares, and reducing the amount of corticosteroids needed. When active treatment was combined with moisturizer, greater benefits were seen. Evidence does not exist to support the use of one moisturizer over another.

Atopic Dermatitis

Clinical Features
- subacute and chronic eczematous reaction associated with prolonged severe pruritus
- distribution depends on age
- inflammation, lichenification, and excoriations are secondary to relentless scratching
- atopic palms: hyperlinearity of the palms (associated with ichthyosis vulgaris)
- associated with: keratosis pilaris (hyperkeratosis of hair follicles, "chicken skin"), xerosis, occupational hand dryness
- associated with severe or poorly controlled psychosocial distress and psychiatric comorbidities

Epidemiology
- frequently affects infants, children, and young adults
- 10-20% of children in developed countries <5 y/o are affected
- associated with personal or family history of atopy (asthma, hay fever), anaphylaxis, eosinophilia
- polygenic inheritance: one parent >60% chance for child; two parents >80% chance for child
- long-term condition with 1/3 of patients continuing to show signs of AD into adulthood

Pathophysiology
- a T-cell driven inflammatory process with epidermal barrier dysfunction

Triggers for Atopic Dermatitis
- Irritants (detergents, solvents, clothing, water hardness)
- Contact allergens
- Environmental aeroallergens (e.g. dust mites)
- Inappropriate bathing habits (e.g. long hot showers)
- Sweating
- Microbes (e.g. *S. aureus*)
- Stress

Investigations
- clinical diagnosis
- consider: skin biopsy, patch testing if allergic contact dermatitis is suspected

Management
- goal: reduce signs and symptoms, prevent or reduce recurrences/flares
- better outcomes (e.g. less flare-ups, modified course of disease) if diagnosis made early
- avoid triggers of AD (e.g. wool, scented products, heat, etc.)
- be vigilant for depressive symptoms and the possible need for psychiatric referral, especially among those with severe disease
- non-pharmacologic therapy
  - moisturizers
    - apply liberally and reapply at least twice a day with goal of minimizing xerosis
    - include in treatment of mild to severe disease as well as in maintenance therapy
    - bathe in plain warm water for a short period of time once daily followed by lightly, but not completely, drying the skin with a towel; immediately apply topical agents or moisturizers after this
  - use fragrance-free hypoallergenic non-soap cleansers
- pharmacologic therapy
  - topical corticosteroids
    - effective in reducing acute and chronic symptoms as well as prevention of flares
    - choice of steroid potency depends on age, body site, short vs. long-term use
    - apply one adult fingertip unit (0.5 g) to an area the size of two adult palms BID for acute flares
    - local side effects: skin atrophy, purpura, telangiectasia, striae, hypertrichosis, and acneiform eruption are all very rarely seen
  - topical calcineurin inhibitors
    - tacrolimus 0.03%, 0.1% (Protopic®) and pimecrolimus 1% (Elidel®)
    - can be used as acute treatments and as steroid-sparing agents in the long-term
    - advantages over long-term corticosteroid use: no skin atrophy; safe for sensitive areas such as the face and neck
    - apply BID for acute flares, and 2-3x/wk to recurrent sites to prevent relapses
    - local side effects: stinging, burning, cost
    - U.S. black box warning of malignancy risk: rare cases of skin cancer and lymphoma reported; no causal relationship established, warning is discounted by both the Canadian Dermatology Association and the American Academy of Dermatology
  - biologics
    - dupilumab
  - topical PDE-4 inhibitor
    - Eucrisa

Complications
- infections
  - treatment of infections:
    - topical mupirocin, ozenoxacin, or fusidic acid (Canada only, not available in US)
    - oral antibiotics (e.g. cloxacillin, cephalexin) for widespread *S. aureus* infections

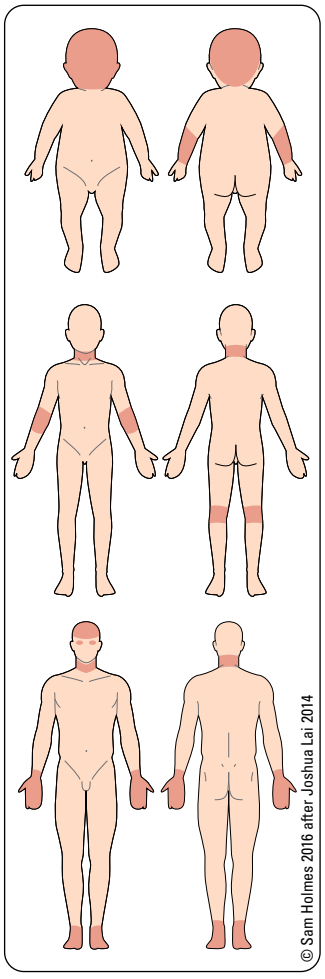

Figure 8. AD distribution
The typical distribution of AD in infants <6 mo (top), children >18 mo (middle), and adults ≥18 yr (bottom)

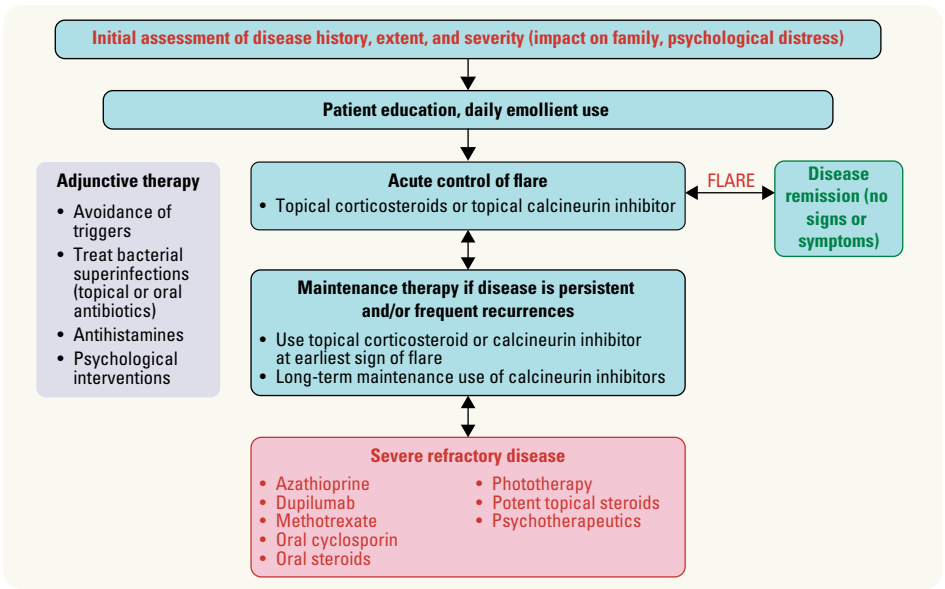

Figure 9. Atopic dermatitis treatment algorithm
Adapted from: Ellis C, et al. ICCAD II Faculty. International Consensus Conference on Atopic Dermatitis II (ICCAD II): clinical update and current treatment strategies.
Br J Dermatol 2003;148(Suppl 63):3-10

Contact Dermatitis

Clinical Features
- cutaneous inflammation caused by an external agent(s)

Table 13. Contact Dermatitis

	Irritant Contact Dermatitis	Allergic Contact Dermatitis
Mechanism of Reaction	Toxic injury to skin; non-immune mechanism	Cell-mediated delayed (Type IV) hypersensitivity reaction (see Rheumatology, RH2)
Type of Reaction	Erythema, dryness, fine scale, burning Acute: quick reaction, sharp margins (e.g. from acid/alkali exposure) Cumulative insult: slow to appear, poorly defined margins (e.g. from soap), more common	Erythema with a papulovesicular eruption, swelling, pruritus
Frequency	Majority; will occur in anyone given sufficient concentration of irritants	Minority; patient acquires susceptibility to allergen that persists indefinitely
Distribution	Hands are the most common site	Areas exposed to allergen
Examples	Soaps, weak alkali, detergents, organic solvents, alcohol, oils	Many allergens are irritants, so may coincide with irritant dermatitis Nickel Tattoos
Management	Avoidance of irritants Wet compresses with Burow's solution (drying agent) Barrier moisturizers Topical/oral steroids	Patch testing to determine specific allergen Avoid allergen and its cross-reactants Wet compresses soaked in Burow's solution Topical steroids BID PRN Systemic steroids PRN if extensive

Dyshidrotic Dermatitis

Clinical Features
- "tapioca pudding" papulovesicular dermatitis of hands and feet that coalesce into plaques, followed by painful fissuring
- acute stage often very pruritic
- secondary infections common
- lesions heal with desquamation and may lead to chronic lichenification
- sites: palms and soles ± dorsal surfaces of hands and feet

Pathophysiology
- unknown
- NOT caused by hyperhidrosis (excessive sweating)
- emotional stress may precipitate flares

Management
- topical: high potency corticosteroid with plastic cling wrap occlusion to increase penetration
- intralesional triamcinolone injection
- systemic
  - prednisone in severe cases
  - alitretinoin (Toctino®) for all types of chronic hand dermatitis, including dyshidrotic dermatitis
  - antibiotics for secondary *S. aureus* infection

Nummular Dermatitis

Clinical Features
- nummular (coin-shaped), pruritic, dry, scaly, erythematous plaques
- often associated with atopic and dyshidrotic dermatitis
- secondary infection common

Pathophysiology
- little is known, but it is often accompanied by xerosis, which results from a dysfunction of the epidermal lipid barrier; this in turn can allow permeation of environmental agents, which can induce an allergic or irritant response

Management
- moisturization
- mid- to high-potency corticosteroid ointment BID

Seborrheic Dermatitis

Clinical Features
- greasy, erythematous, yellow, scaling, minimally elevated papules and plaques in areas rich in sebaceous glands, can look moist and superficially eroded in flexural regions
- infants: "cradle cap"
- children: may be generalized with flexural and scalp involvement
- adults: diffuse involvement of scalp margin with yellow to white flakes, pruritus, and underlying erythema
- sites: scalp, eyebrows, eyelashes, beard, glabella, post-auricular, over sternum, trunk, body folds, genitalia

Pathophysiology
- possible etiologic association with *Malassezia* spp. (yeast)

Epidemiology
- common in infants and adolescents
- increased incidence and severity in immunocompromised patients and Parkinson's disease
- in adults can cause dandruff (pityriasis sicca)

Management
- face: ketoconazole (Nizoral®) cream daily or BID and/or mild steroid cream daily or BID
- scalp: Derma-Smoothe FS® lotion (peanut oil, mineral oil, fluocinolone acetonide 0.01%) to remove dense scales, ketoconazole 2% shampoo (Nizoral®), ciclopirox (Stieprox®) shampoo, selenium sulfide (e.g. Selsun®) or zinc pyrithione (e.g. Head and Shoulders®) shampoo, steroid lotion (e.g. betamethasone valerate 0.1% lotion BID)

Stasis Dermatitis

Clinical Features
- erythematous, scaly, pruritic plaques on lower legs, particularly the medial ankle
- brown hemosiderin deposition, woody fibrosis, atrophy blanche, and lipodermatosclerosis in late stages
- usually bilateral, accompanied by swelling, oozing, crusting, may have accompanying varicosities

Pathophysiology
- chronic venous insufficiency leads to venous stasis
- surrounding soft tissue inflammation and fibrosis results

Investigations
- Doppler if suspicious for DVT, other vascular studies (e.g. ankle-brachial index)
- swab for bacterial culture if there is crusting

Management
- compression stockings
- rest and elevate legs (above the level of the heart)
- moisturizer daily after shower to treat xerosis
- mid-high potency topical corticosteroids to control inflammation

Complications
- ulceration (common at medial malleolus), secondary bacterial infections

Lichen Simplex Chronicus

Clinical Features
- well-defined plaque(s) of lichenified skin with increased skin markings ± excoriations
- common sites: neck, scalp, lower extremities, urogenital area
- often seen in patients with atopy

Pathophysiology
- skin hyperexcitable to itch, resulting in continued rubbing/scratching of skin
- eventually lichenification occurs

Investigations
- if patient has generalized pruritus, rule out systemic cause: CBC with differential count, transaminases, bilirubin, ferritin, renal and thyroid function tests, TSH, glucose, SPEP
- CXR if lymphoma suspected

Management
- antipruritics (e.g. antihistamines, topical or intralesional glucocorticoids, Unna boot)

Papulosquamous Diseases

Lichen Planus

Clinical Features
- acute or chronic inflammation of skin or mucous membranes
- morphology: pruritic, well-demarcated, violaceous, polygonal, flat-topped papules
- common sites: wrists, nails, scalp, mucous membranes in 60% (mouth, vulva, glans)
- distribution: symmetrical and bilateral
- Wickham's striae: reticulate white-grey lines over surface; pathognomonic but may not be present
- mucous membrane lesions: lacy, whitish reticular network, milky-white plaques/papules; increased risk of SCC in erosions and ulcers
- nails: longitudinal ridging; pterygium formation, complete dystrophy
- scalp: scarring alopecia with perifollicular hyperkeratosis and erythema
- spontaneously resolves but may last for wk, mo, or yr (mouth and skin lesions)
- rarely associated with hepatitis C
- Koebner phenomenon

Pathophysiology
- immune-mediated, antigen unknown
- lymphocyte activation leads to keratinocyte apoptosis

Epidemiology
- 1%, 30-60 yr, F>M

Investigations
- consider a skin biopsy
- hepatitis C serology if patient has risk factors

Management
- topical or intralesional corticosteroids
- short courses of oral prednisone (rarely)
- phototherapy, oral retinoids, or systemic immunosuppressants (e.g. azathioprine, methotrexate, cyclosporine) for extensive or recalcitrant cases

The 6 Ps of Lichen Planus
Purple
Pruritic
Polygonal
Peripheral
Papules
Penis (i.e. mucosa)

Pityriasis Rosea

Clinical Features
- acute, self-limiting eruption characterized by red, oval plaques/patches with central scale that does not extend to edge of lesion
- long axis of lesions follows skin tension lines (i.e. Langer's lines) parallel to ribs producing "Christmas tree" pattern on back
- varied degree of pruritus
- most start with a "herald" patch which precedes other lesions by 1-2 wk
- common sites: trunk, proximal aspects of arms and legs

Pathophysiology
- suspected HHV-7 or HHV-6 reactivation

Investigations
- none required

Management
- none required; clears spontaneously in 6-12 wk
- symptomatic: topical corticosteroids if pruritic, cool compresses, emollients

Skin Treatments for Chronic Plaque Psoriasis
Cochrane DB Syst Rev 2013:CD005028
Purpose: To review the effectiveness, tolerability, and safety of topical treatments for chronic plaque psoriasis.
Methods: This review identified RCTs comparing active topical treatments to either placebo or vitamin D analogues (used alone or in combination) in people with chronic plaque psoriasis.
Results: 170 studies including a total of 34808 participants were included in this review.
Conclusion: Both topical corticosteroids and vitamin D analogues were effective in treating chronic plaque psoriasis of the body. Corticosteroids showed benefits over vitamin D analogues in treating chronic plaque psoriasis of the scalp. Treatments combining vitamin D analogues and topical corticosteroids were more effective than using either vitamin D analogues or corticosteroids alone. Vitamin D analogues did result in more local adverse events than topical corticosteroids, the most common event being skin irritation or burning. People were more likely to discontinue using vitamin D analogues than topical corticosteroids.

Psoriasis

Classification
1. plaque psoriasis 2. guttate psoriasis 3. erythrodermic psoriasis
4. pustular psoriasis 5. inverse psoriasis

Pathophysiology
- not fully understood, genetic and immunologic factors
- shortened keratinocyte cell cycle correlates with Th1- and Th17-mediated inflammatory response

Calcipotriol is a Vitamin D Derivative
Dovobet® = calcipotriene combined with betamethasone dipropionate and is considered to be one of the most potent topical psoriatic therapies

Epidemiology
- 1.5-2%, M=F
- all ages: peaks of onset: 20-30 yr and 50-60 yr
- polygenic inheritance: 8% with one affected parent, 41% with both parents affected
- risk factors: smoking, obesity, alcohol, drugs, infections, physical trauma (Koebner phenomenon)

Differential Diagnosis
- AD, mycosis fungoides (cutaneous T-cell lymphoma), seborrheic dermatitis, tinea, nummular dermatitis, lichen planus

Investigations
- none required; biopsy if atypical presentation

See Landmark Dermatology Trials table for more information on the BE VIVID trial comparing the efficacy and safety of a 52 wk treatment with bimekizumab vs. placebo vs. ustekinumab in patients with moderate to severe plaque psoriasis.

PLAQUE PSORIASIS

Clinical Features
- chronic and recurrent disease characterized by well-circumscribed erythematous papules/plaques with silvery-white scales
- often worse in winter (lack of sun)
- Auspitz sign: bleeds from minute points when scale is removed
- common sites: scalp, extensor surfaces of elbows and knees, trunk (especially buttocks), nails, pressure areas

Management
- depends on severity of disease, as defined by BSA affected or less commonly PASI
- mild (<3% BSA)
  - first line treatment includes topical steroids ± topical vitamin D analogue combination
  - topical retinoid ± topical steroid combination, anthralin, and tar are also effective but tend to be less tolerated than first line therapies
  - emollients
  - phototherapy or systemic treatment may be necessary if the lesions are scattered or in difficult-to-treat areas (e.g. palms, soles, scalp, and genitals)
- moderate (3-10% BSA) to severe (>10% BSA)
  - goal of treatment is to attain symptom control that is adequate from patient's perspective
  - phototherapy if accessible
  - systemic or biological therapy based on patient's treatment history and comorbidities
  - topical steroid ± topical vitamin D3 analogue as adjunct therapy

Table 14. Topical Treatment of Psoriasis

Treatment	Mechanism	Comments
Emollients	Reduce fissure formation	
Salicylic acid 1-12%	Remove scales	
Tar (LCD: liquor carbonis detergens)	Inhibits DNA synthesis, increases cell turnover	Poor long-term compliance
Topical corticosteroids	Reduce scaling, redness and thickness	Use appropriate potency steroid in different areas for degree of psoriasis
Vitamin D analogues: calcipotriene/ calcipotriol (Dovonex®, Silkis®)	Reduces keratinocyte hyperproliferation	
Betamethasone + calcipotriene (Dovobet®)	Combined corticosteroid and vitamin D analogue. See above mechanisms	Not to be used on face or folds
Tazarotene (Tazorac®) (gel/cream)	Retinoid derivative, reduce scaling	Irritating

Table 15. Systemic Treatment of Psoriasis

Treatment	Considerations	Adverse Effects
Acitretin	More effective when used in combination with phototherapy	Alopecia, cheilitis, teratogenicity, hepatotoxicity, photosensitivity, epistaxis, xerosis, hypertriglyceridemia
Cyclosporine	Used for intermittent control rather than continuously Avoid using for >1 yr	Renal toxicity, hypertension, hypertriglyceridemia, immunosuppression, lymphoma
Methotrexate	Has been used for over 50 yr	Bone marrow toxicity, hepatic cirrhosis, teratogenicity
Apremilast (Otezla®)	Extremely safe	GI upset, headache, loose stool, weight loss
PUVA	Highly effective in achieving remission Avoid >200 sessions in lifetime	Pruritus, burning, skin cancer
Broadband UVB and NB-UVB (311-312 nm)	UVB is much less carcinogenic than PUVA. NB-UVB has not been shown to increase the risk of skin cancer	Rare burning

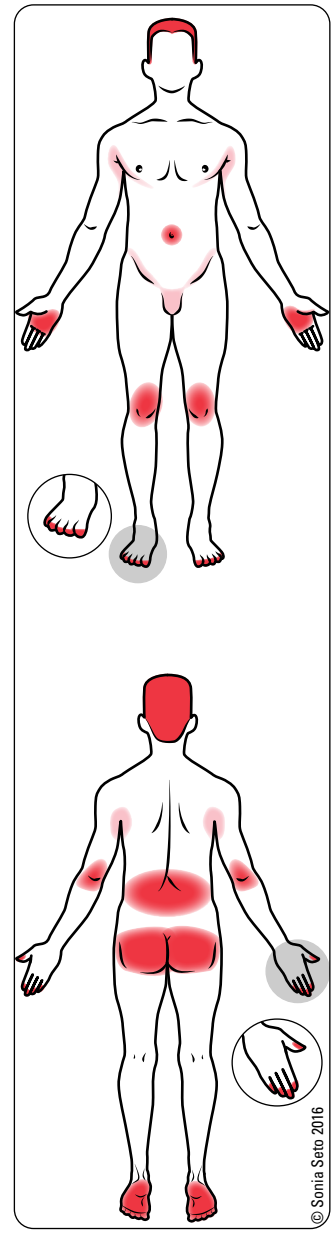

Figure 10. Psoriasis distribution

Mechanism of Biologics
"-mab" = monoclonal antibody
"-cept" = receptor

Table 16. Biologics Approved in Canada

Treatment	Route	Dosing Schedule	Effectiveness	Action
Etanercept (Enbrel®)*	SC	50 mg twice per wk for 3 mo, then 50 mg every wk	+++	Anti-TNF
Adalimumab (Humira®)*	SC	80 mg x 1, then 40 mg at wk 1 and every 2 wk thereafter	++++	Anti-TNF
Infliximab (Remicade®)*	IV	5 mg/kg at wk 0, 2, 6, and every 8 wk thereafter	+++++	Anti-TNF
Ustekinumab (Stelara®)*	SC	45 mg or 90 mg at wk 0, 4, and every 12 wk thereafter	++++	Anti-IL 12/23
Secukinumab (Cosentyx®)*	SC	300 mg at wk 0, 1, 2, 3, 4, and every month thereafter	+++++	Anti-IL 17A
Ixekizumab (Taltz®)*	SC	160 mg at wk 0, then 80 mg at wk 2, 4, 6, 8, 10, 12, then 80 mg every 4 wk thereafter	+++++	Anti-IL 17A
Guselkumab (Tremfya®)	SC	100 mg at wk 0, 4, and every 8 wk thereafter	+++++	Anti-IL 23
Brodalumab (Siliq®)	SC	210 mg at wk 0, 1, 2 and every 2 wk thereafter	+++++	mAb IL-17R (brodalumab is a monoclonal antibody that targets the IL-17 receptor
Certolizumab pegol (Cimzia®)*	SC	400 mg every 2 wk	++++	Anti-TNF
Risankizumab (Skyrizi®)	SC	150 mg at wk 0, 4, and every 12 wk thereafter	+++++	Anti-IL 23

*Can also be used to treat psoriatic arthritis

- biologics under study for treatment of plaque psoriasis: tildrakizumab, bimekizumab, mirikizumab

GUTTATE PSORIASIS ("DROP-LIKE")

Clinical Features
- discrete, scattered salmon-pink small scaling papules
- sites: diffuse, usually on trunk and legs, sparing palms and soles
- often antecedent streptococcal pharyngitis

Management
- UVB phototherapy, sunlight, lubricants, topical steroids
- penicillin V, erythromycin, or azithromycin if GAS on throat culture

ERYTHRODERMIC PSORIASIS

Clinical Features
- generalized erythema (>90% of BSA) with fine desquamative scale on surface
- associated signs and symptoms: arthralgia, pruritus, dehydration, electrolyte imbalance
- aggravating factors: lithium, β-blockers, NSAIDs, antimalarials, phototoxic reaction, infection

Management
- potentially life-threatening, requires immediate medical care
- IV fluids, monitor fluids and electrolytes, may require hospitalization
- treat underlying aggravating condition, sun avoidance
- cyclosporine, acitretin, methotrexate, UV, biologics

PUSTULAR PSORIASIS

Clinical Features
- sudden onset of erythematous macules and papules which evolve rapidly into pustules, can be painful
- may be generalized or localized
- patient usually has a history of psoriasis; may occur with sudden withdrawal from steroid therapy

Management
- methotrexate, cyclosporine, acitretin, UV, biologics

INVERSE PSORIASIS

Clinical Features
- erythematous plaques on flexural surfaces such as axillae, inframammary folds, gluteal fold, inguinal folds
- lesions may be macerated

Management
- low potency topical corticosteroids
- topical vitamin D analogues (e.g. calcipotriene, calcitriol)
- topical calcineurin inhibitors (e.g. tacrolimus, pimecrolimus)

PSORIATIC ARTHRITIS
- 20-30% of patients with psoriasis also suffer from psoriatic arthritis
- psoriatic patients with nail or scalp involvement are at a higher risk for developing psoriatic arthritis
- see Rheumatology, RH26

Vesiculobullous Diseases

Bullous Pemphigoid

Clinical Features
- chronic autoimmune bullous eruption characterized by pruritic, tense, subepidermal bullae on an erythematous or normal skin base
- can present as urticarial plaques without bullae
- common sites: flexor aspect of forearms, axillae, medial thighs, groin, abdomen, mouth in 33%

Pathophysiology
- IgG produced against dermal-epidermal basement membrane proteins (hemidesmosomes) leading to subepidermal bullae

Epidemiology
- mean age of onset: 60-80 yr, F=M

Investigations
- immunofluorescence shows linear deposition of IgG and C3 along the basement membrane
- anti-basement membrane antibody (IgG) (pemphigoid antibody detectable in serum)

Prognosis
- heals without scarring, usually chronic
- rarely fatal

Management
- prednisone 0.5-1 mg/kg/d until clear, then taper ± steroid-sparing agents (e.g. azathioprine, cyclosporine, mycophenolate mofetil)
- topical potent steroids (clobetasol) may be as effective as systemic steroids in limited disease
- tetracycline ± nicotinamide is effective for some cases
- immunosuppressants such as azathioprine, mycophenolate mofetil, cyclosporine
- IVIg or rituximab for refractory cases

Pemphigus Vulgaris

Clinical Features
- autoimmune blistering disease characterized by flaccid, non-pruritic intraepidermal bullae/vesicles on an erythematous or normal skin base
- may present with erosions and secondary bacterial infection
- sites: mouth (90%), scalp, face, chest, axillae, groin, umbilicus
- Nikolsky's sign: epidermal detachment with shear stress
- Asboe-Hansen sign: pressure applied to bulla causes it to extend laterally

Pathophysiology
- IgG against epidermal desmoglein-1 and -3 lead to loss of intercellular adhesion in the epidermis

Epidemiology
- 40-60 yr, M=F, higher prevalence in Jewish, Mediterranean, Asian populations
- paraneoplastic pemphigus may be associated with thymoma, myasthenia gravis, malignancy, and use of D-penicillamine

Investigations
- immunofluorescence: shows intraepidermal IgG and C3 deposition
- circulating serum anti-desmoglein IgG antibodies

Prognosis
- lesions heal with hyperpigmentation but do not scar
- may be fatal unless treated with immunosuppressive agents

Management
- prednisone 1-2 mg/kg until no new blisters, then 1-1.5 mg/kg until clear, then taper ± steroid-sparing agents (e.g. azathioprine, cyclophosphamide, cyclosporine, IVIg, mycophenolate mofetil, rituximab)

Pemphigus Vulgaris vs. Bullous Pemphigoid
VulgariS = Superficial, intraepidermal, flaccid lesions
PemphigoiD = Deeper, tense lesions at the dermal-epidermal junction

Pemphigus Foliaceus
An autoimmune intraepidermal blistering disease that is more superficial than pemphigus vulgaris due to antibodies against desmoglein-1, a transmembrane adhesion molecule. Appears as crusted patches, erosions and/or flaccid bullae that usually start on the trunk. Localized disease can be managed with topical steroids. Active widespread disease is treated like pemphigus vulgaris

Dermatitis Herpetiformis

Clinical Features
- grouped papules/vesicles/urticarial wheals on an erythematous base, associated with intense pruritus, burning, stinging, excoriations
- lesions grouped, bilaterally symmetrical
- common sites: extensor surfaces of elbows/knees, sacrum, buttocks, scalp

Pathophysiology
- transglutaminase IgA deposits in the skin alone or in immune complexes leading to eosinophil and neutrophil infiltration
- 90% have human leukocyte antigen (HLA) B8, DR3, DQWZ
- 90-100% associated with clinical or subclinical gluten-sensitive enteropathy (e.g.celiac disease)
- 30% have thyroid disease; increased risk of intestinal lymphoma in untreated comorbid celiac disease; iron/folate deficiency is common

Epidemiology
- 20-60 yr, M:F=2:1

Investigations
- biopsy
- immunofluorescence shows IgA deposits in perilesional skin

Management
- dapsone (sulfapyridine if contraindicated or poorly tolerated)
- gluten-free diet for life – this can reduce risk of lymphoma

Porphyria Cutanea Tarda

Clinical Features
- skin fragility followed by formation of tense vesicles/bullae and erosions on photo-exposed skin
- gradual healing to scars, milia
- periorbital violaceous discolouration, diffuse hypermelanosis, facial hypertrichosis
- common sites: light-exposed areas subjected to trauma, dorsum of hands and feet, nose, and upper trunk

Pathophysiology
- uroporphyrinogen decarboxylase deficiency leads to excess heme precursors
- can be associated with hemochromatosis, alcohol abuse, DM, drugs (estrogen therapy, NSAIDs), HIV, hepatitis C, increased iron indices

Epidemiology
- 30-40 yr, M>F

Investigations
- urine and 5% HCl shows orange-red fluorescence under Wood's lamp (UV rays)
- 24 h urine has elevated uroporphyrins
- stool contains elevated coproporphyrins
- immunofluorescence shows IgE at dermal-epidermal junctions

Management
- discontinue aggravating substances (alcohol, estrogen therapy)
- phlebotomy to decrease body iron load
- low dose hydroxychloroquine

Drug Eruptions

Exanthematous

EXANTHEMATOUS DRUG REACTION

Clinical Features
- morphology: erythematous macules and papules ± scale
- spread: symmetrical, trunk to extremities
- time course: 7-14 d after drug initiation, fades 7-14 d after withdrawal

Diagnosis of a Drug Reaction
Classification by Naranjo et al. has 4 criteria:
1. Temporal relationship between drug exposure and reaction
2. Recognized response to suspected drug
3. Improvement after drug withdrawal
4. Recurrence of reaction on re-challenge with the drug

Definite drug reaction requires all 4 criteria to be met
Probable drug reaction requires #1-3 to be met
Possible drug reaction requires only #1

Epidemiology
- most common cutaneous drug reaction; increased in presence of infections
- common causative agents: penicillin, sulfonamides, phenytoin

Management
- weigh risks and benefits of drug discontinuation
- antihistamines, emollients, topical steroids

Drug Hypersensitivity Syndrome Triad
Fever
Exanthematous eruption
Internal organ involvement

DRUG-INDUCED HYPERSENSITIVITY SYNDROME (DIHS)/DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS)

Clinical Features
- morphology: morbilliform rash involving face, trunk, arms; can have facial edema
- systemic features: fever, malaise, cervical lymphadenopathy, internal organ involvement (e.g. hepatitis, arthralgia, nephritis, pneumonitis, lymphadenopathy, hematologic abnormalities, thyroid abnormalities)
- spread: starts with face or periorbitally and spreads caudally; no mucosal involvement
- time course: onset 1-6 wk after first exposure to drug; persists wk after withdrawal of drug

Epidemiology
- rare: incidence varies considerably depending on drug
- common causative agents: anticonvulsants (e.g. phenytoin, phenobarbital, carbamazepine, lamotrigine), sulfonamides, and allopurinol
- 10% mortality if severe, undiagnosed, and untreated

Management
- discontinue offending drug ± prednisone 0.5 mg/kg/d, consider cyclosporine in severe cases
- may progress to generalized exfoliative dermatitis/erythroderma if drug is not discontinued

Urticarial

DRUG-INDUCED URTICARIA AND ANGIOEDEMA

Clinical Features
- morphology: wheals lasting >24 h unlike non-drug induced urticaria, angioedema (face and mucous membranes)
- systemic features: may be associated with systemic anaphylaxis (bronchospasm, laryngeal edema, shock)
- time course: h-d after exposure depending on the mechanism

Epidemiology
- second most common cutaneous drug reaction
- common causative agents: penicillins, ACEI, analgesics/anti-inflammatories, radiographic contrast media

Management
- discontinue offending drug, treatment with antihistamines, oral corticosteroids, epinephrine if anaphylactic

SERUM SICKNESS-LIKE REACTION

Clinical Features
- morphology: symmetrical cutaneous eruption (usually urticarial)
- systemic features: malaise, low grade fever, arthralgia, lymphadenopathy
- time course: appears 1-3 wk after drug initiation, resolve 2-3 wk after withdrawal

Epidemiology
- more prevalent in children (0.02-0.2%)
- common causative agents: cefaclor in children; bupropion in adults

Management
- discontinue offending drug ± topical/oral corticosteroids

Pustular

ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS (AGEP)

Clinical Features
- morphology: extensive erythematous, edematous, and sterile pustules
- systemic features: high fever, leukocytosis with neutrophilia
- spread: starts in face and intertriginous areas, spreads to trunk and extremities
- time course: appears 1 wk after drug initiation, resolves 2 wk after withdrawal

Epidemiology
- rare: 1-5/million
- common causative agents: aminopenicillins, cephalosporins, clindamycin, calcium channel blockers

Management
- discontinue offending drug and systemic corticosteroids

Bullous

STEVEN-JOHNSON SYNDROME (SJS)/TOXIC EPIDERMAL NECROLYSIS (TEN)

Clinical Features
- morphology: prodromal rash (morbilliform/targetoid lesions ± purpura, or diffuse erythema), confluence of flaccid blisters, positive Nikolsky sign (epidermal detachment with shear stress), full thickness epidermal loss; dusky tender skin, bullae, desquamation/skin sloughing, atypical targets
- classification:
  - BSA with epidermal detachment: <10% in SJS, 10-30% in SJS/TEN overlap, and >30% in TEN
- spread: face and extremities; may generalize; scalp, palms, soles relatively spared; erosion of mucous membranes (lips, oral mucosa, conjunctiva, GU mucosa)
- systemic features: fever (higher in TEN), cytopenias, renal tubular necrosis/AKI, tracheal erosion, infection, contractures, corneal scarring, phimosis, vaginal synechiae
- time course: appears 1-3 wk after drug initiation; progression <4 d; epidermal regrowth in 3 wk
- can have constitutional symptoms: malaise, fever, hypotension, tachycardia

Epidemiology
- SJS: 1.2-6/million; TEN: 0.4-1.2/million
- risk factors: SLE, HIV/AIDS, HLA-B1502 (reaction most prevalent in East Asians, associated with carbamazepine), HLA-B5801 (reaction most prevalent in Asian and White populations, associated with allopurinol)
- common causative agents: drugs (allopurinol, anti-epileptics, sulfonamides, NSAIDs, cephalosporins) responsible in 50% of SJS and 80% of TEN; viral or mycoplasma infections
- prognosis: 5% mortality in SJS, 30% in TEN due to fluid loss and infection

Differential Diagnosis
- scarlet fever, phototoxic eruption, GVHD, SSSS, exfoliative dermatitis, AGEP, paraneoplastic pemphigus

Management
- discontinue offending drug
- admit to intermediate/intensive care/burn unit
- supportive care: IV fluids, electrolyte replacement, nutritional support, pain control, wound care, sterile handling, monitor for and treat infection
- IVIg, cyclosporine, or etanercept

SCORTEN Score for TEN Prognosis
One point for each of: age ≥40, malignancy, initial BSA detached ≥10%, tachycardia ≥120 bpm, serum urea >10 mmol/L, serum glucose >14 mmol/L, serum bicarbonate <20 mmol/L

Used to determine appropriate clinical setting: score 0-1 can be treated in non-specialized wards; score ≥2 should be transferred to intensive care or burn unit

Score at admission is predictive of survival: 94% for 0-1, 87% for 2, 53% for 3, 25% for 4, and 17% for ≥5

Systemic Immunomodulating Therapies for Stevens-Johnson Syndrome and Toxic Epidermal Necrolysis: A Systematic Review and Meta-analysis
JAMA Dermatol 2017;153:514-522
Purpose: To examine possible immunomodulating treatments for SJS/TEN and estimate mortality effect compared to supportive care.
Methods: Systematic review of randomized and nonrandomized studies on systemic immunomodulating therapies or supportive care for SJS/TEN.
Results: Ninety-six studies with 3248 patients were included in the final analysis. Glucocorticoids were associated with a survival benefit for patients (aggregate - OR 0.5, 95% CI 0.3-1.01). Though findings were limited to a small number of patients overall, cyclosporine was associated with significant benefit (OR 0.1; 95% CI 0.0-0.4). No beneficial effects were observed with other therapies, including IVIg.
Conclusion: Though based on limited evidence, glucocorticoids and cyclosporine were most promising as SJS/TEN immunosuppressive therapies.

Other

FIXED DRUG ERUPTION

Clinical Features
- morphology: sharply demarcated erythematous oval patches on the skin or mucous membranes
- spread: commonly face, mucosa, genitalia, acral; recurs in same location upon subsequent exposure to the drug (fixed location)

Epidemiology
- common causative agents: antimicrobials (tetracycline, sulfonamides), anti-inflammatories, psychoactive agents (barbiturates), phenolphthalein

Management
- discontinue offending drug ± prednisone 1 mg/kg/d x 2 wk for generalized lesions
- potent topical corticosteroids for non-eroded lesions or antimicrobial ointment for eroded lesions

PHOTOSENSITIVITY REACTION

Clinical Features
- phototoxic reaction: "exaggerated sunburn" (erythema, edema, vesicles, bullae) confined to sun-exposed areas
- photoallergic reaction: pruritic eczematous eruption with papules, vesicles, scaling, and crusting that may spread to areas not exposed to light

Pathophysiology
- phototoxic reaction: direct tissue injury
- photoallergic reaction: type IV delayed hypersensitivity

Epidemiology
- common causative agents: chlorpromazine, doxycycline, thiazide diuretics, procainamide

Management
- sun protection ± topical/oral corticosteroids

Heritable Disorders

Ichthyosis Vulgaris

Clinical Features
- xerosis with fine scaling as well as large adherent scales ("fish-scales")
- affects arms, legs, palms, soles, back, forehead, and cheeks; spares flexural creases
- improves in summer, with humidity, and as the child grows into adulthood

Pathophysiology
- genetic deficiency in filaggrin protein leads to abnormal retention of keratinocytes (hyperkeratosis)
- scaling without inflammation

Epidemiology
- 1:300 incidence
- autosomal dominant inheritance
- associated with AD and keratosis pilaris

Investigations
- electron microscopy: keratohyalin granules

Management
- immersion in bath and oils followed by an emollient cream, humectant cream, or creams/oil containing urea or α- or β-hydroxy acids
- intermittent systemic retinoids for severe cases

Epidermolysis Bullosa

Clinical Features
- blisters and erosions on skin and mucous membranes following minor trauma
- extracutaneous manifestation may occur in severe disease and include intraoral blistering and erosions, nail abnormalities, esophageal strictures, and genitourinary abnormalities

Pathophysiology
- group of rare inherited diseases caused by mutations in genes coding for structural proteins involved in basement membrane of skin

Differential Diagnosis
- friction blisters, epidermolysis bullosa acquisita

Investigations
- skin biopsy for immunofluorescence mapping

Management
- symptomatic management
- avoid inducing friction on skin
- place padding on furniture
- wear loose clothing and appropriate footwear
- maintain cool ambient room temperature

Neurofibromatosis (Type I; von Recklinghausen's Disease)

Clinical Features
- diagnostic criteria includes 2 or more of the following:
  1. more than 5 café-au-lait patches >1.5 cm in an adult or more than 5 café-au-lait macules >0.5 cm in a child <5 yr
  2. axillary or inguinal freckling
  3. iris hamartomas (Lisch nodules)
  4. optic gliomas
  5. neurofibromas
  6. distinctive bony lesion (sphenoid wing dysplasia or thinning of long bone cortex)
  7. first degree relative with neurofibromatosis Type 1
- associated with pheochromocytoma, astrocytoma, bilateral acoustic neuromas, bone cysts, scoliosis, precocious puberty, developmental delay, and renal artery stenosis
- skin lesions less prominent in neurofibromatosis Type II (see Paediatrics, P89)

Pathophysiology
- autosomal dominant disorder with excessive and abnormal proliferation of neural crest elements (Schwann cells, melanocytes), high incidence of spontaneous mutation
- linked to absence of neurofibromin (a tumour suppressor gene)

Epidemiology
- incidence 1 in 3000

Investigations
- Wood's lamp to detect café-au-lait macules in patients with pale skin

Management
- refer to orthopaedics, ophthalmology, plastics, and psychiatry
- follow-up annually for brain tumours (e.g. astrocytoma)
- excise suspicious or painful lesions
- see Paediatrics, P89

Oculocutaneous Albinism

Clinical Features
- hypopigmentation of skin and hair, including eyebrows and eyelashes, compared to family members and persons of same ethnicity
- ocular involvement: decreased retinal pigmentation, impaired vision, photophobia, nystagmus, strabismus

Pathophysiology
- group of genetic disorders of melanin biosynthesis
- autosomal recessive

Epidemiology
- 1 in 20000
- varies across ethnic groups

Investigations
- often clinical diagnosis, may consider molecular testing

Management
- sun protection
- close surveillance for skin cancers with whole body skin examinations

Vitiligo

Clinical Features
- primary pigmentary disorder characterized by depigmentation
- acquired destruction of melanocytes characterized by sharply demarcated white patches
- associated with streaks of depigmented hair, chorioretinitis
- sites: extensor surfaces and periorificial areas (mouth, eyes, anus, genitalia)
- Koebner phenomenon, may be precipitated by trauma

Pathophysiology
- acquired autoimmune destruction of melanocytes

Interventions for Vitiligo
Cochrane DB Syst Rev 2015;2:CD003263
Purpose: To assess the effects of existing interventions used in the management of vitiligo.
Study: Systematic review of RCTs assessing the effects of vitiligo treatments (topical treatments, light therapies, oral treatments, surgical methods). Primary outcomes were quality of life and >75% re-pigmentation.
Results: Ninety-six RCTs with 4512 participants were deemed eligible, of which only 25 reported on the primary outcomes and were finally included. Re-pigmentation was better with combination therapy (calcipotriol plus PUVA, than PUVA alone, hydrocortisone-17-butyrate plus excimer laser vs. excimer laser alone; oral minipulse of prednisolone (OMP) plus narrowband UVB (NB-UVB) vs. OMP alone; azathioprine with PUVA vs. PUVA alone; 8-methoxypsoralen (8-MOP) plus sunlight vs. psoralen). A non-significant increase in proportion of participants with >75% re-pigmentation was noted in favour of NB-UVB compared to PUVA. Compared to PUVA, the NV-UVB group reported lower incidences of nausea and erythema, but not itching.
Conclusions: Some studies support existing therapies for vitiligo management, but follow-up is needed to assess permanence of re-pigmentation and higher quality RCTs need to be conducted.

Epidemiology
- 1 in 100 incidence
- 30 in 100 with positive family history

Investigations
- rule out associated autoimmune diseases: thyroid disease, pernicious anemia, Addison's disease, T1DM
- Wood's lamp to detect lesions: illuminates UV light onto skin to detect amelanosis (porcelain white discolouration)

Management
- sun avoidance and protection
- topical calcineurin inhibitor (e.g. tacrolimus, pimecrolimus) or topical corticosteroids
- PUVA or NB-UVB
- camouflage
- "bleaching" normal pigmented areas (i.e. monobenzyl ether of hydroquinone 20%) if widespread loss of pigmentation

Infections

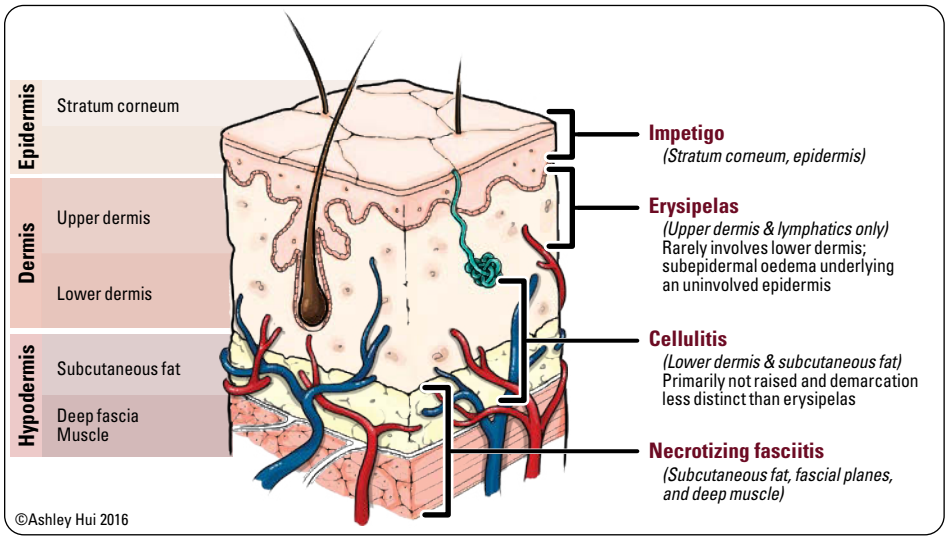

Figure 11. Layers of skin affected by bacterial infections

Bacterial Infections: Epidermis

IMPETIGO

Clinical Features
- acute purulent infection which appears vesicular; progresses to golden yellow "honey-crusted" lesions surrounded by erythema
- can present with bullae
- common sites: face, arms, legs, and buttocks

Etiology
- GAS, *S. aureus*, or both

Epidemiology
- preschool and young adults living in crowded conditions, poor hygiene, neglected minor trauma

Differential Diagnosis
- infected eczema, HSV, VZV

Investigations
- usually clinical diagnosis
- Gram stain and culture of lesion fluid or biopsy

Management
- remove crusts, use saline compresses, and topical antiseptic soaks BID
- topical antibiotics (e.g. mupirocin 2% or fusidic acid 2% (Canada only) TID; continue for 7-10 d after resolution, or 1% ozenoxacin cream BID for 5 d)
- systemic antibiotics (e.g. cloxacillin or cephalexin for 7-10 d)

Staphylococcal Scalded Skin Syndrome
- see Emergency Medicine, ER43

Bacterial Infections: Dermis

Table 17. Comparison of Erysipelas and Cellulitis

	Clinical Features	Etiology	Complications	Differential Diagnosis	Investigations	Management
Erysipelas	Involves upper dermis Confluent, erythematous, sharp raised edge, warm plaque, well demarcated Very painful ("St. Anthony's fire") Sites: face and legs Systemic symptoms: fever, chills, headache, weakness (if present, sign of more serious infection)	GAS	Scarlet fever, streptococcal gangrene, fat necrosis, coagulopathy Spreads via lymphatics	DVT (less red, less hot, smoother), superficial phlebitis, contact dermatitis, photosensitivity reaction, stasis dermatitis, panniculitis, vasculitis	Clinical diagnosis: rarely do skin/blood culture If suspect necrotizing fasciitis: do immediate biopsy and frozen section, histopathology	1st line: penicillin, cephalexin, cloxacillin or cefazolin 2nd line: clindamycin If allergic to penicillin, use erythromycin
Cellulitis	Involves lower dermis/subcutaneous fat Unilateral erythematous flat lesion, often with vesicles, poorly demarcated, not uniformly raised Tender Sites: commonly on legs Systemic symptoms (uncommon): fever, leukocytosis, lymphadenopathy	GAS, *S. aureus* (large sized wounds), *Haemophilus influenzae* (periorbital), *Pasteurella multocida* (dog/cat bite)	Uncommon	Same as erysipelas	Same as erysipelas	1st line: cloxacillin or cefazolin/cephalexin clindamycin Hospitalized and MRSA positive: vancomycin Children: cefuroxime If DM (foot infections): TMP/SMX and metronidazole

COMMON HAIR FOLLICLE INFECTIONS

Table 18. Comparison of Superficial Folliculitis, Furuncles, and Carbuncles

	Clinical Features	Etiology	Management
Superficial Folliculitis	Superficial infection of the hair follicle (versus pseudofolliculitis: inflammation of follicle due to friction, irritation, or occlusion) Acute lesion consists of a dome-shaped pustule at the mouth of hair follicle Pustule ruptures to form a small crust Sites: primarily scalp, shoulders, anterior chest, upper back, other hair-bearing areas	Normal non-pathogenic bacteria (*Staphylococcus* – most common; *Pseudomonas* – hot tub) *Pityrosporum*	Antiseptic (Hibiclens®) Topical antibacterial (fusidic acid, mupirocin, erythromycin, or clindamycin) Oral cloxacillin or cephalexin for 7-10 d
Furuncles (Boils)	Red, hot, tender, inflammatory nodules with central yellowish point, which forms over summit and ruptures Involves subcutaneous tissue that arises from a hair follicle Sites: hair-bearing skin (thigh, neck, face, axillae, perineum, buttocks)	*S. aureus*	Incise and drain large furuncles to relieve pressure and pain If afebrile: hot wet packs, topical antibiotic If febrile/cellulitis: culture blood and aspirate pustules (Gram stain and C&S) Cloxacillin or cephalexin for 1-2 wk (especially for lesions near external auditory canal/nose, with surrounding cellulitis, and not responsive to topical therapy)
Carbuncles	Deep-seated abscess formed by multiple coalescing furuncles Usually in areas of thicker skin Occasionally ulcerates Lesions drain through multiple openings to the surface Systemic symptoms may be associated	*S. aureus*	Same as for furuncles

SKIN ABSCESS

Clinical Features
- painful, fluctuant, erythematous nodule, with or without surrounding cellulitis
- spontaneous drainage or purulent material may be discharged, regional adenopathy may be observed
- may progress to furuncle (deep infection of hair follicle) or carbuncle (collection of furuncles)
- sites: back of the neck, face, axillae, buttocks

Pathophysiology
- one or more pathogens; *S. aureus* with GAS and gram-negative bacilli with anaerobes is common in the perioral, perirectal, or vulvovaginal areas
- collection of pus within the dermis or subcutaneous tissue

Investigations
- clinical diagnosis; laboratory testing with uncomplicated infection in absence of comorbidities or complications is not required

Management
- if drainable abscess, incise and drain
- culture of debrided materials and antibiotics for the following circumstances:
  - severe local infection, systemic signs of infection, history of multiple/recurrent abscesses, presence of underlying comorbidities, immunosuppression, failure of initial antibiotic therapy, extremes of age (i.e. very young or very old), special exposures (e.g. animal bites), prophylaxis against infective endocarditis
- culture of debrided materials is not required in healthy patients who do not receive antibiotics

Bacterial Infections: Epidermis and Dermis

CUTANEOUS ANTHRAX

Clinical Features
- painless, pruritic, red-brown papule with surrounding edema and erythema
- lesions blister and then ulcerate, developing a black eschar
- often associated with systemic symptoms: lymphadenopathy, fever, myalgia, nausea, vomiting

Pathophysiology
- caused by *Bacillus anthracis*

Investigations
- Gram stain and culture
- polymerase chain reaction (PCR)
- full-thickness punch biopsy

Management
- oral antibiotic: ciprofloxacin, levofloxacin, or doxycycline

LEPROSY
- see Infectious Diseases, ID21

PILONIDAL CYST
- see General and Thoracic Surgery, GS49

Dermatophytoses

Clinical Features
- infection of skin, hair, and nails caused by dermatophytes (fungi that live within the epidermal keratin or hair follicle and do not penetrate into deeper structures)

Pathophysiology
- digestion of keratin by dermatophytes resulting in scaly skin, broken hairs, crumbling nails/onycholysis

Etiology
- *Trichophyton, Microsporum, Epidermophyton* species (*Pityrosporum* is a superficial yeast and not a dermatophyte)

Investigations
- skin scrapings, hair, and/or nail clippings analyzed with potassium hydroxide (KOH) prep to look for hyphae and mycelia

Management
- topicals as first line agents for tinea corporis/cruris and tinea pedis (interdigital type): clotrimazole, ketoconazole, terbinafine, or ciclopirox olamine cream applied BID
- oral therapy is indicated for onychomycosis and tinea capitis: terbinafine (Lamisil® – CYP2D6 inhibitor, liver toxicity) or itraconazole (Sporanox® – CYP3A4 inhibitor, liver toxicity)

A Placebo-Controlled Trial of Antibiotics for Smaller Skin Abscesses
NEJM 2017;376:2545-2555
Purpose: To determine the appropriate management of uncomplicated skin abscesses.
Study: Multi-centre, prospective, double-blind trial involving outpatient adults and children with abscesses 5 cm or smaller, stratified by presence of surgically drainable abscess, abscess size, number of sites of skin infection, and presence of non-purulent cellulitis. Following incision and drainage, participants were randomly assigned to 10 d courses of clindamycin, TMP-SMX or placebo. Primary outcome was clinical cure 7 to 10 d after treatment end. Intention-to-treat analyses were conducted.
Results: Seven hundred and eighty-six participants were enrolled (505 adults, 281 children). 10 d after therapy, the cure rate was similar between clindamycin and TMP-SMX (83.1% vs. 81.7%; P=0.73), and was higher than that of the placebo group (68.9%; P=0.001 for both comparisons). Among those who were cured, new infections at 1 mo follow-up were less common in the clindamycin group than the TMP-SMX or placebo groups (6.8% vs. 11.1%; P=0.03 vs. 12.4%; P=0.06). Adverse events were more frequent with clindamycin than either of the other groups (21.9% vs. 11.1% vs. 12.5%), though all resolved without sequelae.
Conclusions: Clindamycin or TMP-SMX in conjunction with incision and drainage for simple abscesses improves short-term outcomes compared to incision and drainage alone, though side-effects must be considered.

Table 19. Different Manifestations of Dermatophyte Infection

	Clinical Features	Differential Diagnosis	Investigations	Management
Tinea Capitis	Round, scaly patches of alopecia, possibly with broken off hairs; pruritic Sites: scalp, eyelashes, and eyebrows; involving hair shafts and follicles Kerion (boggy, elevated, purulent inflamed nodule/plaque) may form secondary to infection by bacteria and result in scarring May have occipital lymphadenopathy Affects children (mainly Black), immunocompromised adults Very contagious and may be transmitted from barber, hats, theatre seats, pets	Alopecia areata, psoriasis, seborrheic dermatitis, trichotillomania	Wood's light examination of hair: green fluorescence only for Microsporum infection Culture of scales/hair shaft Microscopic examination of KOH preparation of scales or hair shafts	Terbinafine (Lamisil®) x 4 wk N.B.: oral agents are required to penetrate the hair root where dermatophyte resides Adjunctive antifungal shampoos or lotions may be helpful, and may prevent spread (e.g. selenium sulfide 2.5%, ketoconazole, ciclopirox)
Tinea Corporis (Ringworm)	Pruritic, scaly, round/oval plaque with active erythematous margin, ± central clearing Sites: trunk, limbs, face	Granuloma annulare, pityriasis rosea, psoriasis, seborrheic dermatitis	Microscopic examinations of KOH prep of scales show hyphae Culture of scales	Topicals: clotrimazole 1%, ketoconazole 2%, miconazole 2%, terbinafine, or ciclopirox olamine cream BID for 2-4 wk Oral: terbinafine (Lamisil®), or itraconazole (Sporanox®), or fluconazole, or ketoconazole if extensive
Tinea Cruris ("Jock Itch")	Scaly patch/plaque with a well-defined, curved border and central clearing Pruritic, erythematous, dry/macerated Sites: starts medial thigh, spreads centrifugally to perineum, gluteal cleft, buttocks	Candidiasis (involvement of scrotum and satellite lesions), contact dermatitis, erythrasma		
Tinea Pedis (Athlete's Foot)	Pruritic scaling and/or maceration of the web spaces, and powdery scaling of soles Acute infection: interdigital (especially 4th web space) red/white scales, vesicles, bullae, often with maceration Secondary bacterial infection may occur Chronic: non-pruritic, pink, scaling keratosis on soles, and sides of feet May present as flare-up of chronic tinea pedis Predisposing factors: heat, humidity, occlusive footwear	AD, contact dermatitis, dyshidrotic dermatitis, erythrasma, intertrigo, inverse psoriasis		
Tinea Manuum	Primary fungal infection of the hand is rare; usually associated with tinea pedis Acute: blisters at edge of red areas on hands Chronic: single dry scaly patch	AD, contact dermatitis, granuloma annulare, psoriasis		
Tinea Unguium (Onychomycosis)	Crumbling, distally dystrophic nails; yellowish, opaque with subungual hyperkeratotic debris Toenail infections usually precede fingernail infections *T. rubrum* (90% of all toenail infections)	Psoriasis, lichen planus, contact dermatitis, traumatic onychodystrophy, bacterial infection	Microscopic examinations of KOH prep of scales from subungual scraping shows hyphae Culture of subungual scraping or nail clippings on Sabouraud's agar Periodic acid-Schiff (PAS) stain of nail clipping by pathology	Terbinafine (Lamisil®) (6 wk for fingernails, 12 wk for toenails) Itraconazole (Sporanox®) 7 d on, 3 wk off (2 pulses for fingernails, 3 pulses for toenails) Topical: ciclopirox (Penlac®); nail lacquer (often ineffective), Efinaconazole (Jublia®) (48 wk)
Tinea Barbae	Superficial inflamed annular lesions; pustules and crusting around hairs Inflammatory kerion may occur and result in scarring hair loss Predominantly affects men who work with animals Site: beard area	Folliculitis, malignant lymphoma, sporotrichosis	Same as for tinea corporis	Terbinafine (Lamisil®) or Itraconazole (Sporanox®) x 4 wk

DIAPER RASH

• see Paediatrics, P15, P44

Parasitic Infections

CUTANEOUS LARVA MIGRANS

Clinical Features

- erythematous pruritic papules at site of initial infection
- larvae migrate under skin causing serpiginous eruption of red pruritic lines
- sites: often feet, legs, buttocks; anywhere skin comes into contact with contaminated sand or soil

Pathophysiology

- parasitic infection caused by hookworm larvae, most commonly from dog or cat feces

Epidemiology

- most common in tropical or subtropical regions

Management

- self-limiting, often resolves without treatment within a few weeks
- consider treatment with anthelmintics, antihistamines

CUTANEOUS LEISHMANIASIS

Clinical Features

- begins as a solitary pink painless papule, enlarges to nodule or plaque-like lesion with central ulceration
- incubation time typically 2 wk to 6 mo

Pathophysiology
- transmitted by sandflies infected with Leishmania

Investigations
- histology, culture, and PCR

Management
- most cases resolve spontaneously
- may consider treatment with oral antifungals (e.g. fluconazole, ketoconazole) or parenteral treatment in severe or complicated cases

SCABIES

Clinical Features
- characterized by superficial burrows, intense pruritus (especially nocturnal), and secondary infection
- primary lesion: superficial linear burrows; inflammatory papules and nodules in the axilla and groin
- secondary lesion: small urticarial crusted papules, eczematous plaques, excoriations
- common sites: axillae, groin, buttocks, hands/feet (especially web spaces); sparing of head and neck (except in infants)

Pathophysiology
- scabies mite remains alive 2-3 d on clothing/sheets
- incubation of 1 mo, then pruritus begins
- re-infection followed by hypersensitivity in 24 h

Etiology
- *Sarcoptes scabiei* (a mite)
- risk factors: sexual promiscuity, crowding, poverty, nosocomial, immunocompromised

Differential Diagnosis
- asteatotic eczema, dermatitis herpetiformis, lichen simplex chronicus (neurodermatitis)

Investigations
- microscopic examination of root and content of burrow and mineral oil mount for mite, eggs, feces
- skin biopsy may sometimes show scabies mite

Management
- bathe, then apply permethrin 5% cream (i.e. Nix®) from neck down to soles of feet (must be left on for 8-14 h and requires second treatment 7 d after first treatment)
- change underwear and linens; wash twice with detergent in hot water cycle then machine dry
- treat family and close contacts
- pruritus may persist for 2-3 wk after effective treatment due to prolonged hypersensitivity reaction
- mid-potency topical steroids and antihistamines for symptom management after treatment with permethrin

LICE (PEDICULOSIS)

Clinical Features
- intensely pruritic, red excoriations, morbilliform rash, caused by louse (a parasite)
- scalp lice: nits (i.e. louse eggs) on hairs; red, excoriated skin with secondary bacterial infection, lymphadenopathy
- pubic lice: nits on hairs; excoriations
- body lice: nits and lice in seams of clothing; excoriations and secondary infection mainly on shoulders, belt-line, and buttocks

Etiology
- *Phthirus pubis* (pubic), *Pediculus humanus capitis* (scalp), *Pediculus humanus humanus* (body): attaches to body hair and feeds on the nearby body site
- can transmit infectious agents (e.g. *Bartonella quintana, Rickettsia prowazekii*)

Differential Diagnosis
- bacterial infection of scalp, seborrheic dermatitis

Diagnosis
- lice visible on inspection of affected area or clothing seams

Management
- permethrin 1%: Nix® cream rinse (ovicidal), RC & Cor® shampoo, or Kwellada-P® shampoo
- comb hair with fine-toothed comb using dilute vinegar solution to remove nits
- repeat in 7 d after first treatment
- shave hair if feasible, change clothing and linens; wash with detergent in hot water cycle then machine dry
- children are medically cleared to return to school after first treatment

BED BUGS (HEMIPTERA)

Clinical Features
- burning wheals, turning to firm papules, often in groups of three – "breakfast, lunch, and dinner" – in areas with easy access (face, neck, arms, legs, hands)

Etiology
- caused by *Cimex lectularius*, a small insect that feeds mainly at night (hides in crevices in walls and furniture during the day)

Differential Diagnosis
- dermatitis herpetiformis, drug eruptions, ecthyma, other insect bites, scabies

Investigations
- none required, but lesional biopsy can confirm insect bite reaction

Management
- professional fumigation
- topical steroids and oral H1-antagonists for symptomatic relief
- definitive treatment is removal of clutter in home and application of insecticides to walls and furniture

Viral Infections

HERPANGINA

Clinical Features
- small vesicles form in mouth after exposure to virus
- lesions evolve into painful shallow oral ulcers, 1-5 mm in size, yellowish with an erythematous base
- often associated with sore throat, dysphagia, and headache

Pathophysiology
- caused by Coxsackie A viruses, highly contagious

Epidemiology
- most common in children and young adults

Investigations
- typically clinical diagnosis

Management
- self-limited
- symptomatic treatment, acetaminophen for fever and pain

HERPES SIMPLEX VIRUS

Clinical Features
- herpetiform (i.e. grouped) vesicles on an erythematous base on skin or mucous membranes
- transmitted via contact with erupted vesicles or via asymptomatic viral shedding
- primary
  - children and young adults
  - usually asymptomatic; may have high fever, regional lymphadenopathy, malaise
  - followed by antibody formation and latency of virus in dorsal nerve root ganglion
- secondary
  - recurrent form seen in adults; much more common than primary
  - prodrome: tingling, pruritus, pain
  - triggers for recurrence: fever, excess sun exposure, physical trauma, menstruation, emotional stress, URTI
- complications: dendritic corneal ulcer, EM, herpes simplex encephalitis (infants at risk), HSV infection on AD causing Kaposi's varicelliform eruption (eczema herpeticum)
- Ramsay Hunt syndrome (see Otolaryngology, OT23)

- two biologically and immunologically different subtypes: HSV-1 and HSV-2
  - HSV-1
    - typically "cold sores" (grouped vesicles at the mucocutaneous junction which quickly burst)
    - recurrent on face, lips, and hard palate, but NOT on soft, non-keratinized mucous membranes (unlike aphthous ulcers)
  - HSV-2
    - usually sexually transmitted; incubation 2-20 d
    - gingivostomatitis: entire buccal mucosa involved with erythema and edema of gingiva
    - vulvovaginitis: edematous, erythematous, extremely tender, profuse vaginal discharge
    - urethritis: watery discharge in males
    - recurrent on vulva, vagina, penis for 5-7 d
    - differential diagnosis of genital ulcers: candidal balanitis, chancroid, syphilitic chancres

Both HSV-1 and HSV-2 can occur on face or genitalia

Investigations
- Tzanck smear with Giemsa stain shows multinucleated giant epithelial cells
- viral culture, electron microscopy, PCR, and direct fluorescence antibody test of specimen taken from the base of a relatively new lesion
- serologic testing for antibody for current or past infection if necessary

Management
- HSV-1
  - treat during prodrome to prevent vesicle formation
  - topical antiviral (Zovirax®/Xerese®) cream, apply 5-6 times daily for 4-7 d for facial/genital lesions
  - oral antivirals (e.g. acyclovir, famciclovir, valacyclovir) are far more effective and have an easier dosing schedule than topicals
- HSV-2
  - rupture vesicle with sterile needle if you wish to culture it
  - wet dressing with aluminum subacetate solution, Burow's compression, or betadine solution
  - 1st episode: acyclovir 200 mg PO 5x times daily x 10 d
    - maintenance: acyclovir 400 mg PO BID
  - famciclovir and valacyclovir may be substituted and have better enteric absorption and less frequent dosing
  - in case of herpes genitalis, look for and treat any other STIs
  - for active lesions in pregnancy, see Obstetrics, OB31

Erythema Multiforme
Etiology: most often HSV or *Mycoplasma pneumoniae*, rarely drugs
Morphology: macules/papules with central vesicles; classic bull's-eye pattern of concentric light and dark rings (typical target lesions)
Management: symptomatic treatment (oral antihistamines, oral antacids); corticosteroids in severely ill (controversial); prophylactic oral acyclovir for 6-12 mo for HSV-associated EM with frequent recurrences

HERPES ZOSTER VIRUS (SHINGLES)

Clinical Features
- unilateral dermatomal eruption occurring 3-5 d after pain and paresthesia of that dermatome
- vesicles, bullae, and pustules on an erythematous, edematous base
- lesions may become eroded/ulcerated and last days to weeks
- pain can be pre-herpetic, synchronous with rash, or post-herpetic
- severe post-herpetic neuralgia often occurs in elderly
- Hutchinson's sign: shingles on the tip of the nose signifies ocular involvement
  - shingles in this area involves the nasociliary branch of the ophthalmic branch of the trigeminal nerve (V1)
- distribution: thoracic (50%), trigeminal (10-20%), cervical (10-20%); disseminated in HIV

HZV typically involves a single dermatome; and lesions rarely cross the midline

Etiology
- caused by reactivation of VZV
- risk factors: immunosuppression, old age, occasionally associated with hematologic malignancy

Differential Diagnosis
- before thoracic skin lesions occur, must consider other causes of chest pain
- contact dermatitis, localized bacterial infection, zosteriform HSV (more pathogenic for the eyes than VZV)

Investigations
- none required, but can do Tzanck test, direct fluorescence antibody test, or viral culture to rule out HSV

Prevention
- routine vaccination in >50 yr with Shingrix® (recombinant zoster vaccine) preferred to in >60 yr Zostavax® (live zoster vaccine)

Management
- compress with normal saline, Burow's or betadine solution
- oral antivirals: famciclovir, valacyclovir, or acyclovir for 7 d; must initiate within 72 h to be of benefit
- analgesia: NSAIDs, acetaminophen for mild-moderate pain; opioids if severe
- post-herpetic neuralgia: tricyclic antidepressants, anticonvulsants (gabapentin, pregabalin)

MOLLUSCUM CONTAGIOSUM

Clinical Features
- discrete dome-shaped and umbilicated pearly, white papules caused by DNA Pox virus (Molluscum contagiosum virus)
- common sites: eyelids, beard (likely spread by shaving), neck, axillae, trunk, perineum, buttocks

Etiology
- virus is spread via direct contact, auto-inoculation, sexual contact
- common in children and sexually active young adults (giant molluscum and severe cases can be seen in the setting of HIV)
- virus is self-limited and can take 1-2 yr to resolve

Investigations
- none required, however can biopsy to confirm diagnosis

Management
- topical cantharidin (a vesicant)
- cryotherapy
- curettage
- topical retinoids
- Aldara® (imiquimod): immune modulator that produces a cytokine inflammation

WARTS (HUMAN PAPILLOMAVIRUS INFECTIONS)

Table 20. Different Manifestations of HPV Infection

	Definition and Clinical Features	Differential Diagnosis	Distribution	HPV Type
Verruca Vulgaris (Common Warts)	Hyperkeratotic, elevated, discrete epithelial growths with papillated surface caused by HPV Paring of surface reveals punctate, red-brown specks (thrombosed capillaries)	Molluscum contagiosum, seborrheic keratosis	Located at trauma sites: fingers, hands, knees of children and teens	At least 80 types are known
Verruca Plantaris (Plantar Warts) **Verruca Palmaris** (Palmar Warts)	Hyperkeratotic, shiny, sharply marginated growths Paring of surface reveals red-brown specks (capillaries), interruption of epidermal ridges	May need to scrape ("pare") lesions to differentiate wart from callus and corn	Located at pressure sites: metatarsal heads, heels, toes	Commonly HPV 1, 2, 4, 10
Verruca Planae (Flat Warts)	Multiple discrete, skin coloured, flat topped papules grouped or in linear configuration Common in children	Syringoma, seborrheic keratosis, molluscum contagiosum, lichen planus	Sites: face, dorsa of hands, shins, knees	Commonly HPV 3, 10
Condyloma Acuminata (Genital Warts)	Skin-coloured pinhead papules to soft cauliflower-like masses in clusters Can be asymptomatic, lasting months to years Highly contagious, transmitted sexually and non-sexually (e.g. Koebner phenomenon via scratching, shaving), and can spread without clinically apparent lesions Investigations: acetowhitening (subclinical lesions seen with acetic acid 5% x5 min and hand lens) Complications: fairy-ring warts (satellite warts at periphery of treated area of original warts)	Condyloma lata (secondary syphilitic lesion, dark field strongly +ve), molluscum contagiosum	Sites: genitalia and perianal areas	Commonly HPV 6 and 11 HPV 16, 18, 31, 33 cause cervical dysplasia, SCC, and invasive cancer

Treatment for Warts
- first line therapies
  - salicylic acid preparations (patches, solutions, creams, ointments), cryotherapy
- second line therapies
  - topical imiquimod, topical 5-fluorouracil, topical tretinoin, podophyllotoxin
- third line therapies
  - curettage, cautery, surgery for non plantar warts, CO_2 laser, oral cimetidine (particularly children), intralesional bleomycin (plantar warts), trichloroacetic acid, diphencyprone

CHICKEN POX (VARICELLA)
- see Paediatrics, P63

ERYTHEMA INFECTIOSUM (FIFTH DISEASE)
- see Paediatrics, P62

HAND-FOOT-AND-MOUTH DISEASE
- see Paediatrics, P62

MEASLES
- see Paediatrics, P62

PARVOVIRUS
- see Paediatrics, P62

ROSEOLA
- see Paediatrics, P62

RUBELLA
- see Paediatrics, P63

VERRUCAE VULGARISMS
- see Table 20, D36

Yeast Infections

CANDIDIASIS

Etiology
- many species of Candida (70-80% of infections are from *Candida albicans*)
- opportunistic infection in those with predisposing factors (e.g. trauma, malnutrition, immunodeficiency)

Candidal Paronychia
- clinical features: painful red swelling of periungual skin
- management: topical agents not as effective; oral antifungals recommended

Candidal Intertrigo
- clinical features
  - macerated/eroded erythematous patches that may be covered with papules and pustules, located in intertriginous areas often under breast, groin, or interdigitally
  - peripheral "satellite" pustules
  - starts as non-infectious maceration from heat, moisture, and friction
- predisposing factors: obesity, DM, systemic antibiotics, immunosuppression, malignancy
- management: keep area dry, terbinafine, ciclopirox olamine, ketoconazole/clotrimazole cream BID until rash clears

Oral terbinafine (Lamisil®) is not effective because it is not secreted by sweat glands

PITYRIASIS (TINEA) VERSICOLOR

Clinical Features
- asymptomatic superficial fungal infection with brown/white scaling macules
- affected skin darker than surrounding skin in winter, lighter in summer (does not tan)
- common sites: upper chest and back

Pathophysiology
- microbe produces azelaic acid → inflammatory reaction inhibiting melanin synthesis yielding variable pigmentation
- affinity for sebaceous glands; requires fatty acids to survive

Etiology
- *Pityrosporum ovale* (*Malassezia furfur*)
- also associated with folliculitis and seborrheic dermatitis
- predisposing factors: summer, tropical climates, excessive sweating, Cushing's syndrome, prolonged corticosteroid use

Investigations
- clinical diagnosis but can perform microscopic examination, KOH prep of scales for hyphae and spores

Management
- ketoconazole 2% shampoo or cream daily for 3 d
- selenium sulfide 2.5% lotion applied for 10 min for 7 d
- ciclopirox olamine BID
- systemic fluconazole or itraconazole for 7 d if extensive

Sexually Transmitted Infections

SYPHILIS

Clinical Features
- characterized initially by a painless ulcer (chancre)
- following inoculation, systemic infection with secondary and tertiary stages

Etiology
- *Treponema pallidum*
- transmitted sexually, congenitally, or rarely by transfusion

Table 21. Stages of Syphilis

	Clinical Features	Investigations	Management
Primary Syphilis	Single red, indurated, painless chancre, that develops into painless ulcer with raised border and scanty serous exudate Chancre develops at site of inoculation after 3 wk of incubation and heals in 4-6 wk; chancre may also develop on lips or anus Regional non-tender lymphadenopathy appears <1 wk after onset of chancre DDx: chancroid (painful), HSV (multiple lesions)	CANNOT be based on clinical features alone VDRL negative – repeat weekly for 1 mo FTA-ABS test has greater sensitivity and may detect disease earlier in course Dark field examination – spirochete in chancre fluid or lymph node	Penicillin G, 2.4 million units IM, single dose
Secondary Syphilis	Presents 2-6 mo after primary infection (patient may not recall presence of primary chancre) Associated with generalized lymphadenopathy, splenomegaly, headache, chills, fever, arthralgias, myalgias, malaise, photophobia Lesions heal in 1-5 wk and may recur for 1 yr 3 types of lesions: 1. Macules and papules: flat top, scaling, non-pruritic, sharply defined, circular/annular rash (DDx: pityriasis rosea, tinea corporis, drug eruptions, lichen planus) 2. Condyloma lata: wart-like moist papules around genital/perianal region 3. Mucous patches: macerated patches mainly found in oral mucosa	VDRL positive FTA-ABS +ve; –ve after 1 yr following appearance of chancre Dark field +ve in all secondary	Same as for primary syphilis
Tertiary Syphilis	Extremely rare 3-7 yr after secondary Main skin lesion: 'Gumma' – a granulomatous non-tender nodule	As in primary syphilis, VDRL can be falsely negative	Penicillin G, 2.4 million units IM weekly x 3 wk

Natural History of Untreated Syphilis
- Inoculation
- Primary syphilis (10-90 d after infection)
- Secondary syphilis (simultaneous to primary syphilis or up to 6 mo after healing of primary lesion)
- Latent syphilis
- Tertiary syphilis (2-20 yr)

Latent Syphilis
70% of untreated patients will remain in this stage for the rest of their lives and are immune to new primary infection

GONOCOCCEMIA

Clinical Features
- disseminated gonococcal infection
- hemorrhagic, tender, pustules on a purpuric/petechial background
- common sites: distal aspects of extremities
- associated with fever, arthritis, urethritis, proctitis, pharyngitis, and tenosynovitis
- neonatal conjunctivitis if infected via birth canal

Etiology
- *Neisseria gonorrhoeae*

Investigations
- requires high index of clinical suspicion because tests are often negative
- bacterial culture of blood, joint fluid, and skin lesions
- joint fluid cell count and Gram stain

Management
- notify public health authorities
- screen for other STIs
- cefixime 400 mg PO (drug of choice) or ceftriaxone 1 g IM

Herpes Simplex Virus
- see *Viral Infections*, D34

Human Papillomavirus
- see *Viral Infections*, D36

Pre-Malignant Skin Conditions

Actinic Keratoses (Solar Keratoses)

Clinical Features
- ill-defined, scaly, erythematous papules or plaques associated with sun-damaged skin (solar heliosis)
- sandpaper-like, gritty sensation felt on palpation, often easier to appreciate on palpation rather than inspection
- sites: areas of sun exposure (face, ears, scalp if bald, neck, sun-exposed limbs)

Pathophysiology
- UV radiation damage to keratinocytes from repeated sun exposure (especially UVB)
- risk of transformation of AK to SCC (~1/1000), but higher likelihood if AK is persistent
- UV-induced p53 gene mutation
- risk factors: increased age, light skin/eyes/hair, immunosuppression, genetic syndromes such as albinism or xeroderma pigmentosum
- risk factors for malignancy: immunosuppression, history of skin cancer, persistence of AK

Types of AK
- Erythematous: typical AK lesion
- Hypertrophic: thicker, rough papule/plaque
- Cutaneous horn: firm hyperkeratotic outgrowth
- Actinic cheilitis: confluent AKs on the lip
- Pigmented: flat, tan-brown, scaly plaque
- Spreading pigmented
- Proliferative
- Conjunctival: pinguecula, pterygium

Epidemiology
- common with increasing age, outdoor occupation, M>F
- skin phototypes I-III, rare in deeper skin tones as melanin is protective

Differential Diagnosis
- SCC *in situ*, superficial BCC, seborrheic keratosis

Investigations
- biopsy refractory or suspicious lesions (infiltrative, tender, bleeding spontaneously)

Management
- destructive: shave excision and curettage with electrodesiccation, or cryotherapy
- topical pharmacotherapy (mechanism: destruction of rapidly growing cells or immune system modulation)
  - topical 5-fluorouracil cream (for 2-4 wk), imiquimod 5% (2x/wk for 16 wk), imiquimod 3.75% (daily for 2 wk, and then daily again for 2 wk more), ingenol mebutate gel 0.015% (daily for 3 d on the head and neck), ingenol mebutate gel 0.05% (daily for 2 d on the body)
- photodynamic therapy
- chemical peels (e.g. TCA, phenol)
- excision

Leukoplakia

Clinical Features
- a morphologic term describing homogeneous or speckled white plaques with sharply demarcated borders
- sites: oropharynx, most often floor of the mouth, soft palate, and ventral/lateral surfaces of the tongue

Pathophysiology
- precancerous or pre-malignant condition
- oral variant is strongly associated with tobacco use and alcohol consumption

Epidemiology
- 1-5% prevalence in adult population >30 y/o; peak at age 50
- M>F, fair-skinned
- most common oral mucosal pre-malignant lesion

Differential Diagnosis
- lichen planus, oral hairy leukoplakia, white sponge nevus

Investigations
- biopsy due to risk of malignancy

Management
- low-risk sites on buccal/labial mucosal or hard palate: eliminate carcinogenic habits, smoking cessation, follow-up
- moderate/dysplastic lesions: excision, cryotherapy

Malignant Skin Tumours

Nonmelanoma Skin Cancers

BASAL CELL CARCINOMA

Subtypes
- noduloulcerative (typical)
  - skin-coloured papule/nodule with rolled, translucent ("pearly") telangiectatic border, and depressed/eroded/ulcerated centre
- pigmented variant
  - areas of pigment in translucent lesion with surface telangiectasia
  - may mimic MM
- superficial variant
  - thin, tan to red-brown plaque, often with scaly, pearly border, and fine telangiectasia at margin
  - least aggressive subtype
- sclerosing (morpheaform) variant
  - flesh/yellowish-coloured, shiny papule/plaque with indistinct borders, indurated

Pathophysiology
- malignant proliferation of basal keratinocytes of the epidermis
  - low grade cutaneous malignancy, locally aggressive (primarily tangential growth), rarely metastatic
  - usually due to UVB light exposure, therefore >80% on sun exposed sites
  - typical latency period of 20-50 yr between time of UV damage and onset of BCC
  - also associated with previous scars, radiation, trauma, arsenic exposure, or genetic predisposition (Gorlin Syndrome)

Epidemiology
- most common malignancy in humans
- 75% of all malignant skin tumours in >40 y/o, increased prevalence in the elderly
- risk factors: M>F, skin phototypes I and II, chronic cumulative sun exposure, ionizing radiation, immunosuppression, arsenic exposure

Differential Diagnosis
- benign: sebaceous hyperplasia, intradermal melanocytic nevus, dermatofibroma
- malignant: nodular MM, SCC, merkel cell carcinoma (MCC)

Management
- see Table 22, *Management of Nonmelanoma Skin Cancers*
- follow-up for new primary disease or recurrence
- 95% cure rate if lesion <2 cm in diameter or if treated early

Workup/Investigations of Basal Cell Carcinoma and Other Nonmelanoma Skin Cancers
- **History:** duration, growth rate, family/personal Hx of skin cancer, prior therapy to the lesion
- **Physical:** location, size, whether circumscribed, tethering to deep structures, full skin exam, lymph node exam
- **Biopsy:** if shallow lesion, can do shave biopsy; otherwise punch or excisional biopsy may be more appropriate

Surgical Margins
- **Smaller lesions:** electrodessication and curettage with 2-3 mm margin of normal skin
- **Deep infiltrative lesions:** surgical excision with 3-5 mm margins beyond visible and palpable tumour border, which may require skin graft or flap; or Mohs surgery, which conserves tissue and does not require margin control

Table 22. Management of Nonmelanoma Skin Cancers

Treatment Category	Treatment Options	Indications	Disadvantages
Topical	Imiquimod 5% cream (Aldara®)	Superficial BCCs, Bowen's Disease	Side effects: erythema, edema, ulceration and scaling
	Cryotherapy	Superficial BCCs, Bowen's Disease Advantages: minimal equipment, simple to perform, cost-effective, no restriction of activity after surgery	Margin around cancer may not be free, potential for scarring, minimally painful, no skin tissue for diagnosis
	5-fluorouracil (Efudex®)	Superficial BCCs, Bowen's Disease	Side effects: pain, burning, swelling
Procedural	Photodynamic therapy	Superficial BCCs Advantages: low cost, tolerable side effect profile	Side effects: pain
	Radiation therapy	Advanced cases of BCC, SCC Advantages: if lesions are located in cosmetically sensitive area	Side effects: alopecia, pigmentary changes, fibrosis, atrophy, buccal mucositis, gingivitis, telangiectasias
Surgical	Shave excision and electrodessication and curettage	Most types of BCCs, Bowen's Disease Advantages: minimal equipment needed, simple to perform, cost-effective, no restriction of activity after surgery	Not used for morpheaform BCC, margin around cancer may not be free, slow healing, possible scarring
	Mohs surgery	BCC and SCC lesions on the face or in areas that are difficult to reconstruct Advantages: highest cure rate, good cosmetic results, healthy skin tissue is preserved	Expensive, highly technical, resource intensive, activity restriction after surgery if skin graft/flap needed
	Traditional surgical excision	SCC Advantages: margin around cancer more likely to be free than shave excision, tissue is available for diagnosis, cosmetic satisfaction	Activity restriction after surgery if skin graft/flap needed, healthy tissue around cancer must be removed
Medical Therapy	Vismodegib	Metastatic BCC, Gorlin Syndrome (multiple BCCs)	Side effects: muscle spasms, hair loss, abnormal taste, weight loss, nausea, amenorrhea

BOWEN'S DISEASE (SQUAMOUS CELL CARCINOMA *IN SITU*)

Clinical Features
- sharply demarcated erythematous patch/thin plaque with scale and/or crusting
- often 1-3 cm in diameter and found on the skin and mucous membranes
- evolves to SCC in 10-20% of cutaneous lesions and >20% of mucosal lesions

Management
- see Table 22, *Management of Nonmelanoma Skin Cancers*, D40
- shave excision with electrodessication and curettage

SQUAMOUS CELL CARCINOMA

Clinical Features
- hyperkeratotic indurated, pink/red/skin-coloured papule/plaque/nodule with surface scale/crust ± ulceration
- more rapid enlargement than BCC
- exophytic (grows outward), may present as a cutaneous horn
- common sites: face, ears, scalp, forearms, dorsum of hands

Pathophysiology
- malignant neoplasm of keratinocytes (primarily vertical growth)
- predisposing factors include: cumulative UV radiation, PUVA, ionizing radiation therapy/exposure, chemical carcinogens (such as arsenic, tar, and nitrogen mustards), HPV 16 or 18, immunosuppression
- may occur in previous scar (SCC more commonly than BCC)

Epidemiology
- second most common type of cutaneous neoplasm
- primarily on sun-exposed skin in the elderly, M>F, skin phototypes I and II, chronic sun exposure
- SCC is the most common cutaneous malignancy in immunocompromised patients such as in organ transplant recipients, with increased mortality as compared to non-immunocompromised population

Differential Diagnosis
- benign: wart, psoriasis, irritated seborrheic keratosis
- pre-malignant: AK, Bowenoid papulosis
- malignant: keratoacanthoma, Bowen's disease, BCC, amelanotic melanoma

Management
- see Table 22 *Management of Nonmelanoma Skin Cancers*, D40
- lifelong follow-up (more aggressive treatment than BCC)

Prognosis
- good prognostic factors: early treatment, negative margins, and small size of lesion
- rate of metastasis from primary SCC is 2-5%
- metastasis rates are higher if diameter >2 cm, depth >4 mm, recurrent, involvement of bone/muscle/nerve, location on scalp/ears/nose/lips, immunosuppressed, caused by arsenic ingestion, or tumour arose from scar/chronic ulcer/burn/genital tract/sinus tract

KERATOACANTHOMA

Clinical Features
- rapidly growing, firm, dome-shaped, erythematous or skin-coloured volcano-like nodule with central keratin-filled crater
- may spontaneously regress
- sites: sun-exposed skin

Pathophysiology
- epithelial neoplasm with atypical keratinocytes in epidermis
- low grade variant of SCC

Etiology
- HPV, UV radiation, chemical carcinogens (tar, mineral oil)

Epidemiology
- most common in >50 y/o, rare in <20 y/o

Differential Diagnosis
- treat as SCC until proven otherwise
- nodular BCC, MCC, hypertrophic solar keratosis, verruca vulgaris

Interventions for AK
Cochrane DB Syst Rev 2012;2:CD004415
Purpose: To assess the efficacy of treatments for AK.
Methods: Systematic review of RCTs.
Results: A total of 83 RCTs (10036 patients) were included evaluating 24 treatments. Cryotherapy, diclofenac, 5-fluorouracil, imiquimod, ingenol mebutate, photodynamic therapy, resurfacing and trichloroacetic acid peel were all effective at treating AK and generally comparable with one another. Skin irritation was more common with diclofenac and 5-fluorouracil. Photodynamic therapy and imiquimod treatment resulted in better cosmetic appearance.
Conclusion: For individual lesions, photodynamic therapy is more effective than cryotherapy. For field-directed treatments, 5-fluorouracil, diclofenac imiquimod and ingenol mebutate had comparable efficacy.

Management
- surgical excision or saucerization (shave biopsy) followed by electrodesiccation of the base, treated similarly to SCC
- intralesional methotrexate injection

Malignant Melanoma

Clinical Features
- malignant characteristics of a mole: "ABCDE" mnemonic
- sites: skin, mucous membranes, eyes, CNS
- ~2/3 arise *de novo* without an associated nevus
- abnormal dermoscopic features

Clinical Subtypes of Malignant Melanoma
- **lentigo maligna**
  - MM *in situ* (normal and malignant melanocytes confined to the epidermis)
  - 2-6 cm, tan/brown/black uniformly flat macule or patch with irregular borders
  - lesion grows radially and produces complex colours
  - often seen in the elderly
  - 10% evolve to lentigo maligna melanoma
- **lentigo maligna melanoma** (5-15% of all melanomas)
  - older individuals, ~7th decade
  - malignant melanocytes invading into the dermis
  - associated with pre-existing solar lentigo, not pre-existing nevi
  - flat, brown, stain-like, gradually enlarging with loss of skin surface markings
  - with time, colour changes from uniform brown to dark brown with black and blue
  - found on all skin surfaces, especially those often exposed to sun, such as the face and hands
- **superficial spreading melanoma** (60-70% of all melanomas)
  - atypical melanocytes initially spread laterally in epidermis then invade the dermis
  - irregular, indurated, enlarging plaques with red/white/blue discolouration, focal papules or nodules
  - ulcerate and bleed with growth
  - subtype most likely associated with pre-existing nevus
- **nodular melanoma** (15-30% of all melanomas)
  - atypical melanocytes that initially grow vertically with little lateral spread
  - uniformly ulcerated, blue-black, and sharply delineated plaque or nodule
  - rapidly fatal
  - may be pink or have no colour at all, this is called an amelanotic melanoma
  - EFG = elevated, firm, growing
- **acral lentiginous melanoma** (5-10% of all melanomas)
  - ill-defined dark brown, blue-black macule
  - palmar, plantar, subungual skin
  - melanomas on mucous membranes have poor prognosis
- **amelanotic melanoma** (2-8% of all melanomas)
  - little to no pigment
  - pink or red macules, papules, or nodules, some may present with light-brown pigmentation
  - delay in diagnosis may contribute to its poor prognosis
  - MM in young children is more commonly amelanotic variant

Pathophysiology
- malignant neoplasm of pigment-forming cells (melanocytes and nevus cells)

Epidemiology
- 1 in 75 (Canada), 1 in 50 (US)
- risk factors: increasing age, fair skin, red hair, positive personal/family history, familial dysplastic nevus syndrome, large congenital nevi (>20 cm), any dysplastic nevi, >50 common nevi, immunosuppression, sun exposure with sunburns, tanning beds
- most common sites: back (M), calves (F)
- worse prognosis if: male, on scalp, hands, feet, late lesion, no pre-existing nevus present

Differential Diagnosis
- benign: nevi, solar lentigo, seborrheic keratosis, dermatofibroma, spitz nevus
- malignant: pigmented BCC, dermatofibrosarcoma protuberans

Management
- excisional biopsy preferable, otherwise incisional biopsy, sentinel lymph node dissection controversial
- remove full depth of dermis and extend beyond edges of lesion only after histologic diagnosis
- beware of lesions that regress – tumour is usually deeper than anticipated
- high dose IFN for stage II (regional), chemotherapy (cis-platinum, BCG) and high dose IFN for stage III (distant) disease
- newer chemotherapeutic regimens, immunotherapy, and vaccines in metastatic melanoma
- radiotherapy may be used as adjunctive treatment

Does this Patient have a Mole or Melanoma?

ABCDE checklist
Asymmetry
Border (irregular and/or indistinct)
Colour (varied)
Diameter (increasing or >6 mm)
Enlargement, elevation, evolution (i.e. change in colour, size, or shape)
Sensitivity 92% (CI 82-96%)
Specificity 100% (CI 54-100%)
JAMA 1998;279:696-701

Risk Factors for Melanoma

no SPF is a SIN
Sun exposure
Pigment traits (blue eyes, fair/red hair, pale complexion)
Freckling
Skin reaction to sunlight (increased incidence of sunburn)
Immunosuppressive states (e.g. renal transplantation)
Nevi (dysplastic nevi; increased number of benign melanocytic nevi)

Node Dissection for Lesions
- >1 mm thick OR <1 mm and ulcerated OR >1 mitoses/mm2 (Stage IB or higher melanoma patients should be offered a sentinel lymph node biopsy)
- Assess sentinel node at time of wide excision

See Landmark Dermatology Trials table for more information on the trial by Hodi et al. 2010, which details improved survival with Ipilimumab in patients with metastatic melanoma.

See Landmark Dermatology Trials table for more information on the BRIM-3 trial comparing the efficacy of BRAF kinase inhibitor vemurafenib (PLX4032) tos dacarbazine in patients with metastatic melanoma.

Table 23. American Joint Committee on Cancer Staging System Based on Breslow's Thickness of Invasion

Tumour Depth	Stage	Approximate 5 Yr Survival
T1 <1.0 mm	Stage I T1a – T2a	5-yr survival 90%
T2 1.01-2.0 mm	Stage II T2b – T4b	5-yr survival 70%
T3 2.01-4.0 mm	Stage III any nodes	5-yr survival 45%
T4 >4.0 mm	Stage IV any mets	5-yr survival 10%

a = no ulceration; b = ulceration

Other Cutaneous Cancers

CUTANEOUS T-CELL LYMPHOMA

Clinical Features
- Mycosis fungoides (limited superficial type)
  - characterized by slightly atrophic scaling, erythematous patches/plaques/nodules/tumours, which may be pruritic and poikilodermic (atrophy, telangiectasia, hyperpigmentation, hypopigmentation)
  - common sites include: trunk, buttocks, proximal limbs
  - mildly symptomatic, usually excellent prognosis for early disease
- Sézary syndrome (widespread systemic type)
  - rare variant characterized by erythroderma, lymphadenopathy, WBC >20 x 10^9/L with Sézary cells
  - can be considered to have evolved from mycosis fungoides (not initially meeting diagnostic criteria), but more commonly arises *de novo*
  - associated with intense pruritus, alopecia, palmoplantar hyperkeratosis, and systemic symptoms (fatigue, fever)
  - often fatal

Pathophysiology
- clonal proliferation of skin-homing CD4 T-cells

Epidemiology
- seen in >50 y, M:F ratio is 2:1

Differential Diagnosis
- tinea corporis, nummular dermatitis, psoriasis, DLE, Bowen's disease, adult T-Cell leukemia-lymphoma (ATL)

Investigations
- skin biopsy (histology, "lymphocyte antigen cell" markers, TcR gene arrangement)
- blood smear looking for Sézary cells or flow cytometry (e.g. CD4:CD8 >10 is characteristic but not diagnostic of Sézary)
- imaging (for systemic involvement)

Management
- Mycosis fungoides
  - depends on stage of disease
  - topical steroids and/or PUVA, NB-UVB (311-313 mm)
- Sézary syndrome
  - oral retinoids and IFN
  - extra-corporeal photopheresis
  - may need radiotherapy for total skin electron beam radiation
  - may maintain on UV therapy
  - other chemotherapy agents

KAPOSI SARCOMA

Definition
- an angioproliferative neoplasm that requires infection with human herpesvirus 8 (HHV-8)
- 4 types based on the clinical circumstance at which it develops
  - classical: develops in middle or old age in individuals of Meditarranen descent
  - endemic: seen in sub-Saharan indigenous Africans
  - iatrogenic: associated with immunosuppressive drug therapy and renal allograft recipients
  - AIDS associated

Clinical Features
- purplish, reddish blue, or dark brown/black macules, plaques, and nodules on the skin
- skin nodules can range in size from very small to several centimeters in diameter, and lesions may ulcerate and bleed
- lesions typically present on the distal extremities
- also affects the gastrointestinal tract and lymphatics leading to secondary lymphoedema

Epidemiology
- incidence is 0.02% to 0.06% of all malignant tumors, M>F

Differential Diagnosis
- well-differentiated angiosarcoma, benign lymphangiomatosis, hypertrophic lichen planus

Investigations
- biopsy
- PCR - can identify HHV-8 DNA sequences

Treatment
- surgery, cryotherapy, laser surgery, photodynamic therapy, topical retinoids, immunomodulators for superficial macules and plaques
- radiation therapy, systemic chemotherapy

Diseases of Hair Density

Hair Growth

- hair grows in a cyclic pattern that is defined in 3 stages (most scalp hairs are in anagen phase)
  1. growth stage = anagen phase
  2. transitional stage = catagen stage
  3. resting stage = telogen phase
- total duration of the growth stage reflects the type and location of hair: eyebrow, eyelash, and axillary hairs have a short growth stage in relation to the resting stage
- growth of the hair follicles is also based on the hormonal response to testosterone and dihydrotestosterone (DHT); this response is genetically controlled

Hair Regrowth Potential
Ability to regrow hair depends on location of inflammatory infiltrates on hair follicle as stem cells are located at the upper part (bulge region) of the hair follicle
- **Scarring alopecia:** Inflammatory infiltrates found in upper part of hair follicles, destroying stem cells
- **Non-scarring alopecia:** Hair follicle is not permanently damaged, and therefore spontaneous or treatment-induced regrowth is possible

Non-Scarring (Non-Cicatricial) Alopecia

ANDROGENETIC ALOPECIA

Clinical Features
- male- or female-pattern alopecia
- males: fronto-temporal areas progressing to vertex, entire scalp may be bald
- females: widening of central part, "Christmas tree" pattern

Pathophysiology
- action of DHT on hair follicles

Epidemiology
- males: early 20s-30s
- females: 40s-50s

Management
- camouflage techniques (i.e. wigs, hair extensions, powders, concealing lotions or sprays)
- topical minoxidil (Rogaine®) solution or foam to reduce rate of loss/partial restoration
- females: spironolactone (anti-androgenic effects), cyproterone acetate (Diane-35®)
- males: finasteride (Propecia®) (5-α-reductase inhibitor) 1 mg/d
- oral minoxidil
- procedural (hair transplant, platelet-rich plasma)

DDx of Non-Scarring (Non-Cicatricial) Alopecia

Autoimmune
- Alopecia areata

Endocrine
- Hypothyroidism
- Androgens

Micronutrient deficiencies
- Iron
- Zinc

Toxins
- Heavy metals
- Anticoagulants
- Chemotherapy
- Vitamin A

Trauma to the hair follicle
- Trichotillomania
- Tight ponytail or braiding styles

Other
- Syphilis
- Severe illness
- Childbirth

TELOGEN EFFLUVIUM

Clinical Features
- uniform decrease in hair density secondary to hairs leaving the growth (anagen) stage and entering the resting (telogen) stage of the cycle

Pathophysiology
- variety of precipitating factors (i.e. post-partum, psychological stress, major illness)
- hair loss typically occurs 2-4 mo after exposure to precipitant
- regrowth occurs within a few mo but may not be complete

Precipitants of Telogen Effluvium

"**SEND**" hair follicles out of anagen and into telogen
Stress and **S**calp disease (surgery)
Endocrine (hypothyroidism, post-partum)
Nutritional (iron and protein deficiency)
Drugs (acitretin, heparin, lithium, IFN, β-blockers, valproic acid, SSRIs)

ANAGEN EFFLUVIUM

Clinical Features
- hair loss due to insult of hair follicle impairing its mitotic activity (growth stage)

Pathophysiology
- precipitated by chemotherapeutic agents (most common), other medications (bismuth, levodopa, colchicine, cyclosporine), exposure to chemicals (thallium, boron, arsenic)
- dose-dependent effect
- hair loss 7-14 d after single pulse of chemotherapy; most clinically apparent after 1-2 mo
- reversible effect; follicles resume normal mitotic activity few wk after agent stopped

Hair Loss

TOP HAT
Telogen effluvium, Tinea capitis
Out of iron, zinc
Physical: trichotillomania, tight ponytail or braiding styles
Hormonal: hypothyroidism, androgenic
Autoimmune: SLE, alopecia areata
Toxins: heavy metals, anticoagulants, chemotherapy, vitamin A, SSRIs

ALOPECIA AREATA

Clinical Features
- autoimmune disorder characterized by patches of complete hair loss often localized to scalp, but can affect eyebrows, beard, eyelashes, etc.
- may be associated with dystrophic nail changes – fine stippling, pitting
- "exclamation mark" pattern (hairs fractured and have tapered shafts, i.e. looks like "!")
- may be associated with autoimmune conditions: pernicious anemia, vitiligo, thyroid disease, Addison's disease
- spontaneous regrowth may occur within mo of first attack (worse prognosis if young at age of onset and extensive loss)
- frequent recurrence often precipitated by emotional distress
- alopecia totalis: complete loss of hair on scalp
- alopecia universalis: complete loss of scalp hair, eyelashes, eyebrows, and body hair

Non-scarring alopecia: intact hair follicles on exam → biopsy not required (but may be helpful)
Scarring alopecia: absent hair follicles on exam → biopsy required

Management
- excellent prognosis for localized disease
- topical corticosteroids and intralesional triamcinolone acetonide (corticosteroids) can be used for isolated patches
- topical immunotherapy (diphencyprone, anthralin)
- systemic immunosuppressants for refractory or extensive disease
- immunomodulatory (diphencyprone, anthralin)
- newer treatments: janus kinase inhibitors

Alopecia Areata Subtypes
Alopecia totalis: loss of all scalp hair and eyebrows
Alopecia universalis: loss of all body hair

OTHER
- trichotillomania: impulse-control disorder characterized by compulsive hair pulling with irregular patches of hair loss, and with remaining hairs broken at varying lengths
- traumatic (e.g. tight braiding styles, wearing tight ponytails, tight tying of hair coverings)

Scarring (Cicatricial) Alopecia

Clinical Features
- irreversible loss of hair follicles with fibrosis

Etiology
- physical: radiation, burns
- infections: fungal, bacterial, TB, leprosy, viral (HSV)
- primary inflammatory – subdivided into lymphocytic, neutrophilic, and mixed
  - lymphocytic:
    - lichen planus (lichen planopilaris) – white scale around hair follicles, up to 50% have lichen planus at other body sites
    - DLE (note that SLE can cause an alopecia unrelated to DLE lesions which are non-scarring)
    - central centrifugal cicatricial alopecia (CCCA): seen in up to 40% of Black women, starting at central scalp; one of the most commonly diagnosed scarring alopecias, may be associated with hair care practices
  - neutrophilic:
    - folliculitis decalvans – discharge of pus and blood, tufting of hair follicles
    - dissecting cellulitis of the scalp – follicular papules, pustules, nodules, and abscesses develop on the scalp
  - mixed
    - acne keloidalis nuchae – dome-shaped papules, pustules, and plaques on the occipital scalp
- morphea: "coup de sabre" with involvement of centre of scalp

Investigations
- biopsy from active border

Management
- infections: treat underlying infection
- inflammatory: topical/intralesional steroids, anti-inflammatory antibiotics, antimalarials, immunosuppressants (e.g. cyclosporine)

Postmenopausal Hair Changes
- estrogen regulates the growth and cycling of hair follicles
- hormonal changes (e.g. reduced estrogen) during menopause leads to decreased hair diameter, growth rate, and percentage of hairs in the anagen phase; moreover, chronological age affects hair density
- these compounded effects of the two factors above (hormone changes and aging) may lead to a perception of decreased scalp hairs in middle-aged women

Nails and Disorders of the Nail Apparatus

Table 24. Nail Changes in Systemic and Dermatological Conditions

Nail Abnormality	Definition/Etiology	Associated Disease
NAIL PLATE CHANGES		
Clubbing	Proximal nail plate has greater than 180° angle to nail fold, watch-glass nails, bulbous digits	Cyanotic heart disease, bacterial endocarditis, pulmonary disorders, GI disorders, etc.
Koilonychia	Spoon shaped nails	Iron deficiency, malnutrition, DM
Onycholysis	Separation of nail plate from nail bed	Psoriasis, dermatophytes, thyroid disease, repetitive trauma
Onychogryphosis	Hypertrophy of the nail plate producing a curved, claw-like deformity	Poor circulation, chronic inflammation, tinea
Onychohemia	Subungual hematoma	Trauma to nail bed
Onychomycosis	Fungal infection of nail (e.g. dermatophyte, yeast, mould)	HIV, DM, peripheral arterial disease
Onychomadesis	Nail plate detachment from proximal nail fold due to severe trauma that produces a complete arrest of nail matrix activity	Manicures, eczema, chronic paronychia, severe or febrile illness, erythroderma
SURFACE CHANGES		
V-Shaped Nicking	Distal margin has v-shaped loss of the nail plate	Darier's disease (keratosis follicularis)
Pterygium Inversum Unguis	Distal nail plate does not separate from underlying nail bed	Scleroderma
Pitting	Punctate depressions that migrate distally with growth	Psoriasis (random pattern), alopecia areata (geometric, grid-shaped arrangement), eczema
Transverse Ridging	Transverse depressions, often more in central portion of nail plate	Serious acute illness slows nail growth (when present in all nails = Beau's lines), eczema, chronic paronychia, trauma
Transverse White Lines	Bands of white discolouration	Poisons, hypoalbuminemia (Muehrcke's lines)
Onychorrhexis	Brittle nails leading to longitudinal ridging	Lichen planus, psoriasis, normal aging, fungal infection
COLOUR CHANGES		
Yellow		Tinea, jaundice, tetracycline, pityriasis rubra pilaris, yellow nail syndrome, psoriasis, tobacco use
Green		*Pseudomonas*
Black		Melanoma, hematoma
Brown		Nicotine use, psoriasis, poisons, longitudinal melanonychia (more common in Fitzpatrick V and VI)
Splinter Hemorrhages	Extravasation of blood from longitudinal vessels of nail bed, blood attaches to overlying nail plate and moves distally as it grows	Trauma, bacterial endocarditis, blood dyscrasias, psoriasis
Oil Spots	Brown-yellow discolouration	Psoriasis
Leukonychia	White nails	Hypoalbuminemia, chronic renal failure
Terry's Nails	White proximal nail, darker distal nail with ground glass appearance, no lunula	Liver cirrhosis
NAIL FOLD CHANGES		
Herpetic Whitlow	HSV infection of distal phalanx	HSV infection
Paronychia	Local inflammation of the nail fold around the nail bed	Acute: painful infection Chronic: constant wetting (e.g. dishwashing, thumbsucking)
Nail Fold Telangiectasias	Cuticular hemorrhages, roughness, capillary changes	Scleroderma, SLE, dermatomyositis
LOSS OF NAILS		
Temporary Loss	Occurs without scarring	Trauma (especially toenails or fingernails after large subungual hematoma), Beau's lines after severe illness
Permanent Loss	Occurs with scarring	Lichen planus (pterygium), genetic abnormalities (rare)

Adnexal Disorders

HIDRADENITIS SUPPURATIVA

Definition
- a chronic inflammatory skin condition that is a result of poor occlusion of the pilosebaceous units within intertriginous zones

Clinical Features
- primary lesions are inflammatory nodules
- presence of sinus formation, clusters of open comedones (double tombstone comedones), and hypertrophic scarring of intertriginous areas
- sites: occurs primarily in the intertriginous areas of the axillae (most common site), inguinal area, inner thighs, perianal and perineal areas, mammary and inframammary regions, buttocks, pubic region, scrotum, vulva, trunk, and occasionally the scalp and retroauricular areas

Pathophysiology
- follicular occlusion, follicular rupture, and an immune response

Epidemiology
- affects 1-4% of the population, F>M
- onset of symptoms occur between puberty and age 40, typically in 2nd or 3rd decade
- increased incidence in people of African descent
- associated with smoking and excess weight

Differential Diagnosis
- folliculitis, furuncles, carbuncles, acne vulgaris, Crohn's disease, granuloma inguinale, pyoderma gangrenosum

Investigations
- diagnosis is made clinically

Treatment
- behavioural: patient self-management including avoidance of skin trauma, smoking cessation, and weight management
- pain management with NSAIDs
- mild disease: local therapy with topical clindamycin, intralesional corticosteroid injections, topical resorcinol
- moderate to severe disease: antibiotic therapy (oral tetracyclines, clindamycin and rifampin combination, dapsone), oral retinoids, hormonal therapy, surgery (punch debridement), laser and light-based therapies (CO_2 laser and Nd:YAG)
- refractory moderate to severe disease: TNF-α inhibitors such as adalimumab and infliximab, systemic glucocorticoids, and cyclosporine

PRIMARY HYPERHIDROSIS

Definition
- secretion of sweat in amounts greater than physiologically needed for thermoregulation

Clinical Features
- focal, visible, excessive sweating of at least 6 mo without apparent cause
- symptoms typically develop during childhood or adolescence and persist throughout life
- symptoms occur only during waking hours (diurnal)
- focal symptoms typically localized to the palms, soles, and axillae, and less commonly the scalp and face

Pathophysiology
- abnormal or exaggerated central response of the eccrine sweat glands to normal emotional stress

Epidemiology
- affects 1-5% of the population
- most patients have a family history of hyperhidrosis

Differential Diagnosis
- excessive heat, medications (e.g. antidepressants, antipyretics, cholinergic agonists, hormonal agents), menopause, and spinal cord injuries (autonomic dysreflexia, orthostatic hypotension, posttraumatic syringomyelia)

Investigations
- clinical diagnosis, iodine starch test

Treatment
- antiperspirants, botulinum toxin, microwave thermolysis, topical glycopyrronium, suction curettage, systemic agents (oral glycopyrrolate, oral oxybutynin), iontophoresis, or endoscopic thoracic sympathectomy

Oral Diseases

LEUKOPLAKIA
- see *Leukoplakia*, D39

RECURRENT APHTHOUS STOMATITIS

Clinical Features
- also known as "canker sores"
- painful, shallow, typically less than 5 mm in diameter, round to oval shaped, covered by a creamy-white pseudomembrane with an erythematous halo
- sites: labial and buccal mucosa, floor of the mouth, ventral surface of the tongue, soft palate, and oropharyngeal mucosa

Pathophysiology
- dysfunction in the immune system resulting in immunologically mediated damage to epithelial cells
- triggered by trauma, infectious agents, genetic factors, HIV infection, and hormonal fluctuations
- early lesions can show a neutrophilic vessel-based submucosal infiltrate

Epidemiology
- women more commonly affected than men
- peak prevalence in ages 20-30

Differential Diagnosis
- Behçet syndrome, SLE, gluten-sensitive enteropathy, HSV

Investigations
- diagnosis is made clinically

Treatment
- oral hygiene: soft toothbrush, waxed tape-style dental floss, soft-tipped gum stimulator for plaque removal, and nonalcoholic mouthwash
- reduce traumatic factors inside the mouth such as biting cheeks or lips, and sharp/rough dental restorations
- pain control: lidocaine viscous 2%, diphenhydramine liquid (12.5 mg/5 mL), dyclonine lozenges

Skin Manifestations of Systemic Disease

Table 25. Skin Manifestations of Internal Conditions

Disease	Related Dermatoses
AUTOIMMUNE DISORDERS	
Behçet's Disease	Painful aphthous ulcers in oral cavity ± genital mucous membranes, erythema nodosum, acneiform papules
Buerger's Disease	Superficial migratory thrombophlebitis, pallor, cyanosis, gangrene, ulcerations, digital resorptions
Dermatomyositis	Periorbital and extensor violaceous erythema, heliotrope with edema, Gottron's papules (violaceous flat-topped papules with atrophy), periungual erythema, telangiectasia, calcinosis cutis
Polyarteritis Nodosa	Subcutaneous nodules, stellate purpura, erythema, gangrene, splinter hemorrhages, livedo reticularis, ulceration
Reactive Arthritis	Keratoderma blennorrhagica (on feet), balanitis circinata (on male penis)
Rheumatic Fever	Petechiae, urticaria, erythema nodosum, rheumatoid nodules, evanescent rash
Scleroderma	Raynaud's, non-pitting edema, waxy/shiny/tense atrophic skin (morphea), ulcers, cutaneous calcification, periungual telangiectasia, acrosclerosis, salt-and-pepper pigmentation
SLE	Malar erythema, discoid rash (erythematous papules or plaques with keratotic scale, follicular plugging, atrophic scarring on face, hands, and arms), hemorrhagic bullae, palpable purpura, urticarial purpura, patchy/diffuse alopecia, mucosal ulcers, photosensitivity
Crohn's Disease/UC	Pyoderma gangrenosum, erythema nodosum, Sweet's syndrome
ENDOCRINE DISORDERS	
Addison's Disease	Generalized hyperpigmentation or limited to skin folds, buccal mucosa, and scars
Cushing's Syndrome	Moon facies, purple striae, acne, hyperpigmentation, hirsutism, atrophic skin with telangiectasia
DM	Infections (e.g. boils, carbuncles, candidiasis, *S. aureus*, dermatophytoses, tinea pedis and cruris, infectious eczematoid dermatitis), pruritus, eruptive xanthomas, necrobiosis lipoidica diabeticorum, granuloma annulare, diabetic foot, diabetic bullae, acanthosis nigricans, calciphylaxis
Hyperthyroidism	Moist, warm skin, seborrhea, acne, nail atrophy, hyperpigmentation, toxic alopecia, pretibial myxedema, acropachy, onycholysis
Hypothyroidism	Cool, dry, scaly, thickened, hyperpigmented skin; toxic alopecia with dry, coarse hair, brittle nails, myxedema, loss of lateral 1/3 eyebrows
HIV-RELATED	
Infections	Viral (e.g. HSV, HZV, HPV, CMV, Molluscum contagiosum, oral hairy leukoplakia), bacterial (impetigo, acneiform folliculitis, dental caries, cellulitis, bacillary epithelioid angiomatosis, syphilis), fungal (candidiasis, histoplasmosis, cryptococcus, blastomycosis)
Inflammatory Dermatoses	Seborrhea, psoriasis, pityriasis rosea, vasculitis
Malignancies	Kaposi's sarcoma, lymphoma, BCC, SCC, MM
MALIGNANCY	
Adenocarcinoma Gastrointestinal Cervix/anus/rectum	Peutz-Jeghers: pigmented macules on lips/oral mucosa Paget's disease: eroding scaling plaques of perineum
Carcinoma Breast GI Thyroid Breast/lung/ovary	Paget's disease: eczematous and crusting lesions of the skin of the nipple and usually areola of the breast Palmoplantar keratoderma: thickened skin of palms/soles Sipple's syndrome: multiple mucosal neuromas Dermatomyositis: heliotrope erythema of eyelids and violaceous plaques over knuckles
Lymphoma/Leukemia Hodgkin's Acute leukemia	Ataxia telangiectasia: telangiectasia on pinna, bulbar conjunctiva Ichthyosis: generalized scaling especially on extremities, Sweet's syndrome Bloom's syndrome: butterfly erythema on face, associated with short stature
Multiple Myeloma	Amyloidosis: large, smooth tongue with facial petechiae and waxy papules on eyelids, nasolabial folds, and lips
OTHERS	
Liver Disease	Pruritus, hyperpigmentation, spider nevi, palmar erythema, white nails (Terry's nails), porphyria cutanea tarda, xanthomas, hair loss, jaundice
Renal Disease	Pruritus, pigmentation, half and half nails, perforating dermatosis, calciphylaxis
Pruritic Urticarial Papules and Plaques of Pregnancy	Erythematous papules or urticarial plaques in distribution of striae distensae: buttocks, thighs, upper inner arms, and lower back
Cryoglobulinemia	Palpable purpura in cold-exposed areas, Raynaud's, cold urticaria, acral hemorrhagic necrosis, bleeding disorders, associated with hepatitis C infection

Raynaud's Phenomenon DDx

COLD HAND
Cryoglobulins/**C**ryofibrinogens
Obstruction/**O**ccupational
Lupus erythematosus, other connective tissue disease
DM/**D**rugs
Hematologic problems (polycythemia, leukemia, etc.)
Arterial problems (atherosclerosis)
Neurologic problems (vascular tone)
Disease of unknown origin (idiopathic)

Acanthosis Nigricans
An asymptomatic dark thickened velvety hyperpigmentation of flexural skin most commonly around the neck. Associated with DM, obesity, and other endocrine disorders, and malignancy. It is a cutaneous marker of tissue insulin resistance

Paediatric Exanthems

• see Paediatrics, P62

Miscellaneous Lesions

Angioedema and Urticaria

Angioedema

- deeper swelling of the skin involving subcutaneous tissues; often involves the eyes, lips, and tongue
- may or may not accompany urticaria
- hereditary or acquired forms
- hereditary angioedema (does not occur with urticaria)
  - onset in childhood; 80% have positive family history
  - recurrent attacks; 25% die from laryngeal edema
  - triggers: minor trauma, emotional upset, temperature changes
- types of acquired angioedema
  - acute allergic angioedema (allergens include food, drugs, contrast media, insect venom, latex)
  - non-allergic drug reaction (drugs include ACEI)
  - acquired C1 inhibitor deficiency
- treatment
  - prophylaxis with danazol or stanozolol for hereditary angioedema
  - epinephrine pen to temporize until patient reaches hospital in acute attack

Urticaria

- also known as "hives"
- transient, red, pruritic well-demarcated wheals
- each individual lesion lasts less than 24 h
- second most common type of drug reaction
- results from release of histamine from mast cells in dermis
- can also result after physical contact with allergen

Table 26. Classification of Urticaria

Type	Etiology
Acute Urticaria >2/3 of cases Attacks last <6 wk Individual lesions last <24 h	Drugs: especially ASA, NSAIDs Foods: nuts, shellfish, eggs, fruit Idiopathic Infection Drugs (antibiotics, hormones, local anesthetics) Foods Parasitic infections Insect stings (bees, wasps, hornets) Physical contact (animal saliva, plant resins, latex, metals, lotions, soap) Direct mast cell release Opiates, muscle relaxants, radio-contrast agents Complement-mediated Serum sickness, transfusion reactions Infections, viral/bacterial (>80% of urticaria in paediatric patients)
Chronic Urticaria <1/3 of cases Attacks last >6 wk Individual lesion lasts <24 h	Idiopathic (90% of chronic urticaria patients) IgE-dependent: trigger associated Aeroallergens Urticarial vasculitis Arachidonic acid metabolism ASA, NSAIDs Physical Dermatographism (friction, rubbing skin), cold (ice cube, cold water), cholinergic (hot shower, exercise), solar, pressure (shoulder strap, buttocks), aquagenic (exposure to water), adrenergic (stress), heat Other Mastocytosis, urticaria pigmentosa Parasitic infections Systemic diseases: SLE, endocrinopathy, neoplasm Stress
Urticarial Vasculitis Individual lesions last >24 h Often painful, less likely pruritic, wheals with bruise type lesions Biopsy indicated	Idiopathic Infections Hepatitis Autoimmune diseases SLE Drug hypersensitivity Cimetidine and diltiazem

DDx for Urticaria

MAD HIVES
Malignancy
Allergic
Drugs and foods
Hereditary
Infection
Vasculitis
Emotions
Stings

Approach to Urticaria

- Thorough Hx and physical exam
- **Acute:** no immediate investigations needed; consider referral for allergy testing
- **Chronic:** further investigations required: CBC and differential, urinalysis, ESR, TSH, LFTs to help identify underlying cause
- **Vasculitic:** biopsy of lesion and referral to dermatology

Wheal

- Typically erythematous flat-topped, palpable lesions varying in size with circumscribed dermal edema
- Individual lesion lasts <24 h
- Associated with mast cell release of histamine
- May be pruritic

Mastocytosis (Urticaria Pigmentosa)
Rare disease due to excessive infiltration of the skin by mast cells. It manifests as many reddish-brown elevated plaques and macules. Friction to a lesion produces a wheal surrounded by intense erythema (Darier's sign), due to mast cell degranulation; this occurs within minutes of rubbing

Erythema Nodosum

Clinical Features
- acute or chronic inflammation of subcutaneous fat (panniculitis)
- round, red, tender, poorly demarcated nodules
- sites: asymmetrically arranged on extensor lower legs (typically shins), knees, arms
- associated with arthralgia, fever, malaise

Etiology
- 40% are idiopathic
- drugs: sulfonamides, OCPs (also pregnancy), analgesics, all-trans retinoic acid
- infections: GAS, TB, histoplasmosis, *Yersinia*
- inflammation: sarcoidosis, Crohn's > UC
- malignancy: acute leukemia, Hodgkin's lymphoma

Epidemiology
- 15-30 y/o, F:M=3:1
- lesions last for days and spontaneously resolve in 6 wk

Investigations
- CXR (to rule out chest infection and sarcoidosis)
- throat culture, ASO titre, PPD skin test

Management
- symptomatic: bed rest, compressive bandages, wet dressings
- NSAIDs, intralesional steroids, oral potassium iodide
- treat underlying cause

DDx of Erythema Nodosum

NODOSUMM
NO cause (idiopathic) in 40%
Drugs (sulfonamides, OCP, etc.)
Other infections (Group A *Strep*)
Sarcoidosis
UC and Crohn's
Malignancy (leukemia, Hodgkin lymphoma)
Many Infections

Pruritus

Clinical Features
- a sensation provoking a desire to scratch, with or without skin lesions
- lesions may arise from the underlying disease, or from excoriation causing crusts, lichenified plaques, or wheals

Etiology
- dermatologic – generalized
  - asteatotic dermatitis ("winter itch" due to dry skin)
  - pruritus of senescent skin (may not have dry skin, any time of year)
  - infestations: scabies, lice
  - immunoglobulins disease (bullous pemphigoid)
  - drug eruptions: ASA, antidepressants, opiates
  - psychogenic states
- dermatologic – local
  - atopic and contact dermatitis, lichen planus, urticaria, insect bites, dermatitis herpetiformis
  - infection: varicella, candidiasis
  - lichen simplex chronicus
  - prurigo nodularis
- systemic disease – usually generalized
  - hepatic: obstructive biliary disease, cholestatic liver disease of pregnancy
  - renal: chronic renal failure, uremia secondary to hemodialysis
  - hematologic: Hodgkin's lymphoma, multiple myeloma, leukemia, polycythemia vera, hemochromatosis, iron deficiency anemia, cutaneous T-cell lymphoma
  - neoplastic: lung, breast, gastric (internal solid tumours), non-Hodgkin's lymphoma
  - endocrine: carcinoid, DM, hypothyroid/thyrotoxicosis
  - infectious: HIV, trichinosis, echinococcosis, hepatitis C
  - psychiatric: depression, psychosis
  - neurologic: post-herpetic neuralgia, multiple sclerosis

Investigations
- blood work: CBC, ESR, Cr/BUN, LFT, TSH, fasting blood sugar, stool culture, and serology for parasites
- biopsy

Management
- treat underlying cause
- cool water compresses to relieve pruritus
- bath oil and emollient ointment (especially if xerosis is present)
- topical corticosteroid and antipruritics (e.g. menthol, camphor, phenol, mirtazapine, capsaicin)

DDx of Pruritus

SCRATCHED
Scabies
Cholestasis
Renal
Autoimmune
Tumours
Crazies (psychiatric)
Hematology (polycythemia, lymphoma)
Endocrine (thyroid, parathyroid, iron)
Drugs, Dry skin

Consider biopsy of any non-healing wound to rule out cancer

- systemic antihistamines: H1 blockers are most effective, most useful for urticaria
- phototherapy with UVB or PUVA
- doxepin, amitriptyline
- immunosuppressive agents if severe: steroids and steroid-sparing

Wounds and Ulcers

- see Plastic Surgery, PL8, PL17

Sunscreens and Preventative Therapy

Sunburn (Solar Erythema)

- erythema 2-6 h post UV exposure often associated with edema, pain and blistering with subsequent desquamation of the dermis, and hyperpigmentation
- chronic UVA and UVB exposure leads to photoaging, immunosuppression, photocarcinogenesis
- prevention: avoid peak UVR (10 am-4 pm), wear appropriate clothing, wide-brimmed hat, sunglasses, and broad-spectrum sunscreen
- clothing with UV protection expressed as UV protection factor (UPF) is analogous to SPF of sunscreen

Sunscreens

- under ideal conditions an SPF of 10 means that a person who normally burns in 20 min will burn in 200 min following the application of the sunscreen
- topical chemical: absorbs UV light
  - requires application at least 15-30 min prior to exposure, should be reapplied every 2 h (more often if sweating, swimming)
  - UVB absorbers: PABA, salicylates, cinnamates, benzylidene camphor derivatives
  - UVA absorbers: benzophenones, anthranilates, dibenzoylmethanes, benzylidene camphor derivatives
- topical physical: reflects and scatters UV light
  - titanium dioxide, zinc oxide, kaolin, talc, ferric chloride, and melanin
  - all are effective against the UVA and UVB spectrum
  - less risk of sensitization than chemical sunscreens and waterproof, but may cause folliculitis or miliaria
- some sunscreen ingredients may cause contact or photocontact allergic reactions, but are uncommon

Management

- sunburn: if significant blistering present, consider treatment in hospital; otherwise, symptomatic treatment (cool wet compresses, oral anti-inflammatory, topical corticosteroids)
- antioxidants, both oral and topical are being studied for their abilities to protect the skin; topical agents are limited by their ability to penetrate the skin

Topical Steroids

Table 27. Potency Ranking of Topical Steroids

Relative Potency	Relative Strength	Generic Names	Trade Names	Usage
Weak	x1	hydrocortisone – 2.5% (1% available OTC)	Emo Cort®	Intertriginous areas, children, face, thin skin
Moderate	x3	hydrocortisone 17-valerate – 0.2% desonide mometasone furoate	Westcort® Tridesilon® Elocom®	Arm, leg, trunk
Potent	x6	betamethasone – 0.1% 17-valerate – 0.1% amcinonide	Betnovate® Celestoderm – V® Cyclocort®	Body
Very Potent	x9	betamethasone dipropionate – 0.05% fluocinonide – 0.05% halcinonide	Diprosone® Lidex, Topsyn gel® Lyderm® Halog®	Palms and soles
Extremely Potent	x12	clobetasol propionate – 0.05% (most potent) betamethasone dipropionate ointment halobetasol propionate – 0.05%	Dermovate® Diprolene® Ultravate®	Palms and soles

Skin Phototypes (Fitzpatrick)

Phototype	Colour of Skin	Skin's Response to Sun Exposure (without SPF protection)
I	White	Always burns, never tans
II	White	Always burns, little tan
III	White	Slight burn, slow tan
IV	Pale brown	Slight burn, faster tan
V	Brown	Rarely burns, dark tan
VI	Dark brown or black	Never burns, dark tan

SPF = burn time with cream/burn time without cream

UV Radiation

UVA (320-400 nm): Aging
- Penetrates skin more effectively than UVB or UVC
- Responsible for tanning, burning, wrinkling, photoallergy, and premature skin aging
- Penetrates clouds, glass and is reflected off water, snow, and cement

UVB (290-320 nm): Burning
- Absorbed by the outer dermis
- Is mainly responsible for burning and premature skin aging
- Primarily responsible for BCC, SCC
- Does not penetrate glass and is substantially absorbed by ozone

UVC (200-290 nm)
- Is filtered by ozone layer

Body Site: Relative Percutaneous Absorption

Forearm	1.0
Plantar foot	0.14
Palm	0.83
Back	1.7
Scalp	3.7
Forehead	6.0
Cheeks	13.0
Scrotum	42.0

Calculation of strength of steroid compared to hydrocortisone on forearm: relative strength of steroid x relative percutaneous absorption

Side Effects of Topical Steroids
- **Local:** atrophy, perioral dermatitis, steroid acne, rosacea, contact dermatitis, tachyphylaxis (tolerance), telangiectasia, striae, hypertrichosis, hypopigmentation
- **Systemic:** suppression of HPA axis, mood changes, nervousness, insomnia, hyperglycemia, fluid/sodium retention, increased appetite, weight gain, muscular weakness

Dermatologic Therapies

Table 28. Common Topical Therapies

Drug Name	Dosing Schedule	Indications	Comments
Calcipotriol (Dovonex®)	0.005% cream, ointment, scalp solution, apply BID For maintenance therapy, apply once daily	Psoriasis	Burning, itching, skin irritation, worsening of psoriasis Avoid face, mucous membranes, eyes; wash hands after application Maximum weekly dosage of cream by age: 2-5 yr – 25 g/wk 6-10 yr – 50 g/wk 11-14 yr – 75 g/wk >14 yr – 100 g/wk Inactivated by light (do not apply before phototherapy)
Imiquimod (Aldara®)	5% cream applied 3x/wk Apply at bedtime, leave on 6-10 h, then wash off with mild soap and water Max duration 16 wk	Genital warts Cutaneous warts AK Superficial BCC	Avoid natural/artificial UV exposure Local skin and application site reactions Erythema, ulceration, edema, flu-like symptoms Works best for warts on mucosal surfaces May induce inflammation and erosion
Permethrin (Kwellada® P Lotion and Nix® Dermal Cream)	1% or 5% cream, applied once overnight to all skin areas from neck down, repeated one wk later	Scabies (Kwellada-P Lotion, Nix® Dermal Cream) Pediculosis (Kwellada-P Crème Rinse®, Nix Crème Rinse®)	Do not use in children <2 yr Hypersensitivity to drug, or known sensitivity to chrysanthemums Local reactions only (resolve rapidly); including burning, pruritus Low toxicity, excellent results Consider second application after 7 d
Pimecrolimus (Elidel®)	1% cream BID Use for as long as lesions persist and discontinue upon resolution of symptoms	AD (mild to moderate)	Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive
Tacrolimus Topical (Protopic®)	0.03% (children) or 0.1% (adults) ointment BID Continue for duration of disease PLUS 1 wk after clearing	AD (mild to moderate)	Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive

Topical Vehicles

- **Ointment** (water in oil): hydrate, greasy
- **Cream** (oil in water): hydrate, variable
- **Lotion** (powder in water): drying, cosmesis
- **Solutions** (water, alcohol, propylene glycol)
- **Gel** (solution that melts on contact with skin, alcohol): drying
- **Foam** is a newer vehicle and several agents are now available in foam vehicles. Examples include Olux-E™ (clobetasol), Verdeso™ (desonide), Luxiq™ (betamethasone), and Enstilar™ (betamethasone propionate and calcipotriol))
- **Sprays**: Lamisil™ (terbinafine) spray, Clobex™ spray (clobetasol)
- **Lacquers**: Penlac® (ciclopirox), Jublia® (efinaconazole)

Deciding on the Amount of Steroid to Use

- 1 palm = 1% BSA
- 1 fingertip unit (FTU) = Amount of topical medication (from 5 mm nozzle) placed on pad of index finger from distal tip to DIP = 500 mg = 2% BSA
- Therefore give 30 g for every 2 palms of area to cover (if applying steroid BID, 1 mo supply)

Table 29. Common Oral Therapies

Drug Name	Dosing Schedule	Indications	Comments
Acitretin (Soriatane®)	25-50 mg PO once daily; maximum 75 mg/d	Severe psoriasis Other disorders of hyperkeratinization (ichthyosis, Darier's disease)	Monitoring Cr at baseline; LFTs at baseline, then q1-2 wk until stable, then as clinically indicated; fasting lipid panel at baseline, then q1-2 wk until stable, then if long-term treatment or high-risk patient, continue periodically; urine or serum pregnancy test x 2 at baseline, qmo during treatment, then q3 mo for >3 yr after discontinuation; glucose if diabetes; radiography periodically if long-term treatment Contraindications Women of childbearing potential unless strict contraceptive requirements are met Drug interactions Other systemic retinoids, methotrexate, tetracyclines, certain contraceptives May be combined with PUVA phototherapy (known as re-PUVA)
Antivirals	famciclovir (Famvir®) 250 mg PO TID x 7-10 d (for 1st episode of genital herpes) 125 mg PO BID x 3 d (for recurrent genital herpes)	Chickenpox HZV Genital herpes Acute and prophylactic to reduce transmission in infected patients Herpes labialis	Side effects Headache, nausea, diarrhea, abdominal pain Reduce dose if impaired renal function Drug interactions Cladribine, varicella vaccine, zoster vaccine
	valacyclovir (Valtrex®) 1000 mg PO BID x 3 d (for 1st episode of genital herpes) 500 mg PO BID x 5 d (for recurrent genital herpes)		Side effects Dizziness, depression, abdominal pain Reduce dose if impaired renal function Drug interactions cladribine, foscarnet, varicella vaccine, zoster vaccine
Cyclosporine (Neoral®)	2.5-4 mg/kg/d PO divided BID Max 4 mg/kg/d After 4 wk may increase by 0.5 mg/kg/d q2 wk Concomitant dose of magnesium may protect the kidneys	Psoriasis May also be effective in: Lichen planus EM Recalcitrant urticaria Recalcitrant AD	Monitoring BUN/Cr x2 at baseline, then q2 wk x 3 mo, then if stable, qmo; BP x 2, CBC, K^+, Mg^{2+}, lipid panel, uric acid at baseline, then q2 wk x 3 mo, then qmo if stable, or more frequently if adjust dose; LFTs Contraindications Abnormal renal function, uncontrolled hypertension, malignancy (except NMSC), uncontrolled infection, immunodeficiency (excluding autoimmune disease), hypersensitivity to drug Long-term effects preclude use of cyclosporine for >2 yr; discontinue earlier if possible May consider rotating therapy with other drugs to minimize adverse effects of each drug
Dapsone	50-100-150 mg PO once daily tapering to 25-50 mg PO once daily to as low as 50 mg 2x/wk	Dermatitis herpetiformis, neutrophilic dermatoses	Monitoring G6PD before treatment starts; CBC qwk x 4, qmo x 6, then q6 mo thereafter; LFTs at baseline, then periodically Side effects Neuropathy Hemolysis (Vitamin C and E supplementation can help prevent this) Drug interactions Substrate of CYP2C8/9 (minor), 2C19 (minor), 2E1 (minor), 3A4 (major) Often a dramatic response within hours

Table 29. Common Oral Therapies

Drug Name	Dosing Schedule	Indications	Comments
Doxycycline	100 mg PO BID	Acne vulgaris Rosacea Bullous pemphigoid	Contraindications Pregnancy, hepatic impairment, drug hypersensitivity Taking acitretin, isotretinoin, or penicillin antibiotic Oral typhoid vaccine
Isotretinoin (Accutane®, Clarus®, Epuris®)	0.5-1 mg/kg/d given once daily to achieve a total dose of 120 mg/kg (20-24 wk)	Severe nodular and/or inflammatory acne Acne conglobata Recalcitrant acne Widespread comedonal acne	Monitoring Fasting lipid panel at baseline, then q1-2 wk until lipid response to isotretinoin is established or if risk factors more frequently; LFTs at baseline, then q1-2 wk until stable; pregnancy test x 2 at baseline; glucose frequently if risk factors Contraindications Teratogenic – in sexually active females, 2 forms of reliable contraception necessary Generally regarded as unsafe in lactation Side effects Decreased night vision, decreased tolerance to contact lenses, dry mucous membranes May transiently exacerbate acne, dry skin Depression, myalgia Drug interactions Caution if used at the same time as tetracycline family antibiotics – both may cause pseudotumour cerebri Discontinue vitamin A supplements Drug may be discontinued at 16-20 wk when nodule count has dropped by >70%; a second course may be initiated after 2 mo prn Refractory cases may require >3 courses
Itraconazole (Sporanox®)	100-400 mg PO once daily, depending on infection Tinea corporis/cruris/versicolor: 200 mg PO once daily x 7 d Tinea pedis: 200 mg PO BID x 3 d Toenails: 200 mg PO BID x 3 d once per mo, repeated 3x Fingernail involvement only: 200 mg BID PO x 3 d once per mo	Onychomycosis Tinea corporis, cruris, pedis, versicolor, capitis	Contraindications CHF Side effects Serious hepatotoxicity Drug Interactions Inhibits CYP3A4 Increases concentration of some drugs metabolized by this enzyme (i.e. statins, diabetic drugs) Give capsules with food, capsules must be swallowed whole
Ivermectin (Mectizan®, Stromectol®)	200-250 µg/kg PO weekly x 2 Take once as directed; repeat one wk later	Onchocerciasis (USA only) Not licensed for use in Canada Also effective for: scabies	No significant serious side effects Efficacious
Methotrexate	10-25 mg qwk, PO, IM, or IV Max: 30 mg/wk To minimize side effects, administer with folic acid supplementation: 1-5 mg once daily	Psoriasis AD Lymphomatoid papulosis May also be effective in: cutaneous sarcoidosis	Monitoring Pregnancy test at baseline; CBC at baseline, then q6 mo or more frequently if initial treatment, dose change, elevated serum level risk, or chemotherapy use; BUN/Cr, LFTs at baseline, then q4-8 wk or more frequently if initial Tx, dose change, elevated serum level risk, or chemotherapy use; serum albumin at baseline if psoriasis, then continue periodically; CXR at baseline; liver biopsy at baseline if psoriasis or if RA with history of alcoholism, persistently abnormal baseline LFTs, or chronic HBV or HCV infection, then if psoriasis repeat after total cumulative dose 1.5 g and each additional 1-1.5 g; serum drug levels if renal impairment, or high dose chemotherapy use Contraindications Pregnancy, lactation, alcohol abuse, liver dysfunction, immunodeficiency syndrome, blood dyscrasias, hypersensitivity to drug Restricted to severe, recalcitrant or disabling psoriasis not adequately responsive to other forms of therapy May be combined with cyclosporine to allow lower doses of both drugs
OCPs (TriCyclen®, Diane 35®, Alesse®)	1 pill PO once daily	Hormonal acne (chin, jawline) Acne associated with polycystic ovarian syndrome or other endocrine abnormalities	All combined OCPs are helpful in acne but those listed on the left have undergone RCTs Contraindications Smoking, HTN, migraines with aura, pregnancy Routine gynaecological health maintenance should be up to date
Spironolactone	50-100 mg PO once daily alone or with OCPs	Hormonal acne (chin, jawline) Acne with endocrine abnormality	Contraindications Pregnancy Side effects Menstrual irregularities at higher doses if not on OCPs Breast tenderness, mild diuresis common Risk of hyperkalemia – counsel patients to reduce intake of potassium rich foods such as bananas
Terbinafine (Lamisil®)	250 mg PO once daily x 2 wk Fingernails x 6 wk Toenails x 12 wk Confirm diagnosis prior to treatment	Onychomycosis Tinea corporis, cruris, pedis, capitis	Contraindications Pregnancy, chronic or active liver disease Drug interactions Potent inhibitor of CYP2D6; use with caution when also taking β-blockers, certain anti-arrhythmic agents, MAOI type B, and/or antipsychotics Drug concentrates rapidly in skin, hair, and nails at levels associated with fungicidal activity
Tetracycline	250-500 mg PO BID to TID Taken 1 h before or 2 h after a meal	Acne vulgaris Rosacea Bullous pemphigoid	Contraindications Severe renal or hepatic dysfunction

Traumatic and Mechanical Disorders

PERNIOSIS

Definition
- abnormal inflammatory response to cold, damp, non-freezing conditions

Epidemiology
- common in the United Kingdom and northwestern Europe; common for those whose homes lack central heating
- women, the elderly, and children are most affected

Clinical Features
- single or multiple erythematous to blue-violet macules, nodules, or papules
- blistering or ulceration seen in severe cases
- lesions present on the distal toes and fingers, and less often on the heels, ears, and nose
- symptoms of burning, itching, or pain, lasting 1-3 wk

Pathophysiology
- unknown but may be associated with cryoglobulins or cold agglutinins

Differential Diagnosis
- chilblain lupus erythematosus, lupus pernio

Treatment
- warming clothing, avoidance of cold, damp conditions, keeping feet dry, smoking cessation
- nifedipine, nicotinamide, phenoxybenzamine, sympathectomy, and erythemogenic UVB phototherapy

Landmark Dermatology Trials

Trial Name	Reference	Clinical Trial Details
MELANOMA		
Hodi et al. 2010	NEJM 2016; 375:311-322	**Title:** Improved Survival with Ipilimumab in Patients with Metastatic Melanoma **Purpose:** To compare ipilimumab administered with or without a glycoprotein 100 (gp100) peptide vaccine to gp100 alone in patients with previously treated metastatic melanoma. **Methods:** 676 HLA-A*0201–positive patients with unresectable stage III or IV melanoma, were randomized in a 3:1:1 ratio to receive ipilimumab+gp100 (n=403), ipilimumab alone (n=137), or gp100 alone (n=136). **Results:** Median survival was 10 mo among patients receiving ipilimumab plus gp100, as compared with 6.4 mo among patients receiving gp100 alone and 10.1 mo median survival with ipilimumab alone. No significant difference in survival between ipilimumab groups was noted. Grade 3 or 4 immune-related adverse events occurred in 10-15% of patients treated with ipilimumab and 3% treated with gp100 alone. **Conclusions:** Ipilimumab, with or without a gp100 peptide vaccine, as compared with gp100 alone, improved overall survival in patients with previously treated metastatic melanoma.
BRIM-3	NEJM 2011; 364:2507-2516	**Title:** Improved Survival with Vemurafenib in Melanoma with BRAF V600E Mutation **Purpose:** To compare the efficacy of BRAF kinase inhibitor vemurafenib (PLX4032) vs. dacarbazine in patients with metastatic melanoma. Methods: Phase 3 RCT comparing vemurafenib with dacarbazine in 675 patients with untreated, metastatic melanoma with BRAF V600E mutation. Patients were randomized to receive vemurafenib (960 mg orally twice daily) or dacarbazine (1000 mg/m^2 of body-surface area intravenously every 3 weeks). Co-primary endpoints: overall and progression-free survival. **Results:** At 6 mo, overall survival was 84% in the vemurafenib group and 64% in the dacarbazine group. Vemurafenib was associated with a relative reduction of death risk by 63% and a reduction of 74% in the risk of either death or disease progression vs. dacarbazine. Response rates were reported to be 48% for vemurafenib and 5% for dacarbazine. Common adverse events associated with vemurafenib: arthralgia, rash, fatigue, alopecia, keratoacanthoma, photosensitivity, nausea, and diarrhea. **Conclusions:** Vemurafenib improved rates of overall and progression-free survival in patients with previously untreated melanoma with the BRAF V600E mutation.
PSORIASIS		
BE VIVID	Lancet 2021, 397: 475-486.	**Title:** Bimekizumab versus Ustekinumab for the Treatment of Moderate to Severe Plaque Psoriasis (BE VIVID): Efficacy and Safety from a 52-week, Multicentre, Double-blind, Active Comparator and Placebo Controlled Phase 3 Trial **Purpose:** To compare the efficacy and safety of a 52 week treatment with bimekizumab vs. placebo vs ustekinumab in patients with moderate to severe plaque psoriasis. **Methods:** Multicentre RCT involving adults 18 years of age or older with moderate to severe plaque psoriasis (Psoriasis Area and Severity Index [PASI] score ≥12, ≥10% body surface area affected by psoriasis, and Investigator's Global Assessment [IGA] score ≥3 on a five point scale). Patients were randomly assigned (4:2:1) to bimekizumab 320 mg every 4 wks, ustekinumab 45 mg or 90 mg at wks 0 and 4, then every 12 wks, or placebo every 4 wks. At 16wks, patients in the placebo group were switched to bimekizumab. **Results:** The study enrolled 567 patients. At wk 16, 85% of patients in bimekizumab group had PASI90 vs. 50% of in ustekinumab group and 5% in placebo group. Approximately 84% patients in bimekizumab group had an IGA response vs. 53% in ustekinumab group and 5% in placebo groups. Major cardiac adverse events occurred in 5 patients with pre-existing CV risk factors in the bimekizumab group whereas none occurred in the ustekinumab group. Additionally, oral candidiasis rates were higher than placebo and ustekinumab, and one case of IBD was recorded. **Conclusion:** Bimekizumab was more efficacious than ustekinumab and placebo in the treatment of moderate to severe plaque psoriasis. Additional studies may be needed to assess safety.

ER Emergency Medicine

Yousuf Ahmed, Danny Ma, Jackie Tsang, and **Kenneth Williams,** chapter editors
Ming Li and **Jacqui Van Warmerdam,** associate editors
Sarah House and **Vrati Mehra,** EBM editors
Dr. Mark Freedman, Dr. Adam Kaufman, Dr. Jo Jo Leung, Dr. Kaif Pardhan, and **Dr. David Rosenstein,** staff editors

Acronyms

AAA	abdominal aortic aneurysm
ABG	arterial blood gas
ACEI	angiotensin-converting enzyme inhibitor
ACLS	Advanced Cardiac Life Support
ACS	acute coronary syndrome
AED	automatic external defibrillator
AFib	atrial fibrillation
AG	anion gap
ARDS	acute respiratory distress syndrome
AVN	avascular necrosis
AVPU	alert, voice, pain, unresponsive
AXR	abdominal x-ray
Bi-PAP	bilevel positive airway pressure
BSA	body surface area
BUN	blood urea nitrogen
CAS	Children's Aid Society
CIWA	Clinical Institute Withdrawal Assessment for Alcohol
CNS	central nervous system
CPAP	continuous positive airway pressure
CPP	cerebral perfusion pressure
CRP	c-reactive protein
CVA	costovertebral angle
CVS	cardiovascular system
D5W	dextrose 5% in water
D10W	dextrose 10% in water
D50W	dextrose 50% in water
D25W	dextrose 25% in water
DGI	disseminated gonococcal infection
DIC	disseminated intravascular coagulation
DKA	diabetic ketoacidosis
DRE	digital rectal exam
DT	delirium tremens
DVT	deep vein thrombosis
ED	emergency department
EM	erythema multiforme
ESR	erythrocyte sedimentation rate
ETT	endotracheal tube
FAST	focused assessment with sonography for trauma
FEV_1	forced expiratory volume in 1 second
FFP	fresh frozen plasma
GERD	gastroesophageal reflux disease
GCS	glasgow coma scale
HEENT	head eyes ears nose throat
HI	head injury
H&N	head and neck
IBD	inflammatory bowel disease
IBS	irritable bowel syndrome
ICS	intercostal space
INR	international normalized ratio
IVC	inferior vena cava
LBBB	left bundle branch block
LOC	level of consciousness
LP	lumbar puncture
LSD	lysergic acid diethylamide
LVH	left ventricular hypertrophy
MAP	mean arterial pressure
MDI	metered dose inhaler
MDMA	methylenedioxy-methamphetamine
MMSE	mini-mental state examination
MVC	motor vehicle collision
NS	normal saline
NSTEMI	non-ST elevation myocardial infarction
PID	pelvic inflammatory disease
PNS	parasympathetic nervous system
POG	plasma osmolar gap
pRBC	packed red blood cells
PT	prothrombin time
PTT	partial thromboplastin time
RAPD	relative afferent pupillary defect
RBBB	right bundle branch block
ROM	range of motion
RPS	rapid primary survey
RSI	rapid sequence induction
rt-PA	recombinant tissue plasminogen activator
SAH	subarachnoid hemorrhage
SBP	spontaneous bacterial peritonitis
SCI	spinal cord injury
SJS	Stevens-Johnson syndrome
SNS	sympathetic nervous system
SOB	shortness of breath
SSRI	selective serotonin reuptake inhibitor
SSSS	staphylococcal scalded skin syndrome
STEMI	ST elevation myocardial infarction
TBI	traumatic brain injury
TCA	tricyclic antidepressant
Tdap	tetanus, diphtheria, acellular pertussis
TEN	toxic epidermal necrolysis
TIA	transient ischaemic attack
TSS	toxic shock syndrome
VBG	venous blood gas
VFib	ventricular fibrillation
VTach	ventricular tachycardia
VTE	venous thromboembolism

Patient Assessment/Management

1. Rapid Primary Survey

- **A**irway maintenance with C-spine control
- **B**reathing and ventilation
- **C**irculation (pulses, hemorrhage control)
- **D**isability (neurological status)
- **E**xposure (complete) and Environment (temperature control)
  - continually reassessed during secondary survey
  - changes in hemodynamic and/or neurological status necessitates a return to the primary survey beginning with airway assessment
- **IMPORTANT:** always watch for signs of shock while doing primary survey
- addressing the "ABCs" is the hallmark of the emergency department
  - in the setting of cardiac arrest, the approach changes to the "CABs": chest compressions, airway, and breathing
  - CAB can also be applied in massive trauma situations in the setting of massive blood loss to treat hypovolemic shock

Approach to the Critically Ill Patient
1. Rapid Primary Survey (RPS)
2. Resuscitation (often concurrent with RPS)
3. Detailed Secondary Survey
4. Definitive Care

Signs of Airway Obstruction
- Agitation, confusion, "universal choking sign"
- Respiratory distress
- Failure to speak, dysphonia, stridor
- Cyanosis

A. AIRWAY
- first priority is to secure airway
- assume a cervical injury in every trauma patient and immobilize with collar
- assess ability to breathe and speak
- can change rapidly, therefore reassess frequently
- assess for facial fractures/edema/burns (impending airway collapse)

Airway Management
- anatomic optimization to allow for oxygenation and ventilation

1. Basic Airway Management
- protect the C-spine
- chin lift (if C-spine injury not suspected) or jaw thrust to open the airway
- sweep and suction to clear mouth of foreign material

2. Temporizing Measures
- nasopharyngeal airway (if gag reflex present, i.e. conscious)
- oropharyngeal airway (if gag reflex absent, i.e. unconscious)
- "rescue" airway devices (e.g. laryngeal mask airway, Combitube®)
- transtracheal jet ventilation through cricothyroid membrane (last resort)

3. Definitive Airway Management

- ETT intubation with in-line stabilization of C-spine
  - orotracheal ± RSI preferred
  - nasotracheal may be better tolerated in conscious patient
- surgical airway (if unable to intubate using oral/nasal route and unable to ventilate)
- cricothyroidotomy

Contraindications to Intubation

- see Table 2, Anesthesia, A8
- supraglottic/glottic pathology that would preclude successful intubation
- provider safety: e.g. SARS-CoV-2 (COVID-19) precludes intubation, CPR, and other aerosol generating procedures in the absence of full PPE

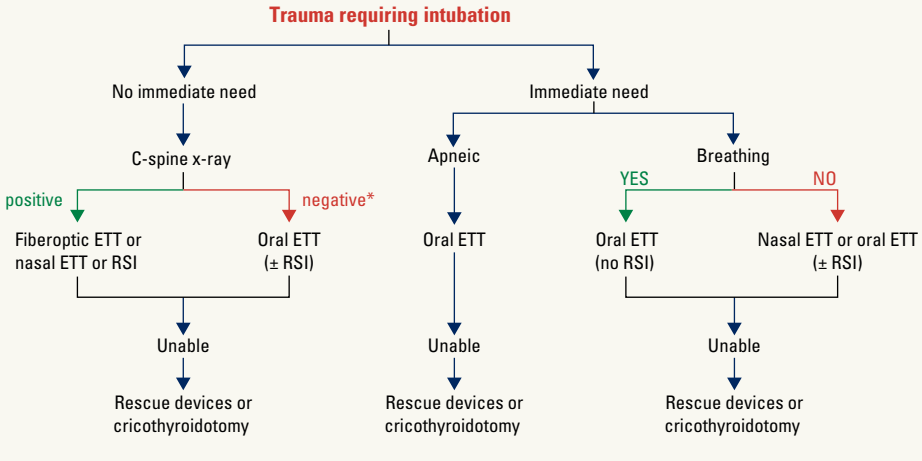

Figure 1. Approach to endotracheal intubation in an injured patient

Medications that can be Delivered via ETT

NAVEL
Naloxone (Narcan®)
Atropine
Ventolin® (salbutamol)
Epinephrine
Lidocaine

Indications for Intubation (4 P's)

- **P**atent airway
- **P**rotects against aspiration (e.g. decreasing GCS < 8)
- **P**ositive pressure ventilation
- **P**ulmonary toilet (suction)

Rescue Techniques in Intubation

- Bougie (used like a guidewire)
- Glidescope®
- Lighted stylet (uses light through skin to determine if ETT in correct place)
- Fiberoptic intubation (uses fiberoptic cable for indirect visualization)

Noisy breathing is obstructed breathing until proven otherwise

B. BREATHING

Breathing Assessment

- quantitative measures of respiratory function: rate, oximetry, ABG, A-a gradient
- **Look**
  - mental status (anxiety, agitation, decreased LOC), chest movement (bilateral vs. asymmetrical), respiratory rate/effort, nasal flaring, increased work of breathing
- **Listen**
  - auscultate for signs of obstruction (e.g. stridor), breath sounds, symmetry of air entry, air escaping
- **Feel**
  - tracheal shift, chest wall for crepitus (e.g. subcutaneous emphysema, rib fracture), flail segments, sucking chest wounds

Management of Breathing

- nasal prongs ➔ simple face mask ➔ non-rebreather mask ➔ high-flow nasal cannula ➔ CPAP/BiPAP (in order of increasing FiO_2)
- Bag-Valve mask and CPAP to supplement inadequate ventilation

O_2 Delivery Methods

	FiO_2	Amount Given
Nasal Prongs	25-40%	1-6 L/min
Face Mask	40-60%	5-10 L/min
Non-rebreather	80-90%	15 L/min
High-flow Nasal Cannula	up to 100%	15-60L/min
CPAP/BiPAP	up to 100%	

C. CIRCULATION

Definition of Shock

- inadequate organ and tissue perfusion with oxygenated blood (brain, kidney, extremities)

Table 1. Major Types of Shock

Hypovolemic	Cardiogenic	Distributive	Obstructive
Hemorrhage (external and internal)	Myocardial ischaemia	Septic (see *Sepsis*, ER38)	Cardiac tamponade (see *Chest Trauma*, ER11)
Severe burns	Dysrhythmias	Anaphylactic (see *Anaphylaxis and Allergic Reactions*, ER29)	Tension pneumothorax (see *Chest Trauma*, ER11)
High output fistulas	CHF	Neurogenic (spinal cord injury)	PE (see *Venous Thromboembolism*, ER32)
Dehydration (diarrhea, DKA)	Cardiomyopathies		Aortic stenosis
	Cardiac valve problems		Constrictive pericarditis

Shock in a trauma patient is hemorrhagic until proven otherwise

Clinical Evaluation

- early: tachypnea, tachycardia, narrow pulse pressure, reduced capillary refill, cool extremities, and reduced central venous pressure
- late: hypotension, altered mental status, reduced urine output

Table 2. Estimation of Degree of Hemorrhagic Shock

Class	I	II	III	IV
Blood Loss	<750 cc	750-1500 cc	1500-2000 cc	>2000 cc
% of Blood Volume	<15%	15-30%	30-40%	>40%
Pulse	<100	>100	>120	>140
Blood Pressure	Normal	Normal	Decreased	Decreased
Respiratory Rate	20	30	35	>45
Capillary Refill	Normal	Decreased	Decreased	Decreased
Urinary Output	30 cc/h	20 cc/h	10 cc/h	None
Fluid Replacement	Crystalloid	Crystalloid	Crystalloid + blood	Crystalloid + blood

Management of Hemorrhagic Shock

- clear airway and assess breathing either first or simultaneously
- apply direct pressure on external wounds while elevating extremities. Do not remove impaled objects in the emergency room setting as they may tamponade bleeds
- start two large bore (14-16G) IVs in the brachial/cephalic vein of each arm
- run 1-2 L bolus of IV Normal Saline/Ringer's Lactate (warmed, if possible)
- if continual bleeding or no response to crystalloids, consider pRBC transfusion, ideally crossmatched. If crossmatched blood is unavailable, consider O- for women of childbearing age and O+ for men. Use FFP, platelets or tranexamic acid in early bleeding. If available, activate 'massive transfusion protocol'
- consider common sites of internal bleeding (abdomen, chest, pelvis, long bones) where surgical intervention may be necessary

D. DISABILITY

- assess LOC using GCS
- pupils
  - assess equality, size, symmetry, reactivity to light
- unequal or sluggish suggests local eye problem or lateralizing CNS lesion
- non-reactive pupils + decreased LOC: structural cause (especially if asymmetric)

Glasgow Coma Scale

- Glasgow coma scale (GCS) is for use in trauma patients with decreased LOC; good indicator of severity of injury and neurosurgical prognosis
- most useful if repeated; change in GCS with time is more relevant than the absolute number
- less meaningful for metabolic coma
- patient with deteriorating GCS needs immediate attention
- prognosis based on best post-resuscitation GCS
- reported as a 3-part score: Eyes + Verbal + Motor = Total
- if patient intubated, GCS score reported out of 10 + T (T = tubed, i.e. no verbal component)

Table 3. Glasgow Coma Scale

Eyes Open		Best Verbal Response		Best Motor Response	
Spontaneously	4	Answers questions appropriately	5	Obeys commands	6
To voice	3	Confused, disoriented	4	Localizes to pain	5
To pain	2	Inappropriate words	3	Withdraws from pain	4
No response	1	Incomprehensible sounds	2	Decorticate (flexion)	3
		No verbal response	1	Decerebrate (extension)	2
				No response	1

13-15 = mild injury, 9-12 = moderate injury, ≤8 = severe injury See Table 36, ER57 for *Modified GCS for infants and children*

E. EXPOSURE/ENVIRONMENT

- expose patient completely and assess entire body for injury; log roll to examine back
- DRE for trauma patients
- keep patient warm with a blanket ± radiant heaters; avoid hypothermia
- warm IV fluids/blood
- keep providers safe (contamination, combative patient)

2. Resuscitation

- done concurrently with primary survey
- attend to ABCs
- manage life-threatening problems as they are identified
- vital signs q5-15 min
- ECG, BP, and O_2 monitors
- Foley catheter and NG tube if indicated
- tests and investigations: CBC, electrolytes, BUN, Cr, glucose, amylase, INR/PTT, β-hCG, toxicology screen, cross and type

Causes of Shock

SHOCKED
Septic, spinal/neurogenic
Hemorrhagic
Obstructive (e.g. tension pneumothorax, cardiac tamponade, PE)
Cardiogenic (e.g. blunt myocardial injury, dysrhythmia, MI)
anaphylacti**K**
Endocrine (e.g. Addison's, myxedema, coma)
Drugs

3:1 Rule
Since only 30% of infused isotonic crystalloids remains in intravascular space, you must give 3x estimated blood loss

Common Sites of Bleeding
- External (e.g. scalp)
- Chest
- Abdomen (peritoneum, retroperitoneum)
- Pelvis
- Long bones

Fluid Resuscitation
Give bolus until HR decreases, urine output increases, and patient stabilizes
- Maintenance: 4:2:1 rule
- 0-10 kg: 4 cc/kg/h
- 10-20 kg: 2 cc/kg/h
- Remaining weight: 1 cc/kg/h
- Replace ongoing losses and deficits (assume 10% of body weight)

Shortcut for calculating maintenance fluids for any patient ≥20kg:
Fluid rate (in cc/hr) = 40 + patient's weight in kg

Unilateral, Dilated, Non-Reactive Pupil, Think
- Focal mass lesion
- Epidural hematoma
- Subdural hematoma

Contraindications to Foley Insertion
- Blood at urethral meatus
- Scrotal hematoma
- High-riding prostate on DRE

NG Tube Contraindications
- Significant mid-face trauma
- Basal skull fracture

Table 4. 2010 AHA CPR Guidelines with 2020 Updates

Step/Action	Adult: >8 yr	Child: 1-8 yr	Infant: <1 yr
Airway	Head tilt-chin lift; ; jaw thrust without head extension if concern for spinal injury		
Breaths	2 breaths at 1 s/breath – stop once see chest rise		
Severe Foreign-Body Airway Obstruction	Abdominal thrust		Back blows and chest compressions
Compressions			
Compression landmarks	In the centre of the chest, lower half of the sternum		Just below nipple line
Compression method: push hard and fast, and allow for complete recoil	2 hands: heel of 1 hand with heel of second hand on top	2 hands: heel of 1 hand with second on top, or 1 hand: heel of 1 hand only	2 fingers, or thumbs
Compression depth	2-2.4 inches	About $^{1}/_{3}$ to $^{1}/_{2}$ the depth of the chest	
Compression rate	100-120/min with complete chest wall recoil between compressions		
Compression-ventilation ratio	30 compressions to 2 ventilations		
Compression-only CPR	Hands-only CPR is preferred if the bystander is not trained or does not feel confident in their ability to provide conventional CPR or if the bystander is trained but chooses to use compressions only		
Defibrillation	Immediate defibrillation for all rescuers responding to a sudden witnessed collapse Compressions (5 cycles/2 min) before AED is considered if unwitnessed arrest Manual defibrillators are preferred for children and infants but can use adult dose AED if a manual defibrillator is not available		

See Anesthesia, A32 for *ACLS Guidelines*

3. Secondary Survey

- done after primary survey once patient is hemodynamically and neurologically stabilized
- identifies major injuries or areas of concern
- full physical exam and x-rays (C-spine, chest, and pelvis – required in blunt trauma, consider T-spine and L-spine if indicated)

HISTORY

- "**SAMPLE**": **S**igns and symptoms, **A**llergies, **M**edications, **P**ast medical history, **L**ast meal, **E**vents related to injury

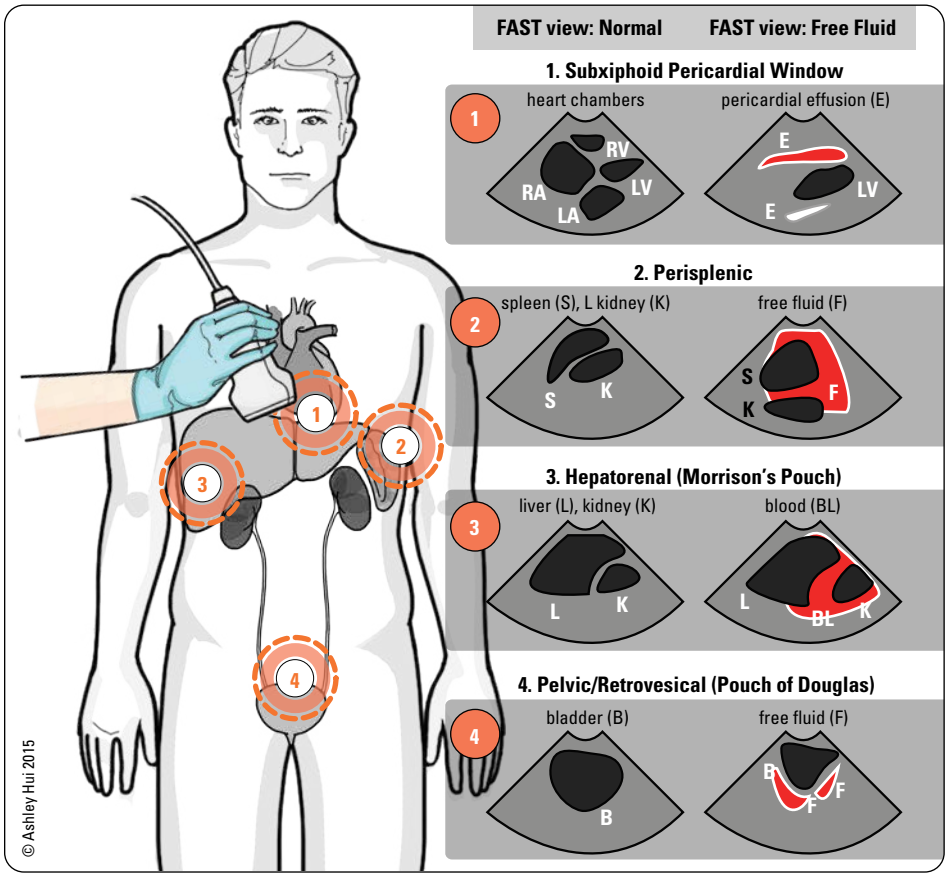

Figure 2. Four areas of a FAST

PHYSICAL EXAM

Head and Neck
- palpation of facial bones, scalp

Chest
- inspect for midline trachea and flail segment: ≥2 rib fractures in ≥2 places; if present look for associated hemothorax, pneumothorax, and contusions
- auscultate lung fields
- palpate for subcutaneous emphysema

Abdomen
- assess for peritonitis, abdominal distention, and evidence of intra-abdominal bleeding
- DRE for GI bleed, high-riding prostate, and anal tone

Musculoskeletal
- examine all extremities for swelling, deformity, contusions, tenderness, ROM
- check for pulses (using Doppler probe) and sensation in all injured limbs
- log roll and palpate thoracic and lumbar spines
- palpate iliac crests and pubic symphysis and assess pelvic stability (lateral, AP, vertical)

Neurological
- GCS
- full cranial nerve exam
- alterations of rate and rhythm of breathing are signs of structural or metabolic abnormalities with progressive deterioration in breathing indicating a failing CNS
- assess spinal cord integrity
- conscious patient: assess distal sensation and motor function
- unconscious patient: response to painful or noxious stimulus applied to extremities

Signs of Increased ICP
- Deteriorating LOC (hallmark)
- Deteriorating respiratory pattern
- Cushing reflex (high BP, low HR, irregular respirations)
- Lateralizing CNS signs (e.g. cranial nerve palsies, hemiparesis)
- Seizures
- Papilledema (occurs late)
- N/V and headache

INITIAL IMAGING
- non-contrast CT head/face/C-spine (rule out fractures and bleeds)
- CXR
- FAST (see Figure 2, ER5) or CT abdomen/pelvis (if stable)
- pelvis x-ray

Non-contrast head CT is the best imaging modality for intracranial injury

Ethical Considerations

Consent to Treatment: Adults
- see Ethical, Legal, and Organizational Medicine, ELOM11
- Emergency Rule: consent is not needed when a patient is at imminent risk from a serious injury AND obtaining consent is either: a) not possible, OR b) would increase risk to the patient
  - assumes that most people would want to be saved in an emergency
- any capable and informed patient can refuse treatment or part of treatment, even if it is life-saving
- exceptions to the Emergency Rule – treatment cannot be initiated if:
  - a competent patient has previously refused the same or similar treatment and there is no evidence to suggest the patient's wishes have changed
  - an advanced directive is available (e.g. do not resuscitate order)
  - NOTE: refusal of help in a suicide situation is NOT an exception; care must be given
- if in doubt, initiate treatment
- care can be withdrawn if necessary at a later time or if wishes are clarified by family

Consent to Treatment: Children
- treat immediately if patient is at imminent risk
- parents/guardians have the right to make treatment decisions
- if parents refuse treatment that is considered life-saving or will potentially alter the child's quality of life, CAS must be contacted – consent of CAS is needed to treat

Other Issues of Consent
- need consent for HIV testing, as well as for administration of blood products
- however, if delay in substitute consent for blood transfusions puts patient at risk, transfusions can be given

Duty to Report
- law may vary depending on province and/or state
- e.g. gunshot wounds, suspected child abuse, various communicable diseases, medical unsuitability to drive, risk of substantial harm to others

Jehovah's Witnesses
- Capable adults have the right to refuse medical treatment
- May refuse whole blood, pRBCs, platelets, and plasma even if considered life-saving
- Should be questioned directly about the use of albumin, immunoglobulins, hemophilic preparations
- Do not allow autologous transfusion unless there is uninterrupted extra corporeal circulation
- Usually ask for the highest possible quality of care without the use of the above interventions (e.g. crystalloids for volume expansion, attempts at bloodless surgery)
- Patient will generally sign hospital forms releasing medical staff from liability
- Most legal cases involve children of Jehovah's Witnesses; if life-saving treatment is refused, contact CAS

Traumatology

- epidemiology
  - 1.7 million people sustain a TBI annually (US), resulting in 52000 deaths, 275000 hospitalizations, and 1.365 million ED visits (data from 2010)
  - leading cause of death in patients <45 yr
  - 4th highest cause of death in North America
  - causes more deaths in children/adolescents than all diseases combined
- trimodal distribution of death
  - minutes: death usually at the scene from lethal injuries
  - early: death within 4-6 h – "golden hour" (decreased mortality with trauma care)
  - days-weeks: death from multiple organ dysfunction, sepsis, VTE, etc.
- injuries fall into two categories
  - blunt (most common): MVC, pedestrian-automobile impact, motorcycle collision, fall, assault, sports
  - penetrating (increasing in incidence): gunshot wound, stabbing, impalement

Always completely expose and count the number of wounds

Considerations for Traumatic Injury

- important to know the mechanism of injury to anticipate traumatic injuries
- always look for an underlying cause (alcohol, medications, illicit substances, seizure, suicide attempt, medical problem)
- always inquire about HI, loss of consciousness, amnesia, vomiting, headache, and seizure activity

Cardiac Box: sternal notch, nipples, and xiphoid process; injuries inside this area should increase suspicion of cardiac injury

Table 5. Mechanisms and Considerations of Traumatic Injuries

Mechanism of Injury	Special Considerations	Associated Injuries
MVC	Vehicle(s) involved: weight, size, speed, damage Location of patient in vehicle Use and type of seatbelt Ejection of patient from vehicle Entrapment of patient under vehicle Airbag deployment Helmet use in motorcycle collision	Head-on collision: head/facial, thoracic (aortic), lower extremity Lateral/T-bone collision: head, C-spine, thoracic, abdominal, pelvic, and lower extremity Rear-end collision: hyper-extension of C-spine (whiplash injury) Rollover: all of the above may be associated injuries
Pedestrian-Automobile Impact	High morbidity and mortality Vehicle speed is an important factor Site of impact on car	Children at increased risk of being run over (multisystem injuries) Adults tend to be struck in lower legs (lower extremity injuries), impacted against car (truncal injuries), and thrown to ground (HI)
Falls	1 storey = 12 ft = 3.6 m Distance of fall: 50% mortality at 4 storeys and 95% mortality at 7 storeys Landing position (vertical vs. horizontal)	Vertical: lower extremity, pelvic, and spine fractures; HI Horizontal: facial, upper extremity, and rib fractures; abdominal, thoracic, and HI

High-Risk Injuries
- MVC at high speed, resulting in ejection from vehicle
- Motorcycle collisions
- Vehicle vs. pedestrian crashes
- Fall from height >12 ft (3.6 m)

Vehicle vs. Pedestrian Crash
- In adults look for triad of injuries
- (Waddle's triad)
- Tibia-fibula or femur fracture
- Truncal injury
- Craniofacial injury

Head Trauma

- see Neurosurgery, NS35
- 60% of MVC-related deaths are due to HI

Specific Injuries

- **fractures**
  - Dx: non-contrast head CT and physical exam

A. skull fractures
  - vault fractures
    - linear, non-depressed
      - most common
      - typically occur over temporal bone, in area of middle meningeal artery (commonest cause of epidural hematoma)
    - depressed
      - open (associated overlying scalp laceration and torn dura, skull fracture disrupting paranasal sinuses or middle ear) vs. closed
  - basal skull fractures
    - typically occur through floor of anterior cranial fossa (longitudinal more common than transverse)
    - can be a radiological or clinical diagnosis
    - associated with Battle's sign, racoon eyes, hemotympanum, and/or CSF otorrhea/rhinorrhea

B. facial fractures (see Plastic Surgery, PL32)
  - neuronal injury
  - beware of open fracture or sinus fractures (risk of infection)
  - severe facial fractures may pose risk to airway from profuse bleeding

Signs of Basal Skull Fracture
- Battle's sign (bruised mastoid process)
- Hemotympanum
- Raccoon eyes (periorbital bruising)
- CSF rhinorrhea/otorrhea

- **scalp laceration**
  - can be a source of significant bleeding
  - achieve haemostasis, inspect and palpate for skull bone defects ± CT head (rule out skull fracture)
- **neuronal injury**

A. diffuse
  - mild TBI = concussion
    - transient alteration in mental status that may involve loss of consciousness
    - hallmarks of concussion: confusion and amnesia, which may occur immediately after the trauma or minutes later
    - loss of consciousness (if present) must be less than 30 min, initial GCS must be between 13-15, and post-traumatic amnesia must be less than 24 h
  - diffuse axonal injury
    - mild: coma 6-24 h, possibly lasting deficit
    - moderate: coma >24 h, little or no signs of brainstem dysfunction
    - severe: coma >24 h, frequent signs of brainstem dysfunction

B. focal injuries
  - contusions
  - intracranial hemorrhage (epidural, subdural, intracerebral)

ASSESSMENT OF BRAIN INJURY

History
- prehospital status
- mechanism of injury

Physical Exam
- assume C-spine injury until ruled out
- vital signs
  - shock (not likely due to isolated brain injury, except in infants)
  - Cushing's response to increasing ICP (bradycardia, HTN, irregular respirations)
- severity of injury determined by
  1. LOC
     - GCS ≤8 intubate, any change in score of 3 or more = serious injury
     - mild TBI = 13-15, moderate = 9-12, severe = 3-8
  2. pupils: size, anisocoria >1 mm (in patient with altered LOC), response to light
  3. lateralizing signs (motor/sensory)
     - may become subtler with increasing severity of injury
     - reassess frequently

Warning Signs of Severe Head Injury
- GCS <8
- Deteriorating GCS
- Unequal pupils
- Lateralizing signs

N.B. Altered LOC is a hallmark of brain injury

Investigations
- labs: CBC, electrolytes, INR/PTT, glucose, toxicology screen
- CT head (non-contrast) to exclude intracranial hemorrhage/hematoma
- C-spine imaging

Management
- goal in ED: reduce secondary injury by avoiding hypoxia, ischaemia, decreased CPP, seizure
- general
  - ABCs
  - ensure oxygen delivery to brain through intubation and prevent hypercarbia
  - maintain BP (sBP >90)
  - treat other injuries
- early neurosurgical consultation for acute and subsequent patient management
- seizure treatment/prophylaxis
  - benzodiazepines, phenytoin, phenobarbital
  - steroids are of no proven value
- treat suspected raised ICP, consider if HI with signs of increased ICP:
  - intubate (neuroprotective RSI where possible)
  - calm (sedate) if risk for high airway pressures or agitation
  - paralyze if agitated
  - hyperventilate (100% O_2) to a pCO_2 of 30-35 mmHg
  - elevate head of bed to 20°
  - adequate BP to ensure good cerebral perfusion
  - diurese with mannitol 1g/kg infused rapidly (contraindicated in shock/renal failure)

Canadian CT Head Rule
Lancet 2001;357:1391-1396
CT Head is only required for patients with minor HI with any one of the following
High-Risk (for neurological intervention)
- GCS score <15 at 2 h after injury
- Suspected open or depressed skull fracture
- Any sign of basal skull fracture (hemotympanum, "raccoon" eyes, CSF otorrhea/rhinorrhea, Battle's sign)
- Vomiting ≥2 episodes
- Age ≥65 yr

Medium-Risk (for brain injury on CT)
- Amnesia before impact >30 min (i.e. cannot recall events just before impact)
- Dangerous mechanism (pedestrian struck by MVC, occupant ejected from motor vehicle, fall from height >3 ft or five stairs)

Minor HI is defined as witnessed loss of consciousness, definite amnesia, or witnessed disorientation in a patient with a GCS score of 13-15.
NB: Canadian CT Head Rule does not apply for non-trauma cases, for GCS <13, ages <16, for patients on Coumadin® and/or having a bleeding disorder, or having an obvious open skull fracture.

Disposition
- neurosurgical ICU admission for severe HI
- in hemodynamically unstable patient with other injuries, prioritize most life-threatening injuries and maintain cerebral perfusion
- for minor HI not requiring admission, provide 24 h HI protocol to competent caregiver, follow up with neurology as even seemingly minor HI may cause lasting deficits

Mild Traumatic Brain Injury

Epidemiology
- TBI results in 1.7 million deaths, hospitalizations, and ED visits each year (US)
- 75% are estimated to be mild TBI; remainder are moderate or severe (see Neurosurgery, NS37)
- highest rates in children 0-4 yr, adolescents 15-19 yr, and elderly >65 yr

Clinical Features
- somatic: headache, sleep disturbance, N/V, blurred vision
- cognitive dysfunction: attentional impairment, reduced processing speed, drowsiness, amnesia
- emotion and behaviour: impulsivity, irritability, depression
- severe concussion: may precipitate seizure, bradycardia, hypotension, sluggish pupils

Extent of retrograde amnesia correlates with severity of injury

Etiology
- falls, MVC, struck by an object, assault, sports

Investigations
- neurological exam
- concussion recognition tool (see thinkfirst.ca)
- imaging – CT as per Canadian CT Head Rules, or MRI if worsening symptoms despite normal CT

Treatment
- close observation and follow-up; for patients at risk of intracranial complications, give appropriate discharge instructions to patient and family; watch for changes to clinical features above, and if change, return to ED
- hospitalization with normal CT (GCS <15, seizures, bleeding diathesis), or with abnormal CT
- pharmacological management of pain, depression, headache
- follow Return to Play guidelines

Prognosis
- most recover with minimal treatment
  - athletes with previous concussion are at increased risk of cumulative brain injury
- repeat TBI can lead to life-threatening cerebral edema or permanent impairment

Spine and Spinal Cord Trauma

- assume cord injury with significant falls (>12 ft), deceleration injuries, blunt trauma to head, neck, or back
- spinal immobilization (cervical collar, spine board during patient transport only) must be maintained until spinal injury has been ruled out (see Figure 3, ER10)
- vertebral injuries may be present without spinal cord injury; normal neurologic exam does not exclude spinal injury
- cord may be injured despite normal C-spine x-ray (spinal cord injury without radiologic abnormality)
- injuries can include: complete/incomplete transection, cord edema, spinal shock

Every Patient with One or More of the Following Signs or Symptoms should be Placed in a C-Spine Collar
- Midline tenderness
- Neurological symptoms or signs
- Significant distracting injuries
- HI
- Intoxication
- Dangerous mechanism
- History of altered LOC

History
- mechanism of injury, previous deficits, SAMPLE
- neck pain, paralysis/weakness, paresthesia

Physical Exam
- ABCs
- abdominal: ecchymosis, tenderness
- neurological: complete exam, including mental status
- spine: maintain neutral position, palpate C-spine; log roll, then palpate T-spine and L-spine, assess rectal tone
  - when palpating, assess for tenderness, muscle spasm, bony deformities, step-off, and spinous process malalignment
- extremities: check capillary refill, suspect thoracolumbar injury with calcaneal fractures

Of the investigations, the lateral C-spine x-ray is the single most important film; 95% of radiologically visible abnormalities are found on this film

Investigations
- bloodwork: CBC, electrolytes, Cr, glucose, coagulation profile, cross and type, toxicology screen
- imaging
  - full C-spine x-ray series for trauma (AP, lateral, odontoid)
- thoracolumbar x-rays
  - AP and lateral views
  - indications
    - C-spine injury
    - unconscious patients (with appropriate mechanism of injury)
    - neurological symptoms or findings
    - deformities that are palpable when patient is log rolled

Cauda Equina Syndrome can occur with any spinal cord injury below T10 vertebrae. Look for incontinence, anterior thigh pain, quadriceps weakness, abnormal sacral sensation, decreased rectal tone, and variable reflexes

- back pain
- bilateral calcaneal fractures (due to fall from height)
  - concurrent burst fractures of the lumbar or thoracic spine in 10% (T11-L2)
- consider CT (for subtle bony injuries), MRI (for soft tissue injuries) if appropriate

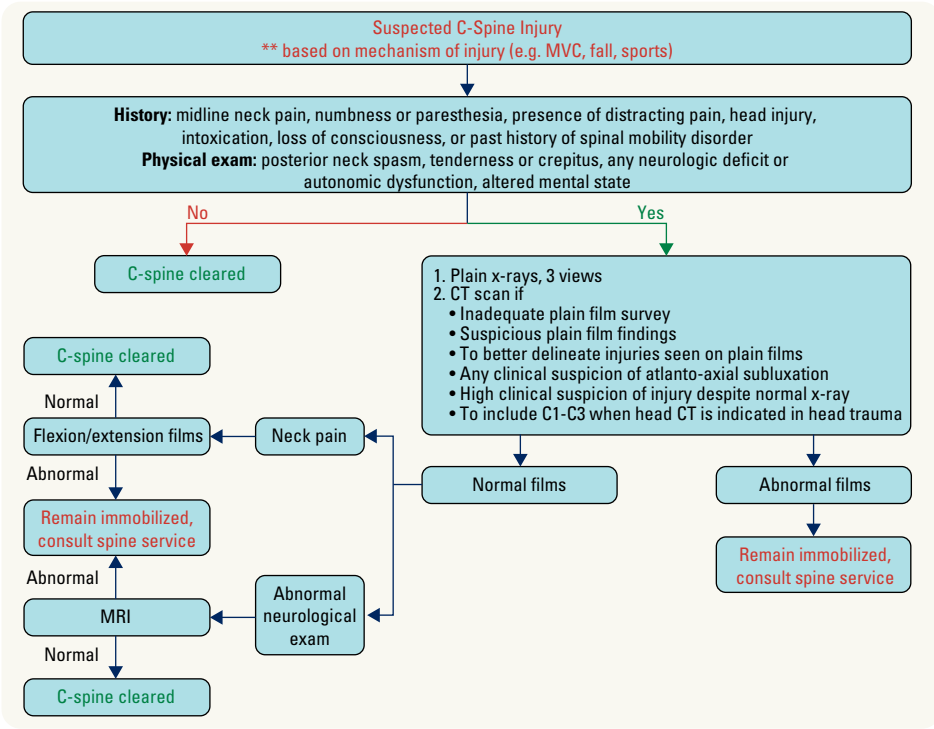

Figure 3. Approach to clearing the C-spine

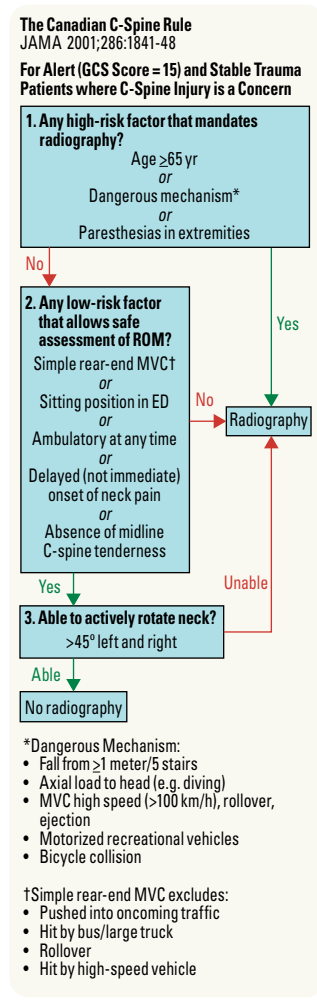

Can Clear C-Spine if:

- oriented to person, place, time, and event
- no evidence of intoxication
- no posterior midline cervical tenderness
- no focal neurological deficits
- no painful distracting injuries (e.g. long bone fracture)

Management of Cord Injury

- immobilize
- evaluate ABCs
- treat neurogenic shock (maintain sBP >100 mmHg)
- insert NG and Foley catheter
- complete imaging of spine and consult spine service if available
- continually reassess high cord injuries as edema can travel up cord
- if cervical cord lesion, watch for respiratory insufficiency
  - low cervical transection (C5-T1) produces abdominal breathing (phrenic innervation of diaphragm still intact but loss of innervation of intercostals and other accessory muscles of breathing)
  - high cervical cord injury (above C4) may require intubation and ventilation
- treatment: warm blanket, Trendelenburg position (occasionally), volume infusion, consider vasopressors

Approach to C-Spine X-Rays

- 3-view C-spine series is the screening modality of choice
  1. lateral C1-T1 ± swimmer's view
     - lateral view is best, identifies 90-95% of injuries
  2. odontoid view (open mouth or oblique submental view)
     - examine the dens for fractures
       - if unable to rule out fracture, repeat view, or consider CT or plain film tomography
     - examine lateral aspects of C1 and spacing relative to C2
  3. AP view
     - alignment of spinous processes in the midline
     - spacing of spinous processes should be equal
     - check vertebral bodies and facet dislocations

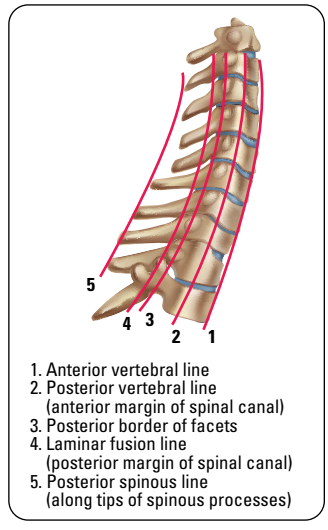

Figure 4. Lines of contour on a lateral C-spine x-ray

Prevertebral soft tissue swelling is only 49% sensitive for injury

Table 6. Interpretation of Lateral View: The ABCS

A	**Adequacy and Alignment** Must see C1 to C7-T1 junction; if not, downward traction of shoulders, swimmer's view, bilateral supine obliques, or CT scan needed Lines of contour in children <8 yr, can see physiologic subluxation of C2 on C3, and C3 on C4, but the spino-laminal line is maintained Fanning of spinous processes suggests posterior ligamentous disruption Widening of facet joints Check atlanto-occipital joint Line extending inferiorly from clivus should transect odontoid Atlanto-axial articulation, widening of predental space (normal: <3 mm in adults, <5 mm in children) indicates injury of C1 or C2
B	**Bones** Height, width, and shape of each vertebral body Pedicles, facets, and laminae should appear as one – doubling suggests rotation
C	**Cartilage** Intervertebral disc spaces – wedging anteriorly or posteriorly suggests vertebral compression
S	**Soft Tissues** Widening of retropharyngeal (normal: <7 mm at C1-4, may be wide in children <2 yr on expiration) or retrotracheal spaces (normal: <22 mm at C6-T1, <14 mm in children <5 yr)

Sequelae of C-Spine Fractures

- see Neurosurgery, NS39
- acute phase of SCI
  - spinal shock: absence of all voluntary and reflex activity below level of injury
    - decreased reflexes, no sensation, flaccid paralysis below level of injury, lasting days to months
  - neurogenic shock: loss of vasomotor tone, SNS tone
    - watch for: hypotension (lacking SNS), bradycardia (unopposed PNS), poikilothermia (lacking SNS so no shunting of blood from extremities to core)
    - occurs within 30 min of SCI at level T6 or above, lasting up to 6 wk
    - provide airway support, fluids, atropine (for bradycardia), vasopressors for BP support
- chronic phase of SCI
  - autonomic dysreflexia: in patients with an SCI at level T6 or above
    - signs and symptoms: pounding headache, nasal congestion, feeling of apprehension or anxiety, visual changes, dangerously increased sBP and dBP
    - common triggers
      - GU causes: bladder distention, urinary tract infection, and kidney stones
      - GI causes: fecal impaction or bowel distension
    - treatment: monitoring and controlling BP, prior to addressing causative issue

Chest Trauma

- two types: those found and managed in 1° survey and those found and managed in 2° survey

Table 7. Life-Threatening Chest Injuries Found in Primary Survey

	Physical Exam	Investigations	Management
Airway Obstruction	Anxiety, stridor, hoarseness, altered mental status Apnea, cyanosis	Do not wait for ABG to intubate	Definitive airway management Intubate early Remove foreign body if visible with laryngoscope prior to intubation
Tension Pneumothorax Clinical diagnosis One-way valve causing accumulation of air in pleural space	Respiratory distress, tachycardia, distended neck veins, cyanosis, asymmetry of chest wall motion Tracheal deviation away from pneumothorax Percussion hyperresonance Unilateral absence of breath sounds	Non-radiographic diagnosis	Needle thoracostomy – large bore needle, 2nd ICS mid clavicular line, followed by chest tube
Open Pneumothorax Air entering chest from wound rather than trachea	Gunshot or other wound (hole >2/3 tracheal diameter) ± exit wound Unequal breath sounds	ABG: decreased pO_2	Air-tight dressing sealed on 3 sides Chest tube Surgery
Massive Hemothorax >1500 cc blood loss in chest cavity	Pallor, flat neck veins, shock Unilateral dullness Absent breath sounds Hypotension	Usually only able to do supine CXR – entire lung appears radiopaque as blood spreads out over posterior thoracic cavity	Restore blood volume Chest tube Thoracotomy if: >1500 cc total blood loss ≥200 cc/h continued drainage
Flail Chest Free-floating segment of chest wall due to >2 rib fractures, each at 2 sites Underlying lung contusion (cause of morbidity and mortality)	Paradoxical movement of flail segment Palpable crepitus of ribs Decreased air entry on affected side	ABG: decreased pO_2, increased pCO_2 CXR: rib fractures, lung contusion	O_2 + fluid therapy + pain control Judicious fluid therapy in absence of systemic hypotension Positive pressure ventilation ± intubation and ventilation
Cardiac Tamponade Clinical diagnosis Pericardial fluid accumulation impairing ventricular function	Penetrating wound (usually) Beck's triad: hypotension, distended neck veins, muffled heart sounds Tachycardia, tachypnea Pulsus paradoxus Kussmaul's sign (increased JVP with inspiration)	Echocardiogram FAST	IV fluids Pericardiocentesis Open thoracotomy

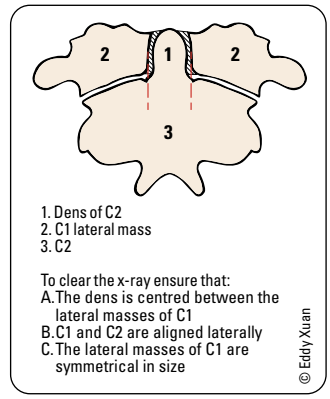

Figure 5. C-spine x-ray; odontoid view

Supine Oblique Views
- Rarely used
- Better visualization of posterior element fractures (lamina, pedicle, facet joint)
- Good to assess patency of neural foramina
- Can be used to visualize the C7-T1 junction

20% of C-spine fractures are accompanied by other spinal fractures, so ensure thoracic and lumbar spine x-rays are normal before proceeding to OR

Trauma to the chest accounts for 50% of trauma deaths

80% of all chest injuries can be managed non-surgically with simple measures such as intubation, chest tubes, and pain control

3-way Seal for Open Pneumothorax (i.e. sucking chest wound)
Allows air to escape during the expiratory phase (so that you do not get a tension pneumothorax) but seals itself to allow adequate breaths during the inspiratory phase

Pulsus Paradoxus: a drop in BP of >10 mmHg with inspiration. Recall that BP normally drops with inspiration, but what's "paradoxical" about this is that it drops more than it should

Table 8. Potentially Life-Threatening Chest Injuries Found in Secondary Survey

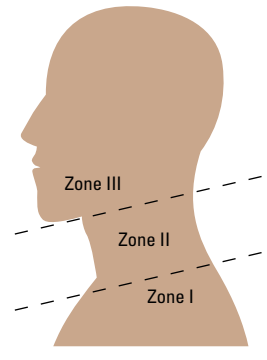
	Physical Exam	Investigations	Management
Pulmonary Contusion	Blunt trauma to chest Interstitial edema impairs compliance and gas exchange	CXR: areas of opacification of lung within 6 h of trauma	Maintain adequate ventilation Monitor with ABG, pulse oximeter, and ECG Chest physiotherapy Positive pressure ventilation if severe
Ruptured Diaphragm	Blunt trauma to chest or abdomen (e.g. high lap belt in MVC)	CXR: abnormality of diaphragm/lower lung fields/NG tube placement CT scan and endoscopy: sometimes helpful for diagnosis	Laparotomy for diaphragm repair and associated intra-abdominal injuries
Esophageal Injury	Usually penetrating trauma (pain out of proportion to degree of injury)	CXR: mediastinal air (not always) Esophagram (Gastrografin®) Flexible esophagoscopy	Early repair (within 24 h) improves outcome but most require repair
Aortic Tear 90% tear at subclavian (near ligamentum arteriosum), most die at scene Salvageable if diagnosis made rapidly	Sudden high speed deceleration (e.g. MVC, fall, airplane crash), complaints of chest pain, dyspnea, hoarseness (frequently absent) Decreased femoral pulses, differential arm BP (arch tear)	CXR, CT scan, transesophageal echocardiogram, aortography (gold standard)	Thoracotomy (may treat other severe injuries first)
Blunt Myocardial Injury (rare)	Blunt trauma to chest (usually in setting of multi-system trauma and therefore difficult to diagnose) Physical exam: overlying injury (e.g. fractures, chest wall contusion)	ECG: dysrhythmias, ST changes Patients with a normal ECG and normal hemodynamics never get dysrhythmias Cardiac blood work (e.g. troponin)	O_2 Antidysrhythmic agents Analgesia

Ruptured diaphragm is more often diagnosed on the left side, as liver conceals right side defect

Aortic Tear

ABC WHITE
X-ray features of **A**ortic tear
Depressed left mainstem **B**ronchus
pleural **C**ap
Wide mediastinum (most consistent)
Hemothorax
Indistinct aortic knuckle
Tracheal deviation to right side
Esophagus (NG tube) deviated to right
(Note: present in 85% of cases, but cannot rule out)

If Penetrating Neck Trauma Present, DON'T:
- Clamp structures (can damage nerves)
- Probe
- Insert NG tube (leads to bleeding)
- Remove weapon/impaled object



Zone III: Superior aspect of neck
Zone II: Midportion of neck (cricoid to the angle of mandible)
Zone I: Base of neck (thoracic inlet to cricoid cartilage)

Figure 6. Zones of the neck in trauma

Other Potentially Life-Threatening Injuries Related to the Chest

Penetrating Neck Trauma
- includes all penetrating trauma to the three zones of the neck
- management: injuries deep to platysma require further evaluation by angiography, contrast CT, or surgery
- do not explore penetrating neck wounds except in the OR

Airway Injuries
- always maintain a high index of suspicion
- larynx
  - history: strangulation, direct blow, blunt trauma, any penetrating injury involving platysma, inhalational injury (e.g. burns)
  - triad: hoarseness, subcutaneous emphysema, palpable fracture
  - other symptoms: hemoptysis, dyspnea, dysphonia
  - investigations: CXR, CT scan, arteriography (if penetrating)
  - management
    - airway: manage early because of edema
    - C-spine may also be injured, consider mechanism of injury
    - surgical: tracheotomy vs. repair
- trachea/bronchus
  - frequently missed
  - history: deceleration, penetration, increased intrathoracic pressure, complaints of dyspnea, hemoptysis
  - examination: subcutaneous emphysema, Hamman's sign (crunching sound synchronous with heartbeat)
  - CXR: mediastinal air, persistent pneumothorax, or persistent air leak after chest tube inserted for pneumothorax
  - management
    - surgical repair if >1/3 circumference

Abdominal Trauma

- two mechanisms
  - blunt: usually causes solid organ injury (spleen = most common, liver = second most common)
  - penetrating: usually causes hollow organ injury or liver injury (most common)

BLUNT TRAUMA
- results in two types of hemorrhage: intra-abdominal and retroperitoneal
- adopt high clinical suspicion of bleeding in multi-system trauma

History
- mechanism of injury, SAMPLE history

Physical Exam
- often unreliable in multi-system trauma, wide spectrum of presentations
  - slow blood loss not immediately apparent
  - tachycardia, tachypnea, oliguria, febrile, hypotension
  - other injuries may mask symptoms
  - serial examinations are required
- abdomen
  - inspect: contusions, abrasions, seat-belt sign, distention
  - auscultate: bruits, bowel sounds
  - palpate: tenderness, rebound tenderness, rigidity, guarding
  - DRE: rectal tone, blood, bone fragments, prostate location
  - placement of NG, Foley catheter should be considered part of the abdominal exam
- other systems to assess: cardiovascular, respiratory (possibility of diaphragm rupture), genitourinary, pelvis, back/neurological

Investigations
- labs: CBC, electrolytes, coagulation, cross and type, glucose, Cr, CK, lipase, amylase, liver enzymes, ABG, blood EtOH, β-hCG, U/A, toxicology screen

Table 9. Imaging in Abdominal Trauma

Imaging	Strengths	Limitations
Ultrasound: FAST	Identifies presence/absence of free fluid in peritoneal cavity RAPID exam: less than 5 min Can also examine pericardium and pleural cavities Can do serial examinations quickly	NOT used to identify specific organ injuries If patient has ascites, FAST will be falsely positive False negatives with small amounts of blood, or retroperitoneal blood Technically difficult if patient is obese
X-Ray	Chest (looking for free air under diaphragm, diaphragmatic hernia, air-fluid levels), pelvis, cervical, thoracic, lumbar spines	Soft tissue not well visualized
CT Scan	Most specific test	Radiation exposure 20x more than x-ray Use with caution if hemodynamic instability
Diagnostic Peritoneal Lavage (rarely used)	Most sensitive test Tests for intraperitoneal bleed	Cannot test for retroperitoneal bleed or diaphragmatic rupture Cannot distinguish lethal from trivial bleed Results can take up to 1 h

- imaging must be done if:
  - equivocal abdominal examination, altered sensorium, or distracting injuries (e.g. head trauma, spinal cord injury resulting in abdominal anesthesia)
  - unexplained shock/hypotension
  - patients have multiple traumas and must undergo general anesthesia for orthopaedic, neurosurgical, or other injuries
  - fractures of lower ribs, pelvis, spine
  - positive FAST

Management
- general: ABCs, early blood products, and stabilization
- surgical: watchful waiting vs. laparotomy
- solid organ injuries: decision based on hemodynamic stability, not the specific injuries
- hemodynamically unstable or persistently high transfusion requirements: laparotomy
- hollow organ injuries: laparotomy
- even if low suspicion of injury: admit and observe for 24 h

PENETRATING TRAUMA
- high-risk of gastrointestinal perforation and sepsis
- history: size of blade, calibre/distance from gun, route of entry
- local wound exploration under direct vision may determine lack of peritoneal penetration (not reliable in inexperienced hands) with the following exceptions:
  - thoracoabdominal region (may cause pneumothorax)
  - back or flanks (muscles too thick)

Management
- general: ABCs, fluid resuscitation, and stabilization
- gunshot wounds always require laparotomy

Seatbelt Injuries May Cause
- Retroperitoneal duodenal trauma
- Intraperitoneal bowel transection
- Mesenteric injury
- L-spine injury

Indications for Foley and NG Tube in Abdominal Trauma

Foley catheter: unconscious or patient with multiple injuries who cannot void spontaneously

NG tube: used to decompress the stomach and proximal small bowel. Contraindicated if suspected facial or basal skull fractures

Point-Of-Care Ultrasonography for Diagnosing Thoracoabdominal Injuries in Patients with Blunt Trauma

Cochrane DB Syst Rev 2018:CD012669

Purpose: Determine the diagnostic accuracy of POCUS for detecting and excluding free fluid, organ injuries, vascular lesions, and other injuries compared to diagnostic reference standard in patients with blunt trauma.

Methods: Systematic review of prospective or retrospective diagnostic cohort studies of patients with any type of blunt trauma.

Results: 34 studies, 8635 participants. For abdominal trauma, POCUS had a sensitivity of 0.68 (95% CI 0.59-0.75) and a specificity of 0.95 (95% CI 0.92-0.97). In children, pooled sensitivity of POCUS was 0.63 (95% CI 0.46-0.77), as compared to 0.78 (95% CI 0.69-0.84) in an adult/mixed population. For chest injuries, POCUS had a sensitivity of 0.96 (95% CI 0.88-0.99) and a specificity of 0.95 (95% CI 0.97-1.00).

Conclusions: In patients with blunt thoracoabdominal trauma, positive POCUS findings are helpful for guiding treatment decisions. However, with regard to abdominal trauma, a negative POCUS does not rule out injuries and must be verified. This is of particular importance in paediatric trauma, where the sensitivity of POCUS is poor. Based on a small number of studies in a mixed population, POCUS may have a higher sensitivity in chest injuries.

Laparotomy is Mandatory if Penetrating Trauma and:
- Shock
- Peritonitis
- Evisceration
- Free air in abdomen
- Blood in NG tube, Foley catheter, or on DRE

"Rule of Thirds" for Stab Wounds
- 1/3 do not penetrate peritoneal cavity
- 1/3 penetrate but are harmless
- 1/3 cause injury requiring surgery

Genitourinary Tract Injuries

- see Urology, U35

Etiology
- blunt trauma: often associated with pelvic fractures
  - upper tract
    - renal
      - contusions (minor injury – parenchymal ecchymoses with intact renal capsule)
      - parenchymal tears/laceration: non-communicating (hematoma) vs. communicating (urine extravasation, hematuria)
    - ureter: rare, at uretero-pelvic junction
  - lower tract
    - bladder
      - extraperitoneal rupture of bladder from pelvic fracture fragments
      - intraperitoneal rupture of bladder from trauma and full bladder
    - urethra
      - posterior urethral injuries: MVCs, falls, pelvic fractures
      - anterior urethral injuries: blunt trauma to perineum, straddle injuries/direct strikes
  - external genitalia
- penetrating trauma
  - damage to: kidney, bladder, ureter (rare), external genitalia
- acceleration/deceleration injury
  - renal pedicle injury: high mortality rate (laceration and thrombosis of renal artery, renal vein, and their branches)
- iatrogenic
  - ureter and urethra (from instrumentation)

History
- mechanism of injury
- hematuria (microscopic or gross), blood on underwear
- dysuria, urinary retention
- history of hypotension

Physical Exam
- abdominal pain, flank pain, CVA tenderness, upper quadrant mass, perineal lacerations
- DRE: sphincter tone, position of prostate, presence of blood
- scrotum: ecchymoses, lacerations, testicular disruption, hematomas
- bimanual exam, speculum exam
- extraperitoneal bladder rupture: pelvic instability, suprapubic tenderness from mass of urine or extravasated blood
- intraperitoneal bladder rupture: acute abdomen
- urethral injury: perineal ecchymosis, blood at penile meatus, high riding prostate, pelvic fractures

Investigations
- urethra: retrograde urethrography
- bladder: U/A, CT scan, urethrogram ± retrograde cystoscopy ± cystogram (distended bladder + post-void)
- ureter: retrograde ureterogram
- renal: CT scan (best, if hemodynamically stable), intravenous pyelogram

Gross hematuria suggests bladder injury

Management
- urology consult
- renal
  - minor injuries: conservative management
    - bedrest, hydration, analgesia, antibiotics
  - major injuries: admit
    - conservative management with frequent reassessments, serial U/A ± re-imaging
    - surgical repair (exploration, nephrectomy): hemodynamically unstable or continuing to bleed >48 h, major urine extravasation, renal pedicle injury, all penetrating wounds and major lacerations, infections, renal artery thrombosis
- ureter
  - ureteroureterostomy
- bladder
  - extraperitoneal
    - minor rupture: Foley drainage x 10-14 d
    - major rupture: surgical repair
  - intraperitoneal
- urethra
  - anterior: conservative, if cannot void, Foley or suprapubic cystostomy and antibiotics
  - posterior: suprapubic cystostomy (avoid catheterization) ± surgical repair

In the case of gross hematuria, the genitourinary system is investigated from distal to proximal (i.e. urethrogram, cystogram, etc.)

Orthopaedic Injuries

- see Orthopaedic Surgery (see *Shoulder* OR12, *Knee* OR34, *Wrist* OR23, *Ankle* OR41)

Goals of ED Treatment
- diagnose potentially life/limb-threatening injuries
- reduce and immobilize fractures (cast/splint) as appropriate
- provide adequate pain relief
- arrange proper follow-up if necessary

History
- use SAMPLE, mechanism of injury may be very important

Physical Exam
- look (inspection): "SEADS" = swelling, erythema, atrophy, deformity, and skin changes (e.g. bruises)
- feel (palpation): all joints/bones for local tenderness, swelling, warmth, crepitus, joint effusions, and subtle deformity
- move: joints affected plus those above and below injury – active ROM preferred to passive
- neurovascular status: distal to injury (before and after reduction)

LIFE- AND LIMB-THREATENING INJURIES

Table 10. Life- and Limb-Threatening Orthopaedic Injuries

Life-Threatening Injuries (usually blood loss)	Limb-Threatening Injuries (usually interruption of blood supply)
Major pelvic fractures	Fracture/dislocation of ankle (talar AVN)
Traumatic amputations	Crush injuries
Massive long bone injuries and associated fat emboli syndrome	Compartment syndrome
Vascular injury proximal to knee/elbow	Open fractures
	Dislocations of knee/hip
	Fractures above knee/elbow

Open Fractures
- communication between fracture site and external surface of skin – increased risk of osteomyelitis
- remove gross debris, irrigate, cover with sterile dressing – formal irrigation and debridement often done in the OR
- control bleeding with pressure (no clamping)
- splint
- antibiotics (1st generation cephalosporin and aminoglycoside) and tetanus prophylaxis
- standard of care is to secure definitive surgical management within 6 h, time to surgery may vary from case-to-case

Vascular Injuries
- realign limb/apply longitudinal traction and reassess pulses (e.g. Doppler probe)
- surgical consult
- direct pressure if external bleeding

Compartment Syndrome
- when the intracompartmental pressure within an anatomical area (e.g. forearm or lower leg) exceeds the capillary perfusion pressure, eventually leading to muscle/nerve necrosis
- clinical diagnosis: maintain a high index of suspicion
  - pain out of proportion to the injury
  - pain worse with passive stretch
  - tense compartment
  - look for "The 6 Ps" (note: radial pulse pressure is 120/80 mmHg while capillary perfusion pressure is 30 mmHg, seeing any of the 6 Ps indicates advanced compartment syndrome, therefore do not wait for these signs to diagnose and treat)
- requires prompt decompression: remove constrictive casts, dressings; emergent fasciotomy may be needed

UPPER EXTREMITY INJURIES
- anterior shoulder dislocation
  - axillary nerve (lateral aspect of shoulder) and musculocutaneous nerve (extensor aspect of forearm) at risk
  - seen on lateral view: humeral head anterior to glenoid
  - reduce (traction, scapular manipulation), immobilize in internal rotation, repeat x-ray, outpatient follow-up with orthopaedics
  - with forceful injury, look for fracture

Description of Fractures

Effect of a Single Dose of Oral Opioid and Nonopioid Analgesics on Acute Extremity Pain in the ED
JAMA 2017;318:1661-1667
Purpose: To compare the efficacy of 4 analgesics on acute extremity pain.
Methods: RCT including 416 patients with moderate to severe acute extremity pain. Participants received ibuprofen 400 mg and acetaminophen 1000 mg; oxycodone 5 mg and acetaminophen 325 mg; hydrocodone 5 mg and acetaminophen 300 mg; or codeine 30 mg and acetaminophen 300 mg. The primary outcome was the difference in decline in pain 2 h after ingestion. Pain was assessed using an 11-point numerical rating scale (NRS).
Results: At 2 h, the mean NRS pain score decreased by 4.3 in the ibuprofen and acetaminophen group; by 4.4 in the oxycodone and acetaminophen group; by 3.5 in the hydrocodone and acetaminophen group; and by 3.9 in the codeine and acetaminophen group (P=0.053).
Conclusions: For patients presenting to the ED with acute extremity pain, there were no statistically significant or clinically important differences in pain reduction at 2 h among single-dose treatment with ibuprofen and acetaminophen or with 3 different opioid and acetaminophen combination analgesics.

When Dealing with an Open Fracture, Remember "STAND"

Splint
Tetanus prophylaxis
Antibiotics
Neurovascular status (before and after)
Dressings (to cover wound)

Vascular injury/compartment syndrome is suggested by "The 6 Ps" Injury Compartment Syndrome -

6 Ps
Pulse discrepancies
Pallor
Paresthesia/hypoesthesia
Paralysis
Pain (especially when refractory to usual analgesics)
Polar (cold)

- Colles' fracture
  - distal radius fracture with dorsal displacement from "Fall on Outstretched Hand" (FOOSH)
  - anteroposterior film: radial shortening, radial deviation, radial displacement
  - lateral film: dorsal displacement, volar angulation
  - reduce, immobilize with splint, out-patient follow-up with orthopaedics or immediate orthopaedic referral if complicated fracture
  - if involvement of articular surface, emergent orthopaedic referral
- scaphoid fracture
  - tenderness in anatomical snuff box, pain on scaphoid tubercle, pain on axial loading of thumb
  - negative x-ray: thumb spica splint, repeat x-ray in 1 wk ± CT scan/bone scan
  - positive x-ray: thumb spica splint x 6-8 wk, repeat x-ray in 2 wk
  - risk of AVN of scaphoid if not immobilized
  - outpatient orthopaedics follow-up

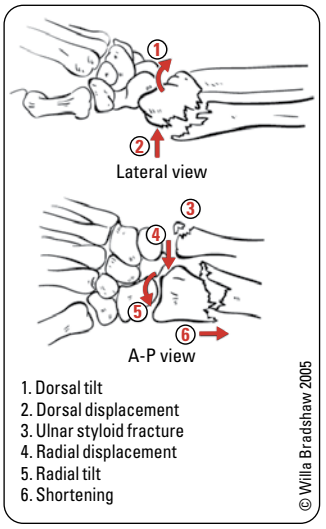

Figure 7. Colles' fracture

LOWER EXTREMITY INJURIES

- knee injuries
  - see *Ottawa Knee Rules*
- ankle and foot fractures
  - see *Ottawa Ankle and Foot Rules*
- avulsion of the base of 5th metatarsal
  - occurs with inversion injury
  - supportive tensor or below knee walking cast for 3 wk
- calcaneal fracture
  - associated with fall from height
  - associated with axial loading (other injuries may involve ankles, knees, hips, pelvis, lumbar spine)

A knee x-ray examination is required only for acute injury patients with one or more of:

- Age 55 yr or older
- Tenderness at head of fibula
- Isolated tenderness of patella
- Inability to flex to 90°
- Inability to bear weight both immediately and in the ED (four steps)

Figure 9. Ottawa knee rules
Adapted from: Stiell IG, Wells GA, Hoag RH, et al. JAMA 1997;278:2075-2079.

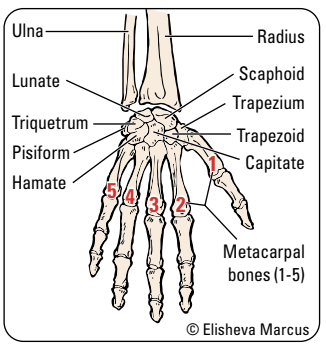

Figure 8. Carpal bones

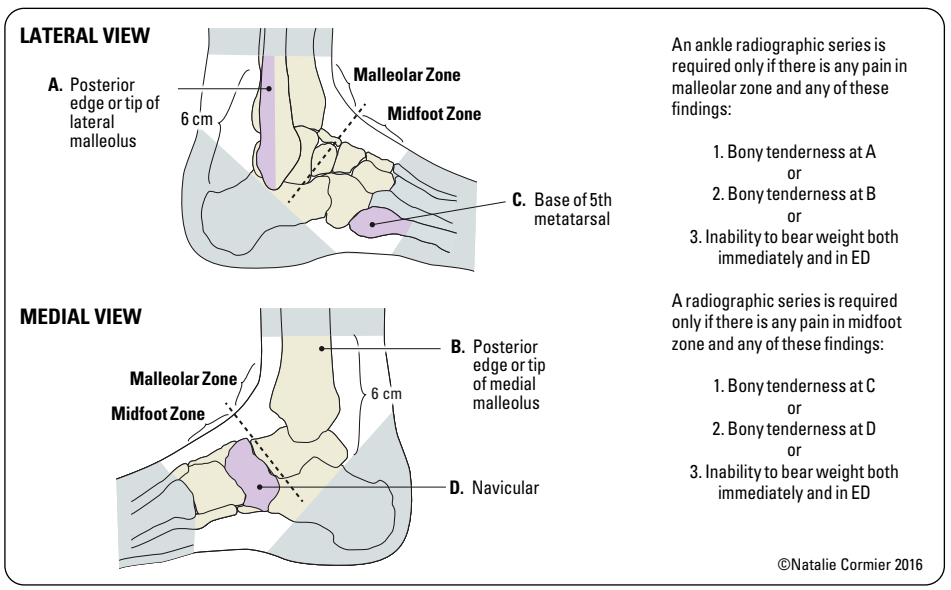

Figure 10. Ottawa ankle and foot rules
Adapted from: Stiell IG, McKnight RD, Greenberg GH, et al. JAMA 1994;271:827-832.

Wound Management

Goals of ED Treatment

- identify injuries and stop any active bleeding – direct pressure
- manage pain
- wound examination and exploration
- cleansing ± antibiotic and tetanus prophylaxis
- closure and dressing

Tetanus Prophylaxis

- both tetanus toxoid (Td) and immunoglobulin (TIG) are safe in pregnancy

Table 11. Guidelines for Tetanus Prophylaxis for Wounds

	Clean, Minor Wounds		All Other Wounds*	
Vaccination History	Tdap or Td†	TIG	Tdap or Td†	TIG
Unknown or fewer than 3 doses	Yes	No	Yes	Yes
3 or more doses	No§	No	No¶	No

*Such as, but not limited to, wounds contaminated with dirt, feces, soil, and saliva; puncture wounds; avulsions; and wounds resulting from missiles, crushing, burns, and frostbite
†Tdap is preferred to Td for adults who have never received Tdap. Single antigen tetanus toxoid (TT) is no longer available in the United States
§Yes, if more than ten years since the last tetanus toxoid-containing vaccine dose
¶Yes, if more than five years since the last tetanus toxoid-containing vaccine dose
Source: MMWR 1991;40(No. RR-10):1-28

Bruises

- non-palpable = ecchymosis
- palpable collection (not swelling) = hematoma following blunt trauma
- assess for coagulopathy (e.g. liver disease), anticoagulant use

Abrasions

- partial to full thickness break in skin
- management
  - clean thoroughly with brush to prevent foreign body impregnation ± local anesthetic antiseptic ointment (Polysporin® or Vaseline®) for 7 d ± tetanus prophylaxis

Lacerations

- see Plastic Surgery, PL8, sidebar PL24
- consider every structure deep to a laceration injured until proven otherwise
- in hand injury patients, include the following in history: handedness, occupation, mechanism of injury, previous history of injury
- physical exam
  - think about underlying anatomy
  - examine tendon function actively against resistance and neurovascular status distally
  - clean and explore under local anesthetic; look for partial tendon injuries
  - x-ray or U/S wounds if a foreign body is suspected (e.g. shattered glass) and not found when exploring wound (remember: not all foreign bodies are radiopaque), or if suspect intra-articular involvement
- management
  - disinfect skin/use sterile techniques
  - irrigate copiously with normal saline or tap water
  - analgesia ± anesthesia
  - maximum dose of lidocaine
    - 7 mg/kg with epinephrine
    - 5 mg/kg without epinephrine
- in children, topical anesthetics such as LET (lidocaine, epinephrine, and tetracaine), distraction provided by Child Life Specialist or parent; and in selected cases a short-acting benzodiazepine (midazolam or other agents) for sedation and amnesia are useful
- secure haemostasis
- evacuate hematomas, debride non-viable tissue, remove hair and foreign bodies
- ± prophylactic antibiotics (consider for animal/human bites, intra-oral lesion, or puncture wounds to the foot)
- suture unless: delayed presentation (>24 h), puncture wound, mammalian bite, crush injury, or retained foreign body
- take into account patient and wound factors when considering suturing
- advise patient when to have sutures removed
- cellulitis and necrotizing fasciitis (see Plastic Surgery, PL16)

Acute Treatment of Contusions

RICE
Rest
Ice
Compression
Elevation

High-Risk Factors for Infection
Wound Factors
- Puncture wounds
- Crush injuries
- Wounds >12 h old
- Hand or foot wounds

Patient Factors
- Age >50 yr
- Prosthetic joints or valves (risk of endocarditis)
- Immunocompromised

Suture Use and Duration

Suture to:	Close with Nylon or Other Non-absorbable Suture	Approx. Duration (d)
Face	6-0 or 5-0	5
Not Joint	4-0	7
Joint	3-0	10
Scalp	4-0	7
Mucous Membrane	Absorbable (vicryl)	N/A

N.B. Patients on steroid therapy may need sutures for longer periods of time

Early wound irrigation and debridement are the most important factors in decreasing infection risk

Alternatives to Sutures
- Tissue glue
- Steristrips®
- Staples

Approach to Common ED Presentations

Abdominal Pain

Table 12. Selected Differential Diagnosis of Abdominal Pain

	Emergent	Usually Less Emergent
GI	Perforated viscus, bowel obstruction, ischaemic bowel, appendicitis, strangulated hernia, IBD flare, esophageal rupture, peptic ulcer disease	Diverticulitis, gastroenteritis, GERD, esophagitis, gastritis, IBS
Hepatobiliary	Hepatic/splenic injury, pancreatitis, cholangitis, spontaneous bacterial peritonitis	Biliary colic, cholecystitis, hepatitis
Genital	Female: Ovarian torsion, ectopic pregnancy, tubo-ovarian abscess Male: Testicular torsion	Female: PID, ovarian cyst, salpingitis, endometriosis Male: epididymitis, prostatitis, orchitis
Urinary	Pyelonephritis	Renal colic, cystitis
CVS	MI, aortic dissection, AAA	Pericarditis
Respirology	PE, empyema	Pneumonia
Metabolic	DKA, sickle cell crisis, toxin, Addisonian crisis	Toxic ingestions (e.g. acetaminophen, Iron, NSAIDs, etc.), lead poisoning, porphyria
Other	Significant trauma, acute angle closure glaucoma	Abdominal wall injury, herpes zoster, psychiatric, abscess, hernia, mesenteric adenitis

- differential can be focused anatomically by location of pain: right upper quadrant, left upper quadrant, right lower quadrant, left lower quadrant, epigastric, periumbilical, diffuse

History
- pain: OPQRST
- review symptoms from genitourinary, gynaecological, gastrointestinal, respiratory, and cardiovascular systems
- abdominal trauma/surgeries, most recent colonoscopy, most recent endoscopy, last FOBT/FIT test

Physical Exam
- vitals, abdominal (including DRE, CVA tenderness), pelvic/genital, respiratory, and cardiac exams as indicated by history

Investigations
- ABCs, do not delay management and consultation if patient unstable
- labs: CBC, electrolytes, glucose, BUN/Cr, U/A ± liver enzymes, LFTs, lipase, β-hCG, ECG, troponins, ± VBG/lactate
- AXR: if suspicious of: foreign body or SBO (if in low resource setting)
- CXR upright: look for pneumoperitoneum (free air under diaphragm), lung disease
- U/S: all gynaecologic structure, testicles, biliary tract, ectopic pregnancy, appendicitis in children and young adults, nephro-urolithiasis in young patients, AAA, free fluid
- CT: SBO, trauma, AAA, pancreatitis, nephro-/urolithiasis, appendicitis, and diverticulitis

Management
- NPO, IV, NG tube (if SBO), analgesics, consider antibiotics and anti-emetics
- growing evidence that small amounts of opioid analgesics improve diagnostic accuracy of physical exam of surgical abdomen
- consult as necessary: internal medicine, general surgery, vascular surgery, gynaecology, etc.

Disposition
- admission: surgical abdomen, workup of significant abnormal findings, need for IV antibiotics or pain control
- discharge: patients with a negative lab and imaging workup who improve clinically during their stay; instruct the patient to return if severe pain, fever, or persistent vomiting develops

Acute Pelvic Pain

Etiology
- gynaecological
  - ovaries: ruptured ovarian cysts (most common cause of pelvic pain), ovarian abscess, ovarian torsion (rare, 50% will have ovarian mass)
  - fallopian tubes: salpingitis, tubal abscess, hydrosalpinx
  - uterus: leiomyomas (uterine fibroids) – especially with torsion of a pedunculated fibroid or in a pregnant patient (degeneration), PID
  - other: ectopic pregnancy (ruptured/expanding/leaking), spontaneous abortion (threatened or incomplete), endometriosis and dysmenorrhea, sexual or physical abuse
- non-gynaecological (see causes of lower abdominal pain above)

History and Physical Exam
- pain: OPQRST
- associated symptoms: vaginal bleeding, discharge, dyspareunia, bowel and/or bladder symptoms
- pregnancy and sexual history, including oligo/amenorrhea, menorrhagia, and fibroids
- vitals
- gynaecological exam: assess for cervical motion tenderness/"chandelier sign" (suggests PID)
- abdominal exam

Investigations
- β-hCG for all women of childbearing age
- CBC and differential, electrolytes, glucose, creatinine, BUN, culture and sensitivity, PTT/INR
- U/A to rule out urologic causes
- vaginal and cervical swabs for culture and sensitivity during physical exam
- pelvic and abdominal U/S: evaluate adnexa, thickness of endometrium, pregnancy, free fluid or masses in the pelvis
- Doppler flow studies for ovarian torsion

Management
- general: analgesia, determine if admission and consults are needed
- specific:
  - ovarian cysts
    - unruptured or ruptured, and hemodynamically stable: analgesia and follow-up
    - ruptured with significant hemoperitoneum: may require surgery
  - ovarian torsion: surgical detorsion or removal of ovary
  - uncomplicated leiomyomas, endometriosis, and secondary dysmenorrhea can usually be treated on an outpatient basis, discharge with gynaecology follow-up
  - PID: broad spectrum antibiotics

Disposition
- referral: gynaecological or obstetrical causes requiring surgical intervention, requiring admission, or oncological in nature
- admission: patients requiring surgery, IV antibiotics/pain management
- discharge: negative workup and resolving symptoms; give clear instructions for appropriate follow-up

Gynaecological Causes of Pelvic Pain
- Ovarian cyst
- Dysmenorrhea
- Mittelschmerz
- Endometriosis
- Ovarian torsion
- Uterine fibroids/neoplasm
- Adnexal neoplasm
- PID + cervicitis

U/S is the preferred imaging modality in the assessment of acute pelvic pain

Possible Causes of Coma

AEIOU TIPS
Acidosis/**A**lcohol
Epilepsy
Infection
Oxygen (hypoxia)/**O**piates
Uremia
Temperature/**T**rauma (especially head)
Insulin (too little or too much)
Psychogenic/**P**oisoning
Structural or space-occupying lesion

Altered Level of Consciousness

Definitions
- altered mental status: collective, non-specific term referring to change in cognitive function, behaviour, or attentiveness, including:
  - delirium (see Psychiatry, PS23)
  - dementia (see Psychiatry, PS24)
  - lethargy: state of decreased awareness and alertness (patient may appear wakeful)
  - stupor: unresponsiveness but rousable
  - coma: a sleep-like state, not rousable to consciousness

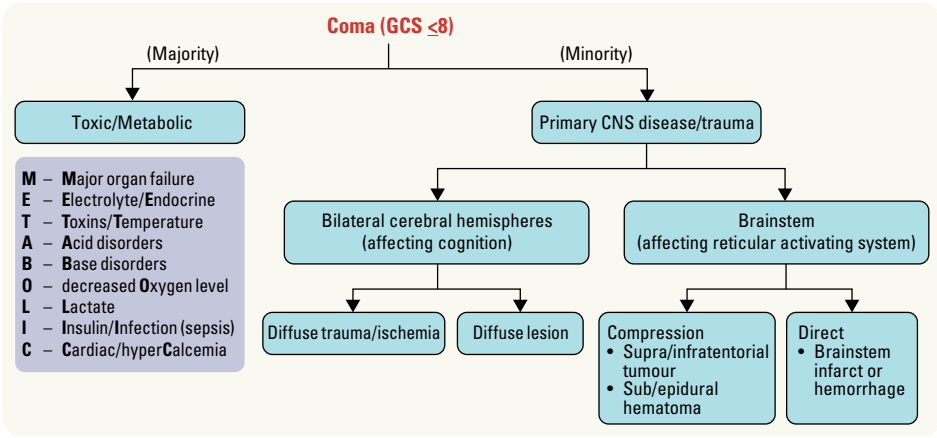

Figure 11. Etiology of coma

MANAGEMENT OF ALTERED LOC

History

- obtain collateral from family, friends, police, paramedics, patient record, MedicAlert® bracelet, etc.
- onset and progression
  - antecedent trauma, seizure activity, fever
  - abrupt onset suggests CNS hemorrhage/ischaemia, cardiac cause, or poisoning
  - progression over hours to days suggests progressive CNS lesion or toxic/metabolic cause
- determine patient's baseline LOC
- past medical history (e.g. similar episode(s), depression, overdose)

Physical Exam

- ABCs, vitals including temperature; cardiac, respiratory, abdominal exams
- complete neurological exam; in particular, examination of the eyes ("PEARL" pupils equal and reactive to light)
- use the GCS to evaluate LOC (see *Patient Assessment/Management*, ER2)

In general, intubate if GCS <8; but ability to protect airway is primary consideration

Investigations

- blood work
  - serum glucose level, electrolytes, creatinine, BUN, LFTs, serum osmolality, CBC, VBG, PT/PTT/INR, troponins
  - serum acetaminophen, salicylate levels, ethanol (± toxic alcohols)
- imaging
  - CT head, CXR (if respiratory compromise or symptoms)
- other tests
  - ECG, U/A, UTox

Diagnosis

- administer appropriate universal antidotes
  - thiamine 100 mg IV if history of EtOH or patient looks malnourished
  - 50 mL D50W if hypoglycemic on point-of-care capillary blood glucose
  - naloxone 0.4 mg, up to 10 mg IV if opiate overdose suspected
  - place patient on oxygen (if needed)
- distinguish between structural and toxic-metabolic coma
  - structural coma
    - pupils, extraocular movements, and motor findings, if present, are usually asymmetric
    - look for focal or lateralizing abnormalities
  - toxic-metabolic coma
    - dysfunction at lower levels of the brainstem (e.g. caloric unresponsiveness)
    - respiratory depression in association with an intact upper brainstem (e.g. equal and reactive pupils)
    - extraocular movements and motor findings are symmetric or absent
    - essential to re-examine frequently because status can change rapidly
- diagnosis may become apparent only with the passage of time
  - delayed deficit after head trauma suggestive of epidural hematoma (characteristic "lucid interval")

Table 13. Toxic-Metabolic Causes of Fixed Pupils

Dilated	Dilated to Normal	Constricted
Anoxia Anticholinergic agents (e.g. atropine, tricyclic antidepressants) Methanol Cocaine Opioid withdrawal Amphetamines Hallucinogens Serotonin syndrome (MAOI + SSRI)	Hypothermia Barbiturates Antipsychotics	Cholinergic agents (e.g. organophosphates) Opioids (e.g. heroin), except meperidine

Disposition
- admission: if ongoing decreased LOC, admit to service based on tentative diagnosis, or transfer patient if appropriate level of care not available
- discharge: readily reversible alteration of LOC; ensure adequate follow-up care available

Chest Pain

Table 14. Differential Diagnosis for Chest Pain

	Emergent	Usually Less Emergent
CVS	MI, unstable angina, aortic dissection, cardiac tamponade, arrhythmia	Stable angina, pericarditis, myocarditis
Respirology	PE, pneumothorax	Pneumonia, pleural effusion, malignancy
GI	Esophageal rupture, Mallory-Weiss tear or pneumomediastinum	Mallory-Weiss tear or esophageal rupture, pneumomediastinum
MSK		Rib fracture, costochondritis
Other		Herpes zoster, psychiatric/panic attack

History and Physical Exam
- OPQRST, previous episodes and change in pattern
- cardiac risk factors (HTN, DM, dyslipidemia, smoking, FHx)
- inquire about any previous cardiac procedures, last stress test, last angiogram and if they are currently followed by a cardiologist
- vitals, cardiac, respiratory, peripheral vascular, abdominal exams

Investigations
- CBC, electrolytes, Cr, BUN, glucose, PTT/INR, cardiac biomarkers (troponin)
- ECG: always compare with previous; may be normal in up to 50% of PE and acute MI
- CXR: compare with previous
- CT: if indicated (e.g. aortic dissection, PE)

Management and Disposition
- ABCs, O_2 (if needed), cardiac monitors, IV access
- treat underlying cause and involve consultants as necessary
- consider further observation/monitoring if unclear diagnosis or risk of dysrhythmia
- discharge: patients with a low probability of life-threatening illness due to resolving symptoms and negative workup; arrange follow-up (e.g. rapid/acute cardiac clinic) and instruct to return if SOB or increased chest pain develops. Can refer to HEART score to risk stratify patients

Life-Threatening Causes of Chest Pain

PET MAP
PE
Esophageal rupture
Tamponade
MI/angina
Aortic dissection
Pneumothorax

Imaging is necessary for all suspected aortic dissections, regardless of BP

Angina Characteristics
1. Retrosternal location
2. Provoked by exertion
3. Relieved by rest or nitroglycerin

Risk for Coronary Artery Disease
3/3 = "typical angina" - high-risk
2/3 = intermediate risk for women >50 yr, all men
1/3 = Intermediate risk in men >40 yr, women >60 yr

Table 15. Comparison of Chest Pain Diagnoses

	Classic History	Classic Findings	Diagnostic Investigations	Management and Disposition
Acute Coronary Syndrome	New or worsening pattern of retrosternal squeezing/ pressure pain, radiation to arm/neck, dyspnea, worsened by exercise, relieved by rest; N/V; syncope	New or worsened murmur, hypotension, diaphoresis, pulmonary edema	ECG: ischaemia (15-lead if hypotensive, AV node involvement or inferior MI), serial troponin I (sensitive 6-8 h after onset), CK-MB, CXR	ABCs, Aspirin®, anticoagulation and emergent cardiology consult to consider percutaneous intervention or thrombolytic
Pulmonary Embolism	Pleuritic chest pain (75%), dyspnea; risk factors for venous thromboembolism	Tachycardia, hypoxemia; evidence of DVT	Wells' criteria: D-dimer, CT pulmonary angiogram*, ventilation-perfusion (V/Q) scan; leg Doppler, CXR	ABCs, anticoagulation; consider airway management and thrombolysis if massive PE (hypotension and cardiovascular collapse)
Acute Pericarditis	Viral prodrome, anterior precordial pain, pleuritic, relieved by sitting up and leaning forward	Friction rub	ECG: sinus tachycardia, diffuse ST elevation, PR depression in II, III, avF and V4-6; reciprocal PR elevation and ST depression in aVR ±V1; echocardiography	ABCs, rule out MI, high dose NSAIDs ± colchicine; consult if chronic/ recurrent, large pericardial effusion, or non-viral cause (e.g. SLE, renal failure, requires surgery)
Pneumothorax	Trauma or spontaneous pleuritic chest pain often in tall, thin, young male athlete	Hemithorax with decreased/absent breath sounds, hyper-resonance; deviated trachea and hemodynamic compromise (if tension pneumothorax)	Clinical diagnosis CXR: posteroanterior view, lateral, expiratory views – lung edge, loss of lung markings, tracheal shift; deep sulcus sign on supine view	ABCs, if unstable, needle to 2nd ICS at mid-clavicular line; urgent surgical consult / thoracostomy 4th intercostal space and chest tube
Aortic Dissection	Sudden severe tearing retrosternal or midscapular pain ± focal pain/neurologic loss in extremities in context of HTN	HTN; systolic BP difference >20 mmHg or pulse deficit between arms; aortic regurgitant murmur	CT angiogram; CXR - wide mediastinum, left pleural effusion, indistinct aortic knob, >4 mm separation of intimal calcification from aortic shadow, 20% normal	ABCs, reduce BP and HR; classify type A (ascending aorta, urgent surgery) vs. B (not ascending aorta, medical) on CT angiogram and urgent consult
Cardiac Tamponade	Dyspnea, cold extremities, ± chest pain; often a recent cardiac intervention or symptoms of malignancy, connective tissue disease	Beck's triad - hypotension, elevated JVP, muffled heart sounds; tachycardia, pulsus paradoxus >10 mmHg	Clinical diagnosis CXR: may show cardiomegaly, evidence of trauma, ECG may show electrical alternans	ABCs, cardiac surgery or cardiology consult, pericardiocentesis if unstable, treat underlying cause
Esophageal Rupture	Sudden onset severe pain after endoscopy, forceful vomiting, labour, or convulsion, or in context of corrosive injury or cancer	Subcutaneous emphysema, findings consistent with sepsis	CXR: pleural effusion (75%), pneumomediastinum; CT or water soluble contrast esophagogram	ABCs, early antibiotics, resuscitation, thoracics consult, NPO, consider chest tube
Esophagitis or GERD	Frequent heartburn, acid reflux, dysphagia, relief with antacids	Oral thrush or ulcers (rare)	None acutely	ABCs, PPI medication, avoid EtOH, tobacco, trigger foods
Herpes Zoster	Abnormal skin sensation – itching/tingling/pain – preceding rash by 1-5 d	None if early; maculopapular rash developing into vesicles and pustules that crust	Clinical diagnosis; direct immunofluorescence assay	ABCs, anti-virals (if < <48 h onset), analgesia ± steroids, dressing; r/o ocular involvement/refer if necessary
MSK	History of injury	Reproduction of symptoms with movement or palpation (not specific – present in 25% of MI)	MSK injury or fracture on x-rays	ABCs, NSAIDs, rest, orthopaedics consultation for fractures
Anxiety	Symptoms of anxiety, depression, history of psychiatric disorder; may coexist with physical disease	Tachycardia, diaphoresis, tremor	Diagnosis of exclusion	ABCs, arrange social supports, rule out suicidality and consider psychiatry consult

ACS more likely to be atypical in females, diabetics, and >80 yr. Anginal equivalents include dyspnea, diaphoresis, fatigue, non-retrosternal pain

It is important to look for reciprocal changes in STEMI in order to differentiate from pericarditis (diffuse elevations)

Tracheal deviation is away from tension or towards non-tension pneumothorax

Does this Patient with Chest Pain have Acute Coronary Syndrome?: The Rational Clinical Examination Systematic Review
JAMA 2015;314:1955-1965
Purpose: To review accuracy of the initial history, physical examination, ECG, and risk scores incorporating these elements with the first cardiac-specific troponin.
Methods: Systematic review of prospective studies among patients admitted to the ED with symptoms suggesting ACS.
Results: Prior abnormal stress test (specificity 96%; LR 3.1, 95% CI 2.0-4.7), peripheral artery disease (specificity 97%; LR 2.7, 95% CI 1.5-4.8), and pain radiating to both arms (specificity 96%; LR 2.6, 95% CI 1.8-3.7) were most suggestive of ACS. The most suggestive ECG findings were ST-segment depression and any evidence of ischaemia. The History, ECG, Age, Risk Factors, Troponin (HEART) (LR 13, 95% CI 7-24) and the Thrombolysis in MI (TIMI) risk scores (LR 6.8, 95% CI, 5.2-8.9) were both predictive of ACS in the high-risk scores.
Conclusions: Among patients with suspected ACS presenting to the ED, the initial history, physical examination, and ECG alone did not confirm or exclude the diagnosis of ACS. Instead, the HEART or TIMI risk scores, which incorporate the first cardiac troponin, provided more diagnostic information.

Conservative vs. Interventional Treatment for Spontaneous Pneumothorax
NEJM 2020;382:405-415
Purpose: Determine whether conservative management is an acceptable alternative to interventional management for uncomplicated, moderate-to-large primary spontaneous pneumothorax.
Methods: Open-label, multicenter, noninferiority trial. Patients 14-50 yr were recruited with a first-known, unilateral, moderate-to-large primary spontaneous pneumothorax. Patients (n=316) were randomly assigned to immediate interventional management of the pneumothorax or a conservative observational approach and were followed for 12 mo. The primary outcome was lung re-expansion within 8 wk.
Results: Re-expansion within 8 wk occurred in 129 of 131 patients with interventional management and in 118 of 125 with conservative management (P = 0.02 for noninferiority). Conservative management resulted in a lower risk of serious adverse events or pneumothorax recurrence than interventional management.
Conclusions: The trial provides modest evidence that conservative management of primary spontaneous pneumothorax was noninferior to interventional management, with a lower risk of serious adverse events.

Table 16. Common Life-Threatening ECG Changes

Pathology	ECG Findings
Dysrhythmia	
Torsades de pointes	Ventricular complexes in upward-pointing and downward-pointing continuum (160-250 bpm)
Ventricular tachycardia	6 or more consecutive premature ventricular beats (>100 bpm, QRS >120 ms)
Ventricular flutter	Smooth sine wave pattern of similar amplitude (>200 bpm)
Ventricular fibrillation	Erratic ECG tracing, no identifiable waves
Conduction	
2nd degree heart block (Mobitz Type II)	PR interval stable, some QRSs dropped
3rd degree heart block	Prolonged QRS complex (>0.12 s) RSR' in V5 or V6 Total AV dissociation, but stable P-P and R-R intervals
Left bundle branch block	Monophasic I and V6 May see ST elevation Difficult to interpret, new LBBB is considered STEMI equivalent
Ischaemia	
STEMI	ST elevation in leads associated with injured area of heart and reciprocal lead changes (depression)
Metabolic	
Hyperkalemia	Initially, tall T-waves Followed by PR prolongation, QRS widening, loss of P waves Finally, sinusoidal pattern and pulse electrical activity (PEA)/Vfib/Asystole
Hypokalemia	P wave flattening QRS complex widening and flattening U waves appear Flattened T waves
Digitalis Toxicity	Supraventricular tachycardia Slow ventricular response Frequent premature ventricular contractions At risk for AV blocks and ventricular irritability
Syndromes	
Brugada	RBBB with ST elevation in V1, V2, and V3 Susceptible to deadly dysrhythmias, including VFib
Wellens	Marked T wave inversion in V2 and V3 Left anterior descending coronary stenosis
Long QT syndrome	QT interval longer than ½ of cardiac cycle Predisposed to ventricular dysrhythmias

Headache

- see Neurology, N46

Etiology

- **common and less serious**
  - common migraine (without aura)/classic migraine (with aura)
    - common: unilateral, throbbing, aggravated by activity, moderate/severe intensity, N/V, photo-/phonophobia
    - classic: fully reversible aura symptoms that precede headache, e.g. flashing lights, pins and needles (paresthesia), loss of vision, dysarthria
    - treatment: simple analgesics (NSAIDs, acetaminophen, Aspirin®), antiemetics, triptans
    - family physician to consider prophylactic treatment
  - tension headache
    - bilateral, non-throbbing, not aggravated by routine physical activity, mild-moderate intensity.
    - can last between 30 min to 7 d
    - triggered with stress, sleep deprivation
    - treatment: modify stressor(s), simple analgesics (NSAIDs, acetaminophen, Aspirin®)
- **less common but potentially fatal**
  - subarachnoid hemorrhage (SAH) (see Neurosurgery, NS22)
    - sudden onset, "worst headache of life," maximum intensity within minutes
    - increased pain with exertion, N/V, meningeal signs
    - diagnosis
      - new generation CT 100% sensitive within 6 h of onset (hyperattenuating signal around Circle of Willis)
      - LP if suspected SAH and normal CT after 6 h
    - management: urgent neurosurgery consult

Diagnosis of Pulmonary Embolism with D-Dimer Adjusted to Clinical Probability
NEJM 2019;381:2125-2134
Purpose: Retrospective analyses suggest that PE is ruled out by a D-dimer level of <1000 ng/mL in patients with a low clinical pretest probability (C-PTP) and by a d-dimer level of <500 ng/mL in patients with a moderate C-PTP.
Methods: Prospective study in which PE was considered to be ruled out without further testing in 2017 outpatients with a low C-PTP and a d-dimer level of <1000 ng/mL or with a moderate C-PTP and a d-dimer level of <500 ng/mL. If PE was not diagnosed, patients did not receive anticoagulant therapy. Patients were followed for 3 mo for VTE.
Results: Of the 1325 patients who had a low C-PTP or moderate C-PTP and a negative d-dimer test, none had VTE during follow-up. This diagnostic strategy resulted in the use of chest imaging in 34.3% of patients. A strategy in which PE is considered to be ruled out with a low C-PTP and a d-dimer level of <500 ng/mL would result in the use of chest imaging in 51.9%.
Conclusion: A combination of a low C-PTP and a d-dimer level of <1000 ng/mL identified a group of patients at low-risk for PE during follow-up.

Immediate Treatment of Acute MI

BEMOAN
β-blocker
Enoxaparin
Morphine
Oxygen
ASA
Nitroglycerin

Common Therapeutic Approach to Severe Migraine
- 1 L bolus of NS
- prochlorperazine/metoclopramide 10 mg IV
- diphenhydramine 25 mg IV
- ketorolac 30 mg IV
- dexamethasone 10 mg IV
- Other options include haloperidol, metoclopramide, ergotamine, sumatriptan, analgesics

Ottawa SAH Rule
JAMA 2013;310(12):1248-1255
Use for alert patients older than 15 yr with new severe non-traumatic headache reaching maximum intensity within 1 h
Not for patients with new neurologic deficits, previous aneurysms, SAH, brain tumours, or history of recurrent headaches (≥3 episodes over the course of ≥6 mo)
Investigate if ≥1 high-risk variables present:
- Age ≥40 yr
- Neck pain or stiffness
- Witnessed loss of consciousness
- Onset during exertion
- Thunderclap headache (instantly peaking pain)
- Limited neck flexion on examination

Subarachnoid hemorrhage can be predicted with 100% sensitivity using this rule.

- increased ICP
  - worse in morning, when supine or bending down, with cough or Valsalva
  - physical exam: neurological deficits, cranial nerve palsies, papilledema
  - diagnosis: CT head
  - management: consult neurosurgery
- meningitis (see Infectious Diseases, ID17)
  - at least two of the following features suggests that the headache could be due to meningitis: fever, neck stiffness, altered mental status
  - possible clinical/laboratory findings: nausea, focal neurologic signs, seizure, papilledema, petechial rash, high CSF WBC count, growth of organism in blood culture
  - investigations: rule out increased ICP (CT head, mental status normal, no neurological signs, no papilledema), if ruled out then perform diagnostic LP
  - treatment: early empiric antibiotics (high dose ceftriaxone + vancomycin ± ampicillin if >50 years old) ± acyclovir ± steroid therapy (administer based on clinical suspicion, DO NOT wait for LP)
- giant cell arteritis/temporal arteritis (causes significant morbidity, blindness) (see Ophthalmology, OP37)
  - vasculitis of large and mid-sized arteries, gender 3:1 F:M, most commonly ages >70 yr
  - headache, scalp tenderness, jaw claudication, arthralgia, myalgia, fever, malaise or weight loss
  - temporal artery tender on palpation, RAPD, optic disc edema on fundoscopy
  - labs: elevated ESR, CRP
  - temporal artery biopsy is gold standard for diagnosis
  - associated with polymyalgia rheumatica
  - treatment: high-dose steroids immediately if suspected, no need to hold treatment until pathology results

Disposition
- admission: if underlying diagnosis is critical or emergent, if there are abnormal neurological findings, if patient is elderly or immunocompromised (atypical presentation), or if pain is refractory to oral medications
- discharge: assess for risk of narcotic misuse; most patients can be discharged with appropriate analgesia and follow-up with their family physician; instruct patients to return for fever, vomiting, neurologic changes, or increasing pain

Validation of the Ottawa Subarachnoid Hemorrhage Rule in Patients with Acute Headache
CMAJ 2017;189:E1379-E1385
Purpose: Validate the Ottawa SAH Rule in emergency department patients.
Methods: Prospective cohort study at 6 university-affiliated tertiary-care hospital emergency departments in Canada from 2010-2014. Included alert, neurologically intact adult patients with headache peaking within 1 hour of onset. The rule was scored before investigations.
Results: 1153/1743 potentially eligible patients were enrolled, 67 had subarachnoid hemorrhage. Ottawa SAH rule had 100% sensitivity and 13.6% specificity with similar neuroimaging rates (87%).
Conclusions: The Ottawa SAH Rule was sensitive for identifying subarachnoid hemorrhage in otherwise alert and neurologically intact patients.

Meningitis
- Do not delay IV antibiotics for LP
- Deliver first dose of dexamethasone with or before first dose of antibiotic therapy

Parenteral Dexamethasone for Preventing Recurrence of Acute Severe Migraine Headache
BMJ 2008;336(7657):1359
Purpose: To examine effectiveness of parenteral corticosteroids for relief of acute severe migraine headache and prevention of recurrent headaches.
Methods: Meta-analysis of RCTs comparing corticosteroids (alone or in combination with standard abortive therapy) to placebo or any other standard treatment for acute migraine in adults.
Results: Seven RCTs met eligibility criteria, all of which used standard abortive therapy and subsequently compared single dose parenteral dexamethasone to placebo. All trials examined pain relief and recurrence of headache within 72 hr. While dexamethasone and placebo were comparable for acute pain reduction (mean difference 0.37, 95% CI -0.20 to 0.94) and side effect profiles, dexamethasone provided lower recurrence rates (relative risk 0.75, 0.60 to 0.90; number needed to treat 9).
Conclusion: Single dose parenteral dexamethasone with standard abortive therapy is associated with a 26% relative reduction in headache recurrence within 72 h.

Joint and Back Pain

JOINT PAIN (see Rheumatology, RH3)
- rule out life-threatening causes e.g. septic joint (see Orthopaedic Surgery, OR11)

History and Physical Exam
- history: recent trauma, drug use (anticoagulants, glucocorticoids)
- associated symptoms: fever, constitutional symptoms, skin lesions, conjunctivitis, urethritis
- patterns of joint involvement: polyarticular vs. monoarticular, symmetric vs. asymmetric
- inflammatory symptoms: morning stiffness ≥30 min, pain/stiffness that ease with activity, mid-day fatigue, soft tissue swelling
- non-inflammatory symptoms: morning stiffness <30 min, stiffness short-lived after inactivity, increasing pain with activity
- assess for pain with ROM, localized joint pain, effusion, erythema, warmth, swelling, inability to bear weight, fever; may indicate presence of septic joint

Investigations
- blood work: CBC, ESR, CRP, INR/PTT, blood cultures, urate
- joint x-ray ± contralateral joint for comparison
- bedside U/S to identify effusion ± joint aspiration
- test joint aspirate for: culture, WBC, polynuclear cells, glucose, Gram stain, crystals

Management
- septic joint: empiric IV antibiotics ± orthopaedic consultation for joint decompression and drainage
- crystalline synovitis: NSAIDs at high dose, colchicine within first 24 h, corticosteroids
  - do not use allopurinol for acute flares, as it may worsen acute attack
- acute polyarthritis: NSAIDs, analgesics (acetaminophen ± opioids), local or systemic corticosteroids
- osteoarthritis: NSAIDs, acetaminophen
- soft tissue pain: allow healing with enforced rest ± immobilization
  - non-pharmacologic treatment: local heat or cold, electrical stimulation, massage
  - pharmacologic: oral analgesics, NSAIDs, muscle relaxants, corticosteroid injections, topical agents

Red Flags for Back Pain

Bowel or bladder dysfunction
Anesthesia (saddle)
Constitutional symptoms
K - Chronic disease, Constant pain
Paresthesia
Age >50 and mild trauma
IV drug use/infection
Neuromotor deficits

BACK PAIN (see Family Medicine, FM42)
- rule out extraspinal emergencies: aortic dissection, AAA, PE, MI, retroperitoneal bleed, pancreatitis
- rule out spinal emergencies: osteomyelitis, cauda equina, epidural abscess or hematoma, spinal fracture, or malignancy

History and Physical Exam
- evaluate risk for fracture (osteoporosis, age, trauma), infection (IV drug user, recent spinal intervention, immunosuppression), cancer, vascular causes (cardiac risk factors), neurological symptoms (e.g. saddle anesthesia)
- typical musculoskeletal back pain is moderate, worse with movement or cough with no visceral symptoms
- assess vital signs, perform precordial, abdominal, and neurologic examination of lower extremities

Investigations
- WBC, ESR, CRP, U/A
- reserve imaging for neurological deficits, metastases, and patients at high-risk of fracture, infection, cancer, or vascular cause
  - consider x-ray ± CT if trauma or fracture risk
  - urgent MRI if neurological findings

Management
- treat underlying cause
- lumbosacral strain and disc herniation: analgesia and continue daily activities as much as tolerated; discuss red flags and organize follow-up
- spinal infection: early IV antibiotics and infectious disease consultation
- cauda equina: dexamethasone, early neurosurgical consultation

Seizures

- see Neurology, N18

Definition
- paroxysmal alteration of behaviour and/or EEG changes resulting from abnormal, excessive activity of neurons
- status epilepticus: continuous or intermittent seizure activity for greater than 5 min without regaining consciousness (life-threatening)

Categories
- generalized seizure (consciousness always lost): tonic/clonic, absence, myoclonic, atonic
- partial seizure (focal): simple partial, complex partial
- causes: primary seizure disorder, structural (trauma, intracranial hemorrhage, infection, increased ICP), metabolic disturbance (hypo-/hyperglycemia, hypo-/hypernatremia, hypocalcemia, hypomagnesemia, toxins/drugs)
- differential diagnosis: syncope, stroke/TIA, pseudoseizures, migraines, movement disorders, narcolepsy/cataplexy

History and Physical Exam
- history of seizures, identify potential precipitants (illness, alcohol withdrawal, sleep deprivation)
- preceding aura, rapid onset, brief duration, alterations in consciousness, tonic-clonic movements, and post-ictal symptoms would suggest a seizure
- common signs include loss of bladder/bowel control, tongue biting, emesis and aspiration
- perform vitals, complete neurologic examination and look for injuries to head, spine, and shoulder (dislocations)

Minimum Workup in an Adult with 1st Time Seizure
CBC and differential
Electrolytes including Ca^{2+}, Mg^{2+}, PO_4^{3-}
Head CT

If administering phenytoin, patient must be on a cardiac monitor as dysrhythmias and/or hypotension may occur

If IV access is not feasible, midazolam 0.2 mg/kg IM up to 10 mg can be used for initial control of seizure in adults

Table 17. Concurrent Investigation and Management of Status Epilepticus

Timing	Steps
Immediate	Protect airway with positioning; intubate if airway compromised or elevated ICP Monitor: vital signs, ECG, oximetry; bedside blood glucose Establish IV access Benzodiazepine - lorazepam 2 mg IV at 2 mg/min up to 10 mg or midazolam 5 mg IM up to 10 mg; repeat at 10 min if ineffective; intranasal or IO if no IV access Fluid resuscitation IV dextrose if glucose <60 mg/dL Give 50% glucose 50 mL (preceded by thiamine 100 mg IM if concerned about alcohol withdrawal) Obtain point of care capillary blood glucose, CBC, electrolytes, Ca^{2+}, Mg^{2+}, toxins, and antiepileptic drug levels; β-hCG Vasopressor support if sBP <90 or MAP <70 mmHg after aggressive fluid resuscitation
Urgent	Establish second IV line, urinary catheter If status persists, phenytoin 20 mg/kg IV at 25-50 mg/min in adults; may give additional 10 mg/kg IV 10 min after loading infusion If seizure resolves, antiepileptic drug still required to prevent recurrence EEG monitoring to evaluate for non-convulsive status epilepticus
Refractory	If status persists after maximum doses above, consult ICU and start one or more of: Phenobarbital 20 mg/kg IV at 50 mg/min Midazolam 0.2 mg/kg IV loading dose and 0.1-0.4 mg/kg/h Propofol 2 mg/kg IV at 2-5 mg/kg/h then loading dose then 2-10 mg/kg/h Requires definitive airway management including rapid sequence intubation and assisted ventilation. Electroencephalography (EEG) for continuous monitoring
Post-Seizure	Investigate underlying cause: consider CT, LP, MRI, ICP monitoring

Note: All interventions should be done as soon as possible
Adapted from Brophy et al. Guidelines for the evaluation and management of status epilepticus. Neurocrit Care 2012;17:3-23

Disposition
- decision to admit or discharge should be based on the underlying disease process identified
  - if a patient had a brief generalized seizure and has returned to baseline function and is neurologically intact, then consider discharge with outpatient follow-up
- first-time seizure patients being discharged should be referred to a neurologist for follow-up
- admitted patients should generally have a neurology consult
- patient should not drive until medically cleared (local regulations vary)
  - complete notification form to appropriate authority regarding ability to drive
- warn regarding other safety concerns (e.g. no swimming, bathing children alone, etc.)

Intramuscular vs. Intravenous Therapy for Prehospital Status Epilepticus
NEJM 2012;366:591-600
Purpose: To investigate the efficacy of intramuscular (IM) midazolam with that of IV lorazepam for children and adults in status epilepticus treated by paramedics.
Methods: Double-blind, randomized, non-inferiority trial. Subjects whose convulsions had persisted more than 5 min and were still convulsing after paramedics arrived were given the study medication by either IM or IV infusion. Primary outcome: absence of seizures at the time of arrival in the emergency department without the need for rescue therapy.
Results: Seizures were absent without rescue therapy in 73% of the IM-midazolam group and in 63.4% of the IV-lorazepam group (P<0.001 for noninferiority and superiority). The median times to active treatment were 1.2 min in the IM midazolam group and 4.8 min in the IV-lorazepam group, with corresponding median times from active treatment to cessation of convulsions of 3.3 min and 1.6 min. Adverse-event rates were similar.
Conclusions: For subjects in status epilepticus, IM midazolam is at least as safe and effective as IV lorazepam for prehospital seizure cessation.

Shortness of Breath

- see Respirology, R3 and Cardiology and Cardiac Surgery, C6

Table 18. Differential Diagnosis for Dyspnea

	High Mortality/Morbidity	Usually Less Emergent
Respiratory	Airway obstruction (foreign body, epiglottitis, abscess, anaphylaxis) Pneumo/hemothorax Gas exchange – pulmonary edema, PE, pneumonia, acute exacerbations of asthma or COPD	Chronic obstructive, interstitial or restrictive lung disease Pleural effusion
Cardiac	CHF, MI, valvular disease, tamponade, arrhythmia	Chronic CHF, angina
Metabolic	Metabolic acidosis NYD, toxin ingestion	Anemia, Hemoglobinopathy
Neuromuscular	Myasthenia gravis, diaphragmatic paralysis	CNS lesion, primary muscle weakness
Other	Anxiety, deconditioning	

History and Physical Exam
- acute SOB is often due to a relatively limited number of conditions; associated symptoms and signs are key to the appropriate diagnosis
  - substernal chest pain with cardiac ischaemia
  - fever, cough, and sputum with respiratory infections
  - urticaria with anaphylaxis
  - wheezing with acute bronchospasm
  - environmental or occupational exposures
- dyspnea may be the sole complaint and the physical exam may reveal few abnormalities (e.g. PE, pneumothorax)
- vitals including pulse oximetry
  - wheeze and stridor (airway) vs. crackles (parenchymal), JVP, and murmurs

Investigations
- blood work
  - CBC and differential (hematocrit to exclude anemia), electrolytes, consider ABG/VBG
  - serial cardiac enzymes and ECG if considering cardiac source
  - PERC or Wells scores to consider appropriateness of D-dimer
- imaging
  - CXR (hyperinflation and bullous disease suggestive of obstructive lung disease, or changes in interstitial markings consistent with inflammation, infection, or interstitial fluid)
  - CT chest may be indicated in acute dyspnea, specifically when suspicion for thromboembolic disease (i.e. PE)

Disposition
- history and physical exam lead to accurate diagnoses in patients with dyspnea in approximately two-thirds of cases; the decision to admit or discharge should be based on the underlying disease process identified and its severity
  - non-invasive positive pressure ventilation (NIPPV) should be considered in patients with severe COPD or CHF, may reduce the need for intubation in this patient population
  - consider intubation in COPD and CHF if NIPPV will not be tolerated (e.g. decreased LOC, vomiting)
- if discharging, organize follow-up and educate regarding signs to return to hospital

Syncope

Definition
- sudden, transient loss of consciousness and postural tone with spontaneous recovery
- usually caused by generalized cerebral or reticular activating system (brainstem) hypoperfusion

Etiology
- cardiogenic: dysrhythmia, outflow obstruction (e.g. PE, pulmonary HTN), MI, valvular disease
- non-cardiogenic: peripheral vascular (hypovolemia), vasovagal, cerebrovascular disorders, CNS, metabolic disturbances (e.g. EtOH intoxication)

History
- gather details from witnesses, and clarify patient's experience (e.g. dizziness, ataxia, or true syncope)
  - two key historical features: prodrome and situation (setting, patient posture)
- distinguish between syncope and seizure (see Neurology, N19)
  - some patients may have myoclonic jerks with syncope – NOT a seizure
    - signs and symptoms during presyncope, syncope, and postsyncope
    - past medical history, drugs
    - think anatomically in differential: pump (heart), blood, vessels, brain
- syncope is cardiogenic until proven otherwise if
  - there is sudden loss of consciousness with no warning or prodrome
  - syncope is accompanied by chest pain

Physical Exam
- postural BP and HR
- cardiac, respiratory, and neurological exams
- examine for signs of secondary injury caused by syncopal episode (e.g. head injury)

Investigations
- ECG (tachycardia, bradycardia, blocks, Wolff-Parkinson White, long QT interval, Brugada Syndrome, right ventricular strain, hypertrophic cardiomyopathy), bedside glucose
- consider blood work: CBC, electrolytes, BUN/Cr, ABGs, troponin, Ca^{2+}, Mg^{2+}, β-hCG, D-dimer
- consider toxicology screen

Management
- ABCs, IV, O_2, monitor
- cardiogenic syncope: admit to medicine/cardiology
- low-risk syncope: discharge with follow-up as indicated by cause (non-cardiogenic syncope may still be admitted)

Disposition
- decision to admit is based on etiology
- most patients will be discharged
- on discharge, instruct patient to follow up with family physician
  - educate about avoiding orthostatic or situational syncope
  - evaluate the patient for fitness to drive or work
  - patients with recurrent syncope should avoid high-risk activities (e.g. driving)

Sexual Assault

Epidemiology
- 1 in 5 women and 1 in 50 men will be sexually assaulted in their lifetime; only 7% are reported

General Approach
- ABCs, treat acute, serious injuries; physician priority is to treat medical issues and provide clearance
- ensure patient is not left alone and provide ongoing emotional support
- obtain consent for medical exam and treatment, collection of evidence, disclosure to police (notify police as soon as consent obtained)
- Sexual Assault Kit (document injuries, collect evidence) if <72 h since assault
- label samples immediately and pass directly to police
- offer community crisis resources (e.g. shelter, hotline)
- do not report unless victim requests or if <16 yr old (legally required)

Interprofessional teams are key; many centres or regions have sexual assault teams who specialize in the assessment and treatment of sexual assault victims, leaving emergency physicians responsible only for significant injuries and medical clearance

History
- ensure privacy for the patient – others should be asked to leave
- questions to ask: who, when, where did penetration occur, what happened, any weapons, or physical assault?
- post-assault activities (urination, defecation, change of clothes, shower, douche, etc.)
- gynaecologic history
  - gravidity, parity, last menstrual period
  - contraception use
  - last voluntary intercourse (sperm motile 6-12 h in vagina, 5 d in cervix)
- medical history: acute injury/illness, chronic diseases, psychiatric history, medications, allergies, etc.

Physical Exam
- never re-traumatize a patient with the examination
- general examination
  - mental status
  - sexual maturity
  - patient should remove clothes and place in paper bag
  - document abrasions, bruises, lacerations, torn frenulum/broken teeth (indicates oral penetration)

- pelvic exam and specimen collection
  - ideally before urination or defecation
  - examine for seminal stains, hymen, signs of trauma
  - collect moistened swabs of dried seminal stains
  - pubic hair combings and cuttings
  - speculum exam
    - lubricate with water only
    - vaginal lacerations, foreign bodies
    - Pap smear, oral/cervical/rectal culture for gonorrhea and chlamydia
    - posterior fornix secretions if present or aspiration of saline irrigation
    - immediate wet smear for motile sperm
    - air-dried slides for immotile sperm, acid phosphatase, ABO group
- fingernail scrapings and saliva sample from victim

Investigations
- Venereal Disease Research Lab (VDRL): repeat in 3 mo if negative
- serum β-hCG
- blood for ABO group, Rh type, baseline serology (e.g. hepatitis, HIV)

Management
- involve local/regional sexual assault team (sexual assault forensic examiner or sexual assault nurse examiner)
- medical
  - suture lacerations, tetanus prophylaxis
  - gynaecology consult for foreign body, complex lacerations
  - assume positive for gonorrhea and chlamydia
    - management: azithromycin 1 g PO x 1 dose (alt: doxycycline 100 mg PO BID x 10 d) and ceftriaxone 250 mg IM x 1 dose
  - may start post-exposure prophylaxis for hepatitis B and HIV
  - pre and post counselling for HIV testing
  - pregnancy prophylaxis offered
    - levonorgestrel 1.5 g PO STAT (Plan B®)
- psychological
  - high incidence of psychological sequelae
  - have victim change and shower after exam completed

Disposition
- discharge if injuries/social situation permit
- follow-up with physician in rape crisis centre within 24 h for repeat pregnancy and STI testing
- best if patient does not leave ED alone

INTIMATE PARTNER VIOLENCE
- women are usually the victims, but male victimization also occurs
- identify the problem (need high index of suspicion)
  - suggestive injuries (bruises, sprains, abrasions, occasionally fractures, burns, or other injuries; often inconsistent with history provided)
  - somatic symptoms (chronic and vague complaints)
  - psychosocial symptoms
  - clinician impression (your 'gut feeling' e.g. overbearing partner that won't leave patient's side)
- if disclosed, be supportive and assess danger
- patient must consent to follow-up investigation/reporting (unless patient is <16 y/o)

Management
- treat injuries and document findings
- ask about sexual assault and children at home (encourage notification of police)
- safety plan with good follow-up with family physician/social worker

Medical Emergencies

Anaphylaxis and Allergic Reactions

Etiology
- anaphylaxis is an exaggerated immune-mediated hypersensitivity reaction that leads to systemic histamine and vasoactive mediator release leading to increased vascular permeability and vasodilation; regardless of the etiology, the presentation and management of anaphylactic reactions are the same
- allergic (e.g. re-exposure to allergen)
- non-allergic (e.g. exercise-induced)

Most Common Triggers for Anaphylaxis
- Foods (nuts, shellfish, etc.)
- Stings
- Drugs (penicillin, NSAIDs, ACEI)
- Radiographic contrast media
- Blood products
- Latex

Diagnostic Criteria
- diagnosis of anaphylaxis is highly likely with any of the following:
  1. acute onset of an illness (min to h) with involvement of the skin, mucosal tissue and at least one of
     - respiratory compromise (e.g. dyspnea, wheeze, stridor, hypoxemia)
     - hypotension/end-organ dysfunction (e.g. hypotonia, collapse, syncope, incontinence)
  2. two or more of the following after exposure to a LIKELY allergen for that patient (min to h)
     - involvement of the skin-mucosal tissue
     - respiratory compromise
     - hypotension or associated symptoms
     - persistent gastrointestinal symptoms (e.g. crampy abdominal pain, vomiting)
  3. hypotension after exposure to a KNOWN allergen for that patient (min to h)
     - management is also appropriate in cases which do not fulfill criteria, but who have had previous episodes of anaphylaxis
     - life-threatening differentials for anaphylaxis include asthma and septic shock
     - angioedema may mimic anaphylaxis but tends not to improve with standard anaphylaxis treatment

Anaphylaxis should be suspected if airway, breathing, or especially circulation compromise is present after exposure to a known allergen

Hypotension is defined as sBP >30% decrease from baseline or
- ≥11 yr: <90 mmHg
- 1-10 yr: <70 mmHg + (2 x age)
- 1 mo-1 yr: <70 mmHg

Management
- moderate reaction: generalized urticaria, angioedema, wheezing, tachycardia
  - epinephrine (1:1000) 0.3-0.5 mg (IM in anterolateral thigh)
  - antihistamine: cetirizine 10 mg PO/IV
  - salbutamol (Ventolin®) 1 cc via MDI
- severe reaction/evolution: severe wheezing, laryngeal/pulmonary edema, shock
  - ABCs, may need definitive airway (e.g. ETT) due to airway edema
  - epinephrine (1:1000) 1-10 µg/min IV (or via ETT if no IV access) titrated to desired effect
  - antihistamine: diphenhydramine (Benadryl®) 50 mg IV (~1 mg/kg)
  - glucocorticoids: methylprednisolone 125-250 mg IV or prednisone/prednisolone 40-60 mg PO
  - large volumes of crystalloid may be required
- patients on β-blockers may not respond to epinephrine in an anaphylactic reaction and may benefit from glucagon for reversal

Early epinephrine is lifesaving and there are no absolute contraindications

Paediatric Dosing
Epinephrine: 0.01 mg/kg IM up to 0.5 mg q5-10 min
Initial crystalloid bolus: 20-30 mL/kg, reassess
Epinephrine infusion: 0.1-1.5 µg/kg/min
Diphenhydramine: 1 mg/kg PO/IV q4-6 h
Methylprednisolone: 1-2 mg/kg IV

Disposition
- monitor for 4-8 h in ED (minimum) and arrange follow-up with family physician in 24-48 h
- can have second phase (biphasic) reaction up to 72 h later, patient may need to be supervised
- educate patient on avoidance of allergens
- medications
  - epinephrine autoinjector
  - H1 antagonist (cetirizine 10 mg PO once daily or Benadryl® 50 mg PO q4-6 h x3 d)
  - glucocorticoids not recommended if good response to epinephrine and absence of asthma; if indicated, methylprednisolone 1-2 mg/kg/d for 2 d is sufficient

Asthma

- see Respirology, R7
- chronic inflammatory airway disease with episodes of bronchospasm and inflammation resulting in reversible airflow obstruction

Beware of the silent chest in asthma exacerbations. This is a medical emergency and requires aggressive treatment. Intubation of patients with severe asthma is extremely high risk and maximum medical therapy should be used to avoid it if possible

History and Physical
- find cause(s) of asthma exacerbation (e.g. viral, environmental, etc.)
- history of asthma control; severity of exacerbations (e.g. ICU, intubation history)
- signs of respiratory distress (e.g. accessory muscle use)
- vitals, specifically O_2

Investigations
- peak flow metre
- ± ABG if in severe respiratory distress
- CXR if diagnosis is in doubt to rule out pneumonia, pneumothorax, etc.

Table 19. Asthma Assessment and Management

Classifications	History and Physical Exam	Management
Respiratory Arrest Imminent	Exhausted, confused, diaphoretic, cyanotic Silent chest, ineffective respiratory effort Decreased HR, respiratory rate (RR) >30, pCO_2 >45 mmHg O_2 sat <90% despite supplemental O_2	Anticipate need for intubation 100% O_2, cardiac monitor, IV access Intubate (consider induction with ketamine) Short acting β-agonist (Ventolin®): nebulizer 5 mg continually Short-acting anticholinergic (Atrovent®): nebulizer 0.5 mg x 3 IV steroids: methylprednisolone 125 mg
Severe Asthma	Agitated, diaphoretic, laboured respirations Speaking in words No relief from β-agonist O_2 sat <90%, FEV_1 <50%	Similar to above management Magnesium sulphate 2 g IV O_2 to achieve O_2 sat >92%
Moderate Asthma	SOB at rest, cough, congestion, chest tightness Speaking in phrases Inadequate relief from β-agonist FEV_1 50-80%	O_2 to achieve O_2 sat >92% Short-acting β-agonist (Ventolin®): MDI or nebulizer q5 min Short-acting Anticholinergic (Atrovent®): MDI or nebulizer x 3 Steroids: prednisone 40-60 mg PO
Mild Asthma	Exertional SOB/cough with some nocturnal symptoms Difficulty finishing sentences FEV1 >80%	β-agonist Monitor FEV_1 Consider steroids (MDI or PO)

Disposition

- discharge safe in patients with FEV_1 or peak expiratory flow (PEF) >60% predicted, and may be safe if FEV_1 or PEF 40-60% predicted based on patient's risk factors for recurrence of severe attack
  - risk factors for recurrence: frequent ED visits, frequent hospitalizations, recent steroid use, recent exacerbation, poor medication compliance, prolonged use of high dose β-agonists
- β-agonist MDI with aerochamber 2-4 puffs q2-4 h until symptoms controlled, then PRN
- initiate inhaled corticosteroids with aerochamber if not already prescribed
- if moderate to severe attack, administer prednisone 30-60 mg/d for 5-10 d with no taper
- counsel on medication adherence and educate on use of aerochamber
  - follow up with primary care physician or asthma specialist

Cardiac Dysrhythmias

- see Cardiology and Cardiac Surgery, C19

Bradydysrhythmias and AV Conduction Blocks

- AV conduction blocks
  - 1st degree: prolonged PR interval (>200 msec), no treatment required
  - 2nd degree
    - Mobitz I: gradual prolongation of PR interval then dropped QRS complex, usually benign
    - Mobitz II: PR interval constant with dropped QRS complex, can progress to 3rd degree AV block
  - 3rd degree: P wave unrelated to QRS complex, PP and RR intervals constant
    - atropine and transcutaneous/transvenous pacing (atropine with caution)
    - if transcutaneous/transvenous pacing fails consider IV dopamine, epinephrine
  - long-term treatment for Mobitz II and 3rd degree block – internal pacemaker
- sinus bradycardia (rate <60 bpm)
  - can be normal (especially in athletes)
  - causes: vagal stimulation, vomiting, MI/ischaemia, increased ICP, sick sinus node, hypothyroidism, drugs (e.g. β-blockers, calcium channel blockers)
  - treat if symptomatic (hypotension, chest pain)
    - acute: atropine ± transcutaneous/transvenous pacing
    - sick sinus: transcutaneous/transvenous pacing
    - drug induced: discontinue/reduce offending drug, consider antidotes

Supraventricular Tachydysrhythmias (narrow QRS)

- sinus tachycardia (rate >100 bpm)
  - causes: increased sympathetic tone, drugs, fever, hypotension, anemia, thyrotoxicosis, MI, PE, emotional, pain, etc.
  - search for and treat underlying cause, consider β-blocker if symptomatic
- regular rhythm (i.e. not sinus tachycardia)
  - vagal maneuvers (e.g. carotid massage, Valsalva), adenosine 6 mg IV push, if no conversion give 12 mg, can repeat 12 mg dose once, electrical cardioversion if vagal maneuvers and adenosine unsuccessful
  - rhythm converts: probable reentrant tachycardia (atrioventricular (AV) nodal reentrant tachycardia (AVNRT) more common than AV reentrant tachycardia (AVRT))
    - monitor for recurrence
    - treat recurrence with adenosine or longer acting medications
  - rhythm does not convert: atrial flutter, ectopic atrial tachycardia, junctional tachycardia
    - rate control (diltiazem, β-blockers) or rhythm control with cardioversion
    - consult cardiology if refractory
- irregular rhythm
  - probable AFib, atrial flutter, or multifocal atrial tachycardia
  - rate control (e.g. diltiazem, β-blockers), or rhythm control if AFib/flutter

Elements of Well-Controlled Asthma
Can Respir J 2010;17(1):15-24
- Daytime symptoms <4x/wk
- Nocturnal symptoms <1x/wk
- No limitation in activity
- No absence from work/school
- Rescue inhaler use <4x/wk
- FEV1 <90% personal best
- PEF <10-15% diurnal variation
- Mild infrequent exacerbations

Combined Inhaled β-Agonist and Anticholinergic Agents for Emergency Management in Adults with Asthma
Cochrane DB Syst Rev 2017:CD001284
Purpose: Determine the effectiveness of combined short-acting β-agonist (SABA) + short-acting anticholinergic (SAAC) vs. SABA alone to reduce hospitalization in adult patients presenting to the ED with an exacerbation of asthma.
Methods: Systematic review of RCTs.
Results: 23 trials, 2724 patients. Combination inhaled therapy was associated with reduced likelihood of hospitalization (RR 0.72, 95% CI 0.59-0.87) for severe but not mild or moderate asthma exacerbations. Combination therapy was also associated with improved FEV1 (MD 0.25L, 95% CI 0.02-0.48) and PEF (MD 24.88, 95% CI 14.83-34.93) and patients were less likely to return to ED for additional care (RR 0.80, 95% CI 0.66-0.98). In contrast, patients receiving combination therapy were more likely to experience adverse events than those treated with SABA alone (OR 2.03, 95% CI 1.28-3.20).
Conclusions: Combination SAAC + SABA therapy reduces hospitalizations and improves pulmonary function in adults presenting to the ED with acute asthma. However, adults receiving combination therapy were more likely to experience adverse events, such as tremor, agitation, and palpitations, compared to patients receiving SABA alone.

Adenosine vs. Intravenous Calcium Channel Antagonists for Supraventricular Tachycardia
Cochrane DB Syst Rev 2017;CD005154
Purpose: Compare adenosine vs. calcium channel antagonists in terminating supraventricular tachycardia.
Methods: Systematic review of RCTs for any patient presenting with supraventricular tachycardia.
Results: 7 RCTs, 622 participants. Moderate-quality evidence shows no differences in the number or people reverting to sinus rhythm who were treated with adenosine or calcium channel antagonist (89.7% vs. 92.9%, OR 1.51). Low-quality evidence suggests no differences in major adverse event rates.
Conclusions: Moderate-quality evidence shows no differences in effects of adenosine and calcium channel antagonists for treatment of supraventricular tachycardia on reverting to sinus rhythm, and low-quality evidence suggests no differences in the incidence of hypotension.

If a patient with tachydysrhythmia is unstable, perform immediate synchronized cardioversion

Atrial Fibrillation

- most common sustained dysrhythmia; no organized P waves (atrial rate >300/min), irregularly irregular heart rate, narrow QRS (typically)
- etiology: HTN, CAD, thyrotoxicosis, EtOH (holiday heart), valvular disease, pericarditis, cardiomyopathy, sick sinus syndrome
- treatment principles: stroke prevention, treat symptoms, identify/treat underlying cause
- decreases cardiac output by 20-30% (due to loss of organized atrial contractions)
- acute management
  - if unstable: immediate synchronized cardioversion
  - hemodynamically stable patients with AFib <48 h: rhythm or rate control ± electrical or chemical cardioversion
- electrical cardioversion: synchronized direct current (DC) cardioversion
- chemical cardioversion: procainamide, flecainide, propafenone
- long-term management: rate or rhythm control, consider anticoagulation (see Cardiology and Cardiac Surgery, *CHADS2 score*, C23)

If patient has Wolff-Parkinson-White and is in AFib, use amiodarone or procainamide or cardiovert; avoid AV nodal blocking agents (adenosine, digoxin, diltiazem, verapamil, β-blockers), as these can increase conduction through bypass tract, leading to cardiac arrest

Ventricular Tachydysrhythmias (wide QRS)

- VTach (rate usually 140-200 bpm)
  - definition: 3 or more consecutive ventricular beats at >100 bpm
  - etiology: CAD with MI is most common cause
  - treatment: sustained VTach (>30 s) is an emergency
    - hemodynamic compromise: synchronized DC cardioversion
    - no hemodynamic compromise: synchronized DC cardioversion, amiodarone, procainamide
- VFib: call a code blue, follow ACLS for pulseless arrest
- torsades de pointes
  - looks like VTach but QRS 'rotates around baseline' with changing axis and amplitude (twisted ribbon)
  - etiology: prolonged QT due to drugs (e.g. quinidine, TCAs, erythromycin, quinolones), electrolyte imbalance (hypokalemia, hypomagnesemia), congenital
  - treatment
    - IV Mg^{2+}, temporary overdrive pacing, isoproterenol
    - correct cause of prolonged QT

Causes of Atrial Fibrillation

C ("sea") PIRATES
CHF, **C**ardiomyopathy
Pulmonary embolism
Ischaemic heart disease
Rheumatic or valvular disease
Anemia
Thyroid (hyperthyroidism)
EtOH, **E**levated blood pressure
Sick **S**inus, **S**tress - surgery, sepsis

Acute Exacerbation of COPD

- see Respirology, R11
- progressive development of irreversible airway obstruction, typically caused by smoking

History and Physical Exam

- cardinal symptoms of acute exacerbation of COPD (AECOPD): increased dyspnea, increased coughing frequency or severity, increased sputum volume or purulence
- triggers: virus, pneumonia, urinary tract infection, PE, CHF, MI, drugs
- characterize previous episodes and hospitalizations, smoking history
- vital signs, LOC, signs of respiratory distress, respiratory exam

Investigations

- CBC, electrolytes, CXR, ECG, consider ABG
- Pulmonary Function Tests are NOT useful in managing acute exacerbations

Management

- oxygen: keep O_2 saturation 88-92% (be aware of chronic hypercapnic/CO_2 retainers but do not withhold O_2 if hypoxic)
- bronchodilators: short-acting β-agonist (salbutamol 4-8 puffs via MDI with spacer q15 min x3 PRN) ± short-acting anticholinergic (ipratropium 0.5 mg via MDI q30 min x3 PRN)
- steroids: prednisone 40-60 mg PO for 7-14 d, or methylprednisolone 1-2 mg/kg IV if severe exacerbation, or unable to take PO
- antibiotics: trimethoprim/sulfamethoxazole, cephalosporins, respiratory quinolones (given if all 3 cardinal symptoms present or 2 cardinal symptoms with increased sputum purulence or mechanical ventilation); no antibiotics for mild exacerbation (only one of three cardinal symptoms)
- ventilation: apply noninvasive positive-pressure ventilation (CPAP or Bi-PAP) if severe distress or signs of fatigue, arterial pH <7.35, or hypercapnic
- if life-threatening, intubate in ED and refer to ICU admission for ventilation (chance of ventilation dependency)

Disposition

- no guidelines for admission - based on clinical judgement, comorbidities, and presence/absence of ongoing symptoms
- lower threshold to admit if comorbid illness (e.g. diabetes, CHF, CAD, alcohol use disorder)
- if discharging, use antibiotics, taper steroids, up to 4-6 puffs QID of ipratropium and salbutamol, and organize follow-up

Early or Delayed Cardioversion in Recent-Onset Atrial Fibrillation
NEJM 2019;380:1499-1508
Purpose: Patients with recent-onset AFib commonly undergo immediate restoration of sinus rhythm by cardioversion. Whether this is necessary is not known, since AFib often terminates spontaneously.
Methods: Randomly assigned patients with stable, recent-onset (<36 h), symptomatic AFib in the ED to be treated with a wait-and-see approach (delayed-cardioversion group) or early cardioversion. The wait-and-see approach involved initial treatment with rate-control medication only and delayed cardioversion if the AFib did not resolve within 48 h.
Primary endpoint: presence of sinus rhythm at 4 wk.
Results: The presence of sinus rhythm at 4 wk occurred in 91% of patients in the delayed-cardioversion group and in 94% in the early-cardioversion group (P=0.005 for noninferiority). Among the patients who completed remote monitoring during 4 wk of follow-up, a recurrence of AFib occurred in 30% of the delayed-cardioversion group and in 29% of the early-cardioversion group.
Conclusions: Wait-and-see approach was non-inferior to early cardioversion in stable AFib patients.

Physical Exam Findings in COPD
- Wheeze
- Maximum laryngeal height ≤4 cm
- Forced expiratory time ≥6 s
- Decreased breath sounds
- Decreased cardiac dullness

Need to Rule Out with COPD
- Exacerbation
- Pneumothorax
- CHF exacerbation
- Acute MI
- Pneumonia and other infectious causes
- PE

Heart Failure

- see Cardiology and Cardiac Surgery, C40

Etiology
- causes of chronic heart failure: decreased myocardial contractility (ischaemia, infarction, cardiomyopathy, myocarditis), pressure overload states (HTN, valve abnormalities, congenital heart disease), restricted cardiac output (myocardial infiltrative disease, cardiac tamponade)
- precipitants of acute decompensated heart failure (ADHF)
  - cardiac (ischaemia, infarction, arrhythmia, e.g. AFib)
  - medications (β-blockers, calcium channel blockers, NSAIDs, steroids, non-compliance)
  - dietary (increased sodium and/or water intake)
  - high output (anemia, infection, pregnancy, hyperthyroid)
  - other (renal failure, hypertensive crisis, iatrogenic fluid overload - blood transfusions or IV fluids)

Presentation
- left-sided heart failure
  - dyspnea, SOB on exertion, orthopnea, paroxysmal nocturnal dyspnea, nocturia, fatigue, altered mental status, presyncope/syncope, angina, systemic hypotension
  - hypoxia, decreased air entry to lungs, crackles, S3 or S4, pulmonary edema (on CXR), pleural effusion (usually right-sided)
- right-sided heart failure
  - dependent bilateral pitting edema, JVP elevation and positive abdominojugular test, ascites, hepatomegaly
- patients often present with a combination of right-sided and left-sided symptoms

Investigations
- blood work: CBC, electrolytes, AST, ALT, bilirubin, Cr, BUN, cardiac enzymes, brain natriuretic peptide
- CXR: most useful test (see sidebar)
- ECG: look for MI, ischaemia (ST elevation/depression, T-wave inversion), LVH, atrial enlargement, conduction abnormalities
- bedside ultrasound: B-lines, rule out cardiac tamponade
- echocardiogram: left ventricular function, structural heart disease
- rule out other serious diagnoses: PE, pneumothorax, pneumonia/empyema, AECOPD

Management
- ABCs, may require intubation if severe hypoxia
- sit upright, cardiac monitoring, and continuous pulse oximetry
- saline lock IV, Foley catheter only if patient cannot void in a commode at bedside
- 100% O_2 by mask
  - if poor response, may require Bi-PAP (preferred) or intubation
- medical
  - diuretic (if volume overloaded): furosemide 0.5-1 mg/kg IV, titrate to response
  - vasodilators (if sBP >100 mmHg): nitroglycerin 0.4 mg SL q5 min PRN ± topical Nitrodur® patch (0.4-0.8 mg/h)
    - if patient not responding to treatment or showing signs of ischaemia (angina): nitroglycerine 5-10 µg/min IV, titrate to response
  - inotropes/vasopressors (if sBP <90 mmHg)
    - without signs of shock: dobutamine 2.5 µg/kg/min IV, titrate up to sBP >90 mmHg, always have norepinephrine or epinephrine running alongside as dobutamine can cause reflex tachycardia and hypotension
    - with signs of shock: norepinephrine 8-12 µg/min IV, titrate up to sBP >90 mmHg
- treat precipitating factor - e.g. rate control (β-blocker, calcium channel blockers) or rhythm-control (electrical or chemical cardioversion) if new AFib
- cardiology or medicine consult

Precipitants of CHF Exacerbation

FAILURE
Forgot medication
Arrhythmia (Dysrhythmia)/Anemia
Ischaemia/Infarction/Infection
Lifestyle (e.g. high salt intake)
Upregulation of cardiac output
(e.g. pregnancy, hyperthyroidism)
Renal failure
Embolism (pulmonary)

CHF on CXR
- Pulmonary vascular redistribution
- Perihilar infiltrates
- Interstitial edema, Kerley B lines
- Alveolar edema, bilateral infiltrates
- May see cardiomegaly, pleural effusions
- Peribronchial cuffing
- Fissural thickening (fluid in fissure)

Acute Treatment of CHF

LMNOP
Lasix® (furosemide)
Morphine
Nitroglycerin
Oxygen
Position (sit upright), Pressure (Bi-PAP)

Hospital Management Required if
- Acute MI
- Pulmonary edema or severe respiratory distress
- Severe complicating medical illness (e.g. pneumonia)
- Anasarca
- Symptomatic hypotension or syncope
- Refractory to outpatient therapy
- Thromboembolic complications requiring interventions
- Clinically significant dysrhythmias
- Inadequate social support for safe outpatient management
- Persistent hypoxia requiring supplemental oxygen

Diagnostic Accuracy of POCUS and CXR in Adults With Symptoms Suggestive of ADHF
JAMA 2019;2:e190703
Purpose: To compare the accuracy of Point-of-Care Lung Ultrasonography (LUS) with the accuracy of CXR in the diagnosis of cardiogenic pulmonary edema.
Methods: Systematic review with inclusion criteria of patients presenting with dyspnea who underwent both LUS and CXR on initial assessment. Imaging results were compared by a clinical expert after either a medical record review or a combination of echocardiography findings and B-type natriuretic peptide (BNP) criteria. Primary outcome was the comparative accuracy of LUS and CXR in diagnosing ADHF as measured by the differences between the 2 modalities in pooled sensitivity and specificity.
Results: 6 studies met the inclusion criteria; a total of 1827 patients. Pooled estimates for LUS were 0.88 for sensitivity and 0.90 for specificity. Pooled estimates for CXR were 0.73 for sensitivity and 0.90 for specificity. The relative sensitivity ratio of LUS, compared with CXR, was 1.2. No difference was found in specificity between tests.
Conclusions: The findings suggest that LUS is more sensitive than CXR in detecting pulmonary edema in ADHF; LUS should be considered as an adjunct imaging modality in the evaluation of patients with dyspnea at risk for ADHF.

Venous Thromboembolism

- see Respirology, R20

Risk Factors
- Virchow's triad: alterations in blood flow (venous stasis), injury to endothelium (smoking, HTN, surgery, catheter, trauma), hypercoagulable state (including pregnancy, use of oral contraceptive pills, malignancy)
- clinical risk factors (see sidebar, *Risk Factors for VTE*, ER33)

DEEP VEIN THROMBOSIS

Presentation
- calf pain, unilateral leg swelling/erythema/edema, palpable cord along the deep venous system on exam
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT (may be asymptomatic; bilateral leg presentation unlikely but does not rule out diagnosis; think inferior vena cava (IVC) occlusion if bilateral DVT)
  - further investigation is often needed

Investigations
- use Wells' criteria for DVT to guide investigations (see Figure 12, ER34)
- D-dimer is only useful for ruling out DVT, and a D-dimer test result should only be considered in cases where a low-moderate risk patient has a negative test (high sensitivity)
  - high-risk of false positives in: elderly, infection, recent surgery, trauma, hemorrhage, late in pregnancy, liver disease, cancer
- U/S has high sensitivity & specificity for proximal clot but only 73% sensitivity for calf DVT (may need to repeat in 1 wk)
  - if positive – treat for DVT regardless of risk
  - if negative and low-risk – rule out DVT
  - if negative and moderate to high-risk – repeat U/S in 5-7 d to rule out DVT

Management
- direct oral anticoagulants (DOAC) can be used in acute management of symptomatic DVT
  - rivaroxaban: 15 mg PO BID for first 21 d; 20 mg PO once daily for remaining treatment (taken with food at the same time each day)
  - apixaban: 10 mg PO BID for first 7 d; 5 mg PO BID for remaining treatment
- low molecular weight heparin (LMWH) unless patient also has renal failure
  - dalteparin 200 IU/kg SC q24 h or enoxaparin 1 mg/kg SC q24 h
- warfarin started at same time as LMWH (5 mg PO once daily initially followed by dosing based on INR)
- LMWH discontinued when INR has been therapeutic (2-3) for 2 consecutive days
- consider thrombolysis if extensive DVT threatening limb compromise
- IVC filter or surgical thrombectomy considered if anticoagulation is contraindicated
- duration of anticoagulation: 3 mo if transient coagulopathy; 6 mo if unprovoked DVT; life-long if ongoing coagulopathy

Risk Factors for VTE

THROMBOSIS
Trauma, travel
Hypercoagulable, hormone replacement therapy (HRT)
Recreational drugs (IV drug use)
Old (age >60 yr)
Malignancy
Birth control pill
Obesity, obstetrics
Surgery, smoking
Immobilization
Sickness (CHF, MI, nephrotic syndrome, vasculitis)

Wells' Criteria for DVT

Active cancer	+1
Paralysis, paresis or recent immobilization of leg	+1
Recently bedridden x3 d or major surgery within 4 wk	+1
Local tenderness	+1
Entire leg swollen	+1
Calf swelling 3 cm > asymptomatic leg	+1
Unilateral pitting edema	+1
Collateral superficial veins	+1
Alternative Dx more likely	-2

0: Low probability
1-2: Moderate probability
>3: High probability

PULMONARY EMBOLISM

Presentation
- dyspnea, pleuritic chest pain, hemoptysis, tachypnea, cyanosis, hypoxia, fever
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT; investigation often needed

Investigations
- use Wells' criteria for PE to guide investigations (see Figure 13, ER34)
- pulmonary embolism rule-out criteria (PERC) score (see EBM on sidebar, Respirology, R21) alone can rule out PE in low-risk patients (as determined by Wells' criteria) unless patient is pregnant
- ECG and CXR are useful to rule out other causes (e.g. ACS, pneumonia, pericarditis) or to support diagnosis of PE
  - ECG changes in PE: sinus tachycardia, right ventricular strain (S1Q3T3, see Cardiology and Cardiac Surgery, C10), T wave inversions in anterior and inferior leads, AFib
  - CXR findings in PE: Hampton's hump (triangular density extending from pleura, sign of pulmonary infarct) or Westermark's sign (dilatation of vessels proximal to an obstruction, with collapse of vessels distal to obstruction, often with a sharp cutoff)
- D-dimer is only useful at ruling out a PE if it is negative in low-moderate risk patients (highly sensitive)
  - if positive D-dimer or high-probability patient, then pursue CT pulmonary angiography or V/Q scan
- CT pulmonary angiography has high sensitivity and specificity for PE, may also indicate an alternative diagnosis
- V/Q scan useful in pregnancy, when CT pulmonary angiography not available, or IV contrast contraindicated

Management
- treatment of PE with anticoagulation and duration of treatment is the same as for DVT (see above)
- thrombolysis indicated in massive PE, which is defined as acute PE with sustained hypotension (sBP <90 mmHg for at least 15 minutes or requiring inotropic support, not due to a cause other than PE)
- catheter-directed thrombolysis or surgical thrombectomy may be considered in massive PE or if anticoagulation is contraindicated
- often can be treated as outpatient, may require analgesia for chest pain (narcotic or NSAID)
- admit if hemodynamically unstable, require supplemental O_2, major comorbidities, lack of sufficient social supports, unable to ambulate, need invasive therapy
  - referral to medicine for coagulopathy and malignancy workup

Wells' Criteria for PE

Previous Hx of DVT/PE	+1.5
HR >100	+1.5
Recent immobility or surgery	+1.5
Clinical signs of DVT	+3
Alternate Dx less likely than PE	+3
Hemoptysis	+1
Cancer	+1

<2: Low probability
2-6: Intermediate probability
>6: High probability

Signs of PE on CXR
Westermark's sign: abrupt tapering of a vessel on chest film
Hampton's hump: a wedge-shaped infiltrate that abuts the pleura
Effusion, atelectasis, or infiltrates 50% normal
Both signs are specific but not sensitive
A normal CXR in the hypoxic patient warrants a work-up for PE

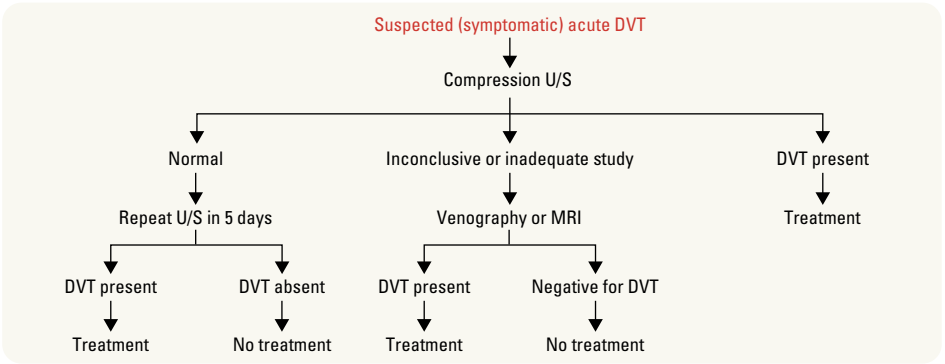

Figure 12. Approach to suspected DVT

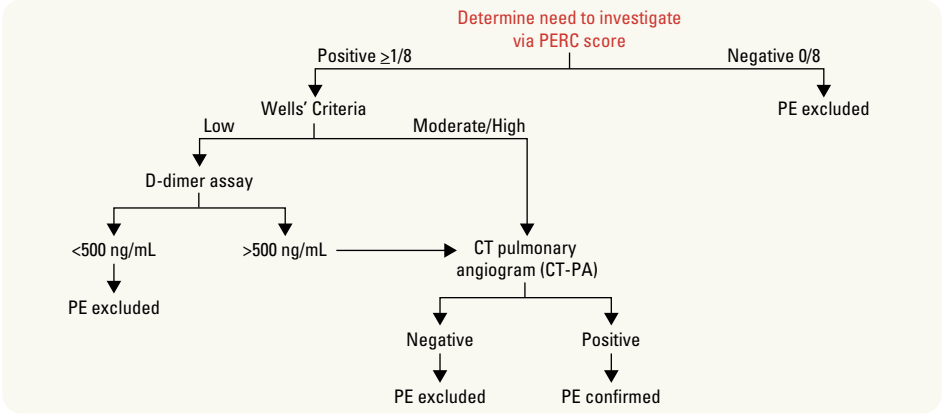

Figure 13. Approach to suspected PE

Diabetic Emergencies

- see Endocrinology, E14

Diabetic Ketoacidosis

- triad of hyperglycemia, ketosis, and acidosis due to severe insulin deficiency and counter-regulatory hormone excess
- precipitating factors: infection, cardiac or mesenteric ischaemia, MI, intoxication, or insulin omission
- clinical features
  - often young, T1DM patients (may rarely be first presentation of undiagnosed T2DM), with symptoms evolving within a day
  - early signs and symptoms: polyuria, polydipsia, malaise, nocturia, weight loss
  - late signs and symptoms
    - GI: anorexia, nausea, vomiting, abdominal pain
    - neurological: fatigue, drowsiness, stupor, coma
    - respiratory: Kussmaul's respiration, dyspnea (often due to acidosis), fruity ketotic breath
- investigations
  - blood work: CBC, electrolytes, Ca^{2+}, Mg^{2+}, PO_4^{3-}, Cr, BUN, glucose, ketones, osmolality, AST/ALT/ALP, amylase, troponin
  - urine: glucose and ketones
  - ABG or VBG
  - ECG (MI is possible precipitant; electrolyte disturbances may predispose to dysrhythmia)
- management
  - rehydration
    - bolus of NS, then high rate NS infusion (beware of overhydration and cerebral edema, especially in paediatric patients (see Paediatrics, P31)
    - beware of a pseudohyponatremia due to hyperglycemia (add 3 Na^+ per 10 glucose over 5.5 mmol/L)
  - potassium
    - essential to avoid hypokalemia: replace KCl (20 mEq/L if adequate renal function, voiding, and initial K^+ <5.5 mmol/L)
    - use cardiac monitoring if potassium levels normal or low

PERC Score
- Age >50 yr
- HR >100 bpm
- O_2 saturation on room air <95%
- Prior Hx of DVT/PE
- Recent trauma or surgery
- Hemoptysis
- Exogenous estrogen
- Clinical signs suggesting DVT

Score 1 for each question; a score 0/8 means patient has <1.6% chance of having a PE and avoids further investigation. Caution using the PERC score in pregnant women as the original study excluded pregnant women

D-dimer is only useful if it is negative; negative predictive value >99%

50% of patients with symptomatic proximal DVT will develop PE, often within days to weeks of the event

Oral Direct Thrombin Inhibitors or Oral Factor Xa Inhibitors for the Treatment of Pulmonary Embolism
Cochrane DB Syst Rev 2015:CD010957
Purpose: Assess effectiveness of oral direct thrombin inhibitors and oral factor Xa inhibitors for long-term treatment of PE.
Methods: Systematic review of RCTs in patients with confirmed PE receiving oral direct thrombin inhibitors or factor Xa inhibitors for minimum 3 mo.
Results: 5 RCTs, 7897 participants. No difference in the effectiveness of oral direct thrombin inhibitors vs. standard anticoagulation in preventing recurrent PE (OR 1.02, 95% CI 0.50-2.04), recurrent VTE (OR 0.93, 95% CI 0.52-1.66), DVT (OR 0.72, 95% CI 0.39-1.32), all-cause mortality (OR 1.16, 95% CI 0.79-1.70), or major bleeding (OR 0.97, 95% CI 0.59-1.62).
Conclusions: High quality evidence suggests there is no difference between oral direct thrombin inhibitors and standard anticoagulation in the prevention of recurrent pulmonary embolism. Moderate-high evidence suggests there is no difference in recurrent VTE, DVT, all-cause mortality, and major bleeding between DOACs and standard anticoagulation.

- insulin
  - critical, as this is the only way to inhibit gluconeogenesis/ketosis
  - do not give insulin if K^+ <3.3 mmol/L as insulin will exacerbate hypokalemia
  - continuous infusion at 0.1 U/kg/h
  - once the blood glucose <14 mmol/L, dextrose should be added to the patient's IV fluids
- bicarbonate is not given unless patient is at risk of shock or death (typically pH <7.0)

Four Criteria for DKA Dx
- Hyperglycemia
- Metabolic acidosis
- Hyperketonemia
- Ketonuria

Hyperosmolar Hyperglycemic State

- hyperosmolar hyperglycemic state (HHS) is characterized by extreme hyperglycemia (44-133.2 mmol/L) due to relative insulin deficiency, counter-regulatory hormones excess, gluconeogenesis, and dehydration (due to osmotic diuresis)
- clinical features
  - often older, T2DM patients with more comorbid illnesses and larger fluid losses with symptoms evolving over days to weeks, fewer GI symptoms and more neurological deficits than DKA including: mental disturbances, coma, delirium, seizures
  - polyuria, N/V
- investigations
  - blood work: CBC, electrolytes, Ca^{2+}, Mg^{2+}, PO_4^{3-}, Cr, BUN, glucose, ketones, osmolality
  - urine: glucose and ketones
  - ABG or VBG
  - find underlying cause: ECG, CXR, blood and urine C&S
- management
  - rehydration with IV NS (total water deficit estimated at average 100 cc/kg body weight)
  - O_2, cardiac monitoring, frequent electrolyte, and glucose monitoring
  - insulin management as per DKA
  - identify and treat precipitating factors, similar to DKA but HHS has also been noted following cardiac surgery and with the use of certain drugs (e.g. diuretics, glucocorticoids, lithium, atypical antipsychotics)
  - admission to medicine

Signs and Symptoms of DKA

Diuresis, dehydration, drowsy, delirium, dizziness
Kussmaul's breathing, ketotic breath
Abdominal pain, anorexia

Precipitating Factors in DKA

The 5 Is
Infection
Ischaemia
Infarction
Intoxication
Insulin missed

Hypoglycemia

- characterized by Whipple's triad: low plasma glucose, symptoms suggestive of hypoglycemia, prompt resolution of symptoms when glucose administered
- clinical features
  - neuroglycopenic symptoms: headaches, confusion, seizures, loss of consciousness, coma
  - autonomic symptoms: diaphoresis, nausea, tremor, hunger, tachycardia, palpitations
- history and physical exam
  - last meal, known DM, prior similar episodes, drug therapy, and compliance
  - liver/renal/endocrine/neoplastic disease
  - depression, alcohol or drug use
- management
  - IV access and rapid blood glucose measurement
  - D50W 50 mL IV push, glucose PO if mental status permits
    - use lower concentration dextrose solutions in children (rule of 50's: 1 mL/kg of D50W, 2 mL/kg of D25W, 5 mL/kg of D10W, 10 mL/kg of D5W)
  - if IV access not possible, glucagon 1-2 mg IM, repeat in 10-20 min
  - O_2, cardiac, frequent blood glucose monitoring
  - thiamine 100 mg IM (if alcohol use disorder is suspected)
  - full meal as soon as mental status permits
  - if due to long-acting insulin, or sulfonylureas, watch for prolonged hypoglycemia due to long half-life (may require admission for monitoring)
  - search for cause (common causes include exogenous insulin, alcohol, or sulfonylureas)

Causes of Hypoglycemia
- **Most common:** excessive insulin use in setting of poor PO intake
- **Common:** alcohol intoxication, sepsis, liver disease, oral anti-hyperglycemics
- **Rare:** insulinomas, hypopituitarism, adrenal insufficiency, medication side effect

Cerebral edema may occur if hyperosmolality is treated too aggressively

Electrolyte Disturbances

- see Nephrology, NP8

Table 20. Electrolyte Disturbances

Electrolyte Disturbance	Common Causes	Symptoms	Treatment	Special Considerations
Hypernatremia	Inadequate H_2O intake (elderly/disabled) or inappropriate excretion of H_2O (diuretics, Li, and diabetes insipidus)	Lethargy, weakness, irritability, and edema; seizures and coma occur with severe elevations of Na^+ levels (>158 mmol/L)	Salt restrict and give normal saline until hemodynamically stable. Use half-normal saline once vitals are stable	No more than 12 mmol/L in 24 h drop in Na^+ (0.5 mmol/L/h) due to risk of cerebral edema, seizures, death
Hyponatremia	Hypovolemic (GI, renal, skin, blood fluid loss), euvolemic (syndrome of inappropriate antidiuretic hormone secretion (SIADH)/ stress, adrenal insufficiency, hypothyroid, diet/intake), hypervolemic (CHF, cirrhosis, nephrotic syndrome)	Neurologic symptoms secondary to cerebral edema, headache, seizure, decreased LOC, depressed reflexes; chronic milder than acute	Hypovolemic: normal saline Euvolemic: restrict water, eliminate underlying cause Hypervolemic: restrict fluid and sodium, loop diuretic if severe 3% hypertonic saline if seizure or coma	Limit total rise to 8 mmol/L in 24 h (0.25 mmol/L/h maximum) as patients are at risk of osmotic demyelinating syndrome (ODS)
Hyperkalemia	Rhabdomyolysis, insulin deficiency, metabolic acidosis (e.g. acute renal failure, missed dialysis), medications (e.g. K^+ sparing diuretics, ACEI, NSAIDs)	Nausea, palpitations, dysrhythmias, muscle stiffness, areflexia	Protect heart: calcium gluconate Shift K^+ into cells: D50W + insulin, $NaHCO_3$, salbutamol Remove K^+: fluids + furosemide, dialysis	High-risk of dysrhythmia - ECG: peaked/ narrow T wave, decreased P wave, prolonged PR interval, widening of QRS, sine wave, AV block, VFib, bradycardia
Hypokalemia	Metabolic alkalosis (e.g. diarrhea), insulin, diuretics (except K^+ sparing), anorexia, salbutamol	N/V, fatigue, muscle cramps, constipation, dysrhythmias	K-Dur®, K^+ sparing diuretics, IV solutions with 20-40 mEq/L KCl over 3-4 h	ECG: U waves most important, flattened/ inverted T waves, prolonged QT, depressed ST May need to restore Mg^{2+}
Hypercalcemia	Hyperparathyroidism and malignancy account for ~90% of cases, medications (e.g. thiazide diuretics, lithium)	Multisystem including CVS, GI (groans), renal (stones), rheumatological, MSK (bones), psychiatric (moans)	Isotonic saline (+ furosemide if hypervolemic) Bisphosphonates, dialysis, chelation (Ethylenediaminetetraacetic acid (EDTA) or oral PO_4^{3-})	Patients with more severe or symptomatic hypercalcemia are usually dehydrated and require saline hydration as initial therapy
Hypocalcemia	Iatrogenic, hypoalbuminemia, liver dysfunction, primary hypo-parathyroid hormone	Laryngospasm, hyperreflexia, paresthesia, tetany, Chvostek's and Trousseau's sign	Acute (ionized Ca^{2+} <0.7 mM) requires immediate treatment: IV calcium gluconate 1-2 g in 10-20 min followed by slow infusion	Prolonged QT interval can arise (leading to dysrhythmia as can upper airway obstruction)

Hypertensive Emergencies

Hypertensive Emergency (Hypertensive Crisis)

- definition: severe elevation of BP with evidence of end-organ damage (CNS, retinal, CVS, renal, GI)
- etiology
  - essential HTN, emotional exertion, pain, use of sympathomimetic drugs (cocaine, amphetamine, etc.), MAOI use with ingestion of tyramine-containing food (cheese, red wine, etc.), pheochromocytoma, pregnancy
- clinical features

Table 21. Signs and Symptoms of Hypertensive Emergencies

	CNS	Retinal	Renal	Cardiovascular	Gastrointestinal
Complication	Stroke/TIA, headache, altered mental status, seizures, hemorrhage	Vision change, hemorrhage, exudates, papilledema	Nocturia, elevated Cr, proteinuria, hematuria, oliguria	Ischaemia/angina, infarction, dissection (back pain), CHF	N/V, abdominal pain, elevated liver enzymes

- investigations
  - blood work: CBC, electrolytes, BUN, Cr
  - urinalysis
  - peripheral blood smear: to detect microangiopathic hemolytic anemia
  - CXR: if SOB or chest pain
  - ECG, troponins, creatine kinase (CK): if chest pain
  - CT head: if neurological findings or severe headache
    - toxicology screen if sympathomimetic overdose suspected (not needed if patient admits to taking it)
- management
  - in general, strategy is to gradually and progressively reduce BP in 24-48 h
  - lower BP by 25% over the initial 60 min by initiating antihypertensive therapy (usually nitroprusside and labetalol)
  - if preeclampsia, immediately consult obstetrician-gynaecologist (OB/GYN) (see Obstetrics, OB26)
  - establish arterial line; transfer to ICU for further reduction in BP under monitored setting
  - in case of ischaemic stroke: do not rapidly reduce BP, maintain BP >150/100 for 5 d
  - in case of aortic dissection: rapid reduction of sBP to 110-120 STAT (do not resuscitate with IV fluids)
  - in case of excessive catecholamines: avoid β-blockers (except labetalol)
  - in case of ACS: address ischaemia initially, then BP

HELLP Syndrome (seen only in preeclampsia/eclampsia)

Hemolytic anemia
Elevated **L**iver enzymes
Low **P**latelet count

Catecholamine-Induced Hypertensive Emergencies
Avoid use of non-selective β-blockers as they inhibit β-mediated vasodilation and leave α-adrenergic vasoconstriction unopposed

Table 22. Commonly Used Agents for the Treatment of Hypertensive Crisis

Drug	Dosage	Onset of Action	Duration of Action	Adverse Effects*	Special Indications
VASODILATORS					
Sodium Nitroprusside (vascular smooth muscle dilator) 1st line	0.25-10 µg/kg/min	Immediate	3-5 min	N/V, muscle twitching, sweating, cyanide intoxication, coronary steal syndrome	Most hypertensive emergencies (especially CHF, aortic dissection) Use in combination with β-blockers (e.g. esmolol) in aortic dissection Caution with high ICP and azotemia
Nicardipine (calcium channel blocker)	5 mg/h IV, then increase by 2.5 mg/h q5-10min (max 15 mg/h)	15-30 min	40 min	Tachycardia, headache, flushing, local phlebitis (e.g. encephalopathy, renal failure, eclampsia, sympathetic crisis)	Most hypertensive emergencies Caution with acute CHF
Fenoldopam Mesylate (dopamine receptor antagonist)	0.05-0.1 µm/kg/min IV	<5 min	8-10 min	Tachycardia, headache, nausea, flushing (e.g. acute respiratory failure)	Most hypertensive emergencies Caution with glaucoma
Enalapril (ACEI)	0.625-1.25 mg IV q6 h	15-30 min	12-24 h	Theoretical fall in pressure in high renin states not seen in studies	Acute LV failure Avoid in acute MI, pregnancy, acute respiratory failure
Nitroglycerin	5-20 µg/min IV	1-2 min	3-5 min	Hypotension, bradycardia, headache, lightheadedness, dizziness	MI, pulmonary edema
Hydralazine	5-10 mg IV/IM q20 min (max 20 mg)	5-20 min	2-6 h	Dizziness, drowsiness, headache, tachycardia, Na+ retention	Eclampsia
ADRENERGIC INHIBITORS					
Labetalol	20 mg IV bolus q10 min or 0.5-2 mg/min	5-10 min	3-6 h	Vomiting, scalp tingling, burning in throat, dizziness, nausea, heart block, orthostatic hypotension	Usually first choice Most hypertensive emergencies (especially eclampsia) Avoid in acute CHF, heart block >1st degree
Esmolol	250-500 µg/kg/min 1 min, then 50 µg/kg/min for 4 min; repeat	1-2 min	10-20 min	Hypotension, nausea, bronchospasm	Aortic dissection, acute MI supraventricular tachycardia (SVT) dysrhythmias, perioperative HTN Avoid in acute CHF, heart block >1st degree
Phentolamine	5-15 mg q5-15 min	1-2 min	3-10 min	Tachycardia, headache, flushing	Catecholamine excess (e.g. pheochromocytoma)

*Hypotension may occur when using any of these agents

With CNS manifestations of severe HTN, it is often difficult to differentiate causal relationships (i.e. HTN could be secondary to a cerebral event with an associated Cushing reflex)

Acute Coronary Syndrome

- see Cardiology and Cardiac Surgery, C32
- definition: new onset of chest pain (cardiac type), or acute worsening of previous chest pain (cardiac type), or chest pain (cardiac type) at rest with:
  - negative cardiac biomarkers and no ECG changes = unstable angina (UA)
  - positive cardiac biomarkers (elevated troponin), NSTEMI on ECG, ± other changes (NSTEMI)
  - positive cardiac biomarkers (elevated troponin) and STEMI on ECG
- investigations
  - ECG STAT (as soon as history suggests possible ACS), serial troponins (2-6 h after symptom onset), CXR (to rule out other causes of the patient's presentation)
- management
  - stabilize: ABCs, oxygen, IV access, cardiac monitors, oximetry
  - ASA 162-325 mg chewed and swallowed
  - nitroglycerin 0.3 mg SL q5 min x 3; IV only if persistent pain, CHF, or hypertensive
    - contraindications: hypotension, phosphodiesterase inhibitor use, right ventricular infarctions (1/3 of all inferior MIs, as these MIs are preload-dependent)
  - anticoagulation: choice of anticoagulation (unfractionated heparin, LMWH, or fondaparinux) and additional antiplatelet therapy (clopidogrel, ticagrelor, or prasugrel) depends on STEMI vs. NSTEMI and reperfusion strategy
  - early cardiology consult for reperfusion therapy
    - UA/NSTEMI: early coronary angiography recommended if high thrombolysis in MI (TIMI) risk score
    - STEMI: primary percutaneous coronary intervention (PCI) (within 90 min) preferred; thrombolytics if percutaneous coronary intervention unavailable within 120 min of medical contact, symptoms <12 h and no contraindications
  - atorvastatin 80 mg to stabilize plaques
  - β-blocker if no signs of CHF, hemodynamic compromise, bradycardia, or severe reactive airway disease
  - initiate ACEI within 24 h

Sepsis

- see Infectious Diseases, ID20 and Respirology, R32
- definitions
  - overall, sepsis can be thought of as a life-threatening organ dysfunction caused by a dysregulated host response to infection; however, definitions exist on a spectrum, as outlined below
  - systemic inflammatory response syndrome (SIRS): two or more of T >38°C or <36°C, HR >90, RR >20, WBC >12
  - sepsis: SIRS and suspected or present source of infection
  - septic shock: sepsis and either initial lactate >4 or hypotension
  - qSOFA score ≥2: high risk for in-hospital mortality (see Infectious Diseases, ID20)
- management
  - early recognition of sepsis and investigations to locate source of infection
  - identify severe sepsis with lactate or evidence of tissue hypoperfusion
  - early "goal-directed" therapy: ensure adequate organ perfusion
  - treatment priorities:
    - ABCs, monitors, lines
    - aggressive fluid resuscitation; consider ventilatory and inotropic support
    - cultures, then early empiric appropriate antibiotics - consider broad spectrum and atypical coverage
    - source control - e.g. remove infected Foley or surgery for ischaemic gut
    - monitor adequate resuscitation with vital signs, inferior vena cava on U/S, and serial measurement of serum lactate
    - in patients presenting with septic shock, goal-directed therapy and aggressive management should not be delayed while waiting for lab values
    - patients failing initial therapy should be resuscitated more aggressively (e.g. use of vasopressors, glucocorticoids, inotropic therapy, blood transfusion, etc.)

Surviving Sepsis Campaign 1 Hour Bundle
J Intensive Care Med 2018;44:925-928
Update sepsis bundle from 3 hour to 1 hour time frame with time zero being time of triage in the ED
Actions include:
- Measure lactate level. Remeasure if initial lactate is >2 mmol/L
- Obtain blood cultures prior to administration of antibiotics
- Administer broad spectrum antibiotics
- Begin rapid administration of 30 mL/kg crystalloid for hypotension or lactate >4 mmol/L
- Apply vasopressors if the patient is hypotensive during or after fluid resuscitation to maintain MAP >65 mmHg

Stroke and Transient Ischaemic Attack

- see Neurology, N51
- definitions
  - stroke: sudden loss of brain function due to ischaemia (87%) or hemorrhage (13%) with persistence of symptoms >24 h or neuroimaging evidence
  - TIA: transient episode of neurologic dysfunction from focal ischaemia without acute infarction or neuroimaging evidence
- clinical features

Table 23. Signs and Symptoms of Stroke

	General	Language/ Throat	Vision	Coordination	Motor	Sensation	Reflex
Signs/ Symptoms	Decreased LOC, changed mental status, confusion, neglect	Dysarthria, aphasia, swallowing difficulty	Diplopia, eye deviation, asymmetric pupils, visual field defect	Ataxia, intention tremor, lack of coordination	Increased tone, loss of power, spasticity	Loss of sensation	Hyper-reflexia, clonus

- patients with hemorrhagic stroke can present with sudden onset thunderclap headache that is usually described as "worst headache of life" and can often recall the exact moment their headache started
- stroke mimickers: seizure, migraine, hypoglycemia, Todd's paresis, peripheral nerve injury, Bell's palsy, tumour, syncope, somatic symptom disorder

Seven Causes of Emboli from the Heart
- AFib
- MI
- Endocarditis
- Valvular disease
- Dilated cardiomyopathy
- Left heart myxoma
- Prosthetic valves

Table 24. Stroke Syndromes

Region of Stroke	Stroke Syndrome
Anterior Cerebral Artery	Contralateral hemianesthesia and hemiparesis (legs > arms/face), gait apraxia, altered mental status, impaired judgement
Middle Cerebral Artery	Contralateral hemianesthesia and hemiparesis (arms/face > legs), contralateral homonymous hemianopsia, ipsilateral gaze
Posterior Cerebral Artery	Contralateral homonymous hemianopsia, cortical blindness, impaired memory
Vertebrobasilar Artery	Wide variety of cranial nerve, cerebellar, and brainstem deficits: vertigo, nystagmus, diplopia, visual field deficits, dysphagia, dysarthria, facial hypoesthesia, syncope, ataxia Loss of pain and temperature sensation in ipsilateral face and contralateral body

Differentiation of Upper Motor Neuron (UMN) Disease vs. Lower Motor Neuron (LMN) Disease

Category	UMN Disease	LMN Disease
Muscular deficit	Muscle groups	Individual muscles
Reflexes	Increased	Decreased/ absent
Tone	Increased	Decreased
Fasciculations	Absent	Present
Atrophy	Absent/ minimal	Present
Plantar Response	Upgoing	Downgoing

Investigations
- CBC, electrolytes, blood glucose, coagulation studies ± cardiac biomarkers ± toxicology screen
- non-contrast CT head: to rule out hemorrhage
- ECG ± echocardiogram: rule out AFib, acute MI as source of emboli
- other imaging: carotid Doppler, CT angiography (CTA) neck and head, magnetic resonance angiography (MRA) as appropriate

Management
- ABCs; intubation with RSI if GCS ≤8, rapidly decreasing GCS, or inadequate airway protective reflexes
- thrombolysis: immediate assessment for eligibility; need acute onset, <4.5 h from drug administration time AND compatible physical findings AND normal CT with no bleed
  - thrombectomy: may be an option in some centres as an alternative to thrombolysis in the first 4.5 to 6 hours, and in some instances up to 24 hours after symptom onset or last seen normal
- dual antiplatelet therapy for 21 days
- elevating head of bed if risk of elevated ICP, aspiration, or worsening cardiopulmonary status
- NPO, IV ± cardiac monitoring
  - judge fluid rate carefully to avoid overhydration (cerebral edema) as well as underhydration (underperfusion of the ischaemic penumbra)
- BP control: only treat severe HTN (sBP >200 mmHg, dBP >120 mmHg, MAP >140 mmHg) or HTN associated with hemorrhagic stroke transformation, cardiac ischaemia, aortic dissection, or renal damage; use IV nitroprusside or labetalol
- glycemic control: keep fasting glucose <6.5% in acute phase (5 d)
- cerebral edema control: hyperventilation, mannitol to decrease ICP if necessary
- consult neurosurgery, neurology, medicine as indicated

Medications
- acute ischaemic stroke: thrombolytics (rt-PA, e.g. alteplase) if within 4.5 h of symptom onset with no evidence of hemorrhage on CT scan
- antiplatelet agents: prevent recurrent stroke or stroke after TIAs, e.g. Aspirin® (1st line); clopidogrel, Aggrenox® (2nd line)
- anticoagulation: DVT prophylaxis if immobile; treat AFib if present
- follow-up for consideration of carotid endarterectomy, cardiovascular risk optimization

If a patient presents within 4.5 h of onset of disabling neurological deficits >60 min with no signs of resolution, they may be a candidate for thrombolysis. Do brief assessment and order CT head STAT

Absolute Exclusion Criteria for Tissue Plasminogen Activator (tPA)
- Suspected subarachnoid hemorrhage
- Previous intracranial hemorrhage
- Cerebral infarct or severe HI within the past 3 mo
- sBP >185 mmHg, or dBP >110 mmHg
- Bleeding diathesis
- Prolonged PT >15 s or INR >1.7
- Platelet count <100000
- Heparin received within last 48 h
- Current use of thrombin inhibitors or direct factor Xa inhibitors
- Blood glucose <2.8 mmol/L (<50 mg/dL)
- Intracranial hemorrhage on CT or large volume infarct

Relative Exclusion Criteria for tPA
- Only minor or rapidly improving symptoms
- Pregnancy
- GI or urinary hemorrhage within the past 21 d
- Seizure at onset causing postictal impairments

Otolaryngological Presentations and Emergencies

- ear symptoms: otalgia, aural fullness, otorrhea, hearing loss, tinnitus, vertigo, pruritus, fever
- risk factors for hearing loss: Q-tip use, hearing aids, headphones, occupational noise exposure

Dizziness and Vertigo
- distinguish four types of dizziness: vertigo ("room spinning"), lightheadedness ("disconnected from environment"), presyncope ("almost blacking out"), dysequilibrium ("unstable," "off-balance")
- broad differential and diverse management (see Family Medicine, FM29 and Otolaryngology, OT6)
- rule out stroke
- consider adverse drug events

Otalgia (see Otolaryngology, OT6)
- differential diagnosis
  - infections: acute otitis externa, acute otitis media, otitis media with effusion, mastoiditis, myringitis, malignant otitis externa in patients with diabetes, herpes simplex/zoster, auricular cellulitis, external canal abscess, dental disease
  - others: trauma, temporomandibular joint dysfunction, neoplasm, foreign body, cerumen impactions, trigeminal neuralgia, granulomatosis with polyangiitis
- inspect for otorrhea, palpate outer ear/mastoid, otoscopic examination to look for bulging erythematous tympanic membrane, perforation, membrane retraction, infiltration, vesicles, ulcers, masses, lesions
- C&S of ear canal discharge, if present
- CT head if suspicion of mastoiditis, malignant otitis externa
- antibiotics/antifungals/antivirals for respective infections

Hearing Loss (see Otolaryngology, OT9)
- differentiate conductive vs. sensorineural hearing loss
- rule out sudden sensorineural hearing loss (SSNHL), a medical emergency requiring high dose steroids and urgent referral
- an elderly patient presenting with unilateral tinnitus or SSNHL must be presumed to have an acoustic neuroma (vestibular schwannoma) until proven otherwise
- consider audiogram and referral to or follow-up with family physician

Epistaxis

- see Otolaryngology, OT27
- 90% of nosebleeds stem from the anterior nasal septum (Kiesselbach's plexus located in Little's area)
- can be life-threatening

Etiology
- most cases of epistaxis are caused by trauma (e.g. digital, blunt, foreign bodies)
- other causes: barometric changes, nasal dryness, chemicals (e.g. cocaine, Otrivin®), or systemic disease (e.g. coagulopathies, HTN)

Investigations
- blood work: CBC, PT/PTT (as indicated)
- imaging: x-ray, CT as needed

Treatment
- goals of treatment: localize bleeding and achieve haemostasis
- first-aid: ABCs, clear clots by blowing nose or suctioning, lean forward, pinch cartilaginous portion of nose for 20 min twice
- assess blood loss: vitals, IV NS, cross match 2 units pRBC if significant
- if first aid measures fail twice, proceed to packing
- apply an anterior pack
  - clear nose of any clots
  - apply topical anesthesia/vasoconstrictors (lidocaine with epinephrine, cocaine, or soaked pledgets)
  - insert either a traditional Vaseline® gauze pack or a commercial nasal tampon or balloon
  - N.B. if the site of bleeding is identified, cautery with silver nitrate can be performed as an alternative to packing (only cauterize one side of the septum because if both are cauterized this can lead to septal perforation)
  - if bleeding stops, arrange follow-up in 48-72 h for reassessment and pack removal
  - if packing both nares, prophylactic anti-staphylococcal antibiotics to prevent sinusitis or TSS
- if suspect posterior bleed or anterior packing does not provide haemostasis, consult ENT for posterior packing and further evaluation
  - though posterior packing may be placed by an ED physician, it requires monitoring; can cause significant vagal response and posterior bleeding source can lead to significant blood loss, therefore usually requires admission

Disposition
- discharge: discharged upon stabilization and appropriate follow-up; educate patients about prevention (e.g. topical vaseline, humidifiers, saline spray, avoiding irritants, managing HTN)
- admission: severe cases of refractory bleeding, and most cases of posterior packing

Thrombocytopenic patients – use resorbable packs to avoid risk of re-bleeding caused by pulling out the removable pack

Complications of Nasal Packing
- Hypoxemia
- TSS
- Aspiration
- Pharyngeal fibrosis/stenosis
- Alar/septal necrosis

Tranexamic Acid For Patients with Nasal Haemorrhage (Epistaxis)
Cochrane DB Syst Rev 2018:CD004328
Purpose: Determine the effects of tranexamic acid compared to placebo, no additional intervention or any other haemostatic agent in the management of patients with epistaxis.
Methods: Systematic review of RCTs comparing tranexamic acid, in addition to standard care, compared to usual care plus placebo in adults and children.
Results: 6 RCTs, 692 participants. Oral (RR 0.73, 95% CI 0.55-0.96) and topical (RR 0.66, 95% CI 0.41-1.05) reduced risk of re-bleeding compared to placebo. There was no difference in time to stop initial bleeding. The proportion of patients whose bleeding stopped within 10 min was higher with topical tranexamic acid than other haemostatic agents (RR 2.35, 95% CI 1.90-2.92).
Conclusions: Moderate-quality evidence that risk of re-bleeding with oral or topical tranexamic acid, in addition to usual care, is lower in adult patients with epistaxis, compared to placebo with usual care. Further, topical tranexamic acid is probably better than other topical agents in stopping bleeding in the first 10 min.

Gynaecologic/Urologic Emergencies

Vaginal Bleeding

- see Gynaecology, GY20 and Obstetrics, OB14

Etiology
- pregnant patient
  - 1st/2nd trimester: ectopic pregnancy, abortion (threatened, incomplete, complete, missed, inevitable, septic), molar pregnancy, implantation bleeding, friable cervix (most common cause)
  - 2nd/3rd trimester: placenta previa, placental abruption, premature rupture of membranes, preterm labour
  - other: trauma, bleeding cervical polyp, passing of mucous plug, incompetent cervix
- postpartum
  - postpartum hemorrhage, uterine inversion, retained placental tissue, endometritis
- non-pregnant patients
  - structural (PALM- polyps, adenomyosis, leiomyoma, malignancies/hyperplasia)
  - non-structural (COEIN - coagulopathy, ovulatory, endometrial, iatrogenic, not yet diagnosed)

History
- characterize bleeding (frequency, duration, number of pads/tampons, types of pads used, cyclicity)
- pain, if present (OPQRSTUV)
- menstrual history, sexual history, STI history, syncope/presyncope, malignancy history, family history, hematological history, cardiac history, abdominal history
- details of pregnancy, including gush of fluid and fetal movement (>20 wk)

Physical Exam
- ABCs (especially noting postural BP/HR and mucous membranes)
- abdominal examination (signs of peritoneal pathology, tenderness, distension, mass)
- speculum examination (NOT if 2nd/3rd trimester bleeding as may worsen bleeding; perform only if placenta previa has been ruled out with U/S)
  - look for active bleeding, trauma/anomaly, and cervical dilatation
- bimanual examination (NOT if 2nd/3rd trimester bleeding as may worsen bleeding; perform only if placenta previa has been ruled out with U/S)
  - cervical motion tenderness, size of uterus, cervical length/dilatation
- sterile gloves and speculum if pregnant
- POCUS: rule in intra-uterine pregnancy, check for free fluid in pelvis/right upper quadrant (RUQ)/left upper quadrant (LUQ), consider assessment of fluid responsiveness (intra-hepatic IVC collapsibility, carotid flow measurement)

Investigations
- β-hCG test for all patients with childbearing potential
- CBC, blood and Rh type, quantitative β-hCG, PTT, INR
- type & cross if significant blood loss
- transvaginal U/S (rule out ectopic pregnancy and spontaneous abortion)
- abdominal U/S (rule out placenta previa, fetal demise, or retained products postpartum)

Management
- ABCs
- pulse oximeter and cardiac monitors if unstable
- Rh immune globulin (Rhogam®) for vaginal bleeding in pregnancy and Rh-negative mother
- 1st/2nd trimester pregnancy
  - ectopic pregnancy: definitive treatment with surgery or methotrexate
  - intrauterine pregnancy, no concerns of coexistent ectopic: discharge patient with obstetrics follow-up
  - U/S indeterminate or β-hCG >1000-2000 IU: further workup and/or gynaecology consult
  - abortions: if complete, discharge if stable; for all others, consult gynaecology
- 2nd/3rd trimester pregnancy
  - placenta previa or placental abruption: obstetrics consult for possible admission
- postpartum
  - manage ABCs: start 2 large bore IV rapid infusion, type & cross 4 units of blood, consult OB/GYN immediately
- non-pregnant
  - if unstable admit to gynaecology for IV hormonal therapy, possible dilation and curettage
  - non-structural abnormalities
    - tranexamic acid to stabilize clots
    - medroxyprogesterone acetate 10 mg PO once daily x10 d, warn patient of a withdrawal bleed
  - stable structural abnormalities (fibroids, polyps, endometrial thickening, adenomyosis), outpatient gynaecology referral once stable

Disposition
- decision to admit or discharge should be based on the stability of the patient, as well as the nature of the underlying cause; consult OB/GYN for patients requiring admission
- if patient can be safely discharged, ensure follow-up with family physician or gynaecologist
- instruct patient to return to ED for increased bleeding or presyncope

Vaginal bleeding can be life-threatening. Always start with ABCs and ensure your patient is stable

Need β-hCG ≥1200 to see intrauterine changes on transvaginal U/S

An ectopic pregnancy can be ruled out by confirming an intrauterine pregnancy by bedside U/S unless the patient is using *in vitro* fertilization (IVF) due to the associated high-risk of heterotopic pregnancy

Vaginal bleeding (and its underlying causes) can be a very distressing event for patients; ensure appropriate support is provided

Pregnant Patient in the ED

Table 25. Complications of Pregnancy

Trimester	Fetal	Maternal
First **1-12 wk**	Pregnancy failure Spontaneous abortion Fetal demise Gestational trophoblastic disease	Ectopic pregnancy Anemia Hyperemesis gravidarum UTI/pyelonephritis
Second **13-27 wk**	Disorders of fetal growth Intrauterine growth restriction Oligo/polyhydramnios	Gestational DM Rh incompatibility UTI/pyelonephritis Cervical incompetence
Third **28-41 wk**	Vasa previa	Preterm labour/preterm premature rupture of the membranes Preeclampsia (hypertension in pregnancy)/eclampsia Placenta previa Placental abruption Uterine rupture DVT/PE

Nephrolithiasis (Renal Colic)

• see Urology, U18

Epidemiology and Risk Factors
- 10% of population (twice as common in males)
- recurrence 50% at 5 yr
- peak incidence 30-50 yr
- 75% of stones <4 mm pass spontaneously within 2 wk, larger stones may require consultation

Kidney Stones
- 80% calcium oxalate
- 10% struvite
- 10% uric acid

Clinical Features
- urinary obstruction ➔ upstream distention of ureter or collecting system ➔ severe colicky pain
- may complain of pain at flank, groin, testes, or tip of penis
- writhing, N/V, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency)
- fever, chills, rigors in secondary pyelonephritis
- peritoneal findings/anterior abdominal tenderness usually absent

Obstruction + Infection
= Urological Emergency
Urgent urology consult

Differential Diagnosis of Renal Colic
- acute ureteric obstruction
- acute abdomen: biliary, bowel, pancreas, AAA
- urogynaecological: ectopic pregnancy, torsion/rupture of ovarian cyst, testicular torsion
- pyelonephritis (fever, chills, pyuria, vomiting)
- radiculitis (L1): herpes zoster, nerve root compression

Investigations
- CBC: elevated WBC in presence of fever may support an infectious cause
- electrolytes, Cr, BUN to assess renal function
- U/A: routine and microscopy (WBCs, RBCs, crystals), C&S
- non-contrast spiral CT is the study of choice
- abdominal U/S may demonstrate stone(s), hydronephrosis (consider in females of childbearing age or if patient has another contraindication to CT scanning), debris in the collecting system, reduced cortical vascularity, abnormal renal parenchyma
- AXR will identify large radiopaque stones (calcium, struvite, and cystine stones) but may miss smaller stones, uric acid stones, or stones overlying bony structures; consider as an initial investigation in patients who have a history of radiopaque stones and similar episodes of acute flank pain (CT necessary if film is negative)

Indications for Admission to Hospital
- Intractable pain
- Fever (suggests infection) or other evidence of pyelonephritis
- Single kidney with ureteral obstruction
- Bilateral obstructing stones
- Intractable vomiting
- Compromised renal function

Management
- analgesics: NSAIDs (usually ketorolac (Toradol®), preferable over opioids), antiemetics, IV fluids if indicated
- urology consult indicated, especially if stone >5 mm, or if patient has signs of obstruction or infection
- α-blocker (e.g. tamsulosin) may be helpful to increase stone passage in select cases

Disposition
- most patients can be discharged
- ensure patient is stable, has adequate analgesia, and able to tolerate oral medications
- may advise hydration and limitation of protein, sodium, oxalate, and alcohol intake

Ophthalmologic Emergencies

• see Ophthalmology, OP5

History and Physical Exam
- patient may complain of pain, tearing, itching, redness, photophobia, foreign body sensation, trauma
- mechanism of foreign body insertion – if high velocity injury suspected (welding, metal grinding, metal striking metal), must obtain orbital x-rays, U/S, or CT scan to exclude presence of intraocular metallic foreign body
- ask about sexual partners and exposure of eye(s) to bodily fluids (semen, urine, blood, vaginal fluids, saliva, etc.)
- visual acuity in both eyes, pupils, extraocular structures, fundoscopy, tonometry, slit lamp exam

Management of Ophthalmologic Foreign Body
- copious irrigation with saline for any foreign body
- remove foreign body under slit lamp exam with cotton swab, sterile needle, or electric burr tool
- antibiotic drops QID until healed
- patching may not improve healing or comfort – do not patch contact lens wearers
- limit use of topical anesthetic to examination only
- consider tetanus prophylaxis
- ophthalmology consult if globe penetration suspected

Table 26. Differential Diagnosis of Red Eye in the Emergency Department

Symptom	Possible Serious Etiology
Light Sensitivity	Iritis, keratitis, abrasion, ulcer
Unilateral	Above + herpes simplex, acute angle closure glaucoma
Significant Pain	Above + scleritis
White Spot on Cornea	Corneal ulcer
Non-Reactive Pupil	Acute glaucoma, iritis
Copious Discharge	Gonococcal conjunctivitis
Blurred Vision	All of the above

Table 27. Select Ophthalmologic Emergencies

Condition	Signs and Symptoms	Management
Acute Angle Closure Glaucoma	Unilateral red, painful eye Decreased visual acuity, halos around lights Fixed, mid-dilated pupil N/V Marked increase in intraocular pressure (IOP) (>40 mmHg) Shallow anterior chamber ± cells	Ophthalmology consult for laser iridotomy Medications: AABCDE/EAT PAL α-agonist: epinephrine α2-agonist: apraclonidine β-blocker: timolol Cholinomimetic: pilocarpine Diuretic: acetazolamide, mannitol Eicosanoid: latanoprost
Chemical Burn	Known exposure to acids or alkali (worse) Pain, decreased visual acuity Vascularization or defects of cornea Iris and lens damage	Irrigate site of accident with NS with eyelid retracted until neutral pH achieved Sweep fornices Cycloplegic drops and topical antibiotics
Orbital Cellulitis	Red, painful eye, decreased visual acuity Headache, fever Lid erythema, edema, and difficulty opening eye Conjunctival injection and chemosis Proptosis, opthalmoplegia ± RAPD	Admission, ophthalmology consult Blood cultures, orbital CT IV antibiotics (ceftriaxone + vancomycin) Drainage of abscess
Retinal Artery Occlusion	Sudden, painless, monocular vision loss RAPD Cherry red spot and retinal pallor on fundoscopy if central retinal artery occlusion	Restore blood flow <2 h Massage globe Decrease IOP (topical β-blockers, inhaled O_2/CO_2 mix, IV Diamox®, IV mannitol, drain aqueous fluid)
Retinal Detachment	Flashes of light, floaters, and curtains of blackness/peripheral vision loss Painless Loss of red reflex, decreased IOP Detached areas are grey Visible detachment orbital POCUS ± RAPD	Ophthalmology consult for scleral buckle/pneumatic retinopexy

Contraindications to Pupil Dilation
- Shallow anterior chamber
- Iris-supported lens implant
- Potential neurological abnormality requiring pupillary evaluation
- Caution with CV disease – mydriatics can cause tachycardia

Other Ophthalmologic Emergencies
Infectious: Red eye, endophthalmitis, hypopyon
Trauma: Globe rupture, orbital blow-out fractures, corneal injuries, eyelid laceration, hyphema, lens dislocation, retrobulbar hemorrhage
Painful vision loss: Acute iritis, corneal abrasion, globe rupture, lens dislocation, retrobulbar hemorrhage, optic neuritis, temporal arteritis, endophthalmitis, keratitis
Painless vision loss: Central retinal vein occlusion, amaurosis fugax, occipital stroke

POCUS for the Diagnosis of Retinal Detachment: A Systematic Review and Meta-Analysis
Acad Emerg Med 2019;26:931-939
Purpose: POCUS has been suggested to identify retinal detachment rapidly. The primary outcome for this review was to determine the test characteristics of POCUS for the diagnosis of retinal detachment.
Methods: Systematic review and meta-analysis looking for all prospective trials and RCTs assessing the accuracy of POCUS for identifying retinal detachment.
Results: 11 studies (n = 844) were identified. Overall, ultrasound was 94.2% (95% CI 78.4% to 98.6%) sensitive and 96.3% (95% CI 89.2% to 98.8%) specific for the diagnosis of retinal detachment with a positive likelihood ratio of 25.2 (95% CI 8.1 to 78.0) and a negative likelihood ratio of 0.06 (95% CI = 0.01 to 0.25).
Conclusions: POCUS is sensitive and specific for the diagnosis of retinal detachment.

Visual acuity is the "vital sign" of the eyes and should ALWAYS be assessed and documented in both eyes when a patient presents to the ED with an ophthalmologic complaint

Dermatologic Emergencies

Rash Characteristics

A. Diffuse Rashes

- Staphylococcal Scalded Skin Syndrome (SSSS)
  - caused by an exotoxin from infecting strain of coagulase-positive S. aureus
  - mostly occurs in children
  - prodrome: fever, irritability, malaise, and skin tenderness
  - sudden onset of diffuse erythema: skin is red, warm, and very tender
  - flaccid bullae that are difficult to see, then desquamate in large sheets
- Steven-Johnson Syndrome (SJS) and Toxic Epidermal Necrolysis (TEN)
  - see Dermatology, D26
  - caused by drugs (e.g. phenytoin, sulfas, penicillins, and NSAIDs), bone marrow transplantation, and blood product transfusions
  - usually occurs in adults
  - diffuse erythema followed by necrosis
  - severe mucous membrane blistering
  - entire epidermis desquamation
  - high mortality (>50%)
- Toxic Shock Syndrome (TSS)
  - see Infectious Diseases, ID22
  - caused by superantigen from *S. aureus* or Group A *Streptococcus* (GAS) activating T-cells and cytokines
  - patient often presents with onset of shock and multi-organ failure, fever
  - diffuse erythematous macular rash
  - at least 3 organ systems involved: CNS, respiratory, GI, muscular, mucous membranes, renal, liver, hematologic, and skin (necrotizing fasciitis, gangrene)
  - vesiculobullous lesions

- Erythema Multiforme (EM)
  - immunologic reaction to herpes simplex
  - viral prodrome 1-14 d before rash
  - target lesion: central grey bulla or wheal surrounded by concentric rings of erythema and normal skin
  - Drug reaction with eosinophilia and systemic symptoms (DRESS) syndrome

B. Discrete Lesions

- Pyoderma Gangrenosum
  - often associated with IBD, rheumatoid conditions, leukemia, and monoclonal gammopathies
  - often occurs in arms, hands, feet, or perineal region
  - usually begins as painless macule/vesicle/pustule/bulla on red/blue base sloughing, leaving a gangrenous ulcer
- Disseminated Gonococcal Infection (DGI)
  - see Dermatology, D38
  - fever, skin lesions (pustules/vesicles on erythematous base ~5 mm in diameter), arthritis (joint swelling and tenderness), and septic arthritis (in larger joints, such as knees, ankles, and elbows)
  - most commonly in gonococcus-positive women during menstruation or pregnancy
  - skin lesions usually appear in extremities and resolve quickly (<7 d)
- Meningococcemia
  - flu-like symptoms of headache, myalgia, N/V
  - petechial, macular, or maculopapular lesions with grey vesicular centres
  - usually a few millimeters in size, but may become confluent and hemorrhagic
  - usually appear in extremities, but may appear anywhere
  - look for signs of meningeal irritation: positive jolt accentuation test, Brudzinski, Kernig

History and Physical Exam

- determine onset, course, and location of skin lesions
- fever, joint pain
- associated symptoms: CNS, respiratory, GU, GI, renal, liver, mucous membranes
- medications, sexual encounters, living environment, occupational exposures
- vitals, physical exam based on relevant history

Investigations

- immediate consultation if patient unstable
- case-dependent, consider: CBC, electrolytes, Cr, AST, ALT, ALP, blood culture, skin biopsy, serum immunoglobulin levels (serum IgE)

Thorough dermatologic examinations are required; examination of asymptomatic skin may identify more lesions; ensure adequate draping during dermatologic examinations

Management

- general: judicious IV fluids and electrolyte control, consider vasopressors if hypotensive, prevention of infection
- determine if admission and consult needed: dermatology or infectious diseases
- specific management is determined by etiology
  - SSSS, TSS, DGI, and meningococcemia
    - IV antibiotics
  - EM, SJS, TEN, and DRESS syndrome
    - stop precipitating medication
    - fluids
    - symptomatic treatment: antihistamines, antacids, topical corticosteroids, systemic corticosteroids (controversial), prophylactic oral acyclovir, consider IV immunoglobulin (IVIG), plasmapheresis
    - TEN: debride necrotic tissue

SJS = <10% of BSA
SJS/TEN = 10-30% BSA
TEN = >30% BSA

Disposition

- most cases will require urgent care and hospitalization
- SJS & TEN: early transfer to burn centre improves outcome

Environmental Injuries

Heat Exhaustion and Heat Stroke

Heat exhaustion may closely resemble heat stroke; heat exhaustion may eventually progress to heat stroke, so if diagnosis is uncertain treat as heat stroke

HEAT EXHAUSTION

- clinical features relate to loss of circulating volume caused by exposure to heat stress
- "water depletion": heat exhaustion occurs if lost fluid not adequately replaced
- "salt depletion": heat exhaustion occurs when losses replaced with hypotonic fluid

HEAT STROKE

- life-threatening emergency resulting from failure of normal compensatory heat-shedding mechanisms
- divided into classical and exertional subtypes
- if patient does not respond relatively quickly to cooling treatments, consider other possible etiologies of hyperpyrexia (e.g. meningitis, thyroid storm, anticholinergic poisoning, delirium tremens, infections), adverse drug events (including drug interactions)

Table 28. Heat Exhaustion vs. Heat Stroke

	Heat Exhaustion	Classical Heat Stroke	Exertional Heat Stroke
Clinical Features	Non-specific malaise, headache, fatigue Body temperature <40.5°C (usually normal) No coma or seizures Dehydration (HR, orthostatic hypotension)	Occurs in setting of high ambient temperatures (e.g. heat wave, poor ventilation) Often patients are older and sedentary or immobile Dry, hot skin Temp usually >40.5°C Altered mental status, seizures, delirium, or coma May have elevated AST, ALT	Occurs with high endogenous heat production (e.g. exercise) that overwhelms homeostatic mechanisms Patients often younger, more active Skin often diaphoretic Other features as for classical heat stroke, but may also have DIC, acute renal failure, rhabdomyolysis, marked lactic acidosis
Treatment	Rest in a cool environment IV NS if orthostatic hypotension; otherwise replace losses slowly PO	Cool body temperature with water mist (e.g. spray bottle) and standing fans Ice water immersion also effective; monitor body temperature closely using rectal thermometer, to avoid hypothermic overshoot Secure airway because of seizure and aspiration risk Give fluid resuscitation if still hypotensive after above therapy Avoid β-agonists (e.g. epinephrine), peripheral vasoconstriction, and antipyretics (e.g. ASA)	

Hypothermia and Cold Injuries

HYPOTHERMIA

- hypothermia is defined as a core temperature below 35°C, in which the body's heat loss is greater than heat production.
- etiology: increased heat loss (e.g. environmental exposure), decreased heat production (e.g. endocrine disease), impaired regulation (e.g. CNS failure)
- predisposing risk factors: ethanol use, homelessness, psychiatric disease, and older age (the elderly have increased risk due to decreased physiological reserve, chronic diseases, medication side effects, and social isolation)
- treatment based on re-warming and supporting cardiorespiratory function
- complications: coagulopathy, acidosis, ventricular dysrhythmias (VFib), asystole, volume, and electrolyte depletion
- labs: CBC, electrolytes, ABG, serum glucose, Cr/BUN, Mg^{2+}, Ca^{2+}, amylase, coagulation profile
- imaging: CXR (aspiration pneumonia, pulmonary edema are common)
- monitors: ECG, rectal thermometer or transesophageal temperature probe, Foley catheter, NG tube, monitor metabolic status frequently

Table 29. Classification of Hypothermia

Class	Temp	Symptoms/Signs
Mild	32-34.9°C	Tachypnea, tachycardia, ataxia, dysarthria, shivering
Moderate	28-31.9°C	Loss of shivering, dysrhythmias, Osborne (J) waves on ECG, decreased LOC, combative behaviour, muscle rigidity, dilated pupils
Severe	<28°C	Coma, hypotension, acidemia, VFib, asystole, flaccidity, apnea

Re-warming Options

- gentle fluid and electrolyte replacement in all (due to cold diuresis)
- passive external re-warming
  - suitable for most stable patients with core temperature >32.2°C
  - involves covering patient with insulating blanket; body generates heat and re-warms through metabolic process, shivering
- active external re-warming
  - involves use of warming blankets
  - beware of "afterdrop" phenomenon
  - safer when done in conjunction with active core re-warming

Afterdrop Phenomenon
Warming of extremities causes vasodilation and movement of cool pooled blood from extremities to core, resulting in a drop in core temperature leading to cardiac arrest

- active core re-warming
  - generally for patients with core temperature <32.2°C, and/or with cardiovascular instability
  - avoids "afterdrop" seen with active external re-warming alone
  - re-warm core by using
    - warmed humidified oxygen, IV fluids
    - peritoneal dialysis with warm fluids
    - gastric/colonic/pleural irrigation with warm fluids
    - external circulation (cardiopulmonary bypass machine) is most effective and fastest

Approach to Cardiac Arrest in the Hypothermic Patient

- do all procedures gently or may precipitate VFib
- check pulse and rhythm for at least 1 min; may have profound bradycardia
- if any pulse at all (even very slow) do NOT do CPR
- if in VFib try to defibrillate up to maximum 3 shocks if core temperature <30°C
- intubate if required, ventilate with warmed, humidified O_2
- medications (vasopressors, antidysrhythmics) may not be effective at low temperatures controversial; may try one dose
- focus of treatment is re-warming

FROSTBITE

Classification

- ice crystals form between cells
- classified according to depth – similar to burns (1st to 3rd degree)
- 1st degree
  - symptoms: initial paresthesia, pruritus
  - signs: erythema, edema, hyperemia, no blisters
- 2nd degree
  - symptoms: numbness
  - signs: blistering (clear), erythema, edema
- 3rd degree
  - symptoms: pain, burning, throbbing (on thawing); may be painless if severe
  - signs: hemorrhagic blisters, skin necrosis, edema, no movement
- 4th degree
  - extension into subcuticular, osseous, and muscle tissues

Management

- treat for hypothermia: O_2, IV fluids, maintenance of body warmth
- remove wet and constrictive clothing
- immerse in 40-42°C agitated water for 10-30 min (very painful; administer adequate analgesia)
- clean injured area and leave it open to air
- consider aspiration/debridement of blisters (controversial)
- debride skin
- tetanus prophylaxis
- consider penicillin G as frostbite injury has high-risk of infection
- surgical intervention may be required to release restrictive eschars
- never allow a thawed area to re-chill/freeze

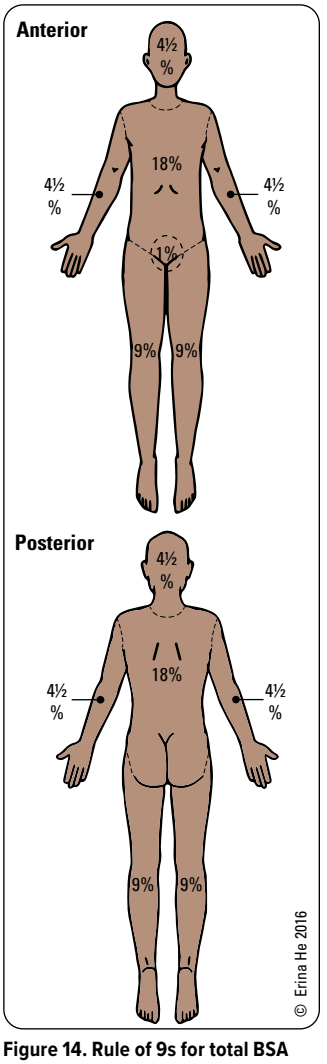

Figure 14. Rule of 9s for total BSA

Burns

- see Plastic Surgery, PL18

Clinical Features/Physical Exam Findings

- burn size
  - rule of nines; does not include 1st degree burns
- burn depth
  - superficial (1st degree): epidermis only (e.g. sunburn), painful and tender to palpation
  - superficial partial thickness (2nd degree): extends to epidermis and superficial dermis, blister formation occurs, very painful
  - deep partial thickness (2nd degree): involves hair follicles, sebaceous glands; skin is blistered, exposed dermis is white to yellow, absent sensation
  - full thickness (3rd degree): epidermis and all dermal layers; skin is pale, insensate, and charred or leathery
  - deep (4th degree): involvement of fat, muscle, even bone

Management

- remove noxious agent/stop burning process and consider appropriate PPE usage
- establish airway if needed (indicated with burns >40% BSA or smoke inhalation injury)
- resuscitation for 2nd and 3rd degree burns (after initiation of 2 large bore IVs)
- fluid boluses if unstable
  - Parkland Formula: Ringer's lactate 4 cc/kg/% BSA burned; give half in first 8 h, half in next 16 h; maintenance fluids are also required if patient cannot tolerate PO hydration
  - urine output is best measure of resuscitation, should be 40-50 cc/h or 0.5 cc/kg/h; avoid diuretics

- pain relief: continuous morphine infusion with breakthrough bolus
- investigations: CBC, electrolytes, U/A, CXR, ECG, ABG, carboxyhemoglobin
- burn wound care: prevent infection, clean/debride with mild soap and water, sterile dressings
- escharotomy or fasciotomy for circumferential burns (chest, extremities)
- topical antibiotics, burn victims are highly susceptible to infection (portal of entry with reduced immune function) – systemic antibiotics are often required
- tetanus prophylaxis if burn is deeper than superficial dermis

Use palm of the patient's hand to estimate 1% of BSA affected

Disposition
- admit
  - 2nd degree burns >10% BSA, or any significant 3rd degree burns
  - 2nd degree burns on face, hands, feet, perineum, or across major joints
  - electrical, chemical burns, and inhalation injury
  - burn victims with chronic medical conditions or immunosuppressed patients

Burn Causes
- Thermal (flame, scald)
- Chemical
- Radiation (UV, medical/therapeutic)
- Electrical

Inhalation Injury

Etiology
- carbon monoxide (CO) or cyanide poisoning
- direct thermal injury: limited to upper airway (above the vocal cords)
- smoke causes bronchospasm and edema from particulate matter and toxic inhalants (tissue asphyxiates, pulmonary irritants, systemic toxins)

History and Physical Exam
- risk factors: closed space fires, period of unconsciousness, noxious chemicals involved
- cherry red skin and bitter almond odour are classic findings of cyanide toxicity but are often not present clinically
- singed nasal hairs, soot on oral/nasal membranes, sooty sputum
- hoarseness, stridor, dyspnea
- decreased LOC, confusion
- PO_2 normal but O_2 saturation low suggests CO poisoning

Always look for inhalational injury in patients with burns. Intubate early if you suspect inhalation injury, as airway can become obstructed due to edema

Investigations
- measure carboxyhemoglobin levels, co-oximetry
- ABG
- CXR ± bronchoscopy

Management
- CO poisoning: 100% O_2 ± hyperbaric O_2 (controversial)
  - cyanide poisoning: hydroxocobalamin 70 mg/kg IV over 15 minutes (max 5 g), up to two doses
- direct thermal injury: humidified oxygen, early intubation, pulmonary toilet, bronchodilators, and mucolytics (N-acetylcysteine)

Bites

MAMMALIAN BITES
- see Plastic Surgery, PL11

History
- time and circumstances of bite, symptoms, allergies, tetanus immunization status, comorbid conditions, risk of rabies exposure/transmission, HIV/hepatitis risk (human bite)
- high morbidity associated with clenched fist injuries, "fight bites"

Physical Exam
- assess type of wound: abrasion, laceration, puncture, crush injury
- assess for direct tissue damage: skin, bone, tendon, neurovascular status, joints (if applicable)

Investigations
- if bony injury or infection suspected, check for fracture and gas in tissue with x-rays
- get skull films in children with scalp bite wounds ± CT to rule out cranial perforation
- ultrasound may be helpful for identifying abscess formation as well as locating radiolucent foreign bodies in infected wounds

Initial Management
- wound cleaning and copious irrigation as soon as possible
- irrigate/debride puncture wounds if feasible, but not if sealed or very small openings; avoid hydrodissection along tissue planes
- debridement is important in crush injuries to reduce infection and optimize cosmetic and functional repair
- culture wound if signs of infection (erythema, necrosis, or pus); obtain anaerobic cultures if wound is foul smelling, necrotizing, or if abscess is present; notify lab that sample is from bite wound

- suturing
  - vascular structures (i.e. face and scalp) are less likely to become infected, therefore consider suturing
  - allow avascular structures (i.e. pretibial regions, hands, and feet) to heal by secondary intention
- tetanus immunization if >5 yr or incomplete primary series (see Table 11, ER17)

Prophylactic Antibiotics
- types of infections resulting from bites: cellulitis, lymphangitis, abscesses, tenosynovitis, osteomyelitis, septic arthritis, sepsis, endocarditis, meningitis
- a 3-5 d course of antibiotics is recommended for all bite wounds to the hand and should be considered in other bites if any high-risk factors present
- dog and cat bites (pathogens: *Pasteurella multocida, S. aureus, S. viridans*)
  - 10-50% of cat bites, and 5% of dog bites become infected
  - 1st line: amoxicillin + clavulanic acid (not cefalexin as it does not cover *Pasteurella* spp. or *Eikenella corrodens*)
- human bites (pathogens: *Eikenella corrodens, S. aureus, S. viridans*, oral anaerobes)
  - 1st line: amoxicillin + clavulanic acid
- rabies (see Infectious Diseases, ID19)
  - reservoirs: warm-blooded animals except rodents (primarily bats and raccoons in Canada), lagomorphs (e.g. rabbits)
  - post-exposure vaccine is effective; treatment depends on local prevalence

INSECT BITES
- bee stings
  - 5 types of reactions to stings (local, large local, systemic, toxic, unusual)
  - history and physical exam key to diagnosis; no lab test will confirm
  - investigations: CBC, electrolytes, BUN, Cr, glucose, ABGs, ECG
  - ABC management, epinephrine 0.1 mg IV over 5 min if shock, antihistamines, cimetidine 300 mg IV/IM/PO, steroids, β-agonists for SOB/wheezing 3 mg in 5 mL NS via nebulizer, local site management
- West Nile virus (see Infectious Diseases, ID23)

Near Drowning

- most common in children <4 yr and teenagers
- causes lung damage, hypoxemia, and may lead to hypoxic encephalopathy
- must also assess for shock, C-spine injuries, hypothermia, and scuba-related injuries (barotrauma, air emboli, lung re-expansion injury)
- complications: volume shifts, electrolyte abnormalities, hemolysis, rhabdomyolysis, renal, DIC

Physical Exam
- ABCs, vitals: watch closely for hypotension
- respiratory: rales (ARDS, pulmonary edema), decreased breath sounds (pneumothorax)
- CVS: murmurs, dysrhythmias, JVP (CHF, pneumothorax)
- H&N: assess for C-spine injuries
- neurological: GCS or AVPU, pupils, focal deficits

Investigations
- labs: CBC, electrolytes, ABGs, Cr, BUN, INR, PTT, U/A (drug screen, myoglobin)
- imaging: CXR (pulmonary edema, pneumothorax) ± C-spine imaging
- ECG

Management
- ABCs, treat for trauma, shock, hypothermia
- cardiac and O_2 monitors, IV access
- intensive respiratory care
  - ventilator assistance if decreased respirations, pCO_2 >50 mmHg, or pO_2 <60 mmHg on maximum FIO_2
  - may require intubation for airway protection, ventilation, pulmonary toilet
  - high flow O_2/CPAP/Bi-PAP may be adequate but some may need mechanical ventilation with positive end-expiratory pressure
- dysrhythmias: usually respond to corrections of hypoxemia, hypothermia, and acidosis
- vomiting: very common, NG suction to avoid aspiration
- convulsions: usually respond to O_2; if not, diazepam 5-10 mg IV slowly
- bronchospasm: bronchodilators
- bacterial pneumonia: prophylactic antibiotics not necessary unless contaminated water or hot tub (*Pseudomonas*)
- always initiate CPR in drowning-induced cardiac arrest even if patient is hypothermic; continue CPR until patient is fully rewarmed

"Secondary drowning" where the onset of symptoms, as a result of pulmonary edema or infection, can be insidious. It can develop over hours, or possibly even days, and must be anticipated in the near drowning patient

Disposition
- non-significant submersion: discharge after short observation
- significant submersion (even if asymptomatic): long period of observation (72 h) as pulmonary edema may appear late
- CNS symptoms or hypoxemia: admit
- severe hypoxemia, decreased LOC: ICU

Toxicology

"ABCD3EFG" of Toxicology

- basic axiom of care is symptomatic and supportive treatment
- address underlying problem only once patient is stable

A **A**irway (consider stabilizing C-spine)
B **B**reathing
C **C**irculation
D1 **D**rugs
  - ACLS as necessary to resuscitate the patient
  - universal antidotes (DONT)

D2 **D**raw bloods
D3 **D**econtamination (decrease absorption)
E **E**xpose (look for specific toxidromes)/examine the patient
F **F**ull vitals, ECG monitor, foley, x-rays
G **G**ive specific antidotes and treatments

Principles of Toxicology
- 4 principles to consider with all ingestions:
- Resuscitation (ABCD3EFG)
- Screening (toxidrome? clinical clues?)
- Decrease absorption of drug
- Increase elimination of drug

Further Steps following ABCD3EFG
- reassess
- call Poison Information Centre
- obtain corroborative history from family, bystanders

D1 – Universal Antidotes

- treatments that will not harm patients and may be essential

Universal Antidotes

DONT
Dextrose
Oxygen
Naloxone
Thiamine (must give BEFORE dextrose)

Dextrose (glucose)
- give to any patient presenting with altered LOC
- measure blood glucose prior to glucose administration if possible
- adults: D50W 0.5-1.0 g/kg (1-2 mL/kg) IV
- children: D25W 0.25 g/kg (2-4 mL/kg) IV

Oxygen
- do not deprive a hypoxic patient of oxygen no matter what the antecedent medical history (i.e. even COPD with CO_2 retention)
- if depression of hypoxic drive, intubate and ventilate
- exception: paraquat or diquat (herbicides) inhalation or ingestion (oxygen radicals increase morbidity)

Naloxone (central μ-receptor competitive antagonist, shorter half-life than naltrexone)
- antidote for opioids: administration is both diagnostic and therapeutic (1 min onset of action)
- used for the undifferentiated comatose patient
- loading dose
  - adults
    - response to naloxone can be drastic, so stepwise delivery of initial 2 mg bolus is recommended
    - draw up 2 mg to deliver IV/IM/SL/SC or via ETT (ETT dose = 2-2.5x IV dose)
      - 1st dose 0.4 mg
      - 2nd dose 2 mg, if no response following 3 min
      - 3rd dose 4 mg, if no response following 3 min
      - continue doubling dose until maximum 12 mg administered
    - naloxone administration during cardiac arrest:
      - begin ACLS protocol and administer 2 mg IV/IM every 3 min, may increase dose by doubling up to maximum of 12 mg
  - child
    - 0.01 mg/kg initial bolus IV/IO/ETT (max 2mg per dose)
    - children over 20 kg can receive naloxone 2 mg IV
  - maintenance dose
    - may be required because half-life of naloxone (30-80 min) is much shorter than many opioids
    - hourly infusion rate at 2/3 of initial dose that allowed patient to be roused

Administration of naloxone can cause acute opioid withdrawal in people who are chronic opioid users (Ultrarapid Opioid Detoxification, UROD):
- **Minor** withdrawal may present as lacrimation, restlessness, rhinorrhea, diaphoresis, yawning, piloerection, HTN, myalgia, N/V, tachycardia
- **Severe** withdrawal may present as hot and cold flashes, arthralgias, myalgias, N/V, and abdominal cramps

Thiamine (Vitamin B_1)
- 100 mg IV/IM with IV/PO glucose to all patients
- given to prevent/treat Wernicke's encephalopathy
- a necessary cofactor for glucose metabolism (may worsen Wernicke's encephalopathy if glucose given before thiamine), but do not delay glucose if thiamine is unavailable
- must assume all undifferentiated comatose patients are at risk

Thiamine is deficient in the malnourished. Consider in patients with alcohol use disorder, anorexia, or malnutrition states

D2 – Draw Bloods

- essential tests
  - CBC, electrolytes, BUN/Cr, glucose, INR/PTT, osmolality
  - ABGs, O_2 sat
  - ASA, acetaminophen, EtOH levels
- potentially useful tests
  - drug levels – this is NOT a serum drug screen (e.g. digoxin, iron)
  - Ca^{2+}, Mg^{2+}, PO_4^{3-}
  - protein, albumin, lactate, ketones, liver enzymes, CK – depending on drug and clinical features

Urine drug screen is costly and generally not helpful in the ED management of the poisoned patient

Serum Drug Levels

- treat the patient, not the drug level
- negative toxicology screen does not rule out a toxic ingestion – signifies only that the specific drugs tested were not detectable in the specimen
- specific drugs available on general screen vary by institution; check before ordering
- urine screens also available (qualitative only; not often thought to change management)

Table 30. Toxic Gaps (see Nephrology, NP18)

METABOLIC ACIDOSIS

Increased AG: "GOLDMARK" (* = toxic)
Glycols* (ethylene glycol, propylene glycol)
Oxoproline (metabolite of acetaminophen)*
L-lactate
D-lactate (acetaminophen, short bowel syndrome, propylene glycol infusions for lorazepam & phenobarbital)
Methanol*
ASA*
Renal failure
Ketoacidosis (DKA, EtOH*, starvation)

Increased osmolar gap: "MAE DIE" (if it ends in "-ol", it will likely increase the osmolar gap)
Methanol
Acetone
Ethanol
Diuretics (glycerol, mannitol, sorbitol)
Isopropanol
Ethylene glycol

Note: normal osmolar gap does not rule out toxic alcohol; only an elevated gap is helpful

Decreased AG
Electrolyte imbalance (increased Na^+/K^+/Mg^{2+})
Hypoalbuminemia (50% fall in albumin ~5.5 mmol/L decrease in the AG)
Lithium, bromine elevation
Paraproteins (multiple myeloma)

Increased O_2 saturation gap
Carboxyhemoglobin
Methemoglobin
Sulfmethemoglobin

Normal AG
Renal HCO_3^- loss: renal tubular acidosis, hyperparathyroidism
GI HCO_3^- loss: diarrhea, fistula
Other: NS infusion, acetazolamide, hyperkalemia, hypoaldosteronism

Table 31. Use of the Clinical Laboratory in the Initial Diagnosis of Poisoning

Test	Finding	Selected Causes
ABG	Hypoventilation (high pCO_2) Hyperventilation (low pCO_2)	CNS depressants (opioids, sedative-hypnotic agents, phenothiazines, EtOH) Salicylates, CO, other asphyxiants
Electrolytes	AG metabolic acidosis Hyperkalemia Hypokalemia	"**GOLDMARK**": see Table 30 Digitalis glycosides, fluoride, potassium Theophylline, caffeine, β-adrenergic agents, soluble barium salts, diuretics, insulin
Glucose	Hypoglycemia	Oral hypoglycemic agents, insulin, EtOH, ASA
Osmolality and Osmolar Gap	Elevated osmolar gap	"**MAE DIE**": see Table 30
ECG	Wide QRS complex Prolonged QT interval Atrioventricular block	TCAs, quinidine, other class Ia and Ic antidysrhythmic agents Terfenadine, astemizole, antipsychotics, hydroxychloroquine Ca^{2+} antagonists, digitalis glycosides, phenylpropanolamine, hydroxychloroquine
Abdominal X-Ray	Radiopaque pills or objects	"**CHIPES**": **C**alcium, **C**hloral hydrate, **CCl4**, **H**eavy metals, **I**ron, **P**otassium, **E**nteric coated **S**alicylates, and some foreign bodies
Serum Acetaminophen	Elevated level (>140 mg/L or 1000 µmol/L 4 h after ingestion)	May be only sign of acetaminophen poisoning

Anion Gap
= $Na^+ - Cl^- - HCO_3^-$
Normal AG ≤12 mM/L

Osmolar Gap
= [(2 x Na^+) + Glu + Urea] - Measured Osmolality
Normal <10

D3 – Decontamination and Enhanced Elimination

Ocular Decontamination
- saline irrigation to neutralize pH; alkali exposure requires ophthalmology consult

Dermal Decontamination
- wear protective gear
- remove clothing, brush off toxic agents, irrigate all external surfaces

Gastrointestinal Decontamination
- single dose activated charcoal
  - use of activated charcoal is a source of much debate amongst toxicologists. Evidence of effectiveness is not strong, and risk of aspiration is high
  - adsorption of drug/toxin to activated charcoal decreases toxin bioavailability
  - contraindications: unprotected airway, late presentation after ingestion (1-2 h post ingestion), small bowel obstruction, poor toxin adsorption
  - dose: 10 g/g drug ingested or 1g/kg body weight (may vary depending on ingestion)
  - odourless, tasteless, prepared as slurry with H_2O
- whole bowel irrigation (occasionally used)
  - 500 mL/h (child) to 2000 mL/h (adult) of polyethylene glycol solution by mouth until clear effluent per rectum
    - start slow (500 mL in an adult) and aim to increase rate hourly as tolerated
  - indications
    - awake, alert, can be nursed upright, with an NG tube who cannot tolerate drinking it, or intubated and airway protected
    - delayed release product
    - drug/toxin not bound to charcoal
    - drug packages (if any evidence of breakage emergency surgery)
    - recent toxin ingestion
  - contraindications
    - evidence of ileus, perforation, or obstruction
- multidose activated charcoal
  - may be used for: carbamazepine, phenobarbital, quinine, theophylline for toxins which undergo enterohepatic recirculation
  - removes drug that has already been absorbed by drawing it back into GI tract
  - various regimens: 12.5 g (1/4 bottle) PO q1 h or 25 g (1/2 bottle) PO q2 h until non-toxic
- surgical removal in extreme cases
  - surgical indicated for drugs that are toxic, form concretions, or cannot be removed by conventional means
- use of cathartics (i.e. ipecac) and gastric lavage in the ED is not recommended

Lipid Emulsification
- new therapy used in cardiogenic shock due to toxins
- may be used for: anesthetics (e.g. lidocaine), β-blocker/calcium channel blocker, atypical antidepressant overdose
- initial bolus lipid solution 20% 1.5 mL/kg over 3 min then infusion of 0.25 mL/kg/min

Urine Alkalinization
- may be used for: ASA, methotrexate, phenobarbital, chlorpropamide
- weakly acidic substances can be trapped in alkaline urine (pH >7.5) to increase elimination

Hemodialysis
- indications/criteria for hemodialysis
  - toxins that have high water solubility, low protein binding, low molecular weight, adequate concentration gradient, small volume of distribution, or rapid plasma equilibration
  - clinical deterioration despite maximal medical support
- useful for the following toxins
  - methanol
  - ethylene glycol
  - salicylates
  - lithium
  - phenobarbital
  - chloral hydrate (trichloroethanol)
- others include theophylline, carbamazepine, valproate, methotrexate

E – Expose and Examine the Patient

- vital signs (including temperature), skin (needle tracks, colour), mucous membranes, pupils, odours, and CNS
- head-to-toe survey including
  - C-spine
  - signs of trauma, seizures (incontinence, "tongue biting," etc.), infection (meningismus), or chronic alcohol/drug misuse (track marks, nasal septum erosion)
  - feel the patient's axillae; in the average patient, should be somewhat moist (if dry, may indicate anticholinergic toxicity)
- mental status

Table 32. Specific Toxidromes

Toxidrome	Overdose Signs and Symptoms		Examples of Drugs
Anticholinergic	Hyperthermia Dilated pupils Dry skin Vasodilation Agitation/hallucinations Ileus Urinary retention Tachycardia	"Hot as a hare" "Blind as a bat" "Dry as a bone" "Red as a beet" "Mad as a hatter" "The bowel and bladder lose their tone and the heart goes on alone"	Antidepressants (e.g. TCAs) Cyclobenzaprine (Flexeril®) Carbamazepine Antihistamines (e.g. diphenhydramine) Antiparkinsonians Antipsychotics Antispasmodics Belladonna alkaloids (e.g. atropine)
Cholinergic	"**DUMBELS**" **D**iaphoresis, **D**iarrhea, **D**ecreased BP **U**rination **M**iosis **B**ronchospasm, **B**ronchorrhea, **B**radycardia **E**mesis, **E**xcitation of skeletal muscle **L**acrimation **S**alivation, **S**eizures		Natural plants: mushrooms, trumpet flower Anticholinesterases: physostigmine Insecticides (organophosphates, carbamates) Nerve gases
Extrapyramidal	Dysphonia, dysphagia Rigidity and tremor Motor restlessness, crawling sensation (akathisia) Constant movements (dyskinesia) Dystonia (muscle spasms, laryngospasm, trismus, oculogyric crisis, torticollis)		Major tranquilizers Antipsychotics
Hemoglobin Derangements	Increased respiratory rate Decreased LOC Seizures Cyanosis unresponsive to O_2 Lactic acidosis		CO poisoning (carboxyhemoglobin) Drug ingestion (methemoglobin, sulfmethemoglobin)
Opioid, Sedative/ Hypnotic, EtOH	Hypothermia Hypotension Respiratory depression (opioid) Dilated or constricted pupils (pinpoint in opioid) CNS depression		EtOH Benzodiazepines Opioids (morphine, heroin, fentanyl, etc.) Barbiturates GHB ("G," "liquid gold")
Sympathomimetic	Increased temperature CNS excitation (including seizures) Tachycardia, HTN N/V Diaphoresis Dilated pupils		Amphetamines, caffeine, cocaine, LSD, phencyclidine Ephedrine and other decongestants Thyroid hormone Sedative or EtOH withdrawal
Serotonin Syndrome	Mental status changes, autonomic hyperactivity, neuromuscular hyperactivity, hyperthermia, diarrhea, HTN		MAOI, TCA, SSRI, opiate analgesics Cough medicine, weight reduction medications

Note: ASA poisoning and hypoglycemia mimic sympathomimetic toxidrome

F – Full Vitals, ECG Monitor, Foley, X-Rays

G – Give Specific Antidotes and Treatments

Urine Alkalinization Treatment for ASA Overdose

- urine pH >7.5
- fluid resuscitate first, then 3 amps $NaHCO_3$/L of D5W at 1.5x maintenance
- add 20-40 mEq/L KCl if patient is able to urinate

Table 33. Protocol for Warfarin Overdose

INR	**Management:** Consider Prothrombin Complex Concentrate (Octaplex®, Beriplex®) for any elevated INR, AND either life-threatening bleeding, or a plan for the patient to undergo a surgical procedure within the next 6 h (vitamin K takes 4-6 h post IV administration to work)
<5.0	Cessation of warfarin administration, observation, serial INR/PT
5.1–9.0	If no risk factors for bleeding, hold warfarin x1-2 d and reduce maintenance dose OR Vitamin K 1-2 mg PO if patient at increased risk of bleeding
9.1–20.0	Hold warfarin, vitamin K 2-4 mg PO, serial INR/PT, additional vitamin K if necessary
>20.0	Hold warfarin, vitamin K 10 mg IV over 10 min, increase vitamin K dosing (q4 h) if needed

Table 34. Specific Antidotes and Treatments for Common Toxins*

Toxin	Treatment	Considerations
Acetaminophen	Decontaminate (activated charcoal) N-acetylcysteine	Often clinically silent; evidence of liver/renal damage delayed >24 h Toxic dose >200 mg/kg (>7.5 g adult) Monitor drug level 4 h post-ingestion; also liver enzymes, INR, PTT, BUN, Cr Hypoglycemia, metabolic acidosis, encephalopathy poor prognosis Dialysis may be required to manage in very high overdoses
Acute Dystonic Reaction	Benztropine: 1-2 mg IM/IV then 2 mg PO 3 d OR Diphenhydramine 1-2 mg/kg IV, then 25 mg PO QID x3 d	Benztropine (Cogentin®) has euphoric effect and the potential for misuse
Anticholinergics	Consider decontamination (activated charcoal) Supportive care	Special antidotes available; consult Poison Information Centre
ASA	Consider decontamination (activated charcoal) Alkalinize urine; want urine pH >7.5	Monitor serum pH and drug levels closely Monitor K^+ level; may require supplement for urine alkalinization Hemodialysis may be needed if intractable metabolic acidosis, very high levels, or end-organ damage (i.e. unable to diurese)
Benzodiazepines	Consider decontamination (activated charcoal) Flumazenil (only use in iatrogenic overdose (operative oversedation) due to extensive contraindications (mixed overdose, Hx of EtOH, seizures)) Supportive care	
β-blockers	Consider decontamination (activated charcoal, consider whole bowel irrigation for extended-release ingestion) IV glucagon, IV calcium chloride, IV high-dose insulin (with dextrose), IV lipid emulsification	
Calcium Channel Blockers	Consider decontamination (activated charcoal, consider whole bowel irrigation for extended-release ingestion) IV glucagon, IV calcium chloride, IV high-dose insulin (with dextrose), IV intralipid	Order ECG, electrolytes (especially Ca^{2+}, Mg^{2+}, Na^+, K^+)
Cocaine	Decontaminate (activated charcoal) if oral Aggressive supportive care	β-blockers are contraindicated in acute cocaine toxicity Intralipid for life-threatening symptoms Consider benzodiazepines for any major side effect of cocaine overdose (agitation, hypertension, tachycardia, etc.)
CO Poisoning	See *Inhalation Injury*, ER47 Supportive care 100% O_2 ; may require hyperbaric O_2	Order ECG, VBG. Consider lactate and troponin depending on specific presentation
Cyanide	Hydroxocobalamin 5 g IV (Cyanokit™)	Consider in all patients found in a fire
Digoxin	Consider decontamination (activated charcoal) Digoxin-specific antibody fragments 10-20 vials IV if acute; 3-6 if chronic 1 vial (40 mg) neutralizes 0.5 mg of toxin	Use for life-threatening dysrhythmias unresponsive to conventional therapy, 6 h serum digoxin >12 nmol/L, initial K^+ >5 mmol/L, ingestion >10 mg (adult)/>4 mg (child) Common dysrhythmias include VFib, VTach, and conduction blocks
Ethanol	Thiamine 100 mg IM/IV Manage airway and circulatory support	Mouthwash = 70% EtOH; perfumes and colognes = 40-60% EtOH Order serum EtOH level and glucose level; treat glucose level appropriately
Ethylene Glycol/ Methanol	Fomepizole (4-methylpyrazole) 15 mg/kg IV load over 30 min, then 10 mg/kg q12 h OR Ethanol (10%) 10 mL/kg over 30 min, then 1.5 mL/h	CBC, electrolytes, glucose, ethanol level Consider hemodialysis
Heparin	Protamine sulfate 25-50 mg IV	For unfractionated heparin overdose only
Insulin IM/SC/ Oral Hypoglycemic	Glucose IV/PO/NG tube Glucagon: 1-2 mg IM (if no access to glucose)	Glyburide carries highest risk of hypoglycemia among oral agents Consider octreotide for oral hypoglycemics (50-100 µg SC q6 h) in these cases; consult local Poison Information Centre
MDMA	Consider decontamination (activated charcoal) Supportive care	Monitor CK; treat rhabdomyolysis with high flow fluids: aggressive external cooling for hyperthermia Review medical history if possible for serotonergic use
Opioids	See *Universal Antidotes*, ER49	
TCAs	Consider decontamination (activated charcoal) Aggressive supportive care $NaHCO_3$ bolus for wide QRS/seizures	Flumazenil antidote contraindicated in combined TCA and benzodiazepine overdose Also consider cardiac and hypotension support, seizure control Intralipid therapy
Organophosphate	100% O_2 + endotracheal intubation Atropine Pralidoxime (2-PAM)	Succinylcholine

* Call local Poison Information Centre for reporting of cases, specific doses, and treatment recommendations. Most toxicology cases should involve communication with your local Poison Information Centre

Alcohol Related Emergencies

- see Psychiatry, PS28

Acute Intoxication

- slurred speech, CNS depression, disinhibition, lack of coordination
- nystagmus, diplopia, dysarthria, ataxia, may progress to coma
- hypotension (peripheral vasodilation)
- if obtunded, rule out
  - head trauma/intracranial hemorrhage
  - associated depressants, toxic alcohols
- may also contribute to respiratory/cardiac depression
  - hypoglycemia (screen with bedside glucometer)
  - hepatic encephalopathy: confusion, altered LOC, coma
- precipitating factors: GI bleed, infection, sedation, electrolyte abnormalities, protein meal
  - Wernicke's encephalopathy (ataxia, ophthalmoplegia, delirium)
  - post-ictal state, basilar stroke

Alcohol levels correlate poorly with intoxication

Alcohol intoxication may invalidate informed consent

Withdrawal

- beware of withdrawal signs
- treatment
  - diazepam 10-20 mg IV/PO or lorazepam 2-4 mg IV/PO q1 h (if known liver dysfunction) until two negative CIWA scores
- frequency of dosing may have to be increased depending on clinical response
  - may use CIWA protocol and give benzodiazepines as above until CIWA <10
  - thiamine 250-500 mg IM/IV then 50-100 mg/d
    - naltrexone & gabapentin if no improvement
  - magnesium sulfate 4 g IV over 1-2 h (if hypomagnesemic)
  - admit patients with delirium tremens or multiple seizures or persistently high CIWA (symptoms) despite high doses of benzodiazepines

CIWA Withdrawal Symptoms
- N/V
- Tremor
- Paroxysmal sweats
- Anxiety
- Agitation
- Visual disturbances
- Tactile disturbances
- Auditory disturbances
- Headache
- Disorientation
- 10 symptoms each scored out of 7 except orientation, which is scored out of 4

Table 35. Alcohol Withdrawal Signs

Time Since Last Drink	Syndrome	Description
6-8 h	Mild withdrawal	Generalized tremor, anxiety, agitation, but no delirium Autonomic hyperactivity (sinus tachycardia), insomnia, N/V
1-2 d	Alcoholic hallucinations	Visual (most common), auditory, and tactile hallucinations Vitals often normal
8 h-2 d	Withdrawal seizures	Typically brief generalized tonic-clonic seizures May have several within a few hours CT head if focal seizures have occurred
3-5 d	DT	5% of untreated withdrawal patients Severely confused state, fluctuating LOC Agitation, insomnia, hallucinations/delusions, tremor Tachycardia, hyperpyrexia, diaphoresis High mortality rate

Cardiovascular Complications

- HTN
- cardiomyopathy: SOB, edema
- dysrhythmias ("holiday heart")
- AFib (most common), atrial flutter, SVT, VTach (especially Torsades if hypomagnesemic/hypokalemic)

Metabolic Abnormalities

- alcoholic ketoacidosis
  - metabolic acidosis, urine ketones, low glucose, and normal osmolality
  - history of chronic alcohol intake with abrupt decrease/cessation
  - malnourished, abdominal pain with N/V
  - treatment: thiamine (250-500 mg IM/IV prior to dextrose), dextrose, volume repletion (with NS)
  - generally resolves in 12-24 h
- toxic alcohols
  - ethylene glycol: CNS, CVS, renal findings
  - methanol
    - early: lethargy, confusion
    - late: headache, visual changes, N/V, abdominal pain, tachypnea
  - both ethylene glycol and methanol produce severe metabolic acidosis with anion gap (as the alcohol is metabolized) and osmolar gap (initially after ingestion but before metabolism)
  - EtOH co-ingestion is protective

  - treatment
    - urgent hemodialysis required
    - fomepizole 15 mg/kg IV bolus (treatment of choice) or 10% EtOH IV bolus and infusion to achieve blood level of 22 mmol/L (EtOH loading may be done PO)
    - consider folic acid for methanol, and pyridoxine and thiamine for ethylene glycol – both help reduce conversion to active metabolites
- other abnormalities associated with alcohol: hypomagnesemia, hypophosphatemia, hypocalcemia, hypoglycemia, hypokalemia

Gastrointestinal Abnormalities
- gastritis
  - common cause of abdominal pain and GI bleed in chronic alcohol users
- pancreatitis
  - serum amylase very unreliable in patients with chronic pancreatitis, may need serum lipase
  - hemorrhagic form (15%) associated with increased mortality
  - fluid resuscitation very important
- hepatitis
  - AST/ALT ratio >2 suggests alcohol as the cause as well as elevated GGT with acute ingestion
- peritonitis/spontaneous bacterial peritonitis
  - leukocytosis, fever, generalized abdominal pain/tenderness
  - occasionally accompanies cirrhosis
  - paracentesis for diagnosis (common pathogens: *E. coli, Klebsiella, Streptococcus*)
  - albumin shown to improve outcomes in sBP patients
- GI bleeds
  - most commonly gastritis or ulcers, even if patient known to have varices
  - consider Mallory-Weiss tear secondary to retching
  - often complicated by underlying coagulopathies
  - minor: treat with antacids
  - severe or recurrent: endoscopy
  - variceal bleeds: octreotide

Disposition
- before patient leaves ED ensure stable vital signs, can walk unassisted, and fully oriented
- offer social services to find shelter or detox program
- ensure patient can obtain any medications prescribed and can complete any necessary follow-up

Approach to the Overdose Patient

History
- age, weight, underlying medical problems, medications
- substance, route, and quantity
- time and symptoms since exposure determines prognosis and need for decontamination
- route
- intention, suicidality

Indications to Suspect Overdose
- Altered LOC/coma
- Young patient with life-threatening dysrhythmia
- Trauma patient
- Bizarre or puzzling clinical feature

Physical Exam
- focus on: ABCs, LOC/GCS, vitals, pupils

Disposition from the Emergency Department
- methanol, ethylene glycol
  - delayed onset, admit, and watch clinical and biochemical markers
- TCAs
  - prolonged/delayed cardiotoxicity warrants admission to monitored ICU bed
  - if asymptomatic and no clinical signs of intoxication: 6 h ED observation adequate with proper decontamination and no ECG abnormalities
  - sinus tachycardia alone (most common finding) with history of overdose warrants observation in ED
- hydrocarbons/smoke inhalation
  - pneumonitis may lag 6-8 h
  - consider observation for repeated clinical and radiographic examination
- ASA, acetaminophen
  - if borderline level, get second level 2-4 h after first
  - for ASA, must have at least 2 measurements showing decreasing toxin serum concentration before discharge (3 levels minimum)
- oral hypoglycemics
  - admit all patients for minimum 24 h if hypoglycemic and 12 h after last octreotide dose
  - observe asymptomatic patient for at least 8 h
- opioids
  - administer naloxone, a short-acting opioid antagonist, preferably IV in incremental doses (0.2-1 mg)
  - patients in cardiorespiratory arrest following possible opioid overdose should be given 2 mg of naloxone minimum
  - admit and observe for 24hr

Psychiatric Consultation
- once patient medically cleared, arrange psychiatric intervention if required
- beware – suicidal ideation may not be expressed

Psychiatric Emergencies

Approach to Common Psychiatric Presentations

- see Psychiatry, PS2
- before seeing patient, ensure your own safety; have security/police available if necessary

Key Functions of Emergency
- Psychiatric Assessment
- Is the patient medically stable?
- Rule out medical cause
- Is psychiatric consult needed?
- Are there safety issues (SI, HI)?
- Is patient certifiable? (must demonstrate risk (present/past test) and apparent mental illness (future test))

History
- safety
  - assess suicidality: suicidal ideation (SI; passive/active), intent, plan, lethal means, past attempts, protective factors
  - assess homicidality: homicidal ideation (HI), access to weapons, intended victim, and history of violence
  - driving and children
  - command hallucinations
- identify current stressors and coping strategies
- mood symptoms: manic, depressive
- anxiety: panic attacks, generalized anxiety, phobias, obsessive-compulsive disorder, post-traumatic stress disorder
- psychotic symptoms: delusions, hallucinations, disorganized speech, disorganized or catatonic behaviour, negative symptoms (affective flattening, alogia, avolition)
- substance use history: most recent use, amount, previous withdrawal reactions
- past psychiatric history, medications, adherence with medications, admissions
- medical history: obtain collateral if available

Psychiatric Review of Systems

MOAPS
Mood
Organic
Anxiety
Psychosis
Safety

Physical Exam
- complete physical exam focusing on: vitals, neurological exam, signs of head trauma, signs of drug toxicity, signs of metabolic disorder; which could be contributing or causing psychiatric presentation
- mental status exam: general appearance, behaviour, cooperation, speech, mood and affect, thought content and form, perceptual disturbances, cognition (including MMSE if indicated), judgment, insight, reliability

Investigations
- investigations vary with age, established psychiatric diagnosis vs. first presentation, history and physical suggestive of organic cause
- as indicated: blood glucose, urine and serum toxicology screen, pregnancy test, electrolytes, TSH, AST/ALT, bilirubin, serum Cr, BUN, and osmolality
- blood levels of psychiatric medications
- CT head if suspect neurological etiology
- LP if indicated (anti-NMDA receptor encephalitis)

Acute Psychosis

Differential Diagnosis
- primary psychotic disorder (e.g. schizophrenia)
- secondary to medical condition (e.g. delirium)
- drugs: substance intoxication or withdrawal, medications (e.g. steroids, anticholinergics)
- infectious (CNS)
- metabolic (hypoglycemic, hepatic, renal, thyroid)
- structural (hemorrhage, neoplasm)
  - autoimmune (anti-NMDA receptor encephalitis)

Management
- violence prevention
  - remain calm, empathic, and reassuring
  - ensure safety of staff and patients, have extra staff and/or security on hand
  - patients demonstrating escalating agitation or overt violent behaviour may require physical restraint and/or chemical restraint
- treat agitation: whenever possible, offer medication to patients as opposed to administering with force (helps calm and engage patient)
  - benzodiazepines: lorazepam 2 mg PO/IM/SL
  - antipsychotics: olanzapine 5-10 mg PO/IM, haloperidol 5 mg PO/IM
- treat underlying medical condition
- psychiatry or Crisis Intervention Team consult

Suicidal Patient

See Psychiatry, *Common Forms*, PS63 for certification (involuntary assessment/admission) considerations

Epidemiology

- attempted suicide F>M, completed suicide M>F
- second leading cause of death in people <24 yr
- significantly increased incidence among marginalized communities, particularly Indigenous peoples and 2SLGBTQQIA Canadians

High-Risk Patients

SAD PERSONS
Sex = male
Age >45 yr
Depression
Previous attempts
Ethanol use
Rational thinking loss
Suicide in family
Organized plan
No spouse, no support system
Serious illness

Management

- ensure patient safety: close observation, remove potentially dangerous objects from person and room
- assess thoughts (ideation), means, action (preparatory, practice attempts), previous attempts, protective factors
- admit if there is evidence of active intent and organized plan, access to lethal means, psychiatric disorder, intoxication (suicidal ideation may resolve with few days of abstinence)
- patient may require certification if unwilling to stay voluntarily
- do not start long-term medications in the ED
- psychiatry or Crisis Intervention Team consult

Common Paediatric ED Presentations

Modified Glasgow Coma Score

Any trauma or suspected trauma patient <1 yr with a large, boggy scalp hematoma requires U/S or CT

Table 36. Modified GCS

Modified GCS for Infants		
Eye Opening	**Verbal Response**	**Motor Response**
4 – spontaneously	5 – coos, babbles	6 – normal, spontaneous movement
3 – to speech	4 – irritable cry	5 – withdraws to touch
2 – to pain	3 – cries to pain	4 – withdraws to pain
1 – no response	2 – moans to pain	3 – decorticate flexion
	1 – no response	2 – decerebrate extension
		1 – no response
Modified GCS for Infant (<2 years)[1] or Non-verbal Patients		
Eye Opening	**Verbal Response**	Motor Response
4 – spontaneously	5 – oriented, social, speaks, interacts	6 – normal, spontaneous movement
3 – to speech	4 – confused speech, disoriented, consolable	5 – localizes to pain
2 – to pain	3 – inappropriate words, not consolable/aware	4 – withdraws to pain
1 – no response	2 – incomprehensible, agitated, restless, not aware	3 – decorticate flexion
	1 – no response	2 – decerebrate extension
		1 – no response

[1]Consider Alert, Pain, Verbal, Unconscious (AVPU) scale

Respiratory Distress

- see Paediatrics, P80, P93

History and Physical Exam

- infants not able to feed, older children not able to speak in full sentences
- anxious, irritable, lethargic – may indicate hypoxia
- tachypnea >60 (>40 if preschool age, >30 if school age), retractions, tracheal tug
  - see Paediatrics, P3 for age specific vital signs
- pulsus paradoxus (rarely used clinically)
- wheezing, grunting, vomiting

Table 37. Stridorous Upper Airway Diseases: Differential Diagnosis

Feature	Croup	Bacterial Tracheitis	Epiglottitis[1]
Age Range (yr)	0.5-4	5-10	2-8
Prodrome	Mild for days then acutely severe	Hours to days	Minutes to hours
Temperature	Low grade	High	High
Radiography	Steeple sign	Exudates in trachea[2]	Thumb sign
Etiology	Parainfluenza	*S. aureus/GAS*	*H. influenzae* type b
Barky Cough	Yes	Yes	No
Drooling	Occasionally	No	Yes
Appear Toxic	No	Yes	Yes

[1]Now rare with Hib vaccine in common use
[2]Found as diffuse haziness and irregularity of the anterior wall of trachea; consider imaging only after ruling out epiglottitis

Table 37. Stridorous Upper Airway Diseases: Differential Diagnosis

Feature	Croup	Bacterial Tracheitis	Epiglottitis[1]
Intubation/ICU	No but yes if severe (rare)	Yes	Yes
Antibiotics	No	Yes	Yes
NOTE	Oral exam	Oral exam	No oral exam, consult ENT

[1]Now rare with Hib vaccine in common use
[2]Found as diffuse haziness and irregularity of the anterior wall of trachea; consider imaging only after ruling out epiglottitis

Management
- croup (usually laryngotracheitis caused by parainfluenza viruses)
  - dexamethasone x 1 dose
  - if moderate-severe, add nebulized or MDI epinephrine (racemic has limited availability)
  - consider bacterial tracheitis/epiglottitis if unresponsive to croup therapy
  - humidified O_2 has no evidence for efficacy
- bacterial tracheitis
  - airway maintenance - usually require intubation, ENT consult, ICU
  - start antibiotics (e.g. cloxacillin), pending C&S
- epiglottitis
  - 4 D's: drooling, dyspnea, dysphagia, dysphonia + tripod sitting
  - do not examine oropharynx or agitate patient
  - immediate anesthesia/ENT call – intubate
  - then IV fluids, antibiotics, blood cultures

Febrile Infant and Febrile Seizures

FEBRILE INFANT
- for fever >38°C without obvious focus
  - <28 d
    - admit
    - full septic workup (CBC and differential, CRP, blood C&S, urine C&S, LP ± stool C&S, CXR if indicated)
    - treat empirically with broad spectrum IV antibiotics (ampicillin, and ceftazidime or cefepime or cefotaxime (if available) or gentamicin (add acyclovir or vancomycin when indicated))
  - 28-90 d
    - as above unless infant meets Rochester criteria, if so, complete a partial septic workup (CBC and differential, blood C&S, urine C&S, CXR if indicated)
    - antibiotics (ceftriaxone or cefotaxime (if available), add acyclovir or vancomycin when indicated)
  - >90 d
    - toxic: admit, treat, full septic workup
    - non-toxic and no focus: investigate as indicated by history and physical
    - antibiotics (Ceftriaxone or cefotaxime (if available), add acyclovir or vancomycin when indicated)

FEBRILE SEIZURES
- see Paediatrics, P88

Etiology
- children ages 6 mo-6 yr with fever or history of recent fever
- typical vs. atypical febrile seizures
- normal neurological exam afterward
- no evidence of intracranial infection or history of previous non-febrile seizures
- often positive family history of febrile seizures
- relatively well-looking after seizure

Investigations and Management
- if confirmed febrile seizure: treat fever and look for source of fever
- if not a febrile seizure: treat seizure and look for source of seizure
  - note: may also have fever but may not meet criteria for febrile seizure
- ± EEG (especially if first seizure), head U/S (if fontanelle open)

Table 38. Typical vs. Atypical Febrile Seizures

Characteristic	Typical	Atypical
Duration	<5 min	>5 min
Type of Seizure	Generalized	Focal features
Frequency	1 in 24 h	>1 in 24 h

Rochester Criteria for Febrile Infants Ages 28-90 Days Old
- Helps identify SBI (serious bacterial infection) and guide testing/work-up for well-looking febrile neonates
- Non-toxic looking
- Previously well (>37 wk gestational age, home with mother, no hyperbilirubinemia, no prior antibiotics or hospitalizations, no chronic/underlying illness)
- No skin, soft tissue, bone, joint, or ear infection on physical exam
- WBC 5000-15000, bands <1500, urine <10 WBC/HPF, stool <5 WBC/HPF

Abdominal Pain

• see Paediatrics, P46

History
- neuro, infections, autoimmune, hematology, trauma, abuse Hx questions
- nature of pain, associated fever
- associated GI, GU symptoms
- anorexia, decreased fluid intake
  - stress and/or social issues (most common in middle aged children)

Physical Exam
- HEENT, respiratory, abdominal exam including DRE, testicular/genital exam

Red Flags for Abdominal Pain
- Significant weight loss or growth retardation (need growth chart)
- Fever
- Joint pain with objective physical findings
- Rash
- Rectal bleeding
- Rebound tenderness and radiation of pain to back, shoulders, or legs
- Pain wakes from sleep
- Severe diarrhea and encopresis

Table 39. Differential Diagnosis of Abdominal Pain in Infants/Children/Adolescents

Medical	Surgical
Colic	Malrotation with volvulus
UTI	Hirschsprung's disease
Constipation	Necrotizing enterocolitis
Gastroenteritis	Incarcerated hernia
Sepsis	Intussusception
Henoch-Schönlein purpura	Duodenal atresia
IBD	Appendicitis
Hemolytic uremic syndrome	Cholecystitis
Pneumonia	Pancreatitis
Strep throat	Adnexal torsion (testicular or ovarian)
Sickle cell disease crisis	Ectopic pregnancy
DKA	Trauma
Functional	Pyloric stenosis

*Remember to keep an index of suspicion for child abuse

Common Infections

• see Paediatrics, P62

Table 40. Antibiotic Treatment of Paediatric Bacterial Infections

Infection	Pathogens	Treatment
MENINGITIS SEPSIS		
Neonatal	Group B *Streptococcus* (GBS), *E. coli, Listeria*, Gram-negative bacilli	ampicillin + cefotaxime
1-3 mo	Same pathogens as above and below	ceftriaxone/cefotaxime + vancomycin + ampicillin (if immunocompromised)
>3 mo	*S. pneumoniae, H. influenzae* type B (>5 yr), meningococcus	ceftriaxone + vancomycin
OTITIS MEDIA		
1st Line	*S. pneumoniae, H. influenzae* type B, *M. catarrhalis*	amoxicillin 75-90 mg/kg/d BID OR 45-60 mg/kg/day TID
1st Line with Penicillin Allergy		1. cefuroxime-axetil 30 mg/kg/d BID/TID OR ceftriaxone 50 mg/kg/dayIM x 3 d (if minor allergy) 2. clarithromycin 15 mg/kg/d BID (for severe allergy)
Treatment Failure		7:1 amoxicillin to clavulanate ratio ≤35 kg: 45-60 mg/kg/d TID >35 kg: 50 mg PO TID
STREP PHARYNGITIS		
	Group A β-hemolytic *Streptococcus*	penicillin/amoxicillin, cefalexin, or erythromycin (can cause GI upset)
UTI		
	E. coli, Proteus, H. influenzae, Pseudomonas, S. saprophyticus, Enterococcus, GBS	Oral: cefalexin IV: aminoglycoside (gentamycin) ± ampicillin
PNEUMONIA		
1-3 mo	Viral, *S. pneumoniae, C. trachomatis, B. pertussis, S. aureus, H. influenzae*	cefuroxime ± macrolide (erythromycin) OR ampicillin ± macrolide
3 mo-5 yr	Viral, *S. pneumoniae, S. aureus, H. influenzae, Mycoplasma pneumoniae*	ampicillin/amoxicillin or cefuroxime
>5 yr	As above	ampicillin/amoxicillin + macrolide OR cefuroxime + macrolide

Child Abuse and Neglect

- see Paediatrics, P18
- obligation to report any suspected/known case of child abuse or neglect to CAS yourself (do not delegate)
- document injuries
- consider skeletal survey x-rays (especially in non-ambulatory child), ophthalmology consult, CT head
- injury patterns associated with child abuse
  - HI: torn frenulum, dental injuries, bilateral black eyes, traumatic hair loss, diffuse severe CNS injury, retinal hemorrhage
  - Shaken baby syndrome: diffuse brain injury, subdural/SAH, retinal hemorrhage, minimal/no evidence of external trauma, associated bony fractures
  - skin injuries: bites, bruises/burns in shape of an object, glove/stocking distribution of burns, bruises of various ages, bruises in protected areas
  - bone injuries: rib fractures without major trauma, femur fractures <1 yr, spiral fractures of long bones in non-ambulatory children, metaphyseal fractures in infants, multiple fractures of various ages, complex/multiple skull fractures
  - GU/GI injuries: chronic abdominal/perineal pain, injury to genitals/rectum, STI/pregnancy, recurrent vomiting or diarrhea

Presentation of Neglect
- Failure to thrive, developmental delay
- Inadequate or dirty clothing, poor hygiene
- Child exhibits poor attachment to parents

Procedures that may Require Sedation
- Setting fractures
- Reducing dislocations
- Draining abscesses
- Exploring wounds/ulcers/superficial infections
- Endoscopic examination
- Reduce patient anxiety/agitation for imaging/procedures

Common Medications

Table 41. Commonly Used Medications

Drug	Dosing Schedule	Indications	Comments
Acetaminophen	325-650 mg PO q4-6h PRN	Pain control	Max 4 g daily
Activated charcoal	30-100 g PO in 250 mL H20	Poisoning/overdose	Efficacy and safety are case-dependent and are a source of debate
ASA	325-650 mg PO q4 h max 4 g/d stroke/MI risk: 81-325 mg PO once daily 160 mg chewed	Pain control Prevention of adverse cardiac events ACS	
β-blockers (metoprolol)	5 mg slow IV q5 min x3 if no contraindications Or 25 mg PO BID up to 100 mg PO BID	Acute MI CAD	
Diazepam	anxiety: 2-10 mg PO TID/QID alcohol withdrawal: 10-20 mg PO/IV q1 h titrated to signs/symptoms	Anxiety Alcohol withdrawal	
Enoxaparin	1 mg/kg SC BID	Acute MI DVT Prophylaxis/treatment	
Epinephrine	anaphylaxis: 0.3-0.5 mg IM; ACLS cardiac arrest: 1 mg IV q3-5 min ACLS bradycardia: 2-10 µg/min IV infusion	Anaphylaxis, ACLS cardiac arrest, ACLS bradycardia Hypotension	Max 1 mg/dose
Fentanyl	0.5-1.0 µg/kg IV	Procedural sedation Pain control	Very short acting narcotic (complication=apnea)
Flumazenil	0.3 mg IV bolus q5 min x3 doses	Reversal of procedural sedation	Benzodiazepine antagonist Can cause seizures/status epilepticus in chronic benzodiazepine users
Furosemide (Lasix®)	CHF: 40-80 mg IV HTN: 10-40 mg PO BID	CHF HTN	Monitor for electrolyte imbalances; also risk of ototoxicity with high dose
Glucose	0.5-1.0 g/kg (1-2 mL/kg) IV of D50W	Hypoglycemia/DKA	In conjunction with Insulin for hyperkalemia
Haloperidol	2.5-5.0 mg PO/IM initial effective dose 6-20 mg/d	Psychosis Cannabis Hyperemesis Syndrome (any N/V) Sedation	Monitor for side effects if prescribing to a patient with Parkinson's disease (extrapyramidal side effects); results in CNS depression
Ibuprofen	200-800 mg PO TID PRN max 1200 mg/d	Mild to moderate acute pain Analgesic and anti-inflammatory properties	
Insulin	bolus 5-10 U (0.2 U/kg) then 5-10 U (0.1 U/kg) per h	Hyperglycemia CCB/BB overdose	Monitor blood glucose levels Consider K+ replacement, also measure blood glucose levels before administration
Ipratropium bromide	2-3 puffs inhaled TID-QID, max 12 puffs/d	Asthma	Contraindications include: peanut/soy allergy Caution with narrow-angle glaucoma
Lidocaine with epi	max 7 mg/kg SC	Local anesthetic	Not to be used in fingers, nose, toes, penis, ears
Lidocaine w/o epi	max 5 mg/kg SC	Local anesthetic	

Table 41. Commonly Used Medications

Drug	Dosing Schedule	Indications	Comments
Lorazepam	anxiety: 0.5-2 mg PO/IM/IV q6-8 h status epilepticus: 4 mg IV repeat up to q5 min	Anxiety Status epilepticus Alcohol withdrawal	
Midazolam	50 µg/kg IV	Procedural sedation Sedation for agitation	Short acting benzodiazepine (complication = apnea when used with narcotic) Fentanyl and midazolam often used together for procedural sedation
Morphine	10-30 mg PO q4 h 2.5-5 mg IV q4 h	Mild to moderate acute/chronic pain Prescribed in combination with NSAIDs or acetaminophen	GI and constipation side effects DO NOT CRUSH, CUT, or CHEW Risk of tolerance
Naloxone	0.5-2 mg or 0.01-0.02 mg/kg initial bolus IV/IM/SL/SC or via ETT (2-2.5x IV dose), increase dose by 2 mg until response/max 10 mg	Comatose patient Opioid overdose Reversal in procedural sedation	If patient is a chronic opioid user begin with very small doses, and go up with small increments as needed
Nitroglycerin	acute angina: 0.3-0.6 mg SL q5 min, OR 5 µg/min IV increasing by 5-20 µg/min q3-5 min	Angina Acute MI Heart failure	Not to be used with other antihypertensives Not in right ventricular MI
Percocet 10/325®	1-2 tabs PO q6 h PRN	Moderate pain control	Oxycodone + acetaminophen Max 4 g acetaminophen daily
Phenytoin	Status epilepticus: see Table 17, ER25	Status epilepticus Epilepsy	Begin maintenance dose 12 h after loading dose Continuous ECG, BP monitoring mandatory
Polysporin®	Apply to affected area BID/TID	Superficial infections	
Propofol	0.25-1 mg/kg IV	Procedural sedation, also refractory status epilepticus Rapid sequence intubation	Short acting Anesthetic/sedative (complication = apnea, decreased BP)
Salbutamol	2 puffs inhaled q4-6 h max 12 puffs/d	Asthma Reactive airways	Caution with cardiac abnormalities
Thiamine	100 mg IV/IM initially, then 50-100 mg IM/IV/PO once daily x3 d	To treat/prevent Wernicke's encephalopathy	Caution use in pregnancy
Tylenol #3®	1-2 tabs PO q4-6 h PRN	Pain control	Acetaminophen + codeine Metabolism of codeine is highly variable Max 4 g acetaminophen daily

Acronyms

A1c	hemoglobin A1c
AAA	abdominal aortic aneurysm
Ab	antibody
ACEI	angiotensin converting enzyme inhibitor
ACR	albumin-creatinine ratio
ADH	antidiuretic hormone
AG	anion gap
ApoB	apolipoprotein B
ARB	angiotensin-receptor blockers
ARR	absolute risk reduction
AVP	arginine vasopressin
BG	blood glucose
BMD	bone mineral density
CAH	congenital adrenal hyperplasia
CHO	carbohydrates
CK	creatine kinase
CKD	chronic kidney disease
CMV	cytomegalovirus
CNS	central nervous system
CrCl	creatinine clearance
CVD	cardiovascular disease
DDAVP	desmopressin (1-deamino-8-D-arginine vasopressin)
DHEA	dehydroepiandrosterone
DI	diabetes insipidus
DKA	diabetic ketoacidosis
DXM	dexamethasone
DVT	deep vein thrombosis
ECF	extracellular fluid
ECFV	extracellular fluid volume
FFA	free fatty acids
FNA	fine needle aspiration
FPG	fasting plasma glucose
GFR	glomerular filtration rate
GHRH	growth hormone releasing hormone
GLP-1	glucagon-like peptide 1
GnRH	gonadotropin releasing hormone
Hb	hemoglobin
hCG	human chorionic gonadotropin
HDL	high density lipoprotein
HHS	hyperosmolar hyperglycemic state
HLA	human leukocyte antigen
HMG-CoA	3-hydroxy-3-methylglutaryl-coenzyme A
HPA	hypothalamic pituitary adrenal
hs-CRP	highly sensitive C-reactive protein
HVA	homovanillic acid
ICF	intracellular fluid
IDL	intermediate density lipoprotein
IFG	impaired fasting glucose
IGT	impaired glucose tolerance
JGA	juxtaglomerular apparatus
LCAT	lecithin-cholesterol acyltransferase
LDL	low density lipoprotein
LDL-C	low density lipoprotein-cholesterol
LP	lipoprotein
MEN	multiple endocrine neoplasia
MMI	methimazole
MTC	medullary thyroid cancer
NS	normal saline
OGTT	oral glucose tolerance test
PA	primary aldosteronism
PAD	peripheral arterial disease
PCOS	polycystic ovarian syndrome
POMC	pro-opiomelanocorticotropin
PRL	prolactin
PTH	parathyroid hormone
PTHrP	parathyroid hormone-related protein
PTU	propylthiouracil
RAI	radioactive iodine
RANKL	receptor activator of nuclear factor-κB ligand
RAIU	radioactive iodine uptake
RAAS	renin-angiotensin-aldosterone system
RH	releasing hormone
RRR	relative risk reduction
SA	secondary aldosteronism
SGLT2i	sodium/glucose cotransporter-2 inhibitor
SHBG	sex hormone binding globulin
T3	triiodothyronine
T4	thyroxine
TBG	thyroid binding globulin
TC	total cholesterol
TG	triglycerides
TgAb	thyroglobulin antibodies
TPOAb	anti-thyroid peroxidase antibodies
TRAb	TSH receptor antibodies
TSI	thyroid stimulating immunoglobulin
VLDL	very low density lipoprotein
VMA	vanillylmandelic acid
WC	waist circumference

Basic Anatomy Review

Major Endocrine Organs

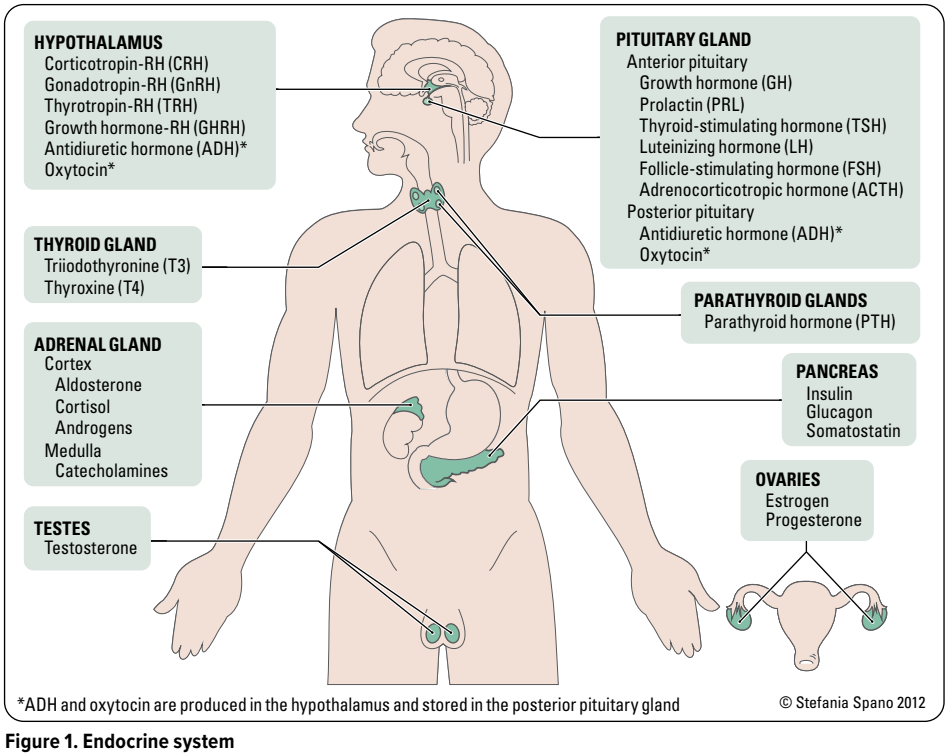

Figure 1. Endocrine system

GENERAL FUNCTION OF ORGANS

The Hypothalamic-Pituitary Axis

The hypothalamus is a small region of the brain which functions as the coordinating centre of the endocrine system and is fundamental to maintaining homeostasis. External environmental signals (e.g. temperature and light), internal environmental inputs (e.g. blood glucose and blood osmolality), and peripheral hormonal feedback are integrated at the hypothalamus. The hypothalamus sends signals to the pituitary gland to release hormones that affect the function of the thyroid, adrenal glands, and gonads as well as influence uterine contraction, lactation, growth, and water balance. The pituitary is regulated by hypothalamic and target organ signals as well as by its own secretions

Anatomy ↔ Function

Hypothalamic hormones: small peptides, non-binding proteins that are prone to rapid degradation
High [ ] in pituitary-portal blood system
Low [ ] in peripheral circulation
The proximity of the hypothalamic-pituitary axis preserves the pulsatile output signals from the hypothalamic neurons

Thyroid

Thyroid hormone is critical to 1) brain and somatic development in fetus and infants, 2) metabolic activity in adults, and 3) function of nearly every organ system

Adrenal

The adrenal glands (6-8 g) produce a variety of hormones. Structure: each gland has an outer cortex (3 layers: zona glomerulosa → aldosterone; zona fasciculata → cortisol; zona reticularis → androgen and estrogen precursors) and inner medulla (stores and synthesizes epinephrine and norepinephrine)

Gonads

Bifunctional: sex steroid synthesis and gamete production
Sex steroids control sexuality and affect metabolic and brain functions

Parathyroid

Synthesize and secrete PTH, a principal regulator of ECF Ca^{2+}, regulated by $[Ca^{2+}]$, $[Mg^{2+}]$. 1,25(OH)2D (active metabolite of vitamin D), and phosphate

Pancreas

Endocrine islet β cells produce insulin, oppose glucose production (glycogenolysis, gluconeogenesis), increase glucose uptake into muscle and fat. Glucagon, epinephrine, cortisol, and GH are the counterregulatory hormones

Dyslipidemias

Definition
- metabolic disorders characterized by elevations of fasting plasma LDL-C, and/or TG, and/or low HDL-cholesterol

Overview of Lipid Transport

- lipoproteins are spherical complexes that consist of a lipid core surrounded by a shell of water-soluble cholesterol, apolipoproteins, and phospholipids
- lipoproteins transport lipids within the body
- apolipoproteins serve as enzyme cofactors, promote clearance of the particle by interacting with cellular receptors, and stabilize the lipoprotein micelle

Table 1. Lipoproteins

Lipoprotein	Function
Chylomicron	Transports dietary TG from gut to adipose tissue and muscle
VLDL	Transports hepatic synthesized TG from liver to adipose tissue and muscle
IDL	Product of hydrolysis of TG in VLDL by lipoprotein lipase resulting in depletion of TG core Enriched in cholesterol esters
LDL	Cholesterol rich atherogenic particles Formed by further removal of residual TG from IDL core by hepatic lipase
HDL	Transports cholesterol from peripheral tissues to liver Acts as a reservoir for apolipoproteins

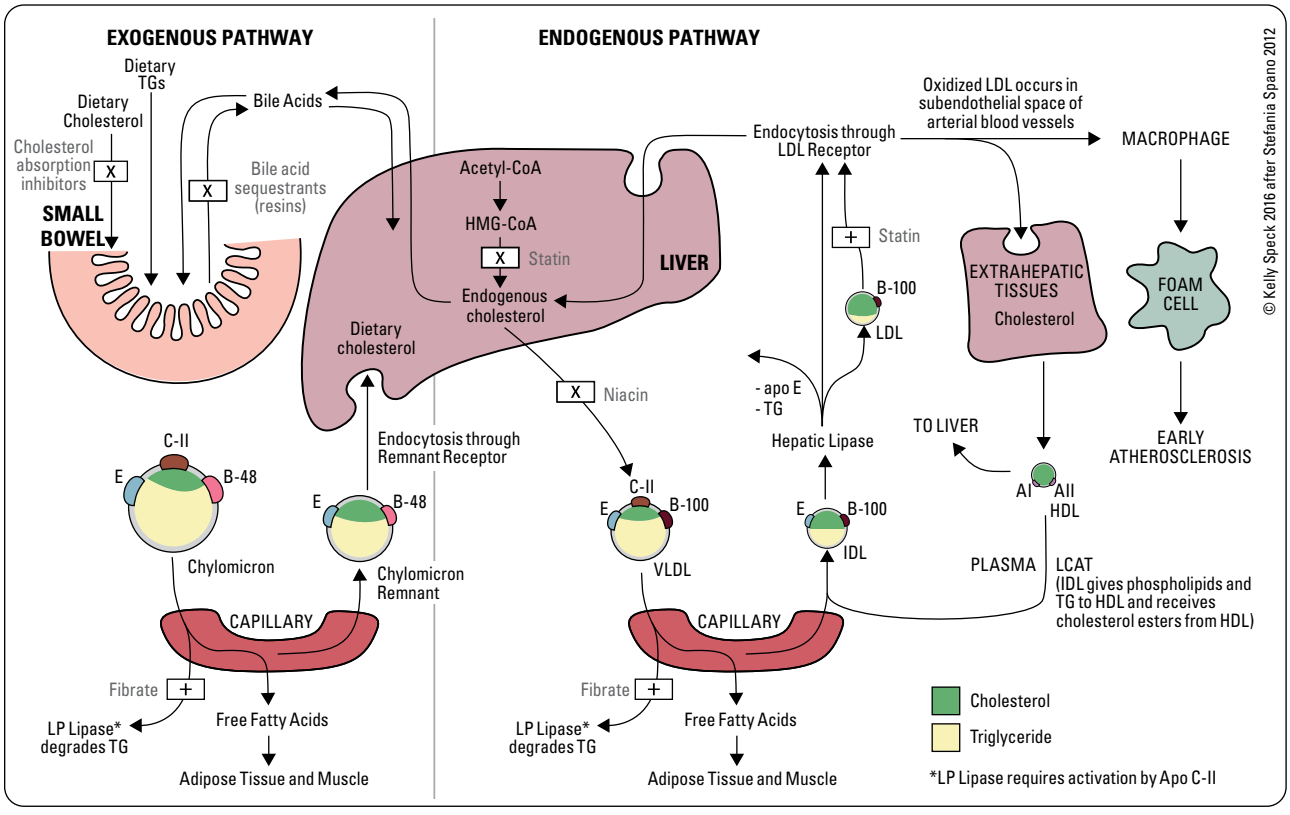

Figure 2. Exogenous and endogenous biosynthetic lipid pathways

Primary Dyslipidemias (rare)

Definition
- caused by a genetic defect in lipid metabolism

Table 2. Primary Dyslipidemias

Condition	Main Lab Abnormality	Mechanism	Clinical Features	Treatment
Familial Hypercholesterolemia	↑ Total cholesterol ↑ LDL cholesterol	Genetic defect in LDLR (most common), PCSK9, or ApoB An autosomal dominant condition that can be homozygous or heterozygous Impacts liver's ability to clear LDL from the circulation	Tendinous xanthomatosis (achilles, patellar, and extensor tendons of hand) Arcus cornealis Xanthelasmata Heterozygotes: premature CAD, 50% risk of MI in men by age 30 Homozygotes: manifest CAD and other vascular disease early in childhood which can be fatal (in <20 y/o)	Maximally tolerated statin as initial drug therapy, addition of second drug (ezetimibe and/or PCSK9 inhibitor) as second line, third line for homozygotes is portacaval shunt or LDL apheresis; potential liver transplant Refer to lipid specialist in drug-resistant hypercholesterolemia
Familial Combined Hyperlipidemia	↑ ApoB ↑ TGs ↑ LDL	Increased production of ApoB-100-containing lipoproteins from the liver	Premature coronary heart disease, xanthelasma, and obesity	Statins as initial drug therapy Addition of ezetimibe and/or PCSK9 inhibitor if LDL lowering is not achieved. May consider fibrate if elevated TG
Polygenic Familial Hypercholesterolemia	↑ LDL	Mild defects in multiple genes responsible for LDL metabolism: LDL-R, ApoB, ApoE4	Higher risk of cardiovascular disease similar to familial hypercholesterolemia for patients older than 40	Statins as first line Use ezetimibe, bile acid sequestrants, PCSK9 inhibitor, or nicotinic acid as alternatives (if not tolerated) or in addition
Hereditary Chylomicronemia **Familial lipoprotein lipase deficiency** **ApoC$_2$ deficiency**	↑ TG from excess chylomicron particles	Lipoprotein lipase deficiency: prevents proper digestion and storage of fats leading to massive accumulation of triglyceride rich chylomicron particles ApoC$_2$ deficiency: prevents activation of lipoprotein lipase leading to massive accumulation of triglyceride rich chylomicron particles	Presents at infancy (LPL), adolescence to adulthood (ApoC$_2$) Abdominal complaints (pain, hepatosplenomegaly, pancreatitis) Lipemia retinalis Eruptive xanthomata	<10-15% of calories from fat Supplement with essential fatty acids, fat-soluble vitamins Plasmapheresis may help individuals with ApoC$_2$ mutation
Familial Hypoalphalipoproteinemia	↓ HDL cholesterol	Autosomal dominant inheritance of a mutation in the ABCA1 or the ApoA$_1$ gene	Premature atherosclerosis Cerebrovascular disease	Reduce the risk of atherosclerosis with lifestyle changes, management of concomitant hypercholesterolemia, hypertriglyceridemia, and metabolic syndrome if present
Tangier Disease	↓ HDL cholesterol	Autosomal recessive inheritance of mutations in the ABCA1 gene Impaired HDL-mediated cholesterol efflux from macrophages and impaired intracellular lipid trafficking	Mild hypertriglyceridemia Neuropathy Enlarged, orange-coloured tonsils Premature atherosclerosis Splenomegaly Hepatomegaly Corneal clouding T2DM	Reduce the risk of atherosclerosis with lifestyle changes, management of concomitant hypercholesterolemia, hypertriglyceridemia, and metabolic syndrome if present

Secondary Dyslipidemias

Definition

- caused by acquired medical conditions or lifestyle factors that affect lipid metabolism

Table 3. Etiology of Secondary Dyslipidemias

Hypercholesterolemia	Low HDL	Hypertriglyceridemia
Endocrine: hypothyroidism (small dense LDL with T2DM and obesity, with normal LDL level)	**Endocrine:** obesity/metabolic syndrome, DM	**Endocrine:** obesity/metabolic syndrome, DM
Renal: nephrotic syndrome, CKD	**Drugs:** β-blockers, anabolic steroids	**Renal:** nephrotic syndrome, CKD
Immunologic: monoclonal gammopathy	**Other:** acute infections, inflammatory conditions	**Drugs:** corticosteroids, estrogen, hydrochlorothiazide, retinoic acid, β-blockers without intrinsic sympathomimetic action (ISA), anti-retroviral drugs, atypical antipsychotics, oral contraceptive pills
Hepatic: cholestatic liver disease (e.g. primary biliary cirrhosis)		**Lifestyle:** alcohol, high carbohydrate/high fat diet
Nutritional: anorexia nervosa		**Other:** pregnancy
Drugs: cyclosporin, carbamazepine, steroids		
Lifestyle: smoking, obesity		

Dyslipidemia and the Risk for Coronary Artery Disease

- increased LDL is a major risk factor for atherosclerosis and CAD as LDL is the major atherogenic lipid particle
- increased HDL is associated with decreased cardiovascular disease and mortality
- moderate hypertriglyceridemia (triglyceride level 2.3-9 mmol/L) is an independent risk factor for CAD, especially in people with DM and in post-menopausal women

Familial Hypercholesterolemia and Cardiovascular Risk Calculators

- Risk calculators such as Framingham and SCORE do not apply to patients with familial hypercholesterolemia
- Consider all adults with familial hypercholesterolemia as "high-risk"

Treatment Effect

- Each 1.0 mmol/L decrease in LDL corresponds to ~20-25% relative risk reduction in cardiovascular disease
- Statins lower LDL by about 30-40%
- Ezetimibe lowers LDL by about 18%
- PCSK9 inhibitors lowers LDL by about 50%

6% Rule

If the dose of a statin is doubled, there is approximately a 6% increase in the LDL lowering efficacy

Screening

- screen men and women ≥40 yr or post-menopausal women
- if following risk factors present, screen at any age:
  - DM
  - current cigarette smoking or COPD
  - HTN (sBP >140, dBP >90), hypertensive diseases of pregnancy
  - obesity (BMI ≥30 kg/m^2)
  - family history of premature CVD or dyslipidemia
  - clinical signs of hyperlipidemia (xanthelasma, xanthoma, arcus cornealis)
  - clinical or radiological evidence of AAA
  - clinical evidence of atherosclerosis
  - inflammatory disease (rheumatoid arthritis, SLE, psoriatic arthritis, ankylosing spondylitis, inflammatory bowel disease)
  - HIV infection on highly active antiretroviral therapy (HAART)
  - CKD (estimated GFR <60 mL/min/1.73 m^2)
  - erectile dysfunction
  - high-risk ethnicity: South Asian, Indigenous peoples
- screen children with a family history of hypercholesterolemia or chylomicronemia
- components of screening:
  - history and physical examination, lipid panel (total cholesterol, LDL-C, HDL-cholesterol, TG), non-HDL cholesterol, BG, eGFR
  - optional: urine ACR, ApoB
- ApoB
  - each atherogenic particle (VLDL, IDL, LDL, and lipoprotein A) contains one molecule of ApoB
  - serum (ApoB) reflects the total number of particles and may be useful in assessing cardiovascular risk and adequacy of treatment in high-risk patients and those with metabolic syndrome
- lipoprotein A (Lp(a)) levels may help stratify those at intermediate risk
- coronary artery calcium (CAC) may help stratify those at intermediate risk
- CRP levels
  - highly sensitive acute phase reactant (non-specific)
  - may be clinically useful to identify those at a higher risk of cardiovascular disease than predicted by the global risk assessment

CVD Risk Assessment

- Framingham Risk Score (FRS): 10 yr risk of major CVD event. Calculated based on gender, age, total cholesterol, HDL-cholesterol, sBP, and smoking (>20%: high-risk; 10-19%: moderate risk; <10%: low-risk)
- Reynolds Risk Score: 10 yr risk of major CVD event. Calculated based on age, sBP, total cholesterol, HDL-cholesterol, high sensitivity CRP, family history of MI

For Statin Follow-Up

- Liver enzymes and lipid profile: liver enzymes measured at the beginning of treatment, then once after therapy initiated. Lipids (once stabilized) measured annually. Order both if patient complains of jaundice, right upper quadrant pain, dark urine
- CK at baseline and if patient complains of myalgia
- Discontinue statin if CK >10x upper limit of normal or patient has persistent myalgia

2021 Canadian Cardiovascular Society Guidelines on the Management of Dyslipidemia for the Prevention of Cardiovascular Disease in the Adult
Can J Cardiol 2021; S0828-282X(21)00165-3

- Patients with clinical atherosclerosis, AAA, LDL-C ≥5 mmol/L, and most with diabetes or CKD should be started on statin therapy
- Lipid/lipoprotein screening is recommended in patients >40 yr or at any age for those at increased risk
- Non-HDL cholesterol or ApoB are preferred to LDL-C as lipid parameters for screening in patients with TGs >1.5 mmol/L
- LP(a) should be measured once in a person's lifetime as part of initial lipid screening to assess cardiovascular risk
- Lipid-lowering therapy should be intensified with ezetimibe and/or PCSK9 inhibitors in patients with LDL-C remaining ≥1.8 mmol/L (or non-HDL cholesterol ≥2.4 mmol/L or ApoB ≥0.7 g/L) on a maximally tolerated statin dose

Treatment of Dyslipidemias

Approach to Treatment

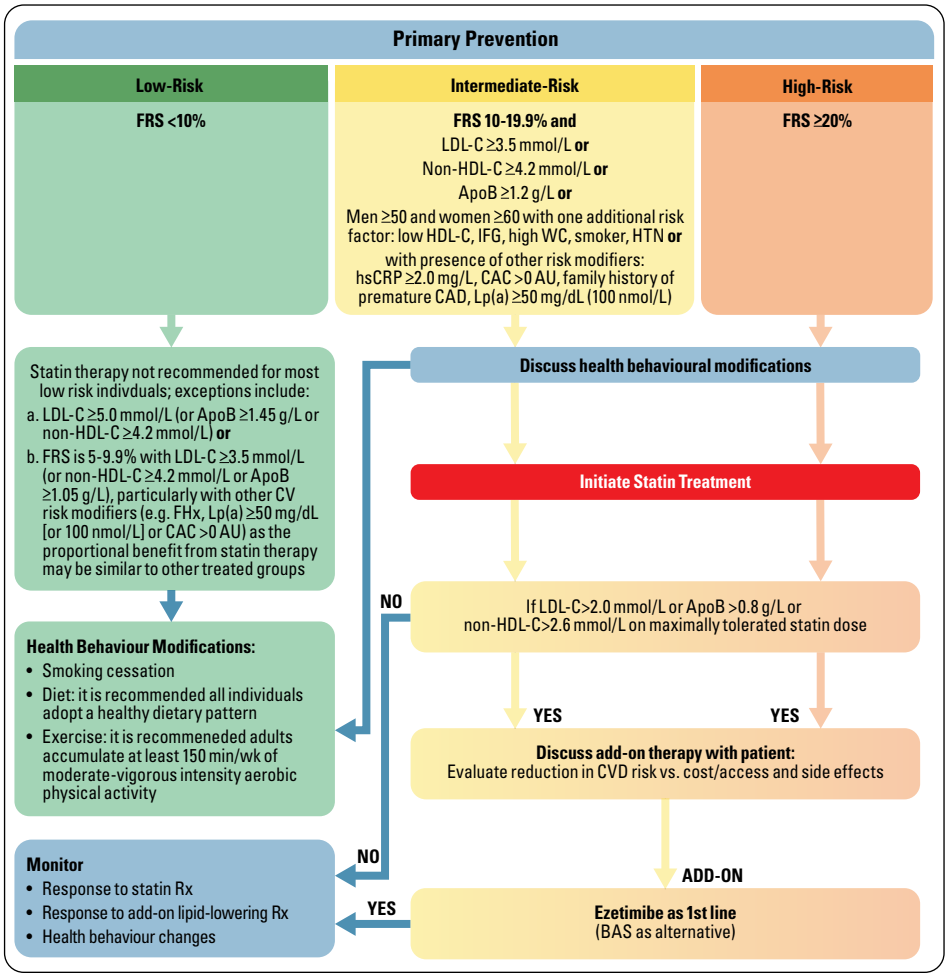

Figure 3a. Treatment approach for primary prevention patients (without a statin indicated condition‡)
Adapted from 2021 Canadian Cardiovascular Society Guidelines for the Management of Dyslipidemia for the Prevention of Cardiovascular Disease in the Adult. Canadian Cardiovascular Society.

See Landmark Endocrinology Trials for more information on the JUPITER trial. It details the effects of statin treatment on cardiovascular events in patients with elevated high-sensitivity CRP levels.

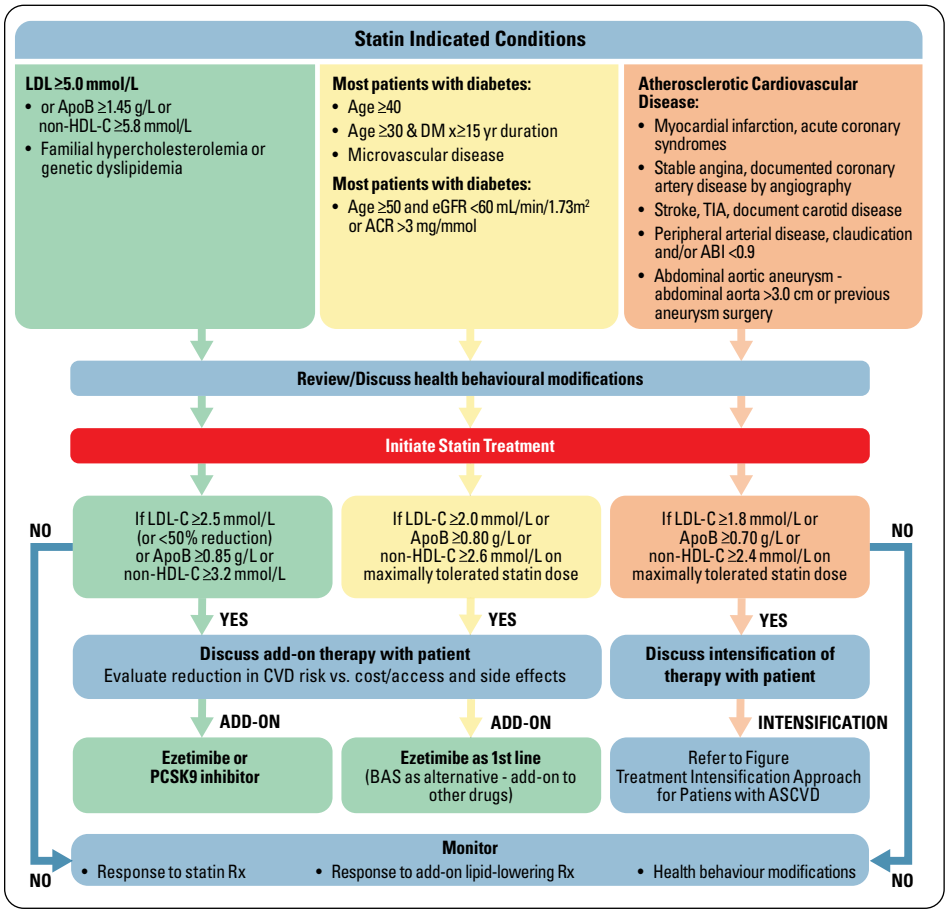

Figure 3b. Treatment approach for patients with a statin indicated condition

Adapted from 2021 Canadian Cardiovascular Society Guidelines for the Management of Dyslipidemia for the Prevention of Cardiovascular Disease in the Adult. Canadian Cardiovascular Society.

Disorders of Glucose Metabolism

Overview of Glucose Regulation

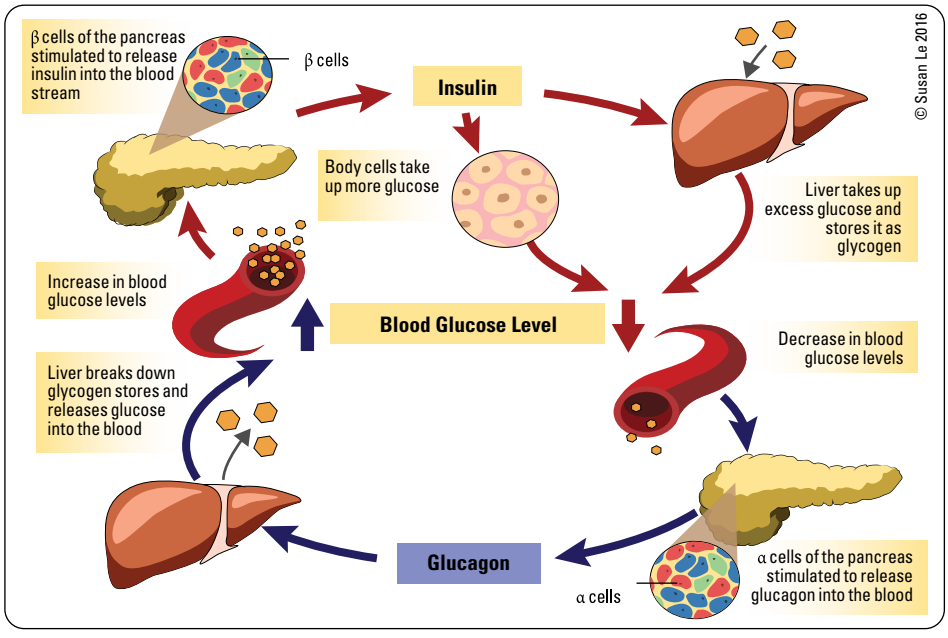

Figure 4. Blood glucose regulation

Three Year Efficacy of Complex Insulin Regimens in T2DM: 4T Trial
NEJM 2009;361:1736-1747
Study: Randomized unblinded trial with 3 yr of follow-up.
Population: 708 patients with T2DM, not on insulin or thiazolidinedione therapy on maximal metformin and sulfonylurea therapy.
Intervention: Thrice-daily prandial insulin aspart, vs. twice-daily biphasic insulin aspart, vs. once-daily basal insulin detemir. Sulfonylurea therapy was replaced with a secondary insulin regime specific to each arm if there was persistent hyperglycemia.
Primary Outcome: Three yr HbA1c.
Results: Significant difference in rates of patient withdrawal from the study: 5.1% biphasic, 11.7% prandial, 8.5% basal regimens (P=0.04). There were no significant differences in median HbA1c levels between all three arms from yr 1-3. A smaller proportion of patients reached HbA1c <6.5% or <7.0% in the biphasic arm. The basal arm had the least weight gain and the least weight circumference increase, but the highest rate of secondary insulin requirement. The basal arm had fewest severe hypoglycemic events per patient year, while the biphasic had the most serious adverse effects.
Conclusion: Basal insulin regimen provides the best glycemic control over a 3 yr study, with better HbA1c control, fewer hypoglycemic events, and less weight gain.

Pre-Diabetes (Impaired Glucose Tolerance/ Impaired Fasting Glucose)

- 1-5% per yr go on to develop DM
- 50-80% revert to normal glucose tolerance
- weight loss may improve glucose tolerance (5-10% of body weight)
- increased risk of developing macrovascular complications
- lifestyle modifications decrease progression to DM by 58%

Diagnostic Criteria (Diabetes Canada 2018 Guidelines) (any of the following)

- IFG: FPG 6.1-6.9 mmol/L
- IGT: 2 h 75 g OGTT 7.8-11.0 mmol/L
- A1c: 6.0-6.4%

Diabetes Mellitus

Definition

- diabetes mellitus is a heterogeneous metabolic disorder characterized by the presence of hyperglycemia
- chronic hyperglycemia of diabetes is associated with relatively specific long-term microvascular complications affecting the eyes, kidneys, and nerves, as well as an increased risk for macrovascular complications such as cardiovascular, stroke, and peripheral vascular disease. Diabetes also increases the risk of heart failure

Diagnostic Criteria (as per Diabetes Canada 2018 Clinical Practice Guidelines)

- any one of the following is diagnostic:

Table 4. Diagnosis of Diabetes

FPG ≥7.0 mmol/L
Fasting = no caloric intake for at least 8 h
or
A1c ≥6.5% (in adults)
Not for diagnosis of suspected T1DM, children, adolescents, or pregnant women
or
2hPG in a 75g OGTT ≥11.1mmol/L
or
Random PG ≥11.1 mmol/L
Random = any time of the day, without regard to the interval since last meal

- in the presence of hyperglycemia symptoms (polyuria, polydipsia, polyphagia, weight loss, blurry vision), a confirmatory test is not required
- in the absence of hyperglycemic symptoms, a repeat confirmatory test (FPG, A1c, 2hPG in a 75 g OGTT) done on another day is required for diagnosis of diabetes

See Landmark Endocrinology Trials for more information on the DCCT trial. It details the use of intensive insulin injection therapy for the treatment of T1DM in patients with no cardiovascular history or severe diabetic complications.

Etiology and Pathophysiology

Table 5. Etiologic Classification of Diabetes Mellitus

I. T1DM immune-mediated or idiopathic β cell destruction, usually leading to absolute insulin deficiency (includes latent autoimmune diabetes in adults (LADA))

II. T2DM occurs when the pancreas does not produce enough insulin or when the body does not effectively use the insulin that is produced

III. Other Specific Causes of DM

a. Genetic defects of β cell function (e.g. Maturity-Onset Diabetes of the Young (MODY; also known as monogenic diabetes)) or insulin action
b. Diseases of the exocrine pancreas:
Pancreatitis, pancreatectomy, neoplasia, cystic fibrosis, hemochromatosis ("bronze diabetes")
c. Endocrinopathies:
Acromegaly, Cushing's syndrome, glucagonoma, pheochromocytoma, hyperthyroidism
d. Drug-induced:
Glucocorticoids, thyroid hormone, β-adrenergic agonists, thiazides, phenytoin, antipsychotics
e. Infections:
Congenital rubella, CMV, coxsackie
f. Genetic syndromes associated with DM:
Down's syndrome, Klinefelter's syndrome, Turner's syndrome

IV. Gestational Diabetes Mellitus (see Obstetrics, OB29)

Table 6. Comparison of Type 1 and Type 2 Diabetes Mellitus

	Type 1	Type 2
Onset	Usually <30 yr of age	Usually >40 yr of age Increasing incidence in paediatric population 2° to obesity
Epidemiology	Traditionally more common in European populations Less common in Asian, Hispanic, Indigenous, and Black populations Accounts for 5-10% of all DM	More common in Black, Hispanic, Indigenous, and Asian populations Accounts for >90% of all DM
Etiology	Autoimmune or idiopathic	Complex and multifactorial
Genetics	Monozygotic twin concordance is 30-40% Associated with HLA class II DR3 and DR4, with either allele present in up to 95% of T1DM Certain DQ alleles also confer a risk	Greater heritability than T1DM Monozygotic twin concordance is 70-90% Polygenic Non-HLA associated
Pathophysiology	Synergistic effects of genetic, immune, and environmental factors that cause β cell destruction resulting in impaired insulin secretion Autoimmune process is believed to be triggered by environmental factors (e.g. viruses, bovine milk protein, urea compounds) Pancreatic cells are infiltrated with lymphocytes resulting in islet cell destruction 80% of β cell mass is destroyed before features of DM present	Impairment of insulin secretion, excess glucose production by the liver, insulin resistance in fat and muscle, impaired renal handling of glucose (SGLT2), impaired incretin activity (decreased insulin production, excess glucagon production, enhanced carbohydrate absorption in the gut and increased appetite from the hypothalamus)
Natural History			After initial presentation, honeymoon period often occurs where glycemic control can be achieved with little or no insulin treatment as residual cells are still able to produce insulin Once these cells are destroyed, there is complete insulin deficiency	Early on, glucose tolerance remains normal despite insulin resistance as β cells compensate with increased insulin production As insulin resistance and compensatory hyperinsulinemia continue, the β cells are unable to maintain the hyperinsulinemic state which results in glucose intolerance and DM
Circulating Autoantibodies	Islet cell Ab present in up to 60-85% Most common islet cell Ab is against glutamic acid decarboxylase (GAD) Up to 60% have Ab against insulin	<10%

See Landmark Endocrinology Trials for more information on the UKPDS trial. It compares the safety and efficacy of intensive blood-glucose control with sulphonylurea or insulin vs. conventional treatment on the risk of complications in T2DM.

Table 6. Comparison of Type 1 and Type 2 Diabetes Mellitus

	Type 1	Type 2
Risk Factors	Personal history of other autoimmune diseases including Graves' disease, myasthenia gravis, autoimmune thyroid disease, celiac disease, and pernicious anemia Family history of autoimmune diseases	Age >40 yr Schizophrenia Abdominal obesity/overweight Fatty liver First-degree relative with DM Hyperuricemia Race/ethnicity (Black, Indigenous, Hispanic, Asian-American, Pacific Islander) Hx of IGT or IFG HTN Dyslipidemia Medications e.g. 2nd generation antipsychotics PCOS Hx of gestational DM or macrosomic baby (>9 lb or >4 kg)
Body Habitus	Normal to thin	Typically overweight with increased central obesity
Treatment	Insulin	Lifestyle modification Non-insulin antihyperglycemic agents - unless contraindicated, metformin should be the initial antihyperglycemic agent of choice. Additional agents to be selected on the basis of clinically relevant issues, such as CV risk, eGFR, glucose-lowering effectiveness, risk of hypoglycemia, and effect on body weight Insulin therapy
Acute Complications	DKA	HHS DKA
Screening	Subclinical prodrome can be detected in first and second-degree relatives of those with T1DM by the presence of pancreatic islet autoantibodies	Screen individuals with risk factors

Diabetes Canada 2018 Clinical Practice Guidelines

	Target
A1c	<7.0% (most adults)
Fasting plasma glucose	4-7 mmol/L
2h post-prandial glucose	5-10 mmol/L 5-8 mmol/L if not meeting target A1c and can be safely achieved
Lipids	LDL <2.0 or 50%
Blood pressure	<130/80

Who should receive statins (regardless of LDL-C level)

- Clinical CVD or
- Age > 40 yr or
- Microvascular complications or
- Diabetes >15 yr duration and age >30 yr or
- Warrants therapy based on the 2016 Canadian Cardiovascular Society Guidelines for the Diagnosis and Treatment of Dyslipidemia

Who should receive ACEI/ARB (regardless of baseline BP)

- Clinical CVD
- Age >55 years with an additional CV risk factor or end organ damage (albuminuria, retinopathy, left ventricular hypertrophy)
- Microvascular complications

ABCDES of Diabetes Care

A1c targets (<7.0%)
Blood pressure (<130/80)
Cholesterol (LDL-C <2.0 mmol/L)
Drugs for CVD risk reduction
Exercise goals and healthy eating
Smoking cessation
Screening for complications
Stress management

Treatment of Diabetes

Glycemic Targets

- A1c reflects glycemic control over 3 mo and is a measure of patient's long-term glycemic control
- A1c is recommended to be measured once every 3-6 mo and personalized A1c targets should be set for patients based on individual's frailty or functional dependence and life expectancy
- therapy in most individuals living with T1DM or T2DM (especially younger patients) should be targeted to achieve an A1c ≤7.0% in order to reduce the risk of microvascular and, if implemented early in the course of disease, macrovascular complications
- more intensive glucose control, A1c <6.5%, may be targeted to further reduce risk of nephropathy and retinopathy, provided this does not result in a significant increase in hypoglycemia
- less stringent A1c targets (7.1-8.5%) may be more appropriate in patients with limited life expectancy, higher level of functional dependency, a history of recurrent severe hypoglycemia, multiple comorbidities, extensive CAD, or a failure to achieve an A1c <7.0% despite intensified basal and bolus insulin therapy
- there may be harm associated with strategy to target A1c <6.0% (see *ACCORD Trial*, E64)
- iron deficiency, vitamin B_{12} deficiency, alcoholism, chronic renal failure, and splenectomy can lead to slightly increased A1c, independent from glycemic status
- chronic liver disease, reticulocytosis, ingestion of ASA, vitamin C or E, and splenomegaly can lead to slightly decreased A1c, independent from glycemic status
- timing and frequency of self-monitored blood glucose is determined based on the type of diabetes, treatment, and the individual's capacity to use the information
- flash glucose monitoring and continuous glucose monitoring devices may be suggested for some people living with diabetes to optimize their diabetes self-management

Diet

- nutritional therapy can reduce A1c by 1-2%
- recommended daily carbohydrate intake 45-60% of energy, protein 15-20% of energy, and fat <35% of energy
- recommended intake of saturated fats <7% and polyunsaturated fats <10% of total calories each
- it is recommended to replace high-glycemic-index carbohydrates with low-glycemic-index carbohydrates and increase fibre intake
- limit sodium, alcohol, and caffeine intake
- people with diabetes should adopt dietary patterns that result in the greatest adherence based on their values and preferences
- type 1: carbohydrate counting is used to titrate prandial insulin dose
- type 2: weight reduction to help control blood glucose levels

Lifestyle
- losing 5-10% of the initial body weight can improve insulin sensitivity, glycemic control, hypertension, and dyslipidemia in people with T2DM
- regular physical exercise to improve insulin sensitivity, lower lipid concentrations, and control blood pressure. At least 150 min per wk of moderate-vigorous aerobic exercise and at least 2 sessions per wk of resistance exercise are recommended
- smoking cessation

Medical Treatment: Non-Insulin Antihyperglycemic Agents (T2DM)
- initiate non-insulin antihyperglycemic therapy (generally metformin first line) within 3 mo if lifestyle management does not result in adequate glycemic control
- if initial A1c >1.5% higher than personalized A1c target at the time of diagnosis, initiate pharmacologic therapy with metformin immediately, and consider combination of therapies or insulin immediately
- if presenting in metabolic decompensation, begin with insulin therapy immediately
- adjust dose or add additional pharmacologic therapy in a timely fashion to achieve target A1c within 3-6 mo of diagnosis
- see *Common Medications*, E58 for details on antihyperglycemic agents

Medical Treatment: Insulin
- used for T1DM at onset, may be used in T2DM at any point in treatment
- routes of administration: subcutaneous injections, continuous subcutaneous insulin infusion pump, IV infusion (regular insulin only)
- basal insulin: control blood sugar (produced by liver) during periods of fasting; slow onset of action, lasts a long time
- bolus insulin: required to dispose of glucose from a meal or BG correction; rapid onset of action, short acting
- estimated total daily insulin requirement: often start with 0.3-0.5 units/kg/d (see Table 7, E13)

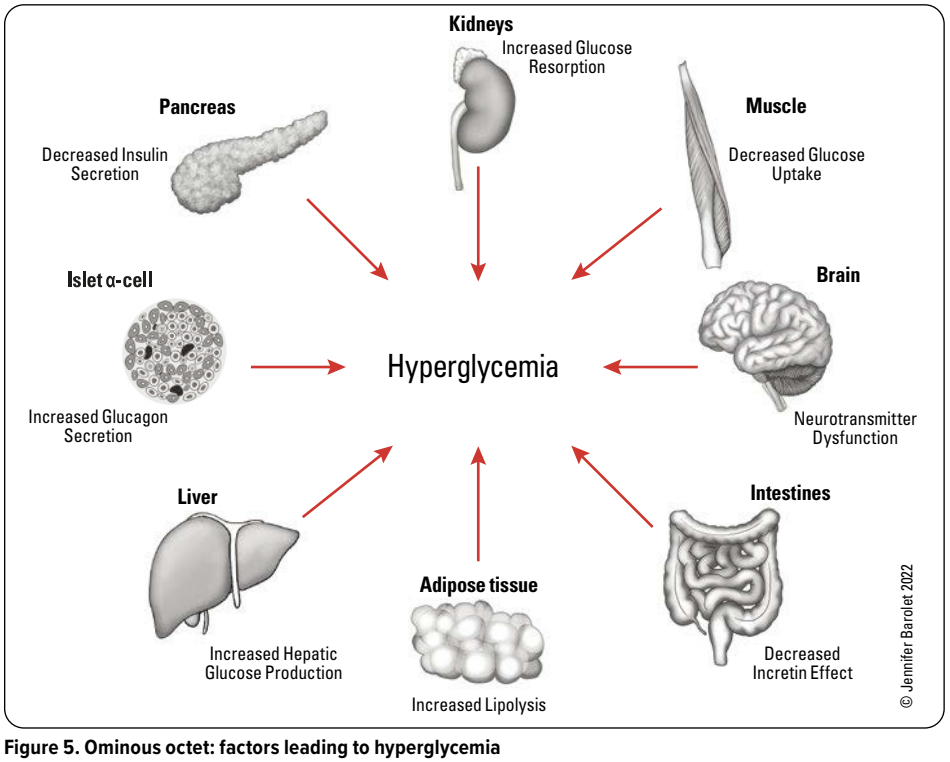

Figure 5. Ominous octet: factors leading to hyperglycemia

Closed-Loop Insulin Delivery for Glycemic Control in Noncritical Care
NEJM 2018;379:547-556
Purpose: To determine if a closed-loop delivery system (artificial pancreas) can improve glycemic control in patients with T2DM receiving noncritical care.
Methods: Patients (n=136) received either closed-loop insulin delivery or conventional subcutaneous insulin therapy. The percentage of time the sensor glucose measurement was within 5.6 to 10.0 mmol/L was measured.
Results: Closed-loop insulin delivery was more effective at maintaining glucose within the target range (95% CI: 18.6-30.0; P<0.001). Patients on closed-loop insulin therapy had lower mean glucose levels (P<0.001). There was no difference in duration of hypoglycemia or amount of insulin delivered between groups.
Conclusions: The use of an automated, closed-loop insulin-delivery system (artificial pancreas) resulted in significantly better glycemic control among inpatients with T2DM receiving noncritical care.

Closed-loop insulin delivery using an artificial pancreas has also shown promise in patients with T1DM (NEJM 2019;381:1707-17).

See Landmark Endocrinology Trials for more information on the ACCORD trial. It details the effects of intensive glucose control in patients with T2DM and cardiovascular risk factors.

Effects of Intensive Blood Pressure Control in T2DM: The ACCORD Trial
NEJM 2010;362:1575-1585
Study: RCT, unblinded with 4.7 yr of mean follow-up.
Population: 4733 patients with T2DM, risk factors for cardiovascular (CV) disease, systolic blood pressure (sBP) between 130-180 mmHg.
Intervention: sBP control <120 mmHg (intensive) or 140 mmHg (standard).
Primary Outcomes: Major CV event (composite nonfatal MI, nonfatal stroke, or CV-related death).
Results: Mean number of medications at 1 yr for intensive therapy was 3.4 (95% CI 3.4-3.5) vs. 2.1 (95% CI 2.1-2.2) for standard therapy. There was a significant increase in all serious adverse events in the intensive treatment arm (3.3% vs. 1.27%, P≤0.001); especially bradycardia or arrhythmia (0.5% vs. 0.13%, P=0.02) and hyperkalemia (0.4% vs. 0.04%, P=0.01). There was no significant difference in primary outcomes in the two study arms, or all-cause mortality. There was a significant reduction in any stroke (0.32%/yr vs. 0.53%/yr, P=0.01) and nonfatal stroke incidences (0.30%/yr vs. 0.47%/yr, P=0.03) in the intensive therapy arm.
Conclusions: Intensive BP lowering to <120 mmHg vs. 140 mmHg in patients with T2DM and CV risk factors does not reduce major CV event risk except for stroke events.

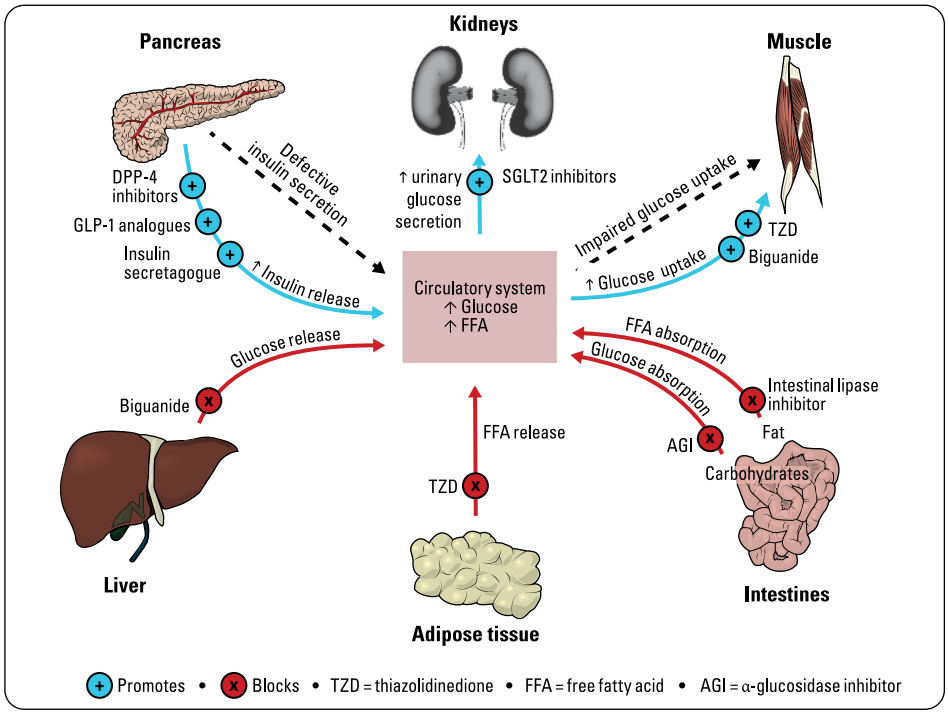

Figure 6. Antihyperglycemic agents

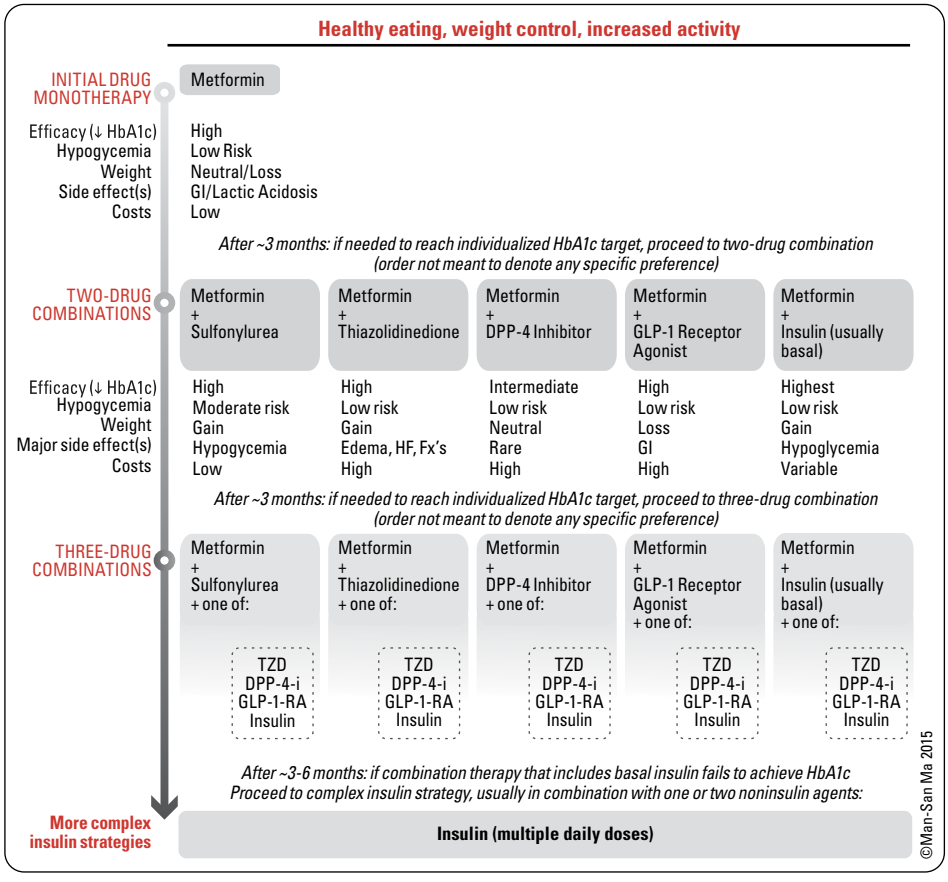

Figure 7. Management of hyperglycemia in T2DM

Adapted from Canadian Journal of Diabetes, Volume 42, Lipscombe L, Booth Gillian, Butalia S, et al. Pharmacologic Glycemic Management of Type 2 Diabetes in Adults, Page S92, Copyright (2020), with permission from Elsevier

Effects of Combination Lipid Therapy in T2DM: The ACCORD Trial
NEJM 2010;362:1563-1574
Study: RCT, double-blinded trial with 4.7 yr of mean follow-up.
Population: 5518 patients with T2DM.
Intervention: Statin with or without fibrate therapy.
Primary Outcome: Major CV event (composite nonfatal MI, nonfatal stroke, or CV-related death).
Results: No significant differences in primary outcome between the two arms. No difference in all MI, all stroke, or all-cause mortality between study arms.
Conclusions: The addition of fibrate therapy to statin therapy in patients with T2DM does not reduce major CV event risk.

See Landmark Endocrinology Trials for more information on the PREDIMED trial. It details the effects of a Mediterranean diet on reducing major cardiovascular events in patients with T2DM or other high cardiovascular risk factors.

Sick Day Management
If patient is ill and is unable to maintain adequate fluid intake, or has an acute decline in renal function, they should hold the following medications:

SAD MANS
Sulfonylureas
ACEIs
Diuretics and direct renin inhibitors
Metformin
ARBs
NSAIDs
SGLT2i

Table 7. Available Insulin Formulations

Insulin Type (trade name)	Onset	Peak	Duration
PRANDIAL (BOLUS) INSULINS			
Rapid-acting insulin analogues			
Insulin aspart (NovoRapid®)	10-15 min	1-1.5 h	3-5 h
Insulin faster aspart (Fiasp®)	4 min	1 h	3-4 h
Insulin lispro (Humalog®, Humalog 200 units/mL)	10-15 min	1-2 h	3.5-4.75 h
Insulin glulisine (Apidra®)	10-15 min	1-1.5 h	3-5 h
Short-acting insulins	30 min	2-3 h	6.5 h
Humulin R®			
Novolin Toronto®			
BASAL INSULINS			
Intermediate-acting	1-3 h	5-8 h	Up to 18 h
Humulin N®			
Novolin NPH®			
Long-acting basal insulin analogues			
Insulin detemir (Levemir®)	90 min	Not applicable	Up to 24 h (detemir 16-24 h)
Insulin glargine 100 units/mL (Lantus®/ Basaglar®)	90 min		Up to 24 h (glargine 24 h)
Insulin glargine 300 units/mL (Toujeo®)	Up to 6 h		Up to 30 h
Insulin glargine (Basaglar®)	90 min		Up to 24 h (glargine 24 h)
Insulin degludec (Tresiba®)	60 min		Ultralong acting (42 h)
PRE-MIXED INSULINS			
Premixed regular insulin – NPH	A single vial or cartridge contains a fixed ratio of insulin		
Humulin 30/70®	(% of rapid acting or short-acting insulin to % of intermediate-acting insulin)		
Novolin 30/70®			
Premixed insulin analogues			
Biphasic insulin aspart (NovoMix 30®)			
Insulin lispro/lispro protamine (Humulin 30/70, Novolin 30/70, Novomix 30 and Humalog Mix 25)			

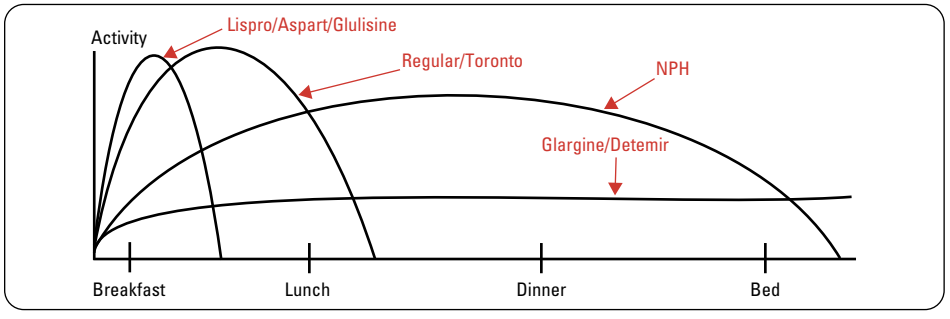

Figure 8. Duration of activity of different insulins

Table 8. Insulin Regimens for T2DM and T1DM

	Regimen	Administration
T2DM	Non-insulin antihyperglycemic agent + basal insulin	Titrate up by 1 unit until FPG <7.0 mmol/L
T1DM	Basal-bolus (multiple daily injections (MDI))	Estimated total insulin requirement is 0.5-0.7 U/kg 40% is given as basal insulin at bedtime 20% is given as bolus insulin before breakfast, lunch, and dinner
	Premixed	Estimated total insulin requirement is 0.5-0.7 U/kg 2/3 dose is given as pre-mixed insulin before breakfast 1/3 dose is given as pre-mixed insulin before dinner

*Bolus insulin: Aspart, Glulisine, Lispro; *Basal insulin: Glargine, Detemir, NPH; *Pre-mixed insulin: Humulin 30/70, Novolin 30/70, Novomix 30, and Humalog Mix2

Table 9. Titrating Insulin Doses

Hyperglycemic Reading	Insulin Correction
High AM sugar	Increase bedtime basal insulin
High lunch sugar	Increase AM rapid/regular insulin
High supper sugar	Increase lunch rapid/regular insulin or increase AM basal insulin
High bedtime sugar	Increase supper rapid/regular insulin

Conversion Chart for Percentage HbA1c to Average Blood Sugar Control

Initial presentation
Intra-abdominal process (e.g. pancreatitis, cholecystitis)
Intraoperative/perioperative stress

Insulin Dose Schedules

Table 10. Insulin Titration and Titration Suggestions for T2DM (as per Diabetes Canada 2018 Clinical Practice Guidelines)

Basal Insulin Only – Add-on to Anti-hyperglycemic Agents	
See above summary for A1c, BG targets Most patients will need 40-50 units/d to achieve target but there is no maximum dose Start at a low dose of 10 U at bedtime (lower for lean patients <50 kg) Titrate dose accordingly until fasting BG target is achieved (see CDA guidelines for appropriate titration) If fasting hypoglycemia, dose of bedtime basal should be reduced If daytime hypoglycemia, reduce dose of oral antihyperglycemic agents (especially secretagogues)	Dosing and Titration Example Starting dose – 10 U at bedtime Increase dose by 1 U every 1 night until fasting BG has reached target of 4-7 mmol/L
Basal-Bolus Insulins	
When addition of basal insulin to anti-hyperglycemic agents is insufficient to reach target BG, bolus (prandial) insulin should be added before meals Option exists to only add bolus insulin to the meal with the highest postprandial BG as a starting point Insulin secretagogues typically stopped when bolus (prandial) insulin added; metformin is continued Maintain the basal dose and add bolus insulin with each meal at a dose equivalent to 10% of basal dose Total Daily Insulin (TDI) = 0.3-0.5 U/kg; 40% TDI = basal, 20% TDI = prandial (bolus) prior to each meal Adjust basal insulin to achieve target fasting BG, bolus insulin to achieve postprandial BG levels (5-10 mmol/L), or preprandial BG levels for subsequent meal (4-7 mmol/L)	Dosing and Titration Example TDI = 0.5 U/kg: 0.5 x 100 kg = 50 U Basal insulin = 40% of TDI 40% x 50 U = 20 U; basal bedtime = 20 U Bolus insulin = 60% of TDI 60% x 50 U = 30 U; 10 U dosed with each meal
Premixed Insulin Before Breakfast and Before Dinner	
Target fasting and pre-dinner BG levels of 4-7 mmol/L Most patients with T2DM need 40-50 U BID to achieve target, but no maximum dose Start at a low dose of 5-10 U BID (before breakfast and before dinner) Patients can self-titrate by increasing insulin dose by 1 U/d until pre-dinner (breakfast dose) or fasting BG (dinner dose) at target Continue metformin and consider stopping secretagogue	Dosing and Titration Example 10 U before breakfast, 10 U before dinner Increase breakfast dose by 1 U/d until pre-dinner BG has reached target Increase dinner dose by 1 U/d until fasting BG has reached target

- Correction Factor (CF) = 100/Total Daily Dose of insulin (TDD) = change in blood glucose per unit insulin
  - BG <4 mmol/L: call physician and give 15 g of rapid-acting carbohydrates and recheck in 15 min
  - BG between 4 to 8: no additional insulin
  - BG between 8 to (8 + CF): give one additional unit
  - BG between (8 + CF) to (8 + 2CF): give two additional units
  - BG between (8 + 2CF) to (8 + 3CF): give three additional units

Insulin Pump Therapy: Continuous Subcutaneous Insulin Infusion (CSII)

- external battery-operated device provides continuous basal dose of rapid-acting insulin analogue (aspart, glulisine, or lispro) through small subcutaneous catheter
- at meals, patient programs pump to deliver insulin bolus based on carbohydrate:insulin ratios
- provides improved quality of life and flexibility
- risk of DKA if pump is inadvertently disconnected or pump malfunctions
- coverage available for insulin pumps for individuals with T1DM varies by province

Acute Complications

Table 11. Acute Complications of Diabetes Mellitus: Hyperglycemic Comatose States

	Diabetic Ketoacidosis (DKA)	Hyperosmolar Hyperglycemic State (HHS)
Pathophysiology	• Usually occurs in T1DM • Insulin deficiency with ↑ counterregulatory hormones (glucagon, cortisol, catecholamines, GH) • Can occur with lack of insulin (non-adherence, inadequate dosage, 1st presentation) or increased stress (surgery, infection, exercise) • Unopposed hepatic glucose production → hyperglycemia → osmotic diuresis → dehydration and electrolyte disturbance → ↓ Na^+ (water shift to ECF causing pseudohyponatremia) • Fat mobilization → ↑ FFA → ketoacids → metabolic acidosis • Severe hyperglycemia exceeds the renal threshold for glucose and ketone reabsorption → glucosuria and ketonuria • Total body K^+ depletion but serum K^+ may be normal or elevated, 2° to shift from ICF to ECF due to lack of insulin, ↑ plasma osmolality	• Occurs in T2DM • Often precipitated by sepsis, stroke, MI, CHF, renal failure, trauma, drugs (glucocorticoids, immunosuppressants, phenytoin, diuretics), dialysis, recent surgery, burns • Partial or relative insulin deficiency decreases glucose utilization in muscle, fat, and liver while inducing hyperglucagonemia and hepatic glucose production • Presence of a small amount of insulin prevents the development of ketosis by inhibiting lipolysis • Characterized by hyperglycemia, hyperosmolality, and dehydration without ketosis • More severe dehydration compared to DKA due to more gradual onset and ↑ duration of metabolic decompensation plus impaired fluid intake which is common in bedridden or elderly • Volume contraction → renal insufficiency → ↑ hyperglycemia, ↑ osmolality → shift of fluid from neurons to ECF → mental obtundation and coma
Clinical Features	• Hyperglycemia (polyuria, polydipsia, weakness) • Acidosis (air hunger, nausea, vomiting, abdominal pain, Kussmaul's respiration, acetone-odoured breath) • Precipitating conditions (insulin omission, new diagnosis of diabetes, infection, MI, thyrotoxicosis, drugs)	• Onset is insidious → preceded by weakness, polyuria, polydipsia • History of decreased fluid intake • History of ingesting large amounts of glucose containing fluids • Dehydration (orthostatic changes) • ↓ LOC → lethargy, confusion, comatose due to high serum osmolality • Kussmaul's respiration is absent unless the underlying precipitant has also caused a metabolic acidosis
Serum	• ↑ BG (typically 14-55 mmol/L, ↓ Na^+ (2° to hyperglycemia → for every ↑ in BG by 10 mmol/L there is a ↓ in Na^+ by 3 mmol/L) • Normal or ↑ K^+, ↓ HCO_3^-, ↑ BUN, ↑ Cr, ketonemia, ↓ PO_4^{3-} • ↑ osmolality • corrected sodium = current sodium + [0.3 x (current glucose -5)] • Be aware of possible euglycemic DKA (with near normal sugars) in pregnancy and with those who use SGLT2 inhibitors	• ↑ BG (typically 44.4-133.2 mmol/L) • In mild dehydration, may have hyponatremia (spurious 2° to hyperglycemia → for every ↑ in BG by 10 mmol/L there is a ↓ in Na^+ by 3 mmol/L) – if dehydration progresses, may get hypernatremia • Ketosis usually absent or mild if starvation occurs • ↑ osmolality

Table 11. Acute Complications of Diabetes Mellitus: Hyperglycemic Comatose States

	Diabetic Ketoacidosis (DKA)	Hyperosmolar Hyperglycemic State (HHS)
ABG	• Anion gap metabolic acidosis with possible 2° respiratory alkalosis • If severe vomiting/dehydration there may also be a metabolic alkalosis	• Metabolic acidosis absent unless underlying precipitant leads to acidosis (e.g. lactic acidosis in MI)
Urine	• +ve for glucose and ketones	• -ve for ketones unless there is starvation ketosis • Glycosuria
Treatment	• ABCs are first priority • Monitor degree of ketoacidosis with AG, not BG or serum ketone level • NOTE: Anion gap is the most important endpoint used to monitor the resolution of the metabolic acidosis • Rehydration – 500 mL/h x4 h, then 250 mL/h x4 h NS if mild-moderate deficit, 1-2 L/h NS if severe deficit (shock) – Switch to 0.45% NaCl once euvolemic (continue NS if corrected [Na^+] is low or rate of fall of plasma osmolality ≥3 mosm/kg/h) – Once BG reaches 14.0 mmol/L add D5W or D10W to maintain BG of 12-14 mmol/L • Insulin therapy – Critical to resolve acidosis, not hyperglycemia – Do not use with hypokalemia (see below), until serum K^+ is corrected to >3.3 mmol/L – Maintain on 0.1 U/kg/h insulin R infusion – Check serum glucose hourly • K^+ replacement – With insulin administration, hypokalemia may develop – If serum K^+<3.3 mmol/L, give 40 mEq/L K^+ replacement and hold insulin until [K^+] ≥3.3mmol/L – When K^+ 3.3-5.0 mmol/L add KCl 10-40 mEq/L to keep K^+ in the range of 3.5-5 mEq/L • HCO_3^- – If pH <7.0 or if hypotension, arrhythmia, or coma is present give HCO_3^- 1 ampoule (50 mmol) in 200 mL D5W (or sterile water if available) over 1 h, repeated q1-2 h until pH ≥7.0 – Do not give if pH >7.1 (risk of metabolic alkalosis) – Can give in case of life-threatening hyperkalemia	• Same resuscitation and emergency measures as DKA • Rehydration – IV fluids: 1 L/h NS initially – Evaluate corrected serum Na^+ – If corrected serum Na^+ high or normal, switch to 0.45% NaCl (4-14 mL/kg/h) – If corrected serum Na^+ low, maintain NS (4-14 mL/kg/h) – When serum BG reaches 13.9 mmol/L (250 mg/dL) switch to D5W • K^+ replacement – Less severe K^+ depletion compared to DKA – If serum K^+ <3.3 mmol/L, give 40 mEq/L K^+ replacement and hold insulin until [K^+] ≥3.3mmol/L – When K^+ 3.3-5.0 mmol/L add KCL 10-40 mEq/L to keep K^+ in the range of 3.5-5 mEq/L – If serum K^+ ≥5.5 mmol/L, check K^+ every 2 h • Search for precipitating event • Insulin therapy – Achieved by monitoring plasma osmolality, adding glucose to infusions once BG reaches 14 mmol/L, using correct concentration of saline – Switch to 0.45% NaCl once euvolemic as urinary loss of electrolytes in osmotic diuresis are usually hypotonic – Increase saline concentration if falling too rapidly
Prognosis	• <1-3.3% mortality in developed countries • Serious morbidity from sepsis, hypokalemia, respiratory complications, thromboembolic complications, and cerebral edema (the latter in children)	• Mortality rates between 12-17%, but studies looking at this included mixed DKA/HHS state

Macrovascular Complications

- increased risk of CAD, ischemic stroke, and peripheral arterial disease secondary to accelerated atherosclerosis
- CAD (see Cardiology and Cardiac Surgery, C30)
  - risk of MI is 3-5x higher in those with DM compared to age-matched controls
  - CAD is the leading cause of death in T2DM
  - most patients with DM are considered "high-risk" under the risk stratification for CAD (see *Dyslipidemias*, E3)
- ischemic stroke (see Neurology, N53)
  - risk of stroke in those with DM is approximately 2-3x higher for men and 2-5x higher for women
  - level of glycemia is both a risk factor for stroke and a predictor of a poorer outcome in patients who suffer a stroke
  - A1c level is a significant and independent predictor of the risk of stroke
- peripheral arterial disease (see Vascular Surgery, VS4)
  - manifests as intermittent claudication in lower extremities, intestinal angina, foot ulceration
  - risk of foot gangrene is 30x higher in those with DM compared to age-matched controls
  - risk of lower extremity amputation is 15x higher in those with DM
- screening: A1c every 3 mo, BP monitoring, lipid profile every 1-3 yr, resting ECG every 3-5 yr for high-risk patients
- treatment
  - tight blood pressure control (<130/80 mmHg), especially for stroke prevention
  - tight glycemic control in early DM without established CVD (refer to ACCORD, VADT, ADVANCE, DCCT, EDIC, UKPDS extension studies)
  - tight LDL control (LDL ≤2.0 mmol/L) or >50% LDL reduction from baseline
  - statin use in patients with clinical CVD, age ≥40, or either diabetes duration >15 yr and age >30, or microvascular complications
  - ACEI or ARB in high-risk patients
  - smoking cessation, healthy diet, physical activity, and maintenance of healthy weight goals
  - for adults with CVD who do not meet glycemic targets, recommended to add anti-hyperglycemic agent with demonstrated cardiovascular benefit (SGLT2 inhibitors/GLP1 RAs) to reduce the risk of major CV events

Laboratory Testing: Ketones

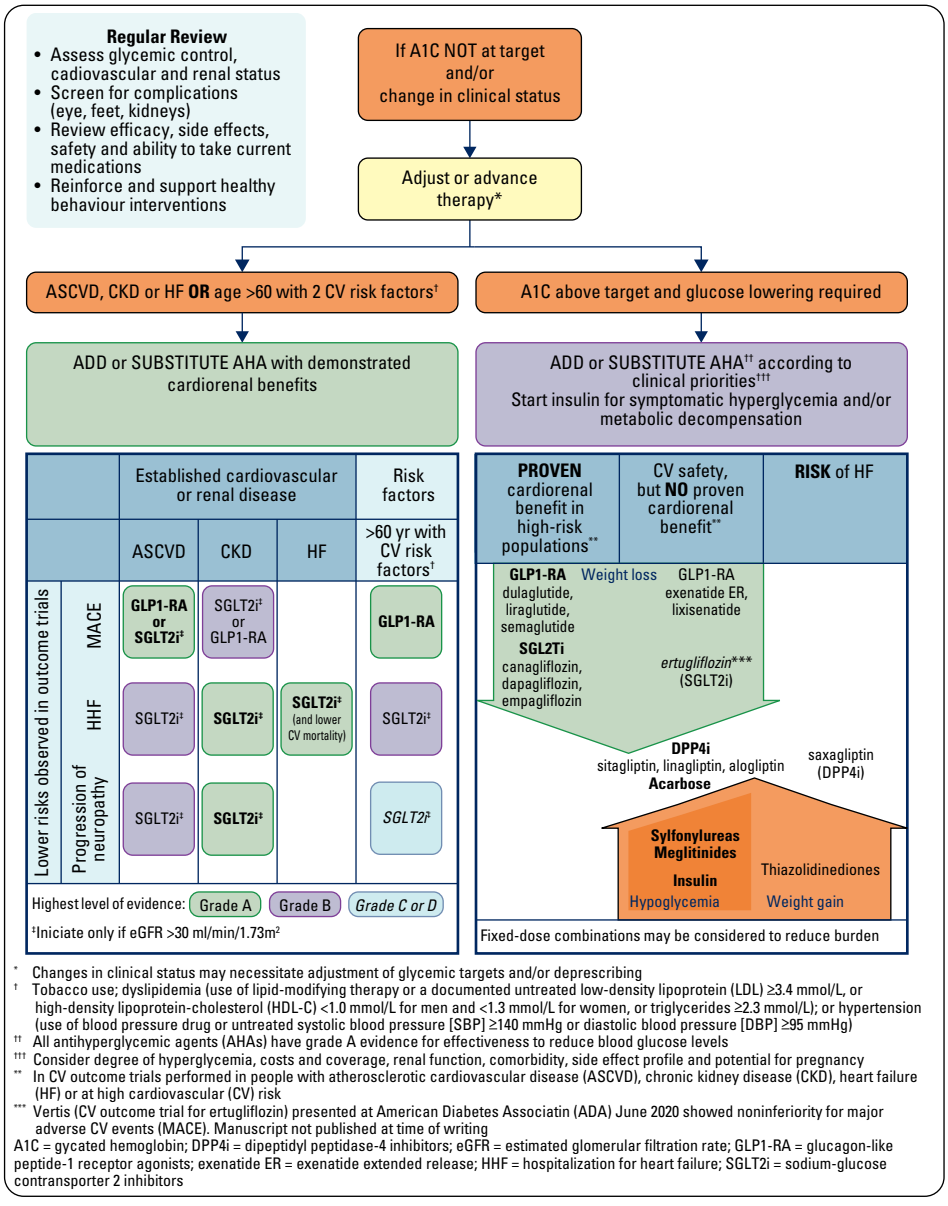
- The nitroprusside test for ketones identifies acetone and acetoacetate but does NOT detect β-hydroxybutyrate (BHB), the ketone most frequently in excess in DKA. This has two clinical consequences:
- Be wary of a patient with a clinical picture of DKA but negative serum or urinary ketones. These could be false negatives because of the presence of BHB
- As DKA is treated, BHB is converted to acetone and acetoacetate. Serum or urinary ketones may therefore rise, falsely suggesting that the patient is worsening when in fact they are improving

Effects of ASA for Primary Prevention in Persons with Diabetes Mellitus

NEJM 2018;379:1529-1539

Patients (n=15480) with diabetes but no evidence of CVD were randomly assigned to receive either ASA 100 mg once daily or placebo. The ASA group experienced a fewer number of vascular events (P=0.01) but a greater number of major bleeding events (P=0.01) compared to the placebo group. Currently, ASA is not recommended for primary prevention in people living with diabetes but is recommended for secondary prevention.

See Landmark Endocrinology Trials for more information on the EMPA-REG OUTCOME trial. It details the effects of empagliflozin (SGL2 inhibitor) on cardiovascular risk in patients with T2DM.



* Changes in clinical status may necessitate adjustment of glycemic targets and/or deprescribing
† Tobacco use; dyslipidemia (use of lipid-modifying therapy or a documented untreated low-density lipoprotein (LDL) ≥3.4 mmol/L, or high-density lipoprotein-cholesterol (HDL-C) <1.0 mmol/L for men and <1.3 mmol/L for women, or triglycerides ≥2.3 mmol/L); or hypertension (use of blood pressure drug or untreated systolic blood pressure [SBP] ≥140 mmHg or diastolic blood pressure [DBP] ≥95 mmHg)
†† All antihyperglycemic agents (AHAs) have grade A evidence for effectiveness to reduce blood glucose levels
††† Consider degree of hyperglycemia, costs and coverage, renal function, comorbidity, side effect profile and potential for pregnancy
** In CV outcome trials performed in people with atherosclerotic cardiovascular disease (ASCVD), chronic kidney disease (CKD), heart failure (HF) or at high cardiovascular (CV) risk
*** Vertis (CV outcome trial for ertugliflozin) presented at American Diabetes Associatin (ADA) June 2020 showed noninferiority for major adverse CV events (MACE). Manuscript not published at time of writing
A1C = gycated hemoglobin; DPP4i = dipeptidyl peptidase-4 inhibitors; eGFR = estimated glomerular filtration rate; GLP1-RA = glucagon-like peptide-1 receptor agonists; exenatide ER = exenatide extended release; HHF = hospitalization for heart failure; SGLT2i = sodium-glucose contransporter 2 inhibitors

Figure 9. Treatment approach for patients living with diabetes

Liraglutide and Cardiovascular Outcomes in T2DM
NEJM 2016; 375:311-322
Purpose: To investigate whether liraglutide (a GLP-1 analogue) has any effect on cardiovascular risk in patients with T2DM when added to standard care.
Study: Multi-centre, double-blind RCT comparing liraglutide to placebo control; 9340 patients (drug n=4668, placebo n=4672), median observation 3.8 yr.
Outcome: Death from cardiovascular causes, nonfatal MI, or nonfatal stroke.
Results: Both groups concurrently received the standard treatment for T2DM. The liraglutide group had significantly lower rates of death from cardiovascular causes than control (4.7%, vs. 6%; P=0.007). The drug group also had lower all-cause mortality (8.2% and 9.6%; P=0.02). Rates of nonfatal MI, nonfatal stroke, and hospitalization for heart failure were not significantly lower in the liraglutide group.
Conclusion: Adding liraglutide to standard treatment for patients with T2DM reduced death from cardiovascular cause and all-cause mortality when compared to placebo.

Microvascular Complications

DIABETIC RETINOPATHY (see Ophthalmology, OP34 for a more detailed description)

Epidemiology
- diabetic retinopathy is the most common cause of incident blindness in people of working age
- among individuals with T1DM, limb amputation and vision loss due to diabetic retinopathy are independent predictors of early death

Clinical Features
- macular edema: diffuse or focal vascular leakage at the macula
- non-proliferative (microaneurysms, intraretinal hemorrhage, vascular tortuosity, vascular malformation) and proliferative (abnormal vessel growth)
- retinal capillary closure

Treatment and Prevention
- tight glycemic control (delays onset, decreases progression), tight lipid control, manage HTN, smoking cessation
- ophthalmological treatments available (see Ophthalmology, OP35 for more details)
- annual follow-up visits with an optometrist or ophthalmologist examination through dilated pupils whether symptomatic or not (immediate referral after diagnosis of T2DM; 5 yr after diagnosis of T1DM for those ≥15 yr)
- interval for follow-up should be tailored to severity of retinopathy

DIABETIC NEPHROPATHY (see Nephrology, NP34 for a more detailed description)

Epidemiology
- DM-induced renal failure is the most common cause of renal failure in North America
- 20-40% of persons with T1DM (after 5-10 yr) and 4-20% with T2DM have progressive nephropathy

Screening
- serum creatinine for eGFR, random urine ACR
- ACR is used as albuminuria is considered the earliest clinical sign of diabetic nephropathy (microalbuminuria); diagnosis requires persistent elevated urinary albumin (2 out of 3 urinary samples required over 3 mo)
- 24 h urine collection for protein/albumin is the gold standard but is difficult to perform, inconvenient, and often incorrect; random urine albumin is insufficient as albumin levels vary with urine concentration
- begin screening annually at diagnosis for all T2DM, and >5 yr after diagnosis of T1DM for postpubertal patients

Treatment and Prevention
- appropriate glycemic control
- appropriate blood pressure control (<130/80 mmHg)
- use either ACEI or ARB to delay progression of CKD (often used first line for their CVD protection)
- use SGLT2i for nephroprotection
- limit use of nephrotoxic drugs and dyes

See Landmark Endocrinology Trials for more information on the Steno-2 trial. It details the effects of intensive, multifactorial interventions on the rates of death in patients with T2DM and microalbuminuria

DIABETIC NEUROPATHY

Epidemiology
- approximately 50% of patients within 10 yr of T1DM and T2DM onset

Pathophysiology
- can have peripheral sensory neuropathy, motor neuropathy, or autonomic neuropathy
- mechanism poorly understood
- acute cranial nerve palsies and diabetic amyotrophy are thought to be due to ischemic infarction of peripheral nerves
- the more common motor and sensory neuropathies are thought to be related to metabolic, vascular, and possibly hormonal factors

Screening
- 128 Hz tuning fork or 10 g monofilament
- begin screening annually at diagnosis for all T2DM, and >5 yr after diagnosis of T1DM for post-pubertal patients

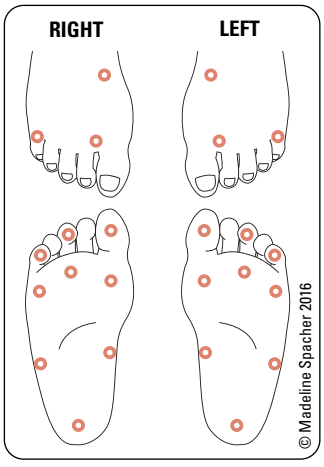


Figure 10. Monofilament testing for diabetic neuropathy

Clinical Features

Table 12. Clinical Features of Diabetic Neuropathies

Peripheral Sensory Neuropathy	Motor Neuropathy	Autonomic Neuropathy
Paresthesias (tingling, itching), neuropathic pain, radicular pain, numbness, decreased tactile sensation	Less common than sensory neuropathy and occurs later in the disease process	Postural hypotension, tachycardia, decreased cardiovascular response to valsalva maneuver
Bilateral and symmetric with decreased perception of vibration and pain/temperature; especially true in the lower extremities but may also be present in the hands	Delayed motor nerve conduction and muscle weakness/atrophy	Gastroparesis and alternating diarrhea and constipation
Decreased ankle reflex	May involve one nerve trunk (mononeuropathy) or more (mononeuritis multiplex)	Urinary retention and erectile dysfunction
Distal-predominant – longest nerves affected first	Some of the motor neuropathies spontaneously resolve after 6-8 wk	
Classic stocking-glove distribution	Reversible CN palsies: III (ptosis/ophthalmoplegia, pupil sparing), VI (inability to laterally deviate eye), and VII (Bell's palsy)	
May result in neuropathic ulceration of foot	Diabetic amyotrophy i.e. Bruns-Garland Syndrome: refers to pain, weakness, and wasting of hip flexors or extensors	

Treatment and Management
- tight glycemic control
- for neuropathic pain syndromes: tricyclic antidepressants (e.g. amitriptyline), pregabalin, duloxetine, anti-epileptics (e.g. carbamazepine, gabapentin), and capsaicin
- foot care education
- Jobst® fitted stocking and tilting of head of bed may decrease symptoms of orthostatic hypotension
- treat gastroparesis with dietary modification, domperidone and/or metoclopramide (dopamine antagonists), erythromycin (stimulates motilin receptors)
- medical, mechanical, and surgical treatment for erectile dysfunction (see Urology, U33)

Pharmacologic Interventions for Painful Diabetic Neuropathy: An Umbrella Systematic Review and Comparative Effectiveness Network Meta-Analysis
Ann Intern Med 2014;161:639-49
Purpose: To compare the efficacies of various oral and topical analgesics for diabetic neuropathy.
Study Selection: RCTs that assessed pharmacologic treatments for painful diabetic peripheral neuropathy in adults.
Results: 65 RCTs involving 12632 patients were included. The following pharmacological agents demonstrated superiority over placebo for short-term pain control: SNRIs (standardized mean difference (SMD), -1.36; 95% credible interval (CrI), [-1.77 to -0.95]), topical capsaicin (SMD, -0.91; CrI [-1.18 to -0.08]), TCAs (SMD, -0.78; CrI [-1.24 to -0.33]), and anticonvulsants (SMD, -0.67; CrI [-0.97 to -0.37]). Specific agents included: carbamazepine (SMD, -1.57; CrI [-2.83 to -0.31]), venlafaxine (SMD, -1.53; CrI [-2.41 to -0.65]), duloxetine (SMD, -1.33; CrI [-1.82 to -0.86]), and amitriptyline (SMD, -0.72; CrI [-1.35 to -0.08]).
Conclusion: SNRIs, topical capsaicin, TCAs and anticonvulsants are effective in short-term management of painful diabetic neuropathy but their relative efficacy compared to each other is unknown.

Other Complications

Dermatologic
- diabetic dermopathy: atrophic brown spots commonly in pretibial region known as "tibia spots," secondary to increased glycosylation of tissue proteins or vasculopathy
- eruptive xanthomas secondary to increased triglycerides
- necrobiosis lipoidica diabeticorum: rare complication characterized by thinning skin over the shins allowing visualization of subcutaneous vessels

Bone and Joint Disease
- juvenile cheiroarthropathy: chronic stiffness of hand caused by contracture of skin over joints secondary to glycosylated collagen and other connective tissue proteins
- Dupuytren's contracture
- increased fracture risk in both T1DM and T2DM due to decreased bone quality
- adhesive capsulitis ("frozen shoulder")

Cataracts
- subcapsular and senile cataracts secondary to glycosylated lens protein or increased sorbitol causing osmotic change and fibrosis

Infections
- see Infectious Diseases, *Diabetic Foot Infections*, ID14

Hypoglycemia

Etiology and Pathophysiology
- hypoglycemia occurs most frequently in people with DM receiving insulin or certain antihyperglycemic therapies (insulin secretagogues)
- in people without DM, care must be taken to distinguish hypoglycemia that occurs in critically ill or medicated patients from hypoglycemia that presents in individuals who are seemingly well
  - each invokes a separate DDx
  - the timing of hypoglycemia may also provide a clue to the diagnosis (e.g. individuals with an insulinoma typically have fasting hypoglycemia whereas those with noninsulinoma pancreatogenous hypoglycemia experience predominantly postprandial hypoglycemia)

Table 13. Causes of Hypoglycemia

Insulin-Dependent Causes	Insulin-Independent Causes
Exogenous insulin	Hepatic failure
Sulfonylurea or meglitinide	Renal failure
Pentamidine (possibly due to β-cell destruction resulting in insulin release)	Inanition
Autoimmune hypoglycemia (autoantibodies to insulin or insulin receptor)	Hormone deficiency (cortisol, glucagon, and epinephrine in insulin-deficient DM)
Insulinoma	Non-islet cell tumours (typically the result of mesenchymal tumour overproduction of IGF-II)
Non-insulinoma pancreatogenous hypoglycemia	Inborn error of carbohydrate metabolism, glycogen storage disease, gluconeogenic enzyme
Post-gastric bypass hypoglycemia	Alcohol
	Drugs (e.g. quinine, indomethacin, gatifloxacin, lithium, ACEI, β-adrenergic receptor blockers)

Clinical Features
- Whipple's triad – suggests a patient's symptoms are from hypoglycemia
  1. serum glucose <4.0 mmol/L
  2. neuroglycopenic symptoms (below)
  3. rapid relief provided by administration of glucose
- autonomic symptoms (typically occur first; caused by autonomic nervous system activity)
  - palpitations, sweating, anxiety, tremor, tachycardia, hunger
- neuroglycopenic symptoms (caused by brain glucose deprivation)
  - dizziness, headache, clouding of vision, mental dullness, fatigue, confusion, seizures, coma

Investigations
- depend on a thorough history, physical exam, and available biochemical investigations as these may provide clues to the etiology of hypoglycemia
  - for example, if suspecting insulin and insulin secretagogues in patients with diabetes, assess for cortisol deficiency. In a patient with weight loss, hyperpigmentation, and hyperkalemia, consider the possibility of IGF-2 mediated hypoglycemia. In an individual with a gastrointestinal stromal tumour (GIST), think about renal/hepatic failure in the setting of critical illness
- when the cause of hypoglycemia is not evident, screen for oral hypoglycemic agents (ideally all available sulfonylureas and glinides) and measure plasma glucose, insulin, proinsulin, C-peptide, Beta-hydroxybutyrate, and insulin antibodies during a spontaneous hypoglycemic episode or a supervised fast of up to 72 h. If hypoglycemia occurs only in the postprandial state, evaluate the patient first with a mixed meal test

Other Players in Glucose Homeostasis
These hormones act to increase blood glucose levels
- Glucagon
- Epinephrine
- Cortisol
- Growth hormone

C-Peptide
A short peptide released into the circulation when proinsulin is cleaved to insulin

Use of C-peptide Levels to Distinguish between Exogenous and Endogenous Source of Hyperinsulinemia
Increased = endogenous
Decreased or normal = exogenous

Treatment of an Acute Hypoglycemic Episode (Blood Glucose <4.0 mmol/L) in the Awake Patient (e.g. able to self-treat)

1) Eat 15 g of rapid-acting carbohydrates (CHO) (e.g. 3 packets of sugar dissolved in water; 3/4 cup of juice)
↓
2) Wait 15 min
↓
3) Retest Blood Glucose (BG)
↓
4) Repeat steps 1-3 until BG >5 mmol/L
↓
5) Eat next scheduled meal. If next meal is >1 h away, eat snack including 15 g of CHO and protein

Hypoglycemia Unawareness (T1DM >>> T2DM)
- Patient remains asymptomatic until severe hypoglycemic levels are reached
- Often occurs after repeated episodes of hypoglycemia as the patient develops blunted/minimal autonomic response
- **Causes:**
  - Decreased glucagon/epinephrine response
  - History of repeated hypoglycemia or low A1c
  - Autonomic neuropathy
- May not be safe for patient to drive
- Suggest that patient obtain a Medic-Alert™ bracelet if at risk for hypoglycemia, especially with hypoglycemia unawareness and consider use of advanced monitoring systems (continuous glucose monitor, flash glucose monitor)

Refer to Diabetes Canada guidelines for advice around diabetes and driving

- correct hypoglycemia with injection of 1.0 mg glucagon IV with measurement of plasma glucose response. This will distinguish endogenous and exogenous hyperinsulinism from other causes of hypoglycemia

Treatment

- for tumoural hypoglycemia, definitive treatment requires resection of the tumour. If that is not possible certain medications can be helpful such as diazoxide for patients with insulinoma
  - for noninsulinoma pancreatogenous hypoglycemia and post-bariatric bypass hypoglycemia, dietary changes including reducing the amount of carbohydrate intake and small frequent meals may be helpful. For patients who do not respond to nutritional modification or have severe symptoms, acarbose can be utilized
- see Emergency Medicine, ER35
- treatment of hypoglycemic episode in the unconscious patient or patient NPO
  - D50W 50 mL (1 ampule) IV in 1-3 min or 1 mg glucagon SC or IM (if no IV access is available)
  - may need ongoing glucose infusion once BG >5 mmol/L

Metabolic Syndrome

- postulated syndrome related to insulin resistance associated with hyperglycemia, hyperinsulinemia, HTN, central obesity, and dyslipidemia
- obesity aggravates extent of insulin resistance
- complications include DM, atherosclerosis, CAD, MI, and stroke
- women with PCOS are at increased risk for developing insulin resistance, hyperlipidemia, and metabolic syndrome
- not to be confused with syndrome X related to angina pectoris with normal coronary arteries (Prinzmetal angina)

Obesity

- see Family Medicine, FM9

Pituitary Gland

Pituitary Hormones

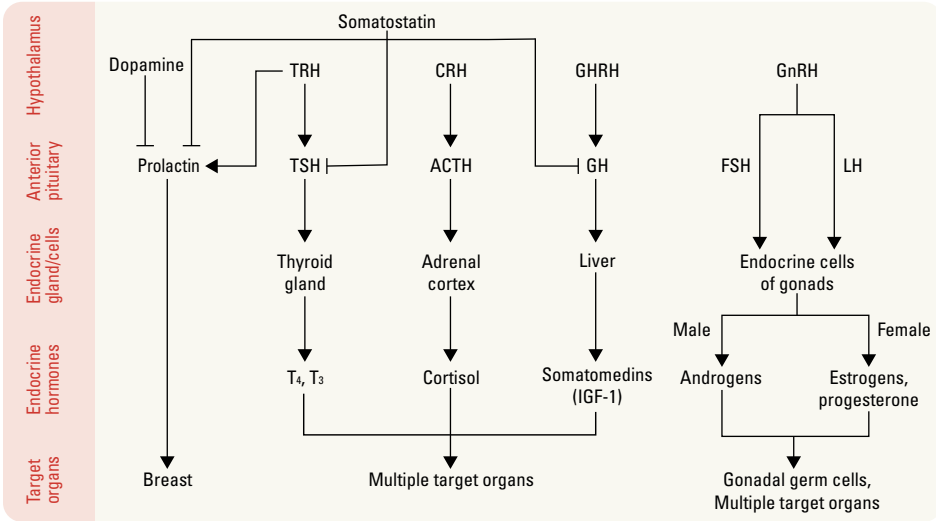

Figure 11. Hypothalamic-pituitary hormonal axes

Hypothalamic Control of Pituitary

- trophic and inhibitory factors control the release of pituitary hormones
- most hormones are primarily under trophic stimulation except PRL, which is primarily under inhibitory control by dopamine. GH and TSH are stimulated by GHRH and TRH respectively while inhibition by somatostatin is less important for control
- transection of the pituitary stalk (i.e. dissociation of hypothalamus and pituitary) leads to pituitary hypersecretion of PRL and hyposecretion of all remaining hormones

Features of Metabolic Syndrome (≥3 measures to make a Dx)

Measure	Men	Women
Abdominal Obesity (Elevated Waist Circumference)		
Canada, USA	≥102 cm (40 inches)	≥88 cm (35 inches)
Europid, Middle Eastern, Sub-Saharan Africa, Mediterranean	≥94 cm (37 inches)	≥80 cm (31.5 inches)
Asian, Japanese, South & Central America	≥90 cm (35 inches)	≥80 cm (31.5 inches)
TG Level	≥1.7 mmol/L (150 mg/dL)	
HDL-C Level	<1.0 mmol/L (<40 mg/dL)	<1.3 mmol/L (<50 mg/dL)
Blood Pressure	≥130/85 mmHg	
Fasting Glucose Level	≥5.6 mmol/L (>100 mg/dL)	

Drug treatment for any elevated marker is an alternate indicator

Anterior Pituitary Hormones

FLAT PiG
FSH
LH
ACTH
TSH

Prolactin
GH

Anterior Pituitary Hormones

- FSH, LH, ACTH, TSH, GH, PRL
  - these hormones are produced, stored, and released from the anterior pituitary but regulated by hormones produced by the hypothalamus

Posterior Pituitary (Hypothalamic) Hormones

- ADH and oxytocin
- peptides synthesized in the supraoptic and paraventricular nuclei of the hypothalamus
- although ADH and oxytocin are produced in the hypothalamus, these hormones are stored in and released from the posterior pituitary

Table 14. The Physiology and Action of Pituitary Hormones

Hormone	Function	Physiology	Inhibitory Stimulus	Secretory Stimulus
LH/FSH	Stimulate gonads via cAMP Ovary: LH: production of androgens (thecal cells) which are converted to estrogens (granulosa cells); induces luteinization in follicles FSH: growth of granulosa cells in ovarian follicle; controls estrogen production Testes: LH: production of testosterone (Leydig cells) FSH: production of spermatozoa (Sertoli cells)	Polypeptide Glycoproteins (same α subunit as TSH and hCG) Secreted in pulsatile fashion	Estrogen Progesterone Testosterone Inhibin Continuous (i.e. non-pulsatile) GnRH infusion	Pulsatile GnRH (low frequency pulsation = FSH release, high frequency pulsation = LH release)
ACTH	Stimulates growth of adrenal cortex and secretion of its hormones via cAMP	Polypeptide Circadian rhythm (highest in the morning, lowest at midnight)	Dexamethasone, cortisol, and other glucocorticoids	CRH Metyrapone hypoglycemia Vasopressin Fever, pain, stress
TSH	Stimulates growth of thyroid and secretion of T4 and T3 via cAMP	Glycoprotein Note: hCG can activate the TSH receptor and therefore have thyroid-stimulating activity	Thyroid hormones (T4 and T3) and analogues, dopamine, somatostatin, cytokines, high dose glucocorticoids	TRH AVP α adrenergic agonist
Prolactin	Promotes milk production and breast tissue development Inhibits gonadotropin secretion	Polypeptide Episodic secretion	Dopamine (only pituitary hormone under tonic inhibition of secretion)	Sleep Stress, hypoglycemia Pregnancy, breastfeeding Mid-menstrual cycle Sexual activity TRH (primary hypothyroidism) Drugs: antipsychotics, tricyclic antidepressants, metoclopramide, domperidone, verapamil, methyldopa, opioids, high dose estrogen
GH	Has direct effects on peripheral target cells Needed for linear growth and also has metabolic effects to increase serum glucose Stimulates secretion of IGF-1 by the liver, a potent growth and differentiation factor	Polypeptide Acts indirectly through IGF-1 (somatomedin-C) synthesized in the liver and has direct effects Serum GH undetectable for most of the day and suppressed after meals high in glucose Sustained rise during sleep	Glucose challenge Glucocorticoids Somatostatin Dopamine D2 receptor agonists in some GH-secreting tumours IGF-1 (long-loop)	GHRH Insulin-induced hypoglycemia Ghrelin Exercise REM sleep Arginine, clonidine, propranolol, L-dopa Sex hormones Dopamine agonists in normal individuals
ADH	Acts at renal collecting ducts on V2 receptors to cause insertion of aquaporin channels and increases water reabsorption thereby concentrating urine	Octapeptide Secreted by posterior pituitary Osmoreceptors in hypothalamus detect serum osmolality Contracted plasma volume detected by baroreceptors is a more potent stimulus than ↑ osmolality	↓ serum osmolality	Hypovolemia or ↓ effective circulatory volume ↑ serum osmolality Stress, pain, fever, system CNS disorders
Oxytocin	Causes uterine contraction Breast milk secretion	Nonapeptide Secreted by posterior pituitary	EtOH	Suckling Distention of female genital tract during labour via stretch receptors

Growth Hormone

GH DEFICIENCY

- cause of short stature in children (see Paediatrics, P13)
- adults exhibit increased fat and decreased lean body mass, decreased bone mineral density, and fatigue
- diagnosis made with low serum IGF-1 levels in individuals with deficiencies in three or more pituitary axes, or by failure to increase GH with a provocative test (see above under GH secretory stimulus); insulin tolerance test to induce hypoglycemia is the gold standard dynamic test
- Tx: GH replacement is not always indicated after max linear height and peak bone mass is reached; consider in an adult patient with childhood onset irreversible GH deficiency (some children who are diagnosed with idiopathic GH deficiency will have normal GH responses when tested as adults and do not require GH treatment). GH replacement can also be provided to patients with adult onset GH deficiency who do not have an active malignancy and prefer treatment after a discussion about its potential benefits, adverse effects, and cost

GH EXCESS

Etiology

- GH secreting pituitary adenoma, neuroendocrine tumours secreting ectopic GH or GHRH (very rare)

Pathophysiology

- normally GH is a catabolic hormone that acts to increase blood glucose levels
- in GH excess states, secretion remains pulsatile but there is loss of hypoglycemic stimulation, glucose suppression, and the nocturnal surge
- proliferation of bone, cartilage, soft tissues, organomegaly
- insulin resistance and impaired glucose tolerance (IGT)

Clinical Features

- in children (before epiphyseal fusion) leads to gigantism
- in adults (after epiphyseal fusion) leads to acromegaly
- dermatologic (thickening of skin, increased sebum production, sweating, acne, sebaceous cysts), musculoskeletal (enlargement of hands and feet, coarsening of facial features, thickening of calvarium, prognathism, carpal tunnel syndrome, osteoarthritis), cardiac/metabolic (HTN, DM, acanthosis nigricans, cardiomyopathy), sleep apnea, sexual (low libido)

Risks Associated with GH Excess

- Cardiac disease (e.g. cardiomyopathy, valvulopathy, arrhythmias, CAD) in 1/3 of patients. Two-fold increase in mortality in acromegaly due to acromegaly-associated complications such as HTN, diabetes, cardiovascular disease, and cerebrovascular disease
- HTN in 1/3 of patients
- Increased risk of cancer (particularly colon cancer)

Investigations

- first line test: serum IGF-1 (expected to be elevated)
- glucose suppression test is the most specific test (75 g of glucose PO suppresses GH levels in healthy individuals but not in patients with acromegaly)
- CT, MRI, or skull x-rays may show cortical thickening, enlargement of the frontal sinuses, and enlargement and erosion of the sella turcica
- MRI of the sella turcica is needed to look for a tumour

Treatment

- surgery is the recommended initial therapy for the majority of patients with acromegaly; octreotide (somatostatin analogue), dopamine agonist (cabergoline), GH receptor antagonist (pegvisomant), radiation
  - medical treatment consists of octreotide or lanreotide (somatostatin analogues), cabergoline (dopamine agonist), pegvisomant (GH-receptor antagonist)
  - radiation may be considered in patients whose disease is not controlled by surgery or medical treatment

Prolactin

HYPERPROLACTINEMIA

Etiology

- prolactinoma: most common pituitary adenoma
- sellar masses or disease with pituitary stalk compression or damage causing reduced dopamine inhibition of PRL release
- primary hypothyroidism (increased TRH), PCOS, acromegaly
- decreased clearance due to chronic renal failure or severe liver disease (PRL is metabolized by both the kidney and liver)
- medications with anti-dopaminergic properties are a common cause of high PRL levels: antipsychotics (common), antidepressants, antihypertensives (verapamil/methyldopa), bowel motility agents (metoclopramide/domperidone), H2-blockers, opiates (morphine), estrogens (e.g. OCP)
- macroprolactinemia (high molecular weight PRL also known as big-big PRL) that has no action but results in falsely elevated serum prolactin
- physiologic causes: pregnancy, stress, sleep, nipple stimulation, factors affecting the chest wall

Approach to Nipple Discharge

- Differentiate between galactorrhea (fat droplets present) vs. breast discharge (usually unilateral, may be bloody or serous)
- If galactorrhea, determine if physiologic (e.g. pregnancy, lactation) vs. pathologic
- If abnormal breast discharge, must rule out a breast malignancy

Clinical Features
- galactorrhea (secretion of breast milk in women and, in rare cases, men), infertility, hypogonadism, amenorrhea, oligomenorrhea, erectile dysfunction

Investigations
- serum PRL, TSH, liver enzyme tests, creatinine, hCG in all women of reproductive age
- macroprolactin level in patients with hyperprolactinemia but no symptoms of PRL excess
- MRI of the sella turcica when a secondary cause is not identified or when PRL levels suggest that there may be underlying tumoural hyperprolactinemia

Treatment
- first line: dopamine agonists (bromocriptine, cabergoline, or quinagolide)
- surgery ± radiation (rare)
- PRL-secreting tumours are often slow-growing; treatment may not be necessary in the setting of small tumours associated with hyperprolactinemia which does not result in hypogonadism or bothersome galactorrhea
- if medication-induced, consider stopping medication if possible
- in certain cases if microprolactinoma and not planning on becoming pregnant, may consider OCP

Diagnosis and Treatment of Hyperprolactinemia: An Endocrine Society Clinical Practice Guideline
J Clin Endocr Metab 2011;96:273-88
- Indications to treat:
  - Symptomatic patients, in particular those with galactorrhea, hypogonadism-amenorrhea, low libido, or infertility
  - Adenomas ≥1 cm in size or any size causing structural compression
- For patients with symptomatic prolactinomas, dopamine agonist therapy should be used to lower prolactin levels, decrease tumor size, and restore gonadal function
- Cabergoline should be preferentially used due to higher efficacy in normalizing prolactin levels and shrinking pituitary tumors
- For symptomatic patients with treatment-resistant prolactinomas, increase the dose to maximal tolerable dose before referring for surgery
- Most women with prolactinomas should discontinue dopamine agonist therapy immediately if they become pregnant (exception is patients with large invasive tumours)

Thyroid Stimulating Hormone

- see *Thyroid*, E25

Adrenocorticotropic Hormone

- see *Adrenal Cortex*, E34

Luteinizing Hormone and Follicle Stimulating Hormone

HYPOGONADOTROPIC HYPOGONADISM
- hypogonadism due to impaired release of FSH and LH

Etiology
- congenital: Kallmann syndrome, CHARGE syndrome, GnRH insensitivity
- secondary: CNS or pituitary tumours, pituitary apoplexy, hypothalamic/pituitary radiation, drugs (GnRH agonists/antagonists, glucocorticoids, narcotics, chemotherapy, drugs causing hyperprolactinemia, opioids), functional deficiency due to another cause (hyperprolactinemia, chronic systemic illnesses, eating disorders, hypothyroidism, DM, Cushing's disease), systemic diseases involving the hypothalamus/pituitary (hemochromatosis, sarcoidosis, histiocytosis)

Clinical Features
- amenorrhea, low libido, decrease in energy, erectile dysfunction (see Urology, U33), loss of body hair, fine skin, testicular atrophy, decrease in muscle mass, and failure of pubertal development

Treatment
- treat underlying cause if present
- combined FSH/LH hormone therapy, hCG, rFSH, or pulsatile GnRH analogue if fertility desired
- symptomatic treatment with estrogen/testosterone

HYPERGONADOTROPIC HYPOGONADISM
- hypogonadism due to impaired response of the gonads to FSH and LH

Etiology
- congenital:
  - chromosomal abnormalities (Turner's syndrome, Klinefelter syndrome, XX gonadal dysgenesis)
  - enzyme defects (17α-hydroxylase deficiency, 17,20-lyase deficiency)
  - gonadotropin resistance (Leydig cell hypoplasia, FSH insensitivity, pseudohypoparathyroidism type 1A)
- acquired:
  - gonadal toxins (chemotherapy, radiation)
  - drugs (antiandrogens, alcohol)
  - infections (STIs, mumps)
  - gonadal failure in adults (androgen decline and testicular failure in men, premature ovarian insufficiency and menopause in women)

Clinical Features
- amenorrhea, erectile dysfunction (see Urology, U33), loss of body hair, fine skin, testicular atrophy, failure of pubertal development, low libido, decrease in energy, and infertility

Treatment
- hormone replacement therapy consisting of androgen (for males) and estrogen and progesterone (for females) administration

Antidiuretic Hormone

DIABETES INSIPIDUS (see Nephrology, NP12)

Definition
- disorder of ineffective ADH (decreased production or peripheral resistance) resulting in passage of large volumes of dilute urine

Etiology and Pathophysiology
- central DI: insufficient ADH due to pituitary surgery, tumours, idiopathic/autoimmune, infiltration or lesion of the stalk, hydrocephalus, Langerhans cell histiocytosis, trauma, familial central DI
- nephrogenic DI: collecting tubules in kidneys resistant to ADH due to drugs (e.g. lithium), hypercalcemia, hypokalemia, CKD, hereditary nephrogenic DI
- psychogenic polydipsia and osmotic diuresis must be ruled out

Clinical Features
- passage of large volumes of dilute urine, polydipsia, and dehydration; hypernatremia can develop with inadequate water consumption or secondary to an impaired thirst mechanism
  - central DI: visual field defect, headache, other neurological features, or evidence of other pituitary hormone deficiencies may be present

Diagnosing Subtypes of DI with DDAVP Response

Concentrated urine = **C**entral
No effect = **N**ephrogenic

Diagnostic Criteria
- fluid deprivation will differentiate true DI (high urine output persists, urine osmolality < plasma osmolality) from psychogenic polydipsia
- response to exogenous ADH (DDAVP) will distinguish central DI from nephrogenic DI

Treatment
- central DI: first line = desmopressin; second line = chlorpropamide, thiazides, NSAIDs, and carbamazepine
- nephrogenic DI: solute restriction, thiazide diuretics

SIADH vs. Cerebral Salt Wasting (CSW)
CSW can occur in cases of subarachnoid hemorrhage. Na^+ is excreted by malfunctioning renal tubules, mimicking findings of SIADH; hallmark is hypovolemia

SYNDROME OF INAPPROPRIATE ADH SECRETION

Diagnostic Criteria
- 1) hyponatremia (serum Na^+ <135 mEq/L) with 2) plasma hypo-osmolality (<275 mOsm/kg), 3) urine Na^+ concentration >40 mEq/L, 4) urine osmolality >100 mOsm/kg), 5) euvolemia (no edema), and 6) absence of adrenal, renal, or thyroid insufficiency

Etiology and Pathophysiology
- stress (post-surgical)
- malignancy (ectopic ADH production by tumours including small cell carcinoma of the lung, extrapulmonary small cell carcinomas, squamous cell cancer of the head and neck)
- CNS disease (inflammatory, hemorrhage, tumour, Guillain-Barré syndrome)
- respiratory disease (tuberculosis, pneumonia, empyema)
- drugs (SSRIs, vincristine, chlorpropamide, cyclophosphamide, carbamazepine, nicotine, morphine, DDAVP, oxytocin)

Clinical Features
- symptoms of hyponatremia: headaches, nausea, vomiting, muscle cramps, tremors, cerebral edema if severe (confusion, mood swings, hallucinations, seizures, coma)

Treatment
- goal is to increase serum sodium
- treat underlying cause, fluid restriction (800-1000 mL/d), vasopressin receptor antagonists (e.g. tolvaptan, conivaptan), demeclocycline (antibiotic with anti-ADH properties; rarely used), and furosemide

Pituitary Pathology

PITUITARY ADENOMA (see Neurosurgery, NS17)

Clinical Features
- local mass effects
  - visual field defects (bitemporal hemianopsia due to compression of the optic chiasm), diplopia (due to oculomotor nerve palsies; rare), headaches; increased ICP is rare
- hypofunction
  - hypopituitarism
- hyperfunction
  - PRL (galactorrhea, hypogonadism), GH (acromegaly in adults, gigantism in children), ACTH (Cushing's disease = Cushing's syndrome caused by a pituitary tumour)
  - tumours secreting TSH are rare

Investigations
- radiological evaluation (MRI sella is imaging procedure of choice)
- formal visual field testing for tumours compressing the optic chiasm
- laboratory tests of hypothalamic-pituitary hormonal function

Important Deficiencies to Recognize are:
- Adrenal insufficiency
- Hypothyroidism
- Concurrent adrenal insufficiency and hypothyroidism should be treated with glucocorticoids first and then with thyroid hormone to avoid adrenal crisis

The Pituitary Hormones
Compression of the pituitary by a mass leads to loss of pituitary hormones in the following usual order:
"**G**o **L**ook **F**or **T**he **A**denoma **P**lease"
GH, **L**H, **F**SH, **T**SH, **A**CTH, **P**RL + posterior pituitary hormones: ADH and oxytocin

HYPOPITUITARISM

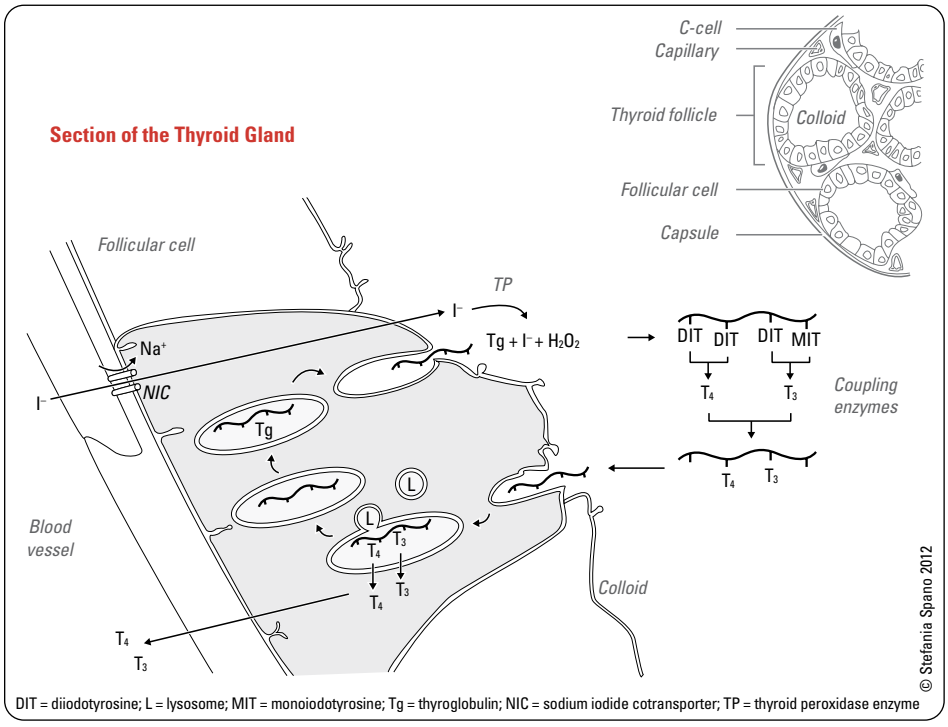
Etiology (The Eight I's)
- **I**nvasive
  - pituitary tumours, craniopharyngioma, cysts (Rathke's cleft, arachnoid, or dermoid), metastases
- **I**nfarction/hemorrhage
  - Sheehan's syndrome (pituitary infarction due to excessive postpartum blood loss and hypovolemic shock)
  - pituitary apoplexy (acute hemorrhage/infarction of a pituitary tumour; presents with sudden loss of pituitary hormones, severe headache, and altered LOC; can be fatal if not recognized and treated early)
- **I**nfiltrative/inflammatory
  - sarcoidosis, hemochromatosis, histiocytosis
- **I**nfectious
  - syphilis, tuberculosis, fungal (histoplasmosis), parasitic (toxoplasmosis)
- **I**njury
  - severe head trauma
- **I**mmunologic
  - autoimmune destruction (hypophysitis)
- **I**atrogenic
  - following surgery or radiation
- **I**diopathic
  - familial forms, congenital midline defects

Clinical Features
- symptoms depend on which hormone is deficient:
  - ACTH: fatigue, weight loss, hypoglycemia, anemia, hyponatremia, failure to thrive, and delayed puberty in children
  - GH: short stature in children; adults exhibit increased fat and decreased lean body mass, decreased BMD, fatigue
  - TSH: tiredness, cold intolerance, constipation, weight gain
  - LH and FSH: oligo- or amenorrhea, infertility, decreased facial/body hair and muscle mass in men, erectile dysfunction, delayed puberty
  - Prolactin: usually asymptomatic, inability to breastfeed
  - ADH: symptoms of DI (extreme thirst, polydipsia, hypernatremia)
  - Oxytocin: usually asymptomatic – only needed during labour and breastfeeding

Investigations
- insulin tolerance test: insulin (usual dose 0.1 unit/kg of human regular insulin) ➔ hypoglycemia ➔ increased GH and cortisol (normal response)
- triple bolus test
  - stimulates release of all anterior pituitary hormones in normal individuals
  - rapid sequence of IV infusion of insulin, GnRH, and TRH
  - insulin (usual dose 0.1 unit/kg of human regular insulin) ➔ hypoglycemia ➔ increased GH and cortisol
  - GnRH (100 µg IV push) ➔ increased LH and FSH
  - TRH (200 µg IV push over 120 s) ➔ increased TSH and PRL (no longer available in Canada)
  - GnRH and TRH stimulation tests are very limited in their utility

Thyroid

Thyroid Hormones



DIT = diiodotyrosine; L = lysosome; MIT = monoiodotyrosine; Tg = thyroglobulin; NIC = sodium iodide cotransporter; TP = thyroid peroxidase enzyme

Figure 12. Thyroid hormone synthesis

Synthetic Function of the Thyroid Gland

- the synthesis of thyroid hormones T_4 and T_3 by the thyroid gland involves trapping and oxidation of iodide, iodination of thyroglobulin, proteolysis of thyroglobulin, and release of T_4 and T_3
  - more than 90% of thyroid hormone secreted by the thyroid is T_4
- free T_4 (0.02%) and free T_3 (0.3%) represent the hormonally active fraction of thyroid hormones
  - the remaining fraction is bound to thyroxine binding globulin (TBG), albumin, and transthyretin, and is biologically inactive
- T_3 is more biologically active (~4X as potent as T_4), but T_3 is present in the blood in smaller quantities and has a shorter half-life compared to T_4
- 85% of T_4 is converted to T_3 or reverse T_3 (RT_3) in the periphery by deiodinase enzymes
- reverse T_3 is metabolically inactive but produced in times of stress to decrease metabolic activity
- most of the plasma T_3 pool is derived from the peripheral conversion of T_4
- calcitonin, a peptide hormone, is also produced in the thyroid by the parafollicular cells or C cells
  - calcitonin functions by inhibiting osteoclast activity and increasing renal calcium excretion

Role of Thyroid Hormones

- thyroid hormones act primarily through modifying gene transcription by binding to nuclear receptors
- action of these hormones is diffuse, affecting nearly every organ system
- thyroid hormones have different tissue-specific effects determined by the expression of the types of thyroid receptor isoform and the local production of T_3
- they increase the basal metabolic rate including: increased Na^+/K^+ ATPase activity, increased O_2 consumption, increased respiration, heat generation, and increased cardiovascular activity
- when present at higher than normal levels they potentiate the actions of GH, catecholamines (epinephrine, norepinephrine), glucagon, and cortisol, resulting in increased gluconeogenesis, ketogenesis, and proteolysis, mimicking what happens in starvation
- they increase sensitivity to catecholamines by up-regulating their receptors, but do not alter their blood concentrations
- thyroid hormones are required for normal growth in the fetus and child, including the CNS, via stimulation of GH release, in synergism with cortisol

Extra-Thyroidal Factors Impacting Thyroid Hormone Homeostasis: A Review
JRM 2015;4(1):40-49

- Most peripheral thyroid metabolism occurs in the liver and kidneys, thus severe liver disease and CKD can significantly alter the T3:T4 ratio.
- Alcohol dependence results in hypothalamic-pituitary-thyroid axis dysfunction demonstrated by decreased TSH, T4, and T3 levels.
- Smoking is associated with lower TSH levels in a dose-dependent manner, with heavy smoking (8-12 cigarettes/d) being associated with more TSH suppression than light smokers (<4 cigarettes/d).
- Heavy metal exposure including lead, mercury, and cadmium has been shown to alter thyroid hormone function and peripheral metabolism.

Patterns of Hormone Levels

	TSH	T_3, T_4
1° Hyper	↓	↑
2° Hyper	↑	↑
1° Hypo	↑	↓
2° Hypo	↓	↓

Regulation of Thyroid Function
- extrathyroid
  - stimulation of thyroid by TSH, epinephrine, prostaglandins (cAMP stimulators); T_3 negatively feeds back on anterior pituitary to inhibit TSH and on hypothalamus to inhibit TRH
- T_3 intrathyroid (autoregulation)
  - synthesis (Wolff-Chaikoff effect, Jod-Basedow effect)
  - varying thyroid sensitivity to TSH in response to iodide availability
  - increased ratio of T_3 to T_4 in iodide deficiency
  - increased activity of peripheral 5' deiodinase in hypothyroidism increases T_3 production despite low T_4 levels

Tests of Thyroid Function and Structure

TSH
- third generation TSH is the best test for assessing thyroid function
- hyperthyroidism
  - primary: TSH is low because of negative feedback from increased levels of circulating T_4 and T_3
  - secondary: increased TSH results in increased T_4 and T_3
- hypothyroidism
  - primary: increased TSH (most sensitive test) because of less negative feedback from T_4 and T_3
  - secondary: TSH is low or inappropriately normal with variable response to TRH depending on the site of the lesion (pituitary or hypothalamic)

Free T_4 and Free T_3
- standard assessment of thyroid function measures TSH and, if necessary, free T_4. Free T_3 should only be measured in the small subset of patients with hyperthyroidism and suspected T_3 toxicosis. In this case, TSH would be suppressed, free T_4 normal, and free T_3 elevated

Thyroid Autoantibodies
- thyroglobulin antibodies (TgAb), anti-thyroid peroxidase antibodies (TPOAb), and TSH receptor antibodies (TRAb) of the blocking variety are increased in Hashimoto's disease; normal variant in 10-20% of individuals
- TRAb of the stimulating variety are also referred to as thyroid stimulating immunoglobulins (TSI) and can cause Graves' disease. Both TRAb receptor blocking and stimulating antibodies are seen in patients with Graves' disease

Plasma Thyroglobulin
- used to monitor for residual thyroid tissue post-thyroidectomy, e.g. tumour marker for thyroid cancer recurrence
- detectable or elevated levels may suggest persistent, recurrent, or metastatic disease
  - assay can be impacted by presence of TgAb therefore both must be tested to ensure accurate thyroglobulin results

Serum Calcitonin
- not routinely done to investigate thyroid nodules
- ordered if suspicion of MTC (e.g. in patients with a thyroid nodule and suspected or confirmed MEN 2A or 2B syndromes or those who have a pathogenic mutation in RET)
- used to monitor for residual or recurrent MTC

Thyroid Imaging/Scans
- normal gland size 15-20 g (estimated by palpation)
- thyroid U/S
  - to measure size of gland, characterize thyroid nodules, facilitate fine needle aspirate biopsy (FNAB)
  - U/S is the first line tool for identification of thyroid nodules that require FNAB; exception is hyperthyroid patients with thyroid nodules where use of a radioisotope thyroid scan and RAIU (see below) permits identification of hyperfunctioning nodules, which generally do not need to be biopsied
- radioisotope thyroid scan (Technetium-99) only if 1) one or more thyroid nodule(s) and 2) patient is hyperthyroid to determine whether nodules are hot (functioning → excess thyroid hormone production) or cold (non-functioning)
- hot nodule → very low chance of malignancy; treat hyperthyroidism
- cold nodule → further workup required (U/S, then FNAB if concerning sonographic features)
- radioactive iodine uptake (RAIU)
  - test of function: order if patient is thyrotoxic
  - RAIU measures the turnover of iodine by thyroid gland *in vivo*
  - if ↑ uptake (e.g. incorporated), gland is overproducing thyroid hormone (hyperthyroid)
  - if ↓ uptake (e.g. not incorporated), gland is leaking thyroid hormone (e.g. thyroiditis), exogenous thyroid hormone use, or excess iodine intake (e.g. amiodarone or contrast dye, which has high iodine content)
- see Figure 12, E25 for further information regarding the utility of these scans

Thyroid Assessment
- TSH
- Serum free thyroid hormones (T_4, T_3)
- Antibodies (TRAb, TgAb, and TPOAb)
- Thyroglobulin (to monitor thyroid cancer)
- Thyroid U/S when there is a palpable thyroid abnormality or suspected thyroid mass
- Nuclear uptake and scan (for hyperthyroidism)
- Biopsy (FNA) of thyroid nodules warranting a cytological evaluation

Does this Patient have a Goitre?
From The Rational Clinical Examination
JAMA 2009; https://jamaevidence.mhmedical.com/content.aspx?bookid=845&sectionid=61357508
Study: Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of a goitre.
Results: Clinical diagnosis was based on degree of lateral prominence, visibility, and palpability of the thyroid gland. No evidence exists to support the superiority of any one method.
The combined results of 4 studies detail the predictive utility of assessing grades of thyroid gland weight:

Weight	Reference	LR+	95% CI
0-20 g	Normal	0.15	(0.10-0.21)
20-40 g	1-2x	1.9	(1.1-3.0)
>40 g	>2x	25.0	(2.6-175)

Alternatively, defining a goitre as a mass larger than the distal phalanx of the thumb has been shown to have an LR+ of 3.0 (95% CI 2.5-3.5) and LR- of 0.30 (95% CI 0.24-0.37) in children, and an LR+ of 4.7 (95% CI 3.6-6.0) and LR- of 0.08 (95% CI 0.02-0.27) for the presence of a goitre.
Conclusions: Use of weight of thyroid tissue is an appropriate method of diagnosing a goitre, while comparing the size of the thyroid mass to the distal phalanx of the thumb may be a useful alternative.

Thyroid Biopsy
- fine needle aspiration (FNA) for cytology
  - differentiates between benign and malignant disease
  - best done under U/S guidance
  - accuracy decreased if nodule is greater than 50% cystic, or if nodule located posteriorly in the gland

Table 15. Summary of Diagnostic Testing in Hyperthyroidism and Hypothyroidism

	Hyperthyroidism	Hypothyroidism
TSH	Decreased in 1° hyperthyroidism Increased in 2° hyperthyroidism	Increased in 1° hypothyroidism Decreased in 2° hypothyroidism
Free T_4	Increased in 1° hyperthyroidism Increased in 2° hyperthyroidism	Decreased in 1° hypothyroidism Decreased in 2° hypothyroidism
Antibodies	Graves': TRAb (thyroid receptor antibody)	Hashimoto's: antithyroid peroxidase, thyroglobulin (TPOAb, TgAb)
RAIU	Increased uptake Graves' Toxic multinodular goitre Toxic adenoma	Decreased uptake Subacute thyroiditis Recent iodine load Exogenous thyroid hormone
Radioisotope Thyroid Scan	Graves': homogenous diffuse uptake Multinodular goitre: heterogeneous uptake Toxic adenoma: single intense area of uptake with suppression elsewhere	

Drugs Affecting Thyroid Function

Thyroid 2010;20(7):763-770
- Lithium plays an inhibitory role in thyroid hormone release, resulting in clinical hypothyroidism and goitre.
- Amiodarone-Induced Hypothyroidism (AIH): Amiodarone, a class III anti-arrhythmic drug, contains 2 atoms of iodine per molecule and is structurally similar to thyroid hormones, and may exert antagonistic effects on TSH receptors. It is also shown to inhibit type I deiodinases resulting in high T4 and low T3 levels. Amiodarone-induced hypothyroidism occurs in 5-15% of patients on amiodarone. AIH can also occur in people without pre-existing thyroid dysfunction.
- Amiodarone-Induced Thyrotoxicosis (AIT): occurs in 2-12% of patients on amiodarone. This may be due to either an increased iodine load in patients with a previously autonomous thyroid such as in Graves' disease and toxic multinodular goitre (AIT type I) or amiodarone-induced destructive thyroiditis (AIT type II).

Thyrotoxicosis

Definition
- clinical, physiological, and biochemical findings in response to elevated thyroid hormone

Epidemiology
- 1% of general population have hyperthyroidism
- F:M=5:1

Etiology and Pathophysiology

Table 16. Differential Diagnosis of Thyrotoxicosis

Disorder	TSH	Free T_4/T_3	Thyroid Antibodies	RAIU	Other
HYPERTHYROIDISM					
Graves' Disease	Decreased	Increased	TRAb	Increased	Homogenous uptake on scan
Toxic Nodular Goitre	Decreased	Increased	None	Increased	Heterogeneous uptake on scan
Toxic Nodule	Decreased	Increased	None	Increased	Intense uptake in hot nodule on scan with suppressed uptake in the rest of the gland
THYROIDITIS					
Subacute, Silent, Postpartum	Decreased	Increased	Up to 50% of cases (TPO, Tg)	Decreased (increases once entering hypothyroid phase, when TSH rises)	In classical subacute painful thyroiditis, ESR increased
EXTRATHYROIDAL SOURCES OF THYROID HORMONE					
Endogenous (struma ovarii, ovarian teratoma, metastatic follicular carcinoma)	Decreased	Increased	None	Decreased	Low thyroglobulin since endogenous thyroid hormone production suppressed
Exogenous (drugs)	Decreased	Increased (T_4 would be decreased if taking T_3)	None	Decreased	
EXCESSIVE THYROID STIMULATION					
Pituitary Thyrotropinoma	Increased or inappropriately normal	Increased	None	Increased	Pituitary mass; possible PRL or GH excess
Pituitary Thyroid Hormone Receptor Resistance	Increased or normal	Increased	None	Increased	Abnormal THRB gene analysis
Increased hCG (e.g. pregnancy)	Decreased	Increased	None	Test is contraindicated in pregnancy	

Signs and Symptoms of HYPERthyroidism

Tremor
Heart rate up
Yawning (fatigue due to insomnia)
Restlessness
Oligomenorrhea/amenorrhea
Intolerance to heat
Diarrhea
Irritability
Sweating
Muscle wasting/weight loss

Common Etiologies

Thyrotoxicosis	Hypothyroidism
Graves' Disease	Hashimoto's
Toxic Nodular Goitre	Congenital
Toxic Nodule	Iatrogenic (thionamides, radioactive iodine, or surgery)
Hyperthyroid phase of thyroiditis	Hypothyroid phase of thyroiditis

Clinical Features

Table 17. Clinical Features of Thyrotoxicosis

General	**Fatigue, heat intolerance, irritability, fine tremor**
CVS	Tachycardia, atrial fibrillation, palpitations Elderly patients may have only cardiovascular symptoms, commonly new onset atrial fibrillation
GI	Weight loss with increased appetite, thirst, increased frequency of bowel movements (hyperdefecation)
Neurology	Proximal muscle weakness, hypokalemic periodic paralysis (more common in Asian individuals)
GU	Oligomenorrhea, amenorrhea, decreased fertility
Dermatology	Fine hair, moist and warm skin, vitiligo, soft nails with onycholysis (Plummer's nails), palmar erythema, pruritus Graves' disease: clubbing (acropachy), pretibial myxedema (rare)
MSK	Decreased bone mass, proximal muscle weakness
Hematology	Graves' disease: leukopenia, lymphocytosis, splenomegaly, lymphadenopathy (occasionally)
Eye	Graves' disease: lid lag, retraction, proptosis, diplopia, decreased acuity, puffiness, conjuctival injection NOTE: Lid lag is a reflection of a hyperadrenergic state and can be present in any form of thyrotoxicosis

Treatment

- β-blockers for control of adrenergic symptoms
- antithyroidals (thionamides): propylthiouracil (PTU) or methimazole (MMI); MMI recommended (except in first trimester pregnancy due to aplasia cutis); block thyroid hormone production
  - antithyroidals to prepare patients with endogenous hyperthyroidism for surgery, for patients with Graves' disease, and for patients with toxic nodules who do not wish to have definitive treatment with radioactive iodine or surgery
- radioactive iodine thyroid ablation for Graves' disease and toxic nodules/adenoma
- surgery in the form of hemi, subtotal, or complete thyroidectomy for toxic nodules
- surgery in the form of total thyroidectomy for Graves' disease

Graves' Disease

Definition

- an autoimmune disorder characterized by autoantibodies that stimulate the TSH receptor leading to hyperthyroidism

Epidemiology

- most common cause of hyperthyroidism
- occurs at any age with peak in 3rd and 4th decade
- F:M=7:1, 1.5-2% of U.S. women
- familial predisposition: 15% of patients have a close family member with Graves' disease and 50% have family members with positive circulating antibodies
- association with HLA-B8 and DR3
- may be associated with other autoimmune disorders (e.g. pernicious anemia, Hashimoto's disease)

Etiology and Pathophysiology

- autoimmune disorder due to breakdown in thyroid tolerance likely due to a combination of factors including autoreactive B lymphocytes and an imbalance favouring a TH2 vs. TH1 immune response
- B lymphocytes produce thyroid-stimulating immunoglobulin (TSI) that binds and stimulates the TSH receptor, and thus, the thyroid gland
- immune response can be triggered by postpartum state, iodine excess, viral or bacterial infections, glucocorticoid withdrawal
- ophthalmopathy (thyroid associated orbitopathy) is a result of increased connective and extraocular muscle tissue volume due to inflammation and accumulation of glycosaminoglycans, stimulated by TSI, that increase osmotic pressure within the orbit; this leads to fluid accumulation and forward displacement of the eyeball
- dermopathy (pretibial or localized myxedema) may be related to cutaneous glycosaminoglycan deposition

Clinical Features

- signs and symptoms of thyrotoxicosis
- diffuse goitre ± thyroid bruit secondary to increased blood flow through the gland
- ophthalmopathy: proptosis, diplopia, conjunctival injection, corneal abrasions, periorbital puffiness, lid lag, decreased visual acuity (plus signs of hyperthyroidism: lid retraction, characteristic stare)
- dermopathy (rare): pretibial myxedema (thickening of dermis that manifests as non-pitting edema)
- acropachy: clubbing and thickening of distal phalanges

Graves' Ophthalmopathy

NO SPECS (in the usual order of changes)
No signs
Only signs: lid lag, lid retraction
Soft tissue: periorbital puffiness, conjuctival injection, chemosis
Proptosis/exophthalmos
Extraocular (diplopia)
Corneal abrasions (since unable to close eyes)
Sight loss

Other Medications Used in the Treatment of Graves'

Glucocorticoids have been useful in the treatment of severe Graves' hyperthyroidism and thyroid storm, by inhibiting the conversion of peripheral T_4 to T_3

Lithium can also be used to treat Graves' hyperthyroidism. It acts by blocking thyroid hormone release, but its toxicity has limited its use in practice

Investigations
- low TSH
- increased free T_4 (and/or increased T_3)
- positive for TRAb (sensitivity and specificity of third-generation TRAb tests that are available currently is over 98% allowing their use for determining the etiology of hyperthyroidism)
- increased radioactive iodine (I-131) uptake
- homogeneous uptake on thyroid scan

Treatment
- treatment for Graves' disease includes thionamides, RAI, or surgery. These treatment options are not mutually exclusive. Patients who start with medical management may eventually require a definitive treatment with RAI or surgery
- thionamides (antithyroid medications): propylthiouracil (PTU) or methimazole (MMI). In 2020, PTU became unavailable in Canada and it is unclear whether it will be available in the future
  - PTU and MMI inhibit thyroid hormone synthesis by inhibiting peroxidase-catalyzed reactions, thereby inhibiting organification of iodide, blocking the coupling of iodotyrosines
  - PTU also inhibits peripheral deiodination of T_4 to T_3
  - treat for approximately 12-18 mo aiming for a normal TSH and TRAb prior to consideration of treatment discontinuation
  - small goitre, mild hyperthyroidism, and low TRAb titres are good predictors for long-term remission with medical therapy
  - remission (normal thyroid indices one yr after discontinuation of PTU or MMI) rates range between 20-50% following 12-18 mo of antithyroid medication
  - major side effects: hepatotoxicity (cholestasis, hepatitis), agranulocytosis, vasculitis
  - minor side effects: minor rash, pruritus
  - MMI preferred vs. PTU due to longer duration of action (once daily dosing for most), more rapid resolution of hyperthyroidism, and lower incidence of side effects
  - in pregnancy: use PTU during first 16 wk of pregnancy and MMI after. MMI is contraindicated in the first trimester due to risk of aplasia cutis; MMI is preferred in the second and third trimester due to the potential risk of hepatotoxicity with PTU in the second and third trimesters
- symptomatic treatment with β-blockers
- thyroid ablation with radioactive I-131 if PTU or MMI trial does not produce disease remission or patient prefers definitive treatment with RAI
  - high incidence of hypothyroidism after I-131 requiring lifelong thyroid hormone replacement
  - contraindicated in pregnancy
  - may worsen ophthalmopathy; concurrent treatment with prednisone if high risk for or if ophthalmopathy present
- total or near total thyroidectomy (indicated for large goitres, suspicious nodule for cancer, if patient is intolerant to thionamides and declines/is not a candidate for RAI ablation, women who wish to conceive in the near future warranting rapid control of hyperthyroidism, uncontrolled hyperthyroidism not responding to anti-thyroid drugs in pregnancy (surgery safest in second trimester), patient preference)
  - risks: permanent hypothyroidism, hypoparathyroidism, and vocal cord palsy due to potential laryngeal nerve damage
- ophthalmopathy/orbitopathy
  - smoking cessation is important
  - prevent drying of eyes and ulceration of cornea by using artificial tears during the day and lubricants at night
  - high dose prednisone or IV methylprednisolone in severe cases
  - high dose glucocorticoids preferably IV as well as potential orbital decompression surgery for sight threatening orbitopathy
  - orbital radiation, surgical decompression

Prognosis
- course involves remission and exacerbation unless gland is destroyed by radioactive iodine or surgery
- total and subtotal thyroidectomy are rapid cures with low-risk of recurrence (2% and 10%, respectively)
- radioactive iodine is less invasive than surgery, but also results in permanent hypothyroidism and requires precautions in contacts several days after treatment
- medical therapy with thionamides is not invasive, but has high recurrence rate at ~50%
- lifetime follow-up needed

Caution with Thionamides
These drugs are highly effective inhibitors of thyroid hormone synthesis, inducing permanent remission in 20-30% of patients with Graves' disease. They are most often employed to achieve a euthyroid state before definitive treatment. Adverse effects include teratogenicity, agranulocytosis, hepatotoxicity, and ANCA-positive vasculitis

Subacute Thyroiditis (Thyrotoxic Phase)

- there are two main types: painful (de Quervain's) and painless (silent)

Table 18. Painful vs. Painless Subacute Thyroiditis

	Painful Thyroiditis (de Quervain's, granulomatous)	Painless Thyroiditis (silent, autoimmune)
Pathophysiology	Presumed to be caused by viral infection or postviral inflammatory process Strongly associated with HLA-D35 Thyroid inflammation damages thyroid follicles, resulting in release of large amounts of T_4 and T_3 until stores are exhausted State of hypothyroidism often persists until thyroid can generate sufficient thyroid hormones	Considered variant of Hashimoto's thyroiditis Associated with HLA-DR3 Postpartum subtype occurs following pregnancy Also caused by inflammatory damage leading to unregulated release of T_4 and T_3 into circulation
Clinical Features	Painful swelling of the thyroid (may radiate to jaw and ears), transient vocal cord paresis, malaise, fatigue, myalgia, fever Often preceded by URTI Painful condition lasts for a week to few months Signs of hyperthyroidism during hyperthyroid phase (palpitations, tachycardia, stare)	Thyroid enlargement without discomfort in association with the typical thyroid function test abnormalities consisting of hyperthyroidism, hypothyroidism, and recovery Signs of hyperthyroidism during hyperthyroid phase (palpitations, tachycardia, stare) Affects women more than men
Laboratory Investigations	Initial elevated T_4 and T_3 Near absent RAIU ESR and CRP often elevated	Initial elevated T_4 and T_3 Near absent RAIU
Treatment	NSAID/prednisone for pain β-adrenergic blockage is usually effective in reversing most of the hypermetabolic and cardiac symptoms If symptomatically hypothyroid, may treat short-term with thyroxine	β-adrenergic blockage is usually effective in reversing most of the hypermetabolic and cardiac symptoms If symptomatically hypothyroid, may treat short-term with thyroxine
Prognosis	Complete spontaneous recovery to normal thyroid function in 90% of patients 10% of patients may become hypothyroid and require permanent replacement	10% of patients may become permanently hypothyroid At risk of recurrent episodes of thyroiditis

Toxic Adenoma/Toxic Multinodular Goitre

Etiology and Pathophysiology

- autonomous thyroid hormone production from a functioning adenoma that is hypersecreting T_4 and T_3
- may be singular (toxic adenoma) or multiple (toxic multinodular goitre (Plummer's disease))

Clinical Features

- multinodular goitre
- tachycardia, heart failure, arrhythmia, weight loss, nervousness, weakness, tremor, and sweats
- local neck compressive symptoms such as dysphagia, dysphonia, or dyspnea may be present with large goitres
- seen most frequently in elderly people as opposed to Graves' disease which is more common in younger individuals

Investigations

- low TSH, high free T_4 and free T_3
- thyroid scan with increased RAIU in nodule(s) and suppression of the remainder of the gland

Treatment

- use high dose radioactive iodine (I-131) to ablate hyperfunctioning nodules
- β-blockers often necessary for symptomatic treatment prior to definitive therapy
- surgical excision may also be used as first-line treatment
- initiate therapy with PTU or MMI to attain euthyroid state in individuals who do not wish to have definitive treatment of their disease, in preparation for thyroidectomy, or prior to RAI in patients at risk for complications due to exacerbation of hyperthyroidism following RAI such as the elderly with cardiovascular disease

Thyrotoxic Crisis/Thyroid Storm

Definition

- medical emergency – acute exacerbation of all of the symptoms of thyrotoxicosis presenting in a life-threatening state secondary to uncontrolled hyperthyroidism
- rare, but serious with mortality rate between 10-30%

Etiology and Pathophysiology
- often precipitated by infection, trauma, or surgery in a hyperthyroid patient

Differential Diagnosis
- sepsis, pheochromocytoma, malignant hyperthermia, drug overdose, neuroleptic malignant syndrome

Clinical Features
- hyperthyroidism
- extreme hyperthermia (≥40°C), tachycardia, vomiting, diarrhea, hepatic failure with jaundice, atrial fibrillation, congestive heart failure
- CNS manifestations including agitation, delirium, psychosis, lethargy, seizures, coma

Laboratory Investigations
- increased free T_4 and T_3, undetectable TSH
- ± anemia, leukocytosis, hyperglycemia, hypercalcemia, elevated LFTs

General Measures
- fluids, electrolytes, and vasopressor agents should be used as indicated
- a cooling blanket and acetaminophen can be used to treat the pyrexia
- propranolol or other β-blockers can additionally be used, but should be used with caution in patients with decompensated heart failure as they may worsen condition
  - propranolol is frequently used because it decreases peripheral conversion of $T_4 \rightarrow T_3$

Specific Measures
- PTU is the anti-thyroid drug of choice and is used in high doses (200 mg q4 h)
- give iodide, which acutely inhibits the release of thyroid hormone, 1 h after the first dose of PTU is given
  - sodium iodide 1 g IV drip over 12 h q12 h
    OR
  - Lugol's solution 10 drops q8 h
    OR
  - potassium iodide (SSKI) 5 drops q6 h
- hydrocortisone 100 mg IV q8 h or dexamethasone 2-4 mg IV q6 h for the first 24-48 h; inhibits peripheral conversion of $T_4 \rightarrow T_3$

Hypothyroidism

Definition
- clinical syndrome caused by insufficient thyroid hormone production

Epidemiology
- 2-3% of general population
- F:M=10:1
- 10-20% of women >50 have subclinical hypothyroidism (normal T_4, TSH mildly elevated)
- iodine deficiency is the most common cause worldwide, but not in North America

Etiology and Pathophysiology
- primary hypothyroidism (90%)
  - inadequate thyroid hormone production due to an intrinsic thyroid defect
  - iatrogenic: post-ablative (I-131 or surgical thyroidectomy)
  - autoimmune: Hashimoto's thyroiditis
  - hypothyroid phase of subacute thyroiditis
  - drugs: goitrogens (iodine), PTU, MMI, lithium
  - infiltrative disease (progressive systemic sclerosis, amyloid)
  - iodine deficiency
  - congenital (1/4000 births)
  - neoplasia
- secondary hypothyroidism: pituitary hypothyroidism
  - insufficiency of pituitary TSH
- tertiary hypothyroidism: hypothalamic hypothyroidism
  - decreased TRH from hypothalamus (rare)
- peripheral tissue resistance to thyroid hormone (Refetoff syndrome)

Factors Affecting Gastrointestinal Absorption of Levothyroxine: A Review
Clin Ther 2017;39(2):378-403
- GI disorders such as celiac disease, atrophic gastritis, lactose intolerance, H. pylori infection may impede levothyroxine absorption.
- Drugs decreasing stomach acidity have been shown to significantly reduce exogenous thyroid hormone absorption from the GI tract. These include: proton-pump inhibitors, H2 receptor antagonists, calcium carbonate, sucralfate, and aluminum hydroxide.
- Iron citrate is shown to reduce intestinal absorption of levothyroxine.
- Food, especially soybeans and coffee, have been shown to reduce absorption of levothyroxine significantly.
- Roughly 80% of levothyroxine is absorbed within 3 h after administration of the drug. Thus, patients should be educated to take levothyroxine on empty stomach at least one hour prior to eating breakfast.

Table 19. Interpretation of Serum TSH and Free T_4 in Hypothyroidism

	Serum TSH	Free T_4
Overt Primary Hypothyroidism	Increased	Decreased
Subclinical Primary Hypothyroidism	Increased	Normal
Secondary Hypothyroidism	Decreased or not appropriately elevated	Decreased

Clinical Features

Table 20. Clinical Features of Hypothyroidism

General	Fatigue, cold intolerance, slowing of mental and physical performance, hoarseness, macroglossia
CVS	Pericardial effusion, bradycardia, hypotension, worsening CHF + angina, hypercholesterolemia, hyperhomocysteinemia, myxedema heart
Respiratory	Decreased exercise capacity, hypoventilation secondary to weak muscles, decreased pulmonary responses to hypoxia, sleep apnea due to macroglossia
GI	Weight gain despite poor appetite, constipation
Neurology	Paresthesia, slow speech, muscle cramps, delayed deep tendon reflex relaxation ("hung reflexes"), carpal tunnel syndrome, asymptomatic elevated CK, seizures
GU	Menorrhagia, amenorrhea, impotence, pre-menopausal abnormal vaginal bleeding
Dermatology	Facial puffiness, periorbital edema, cool and pale, dry and rough skin, dry and coarse hair, eyebrows thinned (lateral 1/3), discolouration (carotenemia)
Hematology	Anemia: 10% pernicious due to presence of anti-parietal cell antibodies with Hashimoto's thyroiditis

Treatment
- L-thyroxine (dose range: 0.05-0.2 mg PO once daily, up to 1.6 µg/kg/d)
- elderly patients and those with CAD: start at 0.025 mg daily and increase gradually every 6 wk (start low, go slow)
- after initiating L-thyroxine, TSH needs to be evaluated in 6 wk; adjust dose until TSH returns to normal reference range
- once maintenance dose achieved, follow up TSH with patient annually
- secondary/tertiary hypothyroidism: monitor via measurement of free T_4 (TSH is unreliable in this setting)

CONGENITAL HYPOTHYROIDISM
- see Paediatrics, P34

Hashimoto's Thyroiditis

Definition
- most common form of primary hypothyroidism in North America
- chronic autoimmune thyroiditis characterized by both cellular and humoral factors in the destruction of thyroid tissue
- two major forms: goitrous and atrophic; both forms share same pathophysiology but differ in the extent of lymphocytic infiltration, fibrosis, and thyroid follicular cell hyperplasia
- goitrous variant usually presents with a small, rubbery goitre and euthyroidism, then hypothyroidism becomes evident
  - associated with fibrosis
- atrophic variant patients are hypothyroid from onset
- risk factor for rare primary thyroid lymphoma

Etiology and Pathophysiology
- defect in a T-suppressor clone leads to cell-mediated destruction of thyroid follicles
- B lymphocytes produce antibodies against thyroid components including thyroglobulin, thyroid peroxidase, TSH receptor, Na^+/I^- symporter

Risk Factors
- F:M=7:1
- genetic susceptibility: increased frequency in patients with Down's syndrome, Turner's syndrome, certain HLA alleles, cytotoxic T-lymphocyte-associated protein 4 (CTLA-4)
- family Hx or personal Hx of other autoimmune diseases
- cigarette smoking
- high iodine intake

Investigations
- high TSH, low T_4 (not necessary to measure T_3 as it will be low as well)
- presence of anti-thyroid peroxidase (TPOAb) and thyroglobulin antibodies (TgAb) in serum

Treatment
- if hypothyroid, replace with L-thyroxine (analog of T_4)

Subclinical Hypothyroidism: A Review
JAMA 2019;322:153-160
Background: Up to 10% of the adult population experiences subclinical hypothyroidism, defined as elevated TSH (>4.4 mU/L) with normal levels of free T_4. The degree of abnormality that warrants management is controversial.
Observations: Subclinical hypothyroidism is most often caused by autoimmune thyroiditis. It may be associated with increased risk of heart failure and CAD events. Further, a substantial portion of patients with subclinical hypothyroidism progress to overt hypothyroidism. Evidence from large RCTs to support levothyroxine therapy in these patients is lacking. The rationale for treatment is therefore based on levothyroxine's potential to prevent CV events and progression to overt hypothyroidism.
Recommendations: Most individuals with subclinical hypothyroidism can be observed without treatment. Candidates for levothyroxine therapy include those with serum TSH levels >10 mU/L and young and middle-aged patients with symptoms of mild hypothyroidism.

Signs and Symptoms of HYPOthyroidism

HIS FIRM CAP
Hypoventilation
Intolerance to cold
Slow HR
Fatigue
Impotence
Renal impairment
Menorrhagia/amenorrhea
Constipation
Anemia
Paresthesia

Myxedema Coma

Definition
- medical emergency – severe hypothyroidism complicated by trauma, sepsis, cold exposure, MI, inadvertent administration of hypnotics or narcotics, and other stressful events
- rare; high level of mortality (up to 40%, despite therapy)

Clinical Features
- decreased mental status and hypothermia are hallmark symptoms
- hyponatremia, hypotension, hypoglycemia, bradycardia, hypoventilation, and generalized non-pitting edema often present

Investigations
- decreased T_4, increased TSH, decreased glucose
- check ACTH and cortisol for evidence of adrenal insufficiency

Treatment
- aggressive and immediate treatment required
- ABCs: ICU admission
- corticosteroids (for risk of concomitant adrenal insufficiency): hydrocortisone 100 mg q8 h
- L-thyroxine 0.2-0.5 mg IV loading dose, then 0.1 mg IV once daily until oral therapy tolerated; also consider T_3 therapy
- supportive measures: mechanical ventilation, vasopressors, passive rewarming, IV dextrose, fluids if necessary (risk of overload)
- monitor for arrhythmia

Non-Thyroidal Illness (Sick Euthyroid Syndrome)

Definition
- changes in the regulation of the hypothalamic-pituitary-thyroid axis, and thyroid hormone metabolism and transport amongst patients with severe illness, trauma, surgery, or starvation
- not due to intrinsic thyroid, pituitary, or hypothalamic disease
- initially low free T_3 may be followed by low TSH and, if severe illness, low free T_4
- with recovery of illness, TSH may become transiently high

Pathophysiology
- abnormalities include alterations in:
  - peripheral transport and metabolism of thyroid hormone
  - regulation of TSH secretion
- may be protective during illness by reducing tissue catabolism

Labs
- initially decreased free T_3 followed by decreased TSH and finally decreased free T_4
- with recovery of illness, TSH may become elevated

Treatment
- treat the underlying disease; thyroid hormone replacement has not shown to be beneficial
- thyroid function tests normalize once patient is well (initially with a transient increase in TSH)

Non-Toxic Goitre

Definition
- generalized enlargement of the thyroid gland in a euthyroid individual that does not result from inflammatory or neoplastic processes

Pathophysiology
- the appearance of a goitre is more likely to present during adolescence, pregnancy, and lactation due to increased thyroid hormone requirements
  - early stages: goitre is usually diffuse
  - later stages: multinodular non-toxic goitre with nodule, cyst formation, and areas of ischemia, hemorrhage, and fibrosis

Etiology
- iodine deficiency or excess
- goitrogens: brassica vegetables (e.g. turnip, cassava)
- drugs: iodine, lithium, para-aminosalicylic acid
- any disorder of hormone synthesis with compensatory growth
- peripheral resistance to thyroid hormone

Treatment
- remove goitrogens
- radioiodine therapy (very high doses required given low iodine uptake, used as last resort in very highly selected cases where the goiter is causing symptoms and surgery is not feasible)
- suppression with L-thyroxine (rarely done)
- surgery may be necessary if severe compressive symptoms develop (rare); patients are often asymptomatic

Complications
- compression of neck structures causing stridor, dysphagia, pain, and hoarseness of voice
- multinodular goitre may become autonomous leading to toxic multinodular goitre and hyperthyroidism

Thyroid Nodules

Definition
- discrete lesion that can be distinguished sonographically from the rest of the thyroid parenchyma
- 19-67% prevalence based on incidentally found nodules on U/S

Etiology
- benign tumours (e.g. follicular adenoma)
- thyroid malignancy
- hyperplastic area in a multinodular goitre
- cyst: true thyroid cyst, area of cystic degeneration in a multinodular goitre

Investigations
- approach to thyroid biopsy depending on U/S characteristics of the nodule
  - benign or very small nodules suspicious for thyroid cancer do not require ongoing surveillance
  - small nodules suspicious for thyroid cancer require up to five years of surveillance
  - larger nodules suspicious for thyroid cancer require biopsy

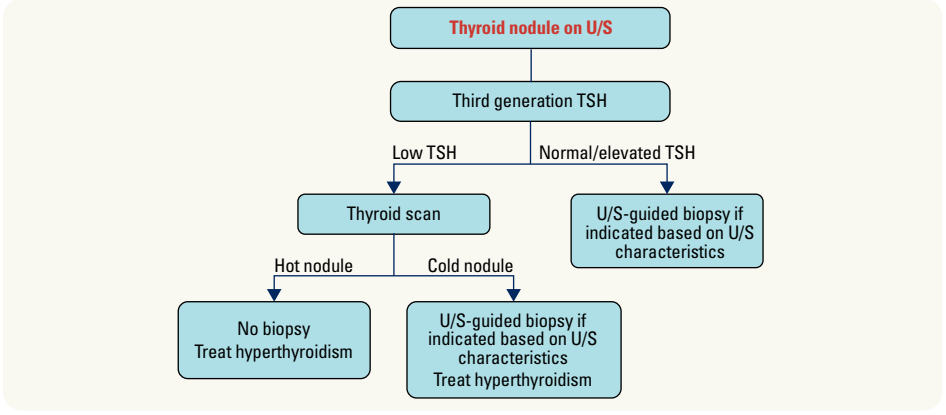


Figure 13. Approach to the evaluation of a thyroid nodule
Adapted from Dr. J Goguen, University of Toronto, MMMD 2013

Thyroid Malignancies

- see Otolaryngology, OT37

Adrenal Cortex

Adrenocorticotropic Hormone

- a polypeptide (cleaved from prohormone POMC), secreted in a pulsatile fashion from the anterior pituitary with diurnal variability (peak: 0200-0400 h; trough: 1800-2400 h)
- secretion regulated by CRH and AVP
- stimulates growth of adrenal cortex and release of glucocorticoids, adrenal androgens and, to a very limited extent, mineralocorticoids
- ACTH can directly bind to MSH receptors on melanocytes, enhancing melanogenesis

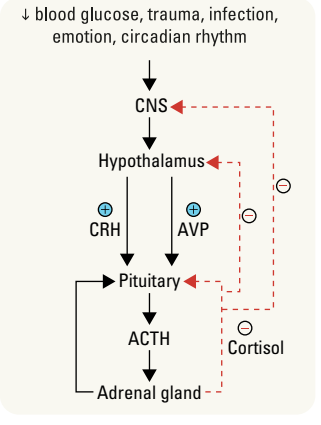

Figure 14. Regulation of CRH-ACTH-adrenal gland axis

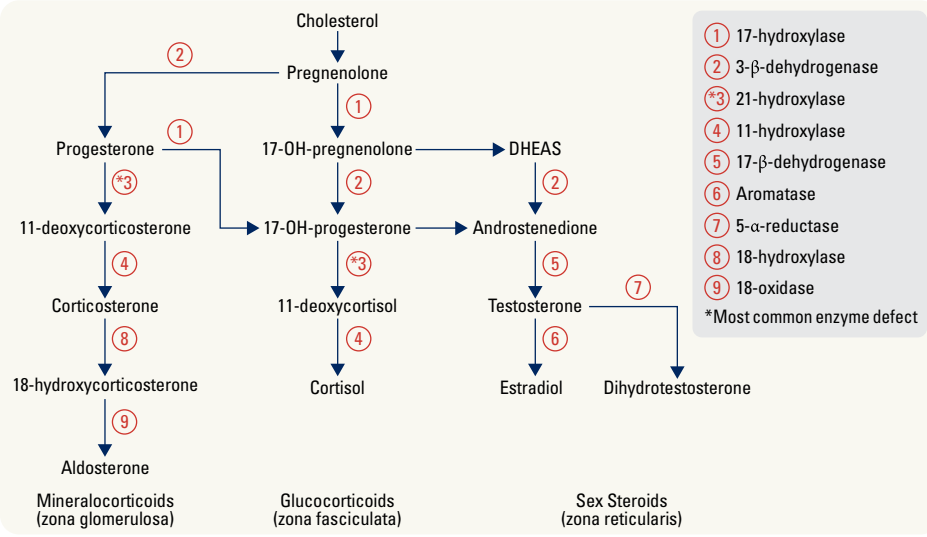
Adrenocortical Hormones

Aldosterone

- a mineralocorticoid which regulates ECFV through Na^+ (and Cl^-) retention and K^+ (and H^+) excretion (stimulates distal tubule Na^+/K^+ ATPase)
- regulated by the RAAS and hyperkalemia
- negative feedback to juxtaglomerular apparatus (JGA) by long loop (aldosterone ↑ volume expansion) and short loop (angiotensin II ↑ peripheral vasoconstriction)



Layers of the Adrenal Cortex

OUTSIDE

Zona Glomerulosa produces mineralocorticoids (aldosterone)

Zona Fasciculata produces glucocorticoids (cortisol)

Zona Reticularis produces androgens (DHEA, androstenedione)

INSIDE

Figure 15. Pathways of major steroid synthesis in the adrenal gland and their enzymes

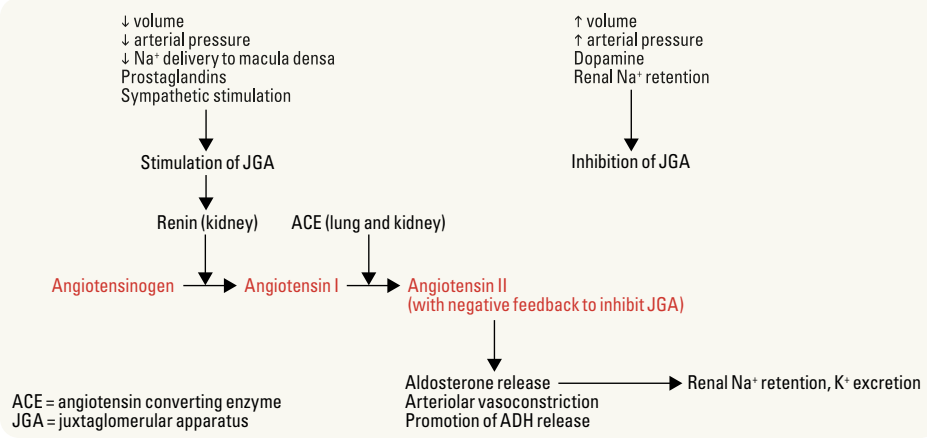


Figure 16. Renin-angiotensin-aldosterone axis (see Nephrology, NP4)

Cortisol

- a glucocorticoid regulated by the HPA axis
- involved in metabolism regulation
- supports blood pressure and vasomotor tone
- also involved in behavioural regulation and immunosuppression

Table 21. Physiological Effects of Glucocorticoids

Stimulatory Effects	Inhibitory Effects
Stimulate hepatic glucose production (gluconeogenesis)	Inhibit bone formation; stimulate bone resorption
Increase insulin resistance in peripheral tissues	Inhibit fibroblasts, causing collagen and connective tissue loss
Increase protein catabolism	Suppress inflammation; impair cell-mediated immunity
Stimulate leukocytosis and lymphopenia	Inhibit growth hormone axis*
Increase cardiac output, vascular tone, Na^+ retention	Inhibit reproductive axis*
Increase PTH release, urine calcium excretion	Inhibit vitamin D_3 and inhibit calcium uptake

*Typically only occurs with cortisol excess

Androgens
- sex steroids regulated by ACTH; primarily responsible for adrenarche (growth of axillary and pubic hair)
- principal adrenal androgens are: DHEA, androstenedione, and 11-hydroxyandrostenedione
- proportion of total androgens (adrenal to gonadal) increases with age

Adrenocortical Functional Workup

STIMULATION TEST
- purpose: diagnose hormone deficiencies
- method: measure target hormone after stimulation with tropic (pituitary) hormone

Tests of Glucocorticoid Reserve
- Cosyntropin (ACTH analogue) Stimulation Test
  - administer 250 µg cosyntropin IV/IM, and measure plasma cortisol levels before and 30 and 60 min after administration
  - physiologic response: stimulated plasma cortisol of >500 nmol/L (>18 µg/dL) at 30 or 60 min
  - inappropriate response: inability to stimulate increased plasma cortisol; peak cortisol levels below 500 nmol/L (18 µg/dL) at 30 or 60 min

SUPPRESSION TESTS
- purpose: diagnose of hormone hypersecretion
- method: measure target hormone after suppression of its tropic (pituitary) hormone

1. Tests of Pituitary-Adrenal Suppressibility
- DXM suppression test
  - principle: DXM suppresses pituitary ACTH, plasma cortisol should be lowered if HPA axis is normal
  - screening test: low-dose overnight DXM suppression test
    - oral administration of 1 mg DXM between 11 pm and midnight, then measure plasma cortisol levels the following day between 8 am and 9 am
    - physiologic response: plasma cortisol <50 nmol (<1.8 µg/dL)
    - inappropriate response: failure to suppress plasma cortisol
    - false positive results due to obesity, depression, alcoholism, medications inducing the metabolism of dexamethasone
  - testing of excess cortisol production
    - elevated 24 h urine free cortisol (shows overproduction of cortisol)
    - midnight salivary cortisol (if available) shows lack of diurnal variation
      - inappropriately remains high, >145 ng/dL (4 nmol/L) (normally will be low at midnight)

2. Tests of Mineralocorticoid Suppressibility
- multiple medications can interfere with the interpretation of screening and confirmatory tests for PA and these may need to be held prior to testing
- positive screen for PA is elevated aldosterone:renin ratio in the presence of high aldosterone
  - there is variability in the interpretation of aldosterone:renin ratio depending on the assays used
- confirmation of PA requires lack of aldosterone suppression: with expansion of ECFV, plasma aldosterone should be lowered
- ECFV Expansion with NS
  - IV infusion of 500 mL/h of NS for 4 h, then measure plasma aldosterone levels
  - plasma aldosterone >277 pmol/L is consistent with PA, <140 pmol/L is normal
  - inappropriate response: failure to suppress plasma aldosterone

Mineralocorticoid Excess Syndromes

Definition
- PA: excess aldosterone production (intra-adrenal cause) (previously called hyperaldosteronism)
- SA: aldosterone production in response to excess RAAS (extra-adrenal cause)

Etiology
- aldosterone-producing adrenal adenoma (Conn's syndrome)
- bilateral or idiopathic adrenal hyperplasia
- glucocorticoid-remediable aldosteronism
- aldosterone-producing adrenocortical carcinoma
- unilateral adrenal hyperplasia
- ectopic aldosterone-producing tumours
- familial hyperaldosteronism (FH) types I-IV

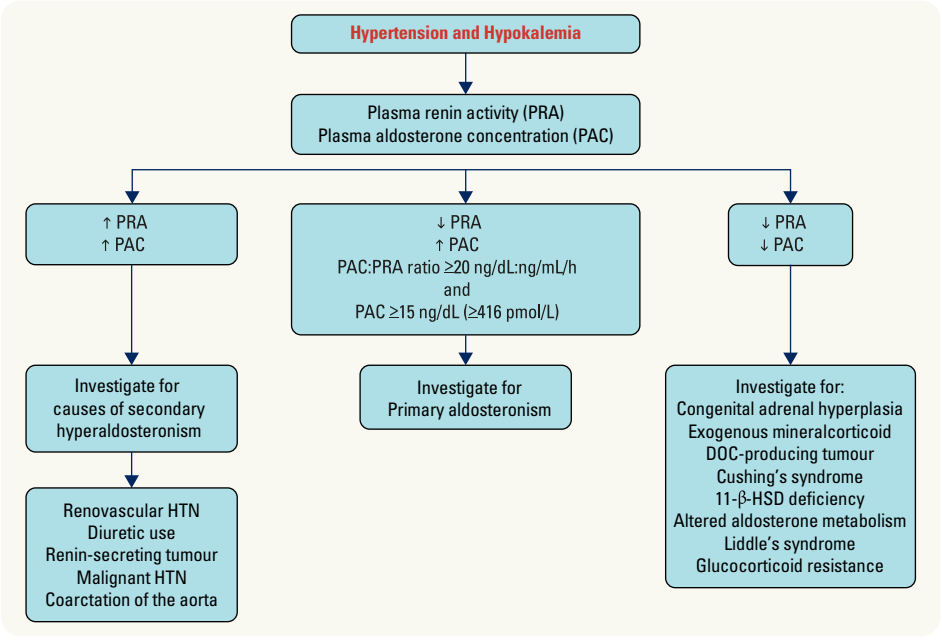

Figure 17. Approach to mineralocorticoid excess syndromes

Clinical Features

- HTN
- hypokalemia (± mild hypernatremia), metabolic alkalosis
- normal K^+, hyponatremia in secondary hyperaldosteronism (low effective circulating volume leads to ADH release)
- increased cardiovascular risk: LV hypertrophy, atrial fibrillation, stroke, and MI
- elevated risk of metabolic syndrome and T2DM
- fatigue, weakness, paresthesia, headache; severe cases present with tetany, intermittent paralysis (only if K^+ <2.5 mEq/L)

Diagnosis

- investigate plasma aldosterone:renin ratio in patients with HTN and hypokalemia, drug resistant HTN, HTN and a first degree relative with PA, HTN and a family history of stoke in a first degree relative ≤40 yr, HTN and adrenal incidentaloma
- confirmatory testing for PA: aldosterone suppression test (demonstrate inappropriate aldosterone secretion with ECF volume expansion), adrenal vein sampling may be required to determine whether there is lateralization of aldosterone excess
- imaging: CT adrenal glands

Table 22. Diagnostic Tests in Hyperaldosteronism

Test	Primary Hyperaldosteronism	Secondary Hyperaldosteronism
Plasma Aldosterone to Renin Ratio (PAC/PRA)	Elevated (↑ aldosterone, ↓ renin)	Normal (↑ aldosterone, ↑ renin)
Salt Loading Test (confirmatory test)		
A) Oral Salt Test	↑ 24 hour urine aldosterone	Not performed
B) IV Saline Test	Plasma aldosterone concentration >277 pmol/L (140-277 indeterminant range)	Not performed

Treatment

- inhibit action of aldosterone: spironolactone, eplerenone, triamterene, amiloride (act on sodium channels)
- surgical excision of adrenal adenoma
- secondary hyperaldosteronism: treat underlying cause

Cushing's Syndrome

Definition
- metabolic disorder caused by chronic glucocorticoid excess

Etiology
- ACTH-dependent (85%) – bilateral adrenal hyperplasia and cortisol hypersecretion due to:
  - ACTH-secreting pituitary adenoma (Cushing's disease; 80% of ACTH-dependent)
  - ectopic ACTH-secreting tumour (e.g. small cell lung carcinoma, bronchial, pancreatic islet cell, pheochromocytoma, or medullary thyroid tumours)
- ACTH-independent (15%)
  - primary adrenocortical tumours: adenoma and carcinoma (uncommon)
  - bilateral adrenal nodular hyperplasia
- iatrogenic Cushing's syndrome is likely more common than endogenous cortisol excess but is infrequently reported; it is ACTH-independent

Clinical Features
- symptoms: weakness, insomnia, mood disorders, impaired cognition, easy bruising, oligo-/amenorrhea, hirsutism, and acne (ACTH dependent)
- signs: central obesity, round face ("moon face"), supraclavicular and dorsal fat pads, facial plethora, proximal muscle wasting, purple abdominal striae, skin atrophy, acanthosis nigricans, HTN, hyperglycemia, osteoporosis, pathologic fractures, hyperpigmentation, hyperandrogenism (if ACTH-dependent)

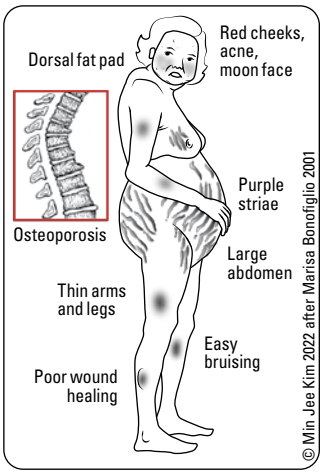

Figure 18. Clinical features of Cushing's syndrome

Diagnosis
- rule out excessive glucocorticoid exposure leading to iatrogenic Cushing's syndrome by conducting a thorough drug history before conducting biochemical testing
- perform one of: 1) 24 h urine free cortisol (≥2 tests), 2) low dose DXM suppression test, or 3) late night salivary cortisol (≥2 tests)
- consider reasons for a false positive (e.g. pregnancy, depression, alcoholism, morbid obesity, poorly controlled DM, glucocorticoid resistance, physical stress, malnutrition, anorexia nervosa, intense chronic exercise, hypothalamic amenorrhea)
- confirm with one of the remaining tests

Treatment
- adrenal
  - adenoma: unilateral adrenalectomy (curative) with glucocorticoid supplementation postoperatively, tapering slowly until HPA axis has recovered
  - carcinoma: adrenalectomy in patients with disease localized to the adrenal, adjunctive mitotane for individuals with high-risk for current disease. Mitotane ± chemotherapy for patients with metastatic disease
  - medical treatment: ketoconazole to reduce cortisol, mitotane can be used – typically reserved for patients with malignant disease
- pituitary
  - transsphenoidal resection, with glucocorticoid supplementation postoperatively
  - if surgery delayed, contraindicated, or unsuccessful, consider medical management e.g. ketoconazole, mitotane, pasireotide, or cabergoline
- ectopic ACTH tumour (paraneoplastic syndrome): usually bronchogenic cancer (poor prognosis) - surgical resection, if possible; chemotherapy/radiation for primary tumour
  - medical treatment with mitotane or ketoconazole to reduce cortisol synthesis. Often required when surgery is delayed, contraindicated, or unsuccessful
- treat comorbidities associated with hypercortisolism

Congenital Adrenal Hyperplasia

- see Paediatrics, P35

Conditions that do Not Represent True Hirsutism
- androgen-independent hair
  - (e.g. lanugo hair)
- drug-induced hypertrichosis
  - (e.g. phenytoin, diazoxide, cyclosporine, minoxidil)
- topical steroid use

Hyperandrogenism

Definition

- state of having excessive secretion of androgens (DHEA, DHEA-sulfate, testosterone)

Etiology and Pathophysiology

Table 23. Etiology of Hyperandrogenism

Medications Androgen-Mediated	Anabolic steroids, ACTH, androgens, progestational agents
Ovarian	PCOS Ovarian hyperthecosis Theca cell tumours Pregnancy: placental sulfatase/aromatase deficiency
Adrenal	Congenital adrenal hyperplasia (CAH, late-onset CAH) Tumours (adenoma, carcinoma)
Pituitary	Cushing's disease – high ACTH Hyperprolactinemia

Clinical Features

Females

- hirsutism
  - male pattern growth of androgen-dependent terminal body hair in women: back, chest, upper abdomen, face, linea alba
  - Ferriman-Gallwey scoring system is used to quantify severity of hirsutism (score of >8 is abnormal for white/black women, ≥9 abnormal for Mediterranean/Hispanic/Middle-Eastern women, ≥2 for Asian women)
    - scores should be interpreted in the context of the specific patient and acknowledge limitations such as the use of cosmetic hair removal
  - scores between 8-15 are mild, 16-25 moderate, and >25 severe hirsutism
- virilization
  - frontal balding, clitoromegaly, increased muscle mass, deepening of the voice
- amenorrhea, ↓ breast size, infertility, anabolic appearance, acne

Conditions that do Not Represent True Hirsutism

- Androgen-independent hair (e.g. lanugo hair)
- Drug-induced hypertrichosis (e.g. phenytoin, diazoxide, cyclosporine, minoxidil)
- Topical steroid use

Males

- minimal effects on hair, muscle mass, etc.
- inhibition of gonadotropin secretion may cause reduction in testicular size, testicular testosterone production, and spermatogenesis

Investigations

- testosterone, DHEA-S as a measure of adrenal androgen production
- LH/FSH (commonly in PCOS >2.5)
- 17-OH progesterone, elevated in CAH due to 21-OH deficiency; check on day 3 of menstrual cycle with a progesterone level
- for virilization: CT/MRI of adrenals and ovaries (identify tumours)
- if PCOS, check blood glucose and lipids

Treatment

- discontinue causative medications (e.g. oral DHEA, valproate, danazol)
- antiandrogens, e.g. spironolactone
- oral contraceptives (increase sex hormone binding globulin, which binds androgens>estrogens; reduces ovarian production of androgens)
- surgical resection of tumour
- glucocorticoid ± mineralocorticoid if CAH confirmed
- treat specific causative disorders, e.g. tumours, Cushing's, etc.
- cosmetic therapy (laser, electrolysis)

Adrenocortical Insufficiency

Definition

- state of inadequate cortisol and/or aldosterone production by the adrenal glands

Etiology

PRIMARY ADRENOCORTICAL INSUFFICIENCY

Table 24. Etiology of Primary Adrenocortical Insufficiency

Autoimmune (70-90%)	Isolated adrenal insufficiency (Addison's Disease) Polyglandular autoimmune syndromes types I and II Antibodies often directed against adrenal enzymes and 3 cortical zones
Infections	Tuberculosis (7-20%) (most common in developing world) Fungal: histoplasmosis, paracoccidioidomycosis HIV, CMV Syphilis African trypanosomiasis
Infiltrative	Metastatic cancer (lung>stomach>esophagus>colon>breast); lymphoma Sarcoidosis, amyloidosis, hemochromatosis
Vascular	Bilateral adrenal hemorrhage (risk increased by heparin and warfarin) Sepsis (meningococcal, Pseudomonas) Coagulopathy in adults or Waterhouse-Friderichsen syndrome in children Thrombosis, embolism, adrenal infarction
Drugs	Inhibit cortisol: ketoconazole, etomidate, megestrol acetate Increase cortisol metabolism: rifampin, phenytoin, barbiturates
Others	Adrenoleukodystrophy and adrenomyeloneuropathy Congenital adrenal hypoplasia (impaired steroidogenesis) Familial glucocorticoid deficiency or resistance Defective cholesterol metabolism

SECONDARY ADRENOCORTICAL INSUFFICIENCY

- inadequate pituitary ACTH secretion
- multiple etiologies (see *Hypopituitarism*, E24), including withdrawal of exogenous steroids

Clinical Features

Table 25. Clinical Features of Primary and Secondary Adrenal Insufficiency (AI)

	Primary AI (Addison's or Acute AI)	Secondary AI
Skin and Mucosa	Dark (palmar crease, extensor surface)	Pale
Potassium	High	Normal
Sodium	Normal or low	Normal or Low
Metabolic Acidosis	Present	Absent
Associated Diseases	Primary hypothyroidism, T1DM, vitiligo	Central hypogonadism or hypothyroidism, growth hormone deficiency, DI
Associated Symptoms	Weakness, fatigue, weight loss, hypotension, salt craving, postural dizziness, myalgia, arthralgia GI: N/V, abdominal pain, diarrhea	Weakness, fatigue, weight loss, hypotension, postural dizziness, myalgia, arthralgia, headaches, visual abnormalities
Diagnostic Test	Cosyntropin Stimulation Test High morning plasma ACTH High renin	Insulin tolerance test Cosyntropin Stimulation Test Low or inappropriately normal morning plasma ACTH

Adapted from: Salvatori R. JAMA 2005;294:2481-2488

Treatment

- acute adrenal crisis – can be life-threatening
  - IV NS 1 L within the first hour followed by continuous IV NS guided by patient requirements; add D5W if hypoglycemic
  - hydrocortisone 100 mg IV stat followed by 50 mg IV q6 h
  - identify and correct precipitating factors
- maintenance
  - hydrocortisone 15-25 mg PO or cortisone acetate 20-35 mg PO total daily dose in 2-3 divided doses, highest dose in the morning
  - prednisolone 3-5 mg once daily or 3-5 mg BID can be used as an alternative to hydrocortisone, especially in patients with reduced compliance
  - Florinef™ (fludrocortisone, synthetic mineralocorticoid) 0.05-0.2 mg PO once daily if mineralocorticoid deficient
  - stress dosing
    - increase dose of steroids 2-3 fold for a few days during moderate-severe illness (e.g. with vomiting, fever)
    - major stress (e.g. surgery, trauma) requires 150-300 mg hydrocortisone IV daily divided into 3 doses
  - medical alert bracelet and instructions for emergency hydrocortisone/dexamethasone IM/SC injection

Adrenal Medulla

Catecholamine Metabolism

- catecholamines are synthesized from tyrosine in postganglionic sympathetic nerves (norepinephrine) and chromaffin cells of adrenal medulla (epinephrine)
- broken down into metanephrines and other metabolites (VMA, HVA) and excreted in urine

ABC of Adrenaline

Adrenaline activates
β-receptors, increasing
Cyclic AMP

Pheochromocytoma/Paraganglioma

Definition

- paragangliomas are rare neuroendocrine tumours that arise from the extra-adrenal autonomic paraganglia (small organs comprised of neuroendocrine cells that secrete catecholamines)
- pheochromocytomas are catecholamine-secreting tumours derived from chromaffin cells of the adrenal gland

Epidemiology

- most commonly a single tumour of adrenal medulla
- rare cause of HTN (<0.2% of all hypertensives)

Etiology and Pathophysiology

- pheochromocytomas and paragangliomas have the greatest genetic inheritance among neuroendocrine tumours
- 30-40% cases are linked to germline mutations, including mutations in the RET, VHL, SDHx, NF1, and SDHAF2 genes
- pheochromocytomas and paragangliomas are divided into clusters: cluster 1 - Pseudohypoxia subtype (FH, VHL/EPAS1-related), cluster 2 - Kinase signaling group (HRAS), cluster 3 - WNT signaling group (CSDE1, UBTF-MAML3 fusion)
- most cases are sporadic; 40% of affected patients have an associated familial disorder. In these patients, the tumours are more likely bilateral adrenal pheochromocytomas/paraganglioma
- hereditary forms present earlier than sporadic cases
- several familial disorders are associated with adrenal pheochromocytoma, all have autosomal dominant inheritance, e.g. multiple endocrine neoplasia type 2 (MEN2) - 50% frequency, von Hippel-Lindau (VHL) syndrome - 10-20% frequency, and less commonly, neurofibromatosis type 1 (NF1) - 0.1-5.7% frequency
- some tumours, via an unknown mechanism, are able to synthesize and release excessive catecholamines

Clinical Features

- 50% suffer from paroxysmal HTN; others have sustained HTN
- classic triad (not found in most patients): episodic "pounding" headache, palpitations/tachycardia, diaphoresis
- other symptoms: tremor, anxiety, chest or abdominal pain, N/V, visual blurring, weight loss, polyuria, polydipsia
- other signs: orthostatic hypotension, papilledema, hyperglycemia, dilated cardiomyopathy
- symptoms may be triggered by stress, exertion, anesthesia, abdominal pressure, certain foods (especially tyramine containing foods – such as aged/strong cheese and cured meats)

Investigations

- urine metanephrines
  - increased catecholamine metabolites (metanephrines) and catecholamines
  - plasma metanephrines, if available (most sensitive)
    - cut-off values will depend on assay used
- CT abdomen
  - if negative, whole body CT and meta-iodo-benzoguanidine (MIBG) scintigraphy, Octreoscan, or MRI

Treatment

- surgical excision of tumour (curative) with careful pre- and postoperative ICU monitoring
- adequate preoperative preparation
  - α-blockade for BP control: doxazosin or phenoxybenzamine (these are the most frequently used alpha blockers) (10-21 d preoperative), IV phentolamine (perioperative, if required)
  - β-blockade if needed for HR control once α blocked for a few days
  - metyrosine (catecholamine synthesis inhibitor) + alpha blocker
  - volume restoration with vigorous salt-loading and fluids
- rescreen urine 1-3 mo postoperatively
- all patients are currently offered genetic testing - probability of germline disease increases with young age, multifocal disease, in the setting of paraganglioma

Disorders of Multiple Endocrine Glands

Multiple Endocrine Neoplasia

- neoplastic syndromes involving multiple endocrine glands
- tumours of neuroectodermal origin
- autosomal dominant inheritance with variable penetrance

Table 26. MEN Classification

Type	Tissues Involved	Clinical Manifestations
MEN 1 (chromosome 11)		
MEN 1 **3 Ps (Pituitary, parathyroid and pancreas)**	Pituitary (30-40%) Anterior pituitary adenoma	Headache, visual field defects, most commonly secrete PRL (prolactinomas are the most common pituitary functional tumour in MEN 1 leading to galactorrhea, erectile dysfunction, decreased libido, amenorrhea, GH (acromegaly). GH+PRL, ACTH (Cushing's), non-functional less common
	Parathyroid (≥95%) Primary hyperparathyroidism from hyperplasia or adenomas	Nephrolithiasis, bone abnormalities, MSK complaints, symptoms of hypercalcemia
	Entero-pancreatic endocrine (30-80%) Pancreatic islet cell tumours Gastrinoma Insulinomas Vasoactive intestinal peptide (VIP)-omas Glucagonoma Carcinoid syndrome Non-functional pancreatic neuroendocrine tumours	Epigastric pain (peptic ulcers and esophagitis) Hypoglycemia Secretory diarrhea Rash (necrolytic migratory erythema), anorexia, anemia, diarrhea, glossitis Flushing, diarrhea, bronchospasm
	Adrenal tumours (~40%)	
MEN 2 (chromosome 10)		
1. MEN 2A (Sipple's Syndrome)	Thyroid (>90%) Medullary thyroid cancer (MTC)	Physical signs are variable and often subtle
	Adrenal medulla (40-50%) Pheochromocytoma (40-50%)	Neck mass or thyroid nodule; non-tender, anterior lymph nodes HTN, palpitations, headache, sweating
	Parathyroid (20-30%) 1° parathyroid hyperplasia	Symptoms of hypercalcemia
	Skin Cutaneous lichen amyloidosis	Scaly skin rash
2. Familial MTC (a variant of MEN 2A)	Thyroid MTC (100%)	MTC without other clinical manifestations of MEN 2A or MEN 2B
3. MEN 2B (also known as MEN3)	Thyroid MTC (>90%)	MTC: most common component, more aggressive and earlier onset than MEN 2A
	Adrenal medulla Pheochromocytoma (≥50%)	HTN, palpitations, headache, sweating
	Neurons Mucosal neuroma, intestinal ganglioneuromas (100%)	Chronic constipation; megacolon
	MSK Marfanoid	Marfanoid habitus (no aortic abnormalities)

MEN 1 Affects the 3 Ps
Pituitary
Parathyroid
Pancreas

Investigations

- MEN 1
  - laboratory
    - offer genetic testing to all patients with a clinical diagnosis of MEN1 and their first-degree relatives
    - gastrinoma: significantly elevated serum gastrin level with a low gastric pH; when gastrin is <10x ULN a secretin stimulation test may be required
    - insulinoma: hypoglycemia with insulin and C-peptide levels that are inappropriately high for the level of glucose
    - glucagonoma: elevated glucagon levels
    - pituitary tumours: assess GH, IGF-1, 24 h urine cortisol, and PRL levels (for over-production), TSH, free T_4, 8 am cortisol, LH, FSH, bioavailable testosterone or estradiol (for underproduction due to mass effect of tumour)
    - hyperparathyroidism: serum Ca^{2+} and albumin, PTH levels; bone density scan (DEXA)
  - imaging
    - MRI for pituitary tumours, CT or MRI for gastrinoma, CT, MRI, or endoscopic ultrasound for insulinoma, parathyroid scan for parathyroid adenomas

- MEN 2
  - laboratory
    - genetic screening for RET mutations on chromosome 10 is the clinical standard of care in all individuals with a family history of MEN2 and has long-term benefits (early cure and prevention of MTC)
    - calcitonin levels (MTC); 24 h urine and serum metanephrines (pheochromocytoma); serum Ca^{2+} and PTH levels (hyperparathyroidism)
    - pentagastrin ± calcium stimulation test if calcitonin level is within reference range
    - FNA for thyroid nodules cytology
  - imaging
    - neck U/S or CT to identify thyroid nodules and lymphadenopathy
    - CT or MRI of adrenal glands to localize pheochromocytoma
    - metastatic disease generally picked up with cross-sectional imaging

Treatment

- MEN 1
  - medical
    - proton pump inhibitor (PPI) for acid hypersecretion in gastrinoma
    - cabergoline or other dopamine agonists to suppress PRL secretion and shrink prolactinomas
    - somatostatin analogue for control of symptoms of some of the GI neuroendocrine tumours such as glucagonoma
  - surgery for hyperparathyroidism when surgical indications met, functional pancreatic tumours (e.g. insulinoma, glucagonoma, gastrinoma), functioning pituitary tumours (except for prolactinomas where dopamine agonists are used), and nonfunctioning pituitary tumours if associated with mass effect
    - trans-sphenoidal approach is generally preferred for pituitary tumours
- MEN 2
  - prophylactic thyroidectomy recommended in individuals with documented pathogenic RET mutation and an increased risk of aggressive MTC; if incident case, thyroidectomy after diagnosis of MTC
    - rule out presence of pheochromocytoma and hyperparathyroidism prior to thyroidectomy
    - thyroid hormone supplementation following total thyroidectomy
  - prostaglandin inhibitors to alleviate diarrhea associated with thyroid cancer
  - pheochromocytoma managed with resection
    - α-blocker for at least 10-21 d for pheochromocytoma preoperatively
  - hyperparathyroidism managed with resection of parathyroid adenoma
    - hydration, IV bisphosphonates, or denosumab for severe hypercalcemia

Primary Hyperparathyroidism
Increased PTH secretion commonly due to parathyroid adenoma, lithium therapy; less often due to parathyroid carcinoma or parathyroid hyperplasia

Secondary Hyperparathyroidism
Partial resistance to PTH action leads to parathyroid gland hyperplasia and increased PTH secretion, often in patients with renal failure and osteomalacia (due to low or low-normal serum calcium levels)

Tertiary Hyperparathyroidism
Irreversible clonal outgrowth of parathyroid glands, usually in long-standing inadequately treated chronic renal failure on dialysis

Calcium Homeostasis

- normal total serum Ca^{2+}: 2.2-2.6 mmol/L
- ionic/free Ca^{2+} levels: 1.15-1.31 mmol/L
- serum Ca^{2+} is 40% protein bound (mostly albumin), 50% ionized, and 10% complexed with PO_4^{3-} and citrate
- regulated mainly by: PTH and vitamin D, whose actions are on three main organs: GI tract, bone, and kidney

Table 27. Major Regulators in Calcium Homeostasis

Major Regulators	Source	Regulation	Net Effect
PTH	Parathyroid glands	Stimulated by low serum Ca^{2+} and high serum PO_4^{3-} Inhibited by high serum Ca^{2+}, high calcitriol, FGF23, and chronic low serum Mg^{2+}	↑ Ca^{2+} ↑ Calcitriol ↓ PO_4^{3-}
Calcitriol ($1,25\text{-}(OH)_2D_3$)	Dietary intake of cholecalciferol (D3) or ergocalciferol (D2) OR Synthesized from cholesterol: UV light on skin makes cholecalciferol (D3). Liver then converts it to calcidiol (25-(OH)D3) and kidneys convert it to calcitriol	Stimulated by: Low serum PO_4^{3-} High PTH Inhibited by: High serum PO_4^{3-} Low PTH Calcitriol (negative feedback) FGF23	↑ Ca2+ ↑ PO_4^{3-}
Calcitonin	Thyroid C cells	Stimulated by: Pentagastrin (GI hormone) and high serum Ca2+; inhibited by low serum Ca^{2+}	↓ Ca^{2+} (in pharmacologic doses) ↓ PO_4^{3-}
$MgCa^{2+}$	Major intracellular divalent cation	See Nephrology, NP16	Cofactor for PTH secretion
PO_4^{3-}	Intracellular anion found in all tissues	See Nephrology, NP15	↓ Ca^{2+}

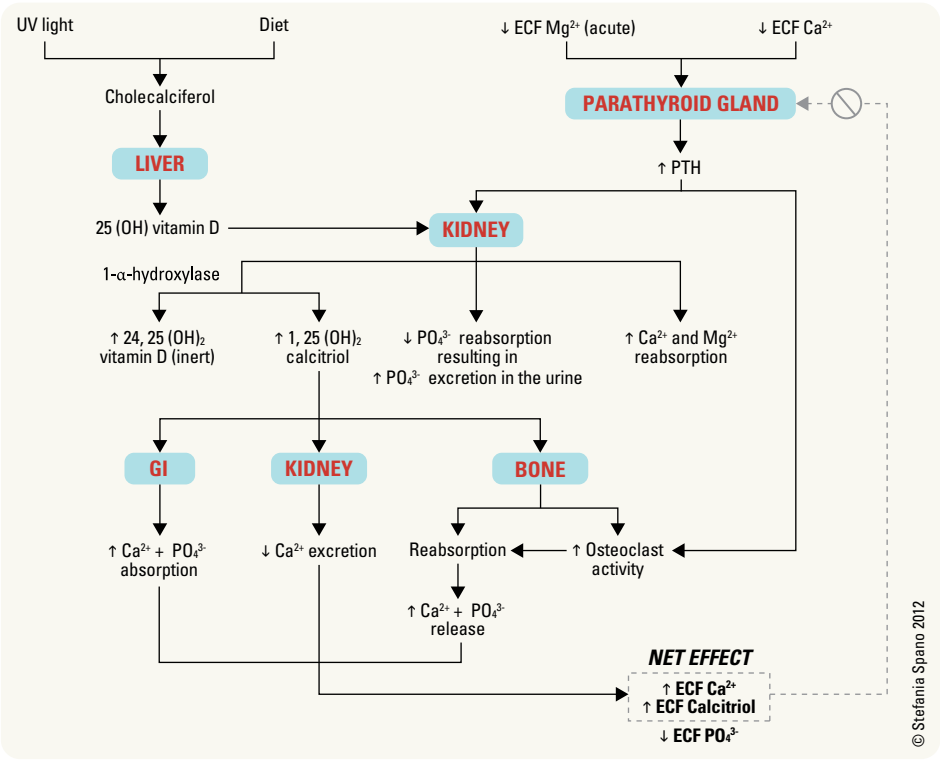

Figure 19. Parathyroid hormone (PTH) regulation

PH is the most common cause of hypercalcemia in healthy outpatients. PH is most commonly related to a solitary adenoma or, less commonly, multiple gland hyperplasia. Surgical excision is the definitive treatment and is recommended for patients who have symptomatic hypercalcemia, loss in bone density, kidney stones, or renal failure. For asymptomatic disease, medical surveillance may be appropriate with annual serum calcium, creatinine, and bone mineral density (BMD)

For asymptomatic patients, surgery is recommended for those who meet ≥1 of the following criteria:
- Serum [calcium] >0.25 mmol/L (1.0 mg/dL) above the upper limit of normal
- Creatinine clearance <60 mL/min
- BMD T-score <-2.5 at hip, spine, or distal radius, and/or previous fragility fracture
- Clinical development of a kidney stone or by imaging (x-ray, ultrasound, or CT)
- Age <50 yr

Total Ca^{2+} does not reflect ionized Ca^{2+} in the following circumstances:
- Abnormal albumin levels
- Critical illness
- Chronic hepatic failure/renal failure

When albumin is low, ionized calcium assessment should be performed

If ionized calcium is not available, total calcium can be corrected for albumin using this approximation:
Corrected Ca^{2+} (mmol/L) = measured Ca^{2+} + 0.02 (40 – albumin)
- for every decrease in albumin by 10, increase in Ca^{2+} by 0.2

Hypercalcemia

Definition

- total corrected serum Ca^{2+} >2.6 mmol/L OR ionized Ca^{2+} >1.35 mmol/L

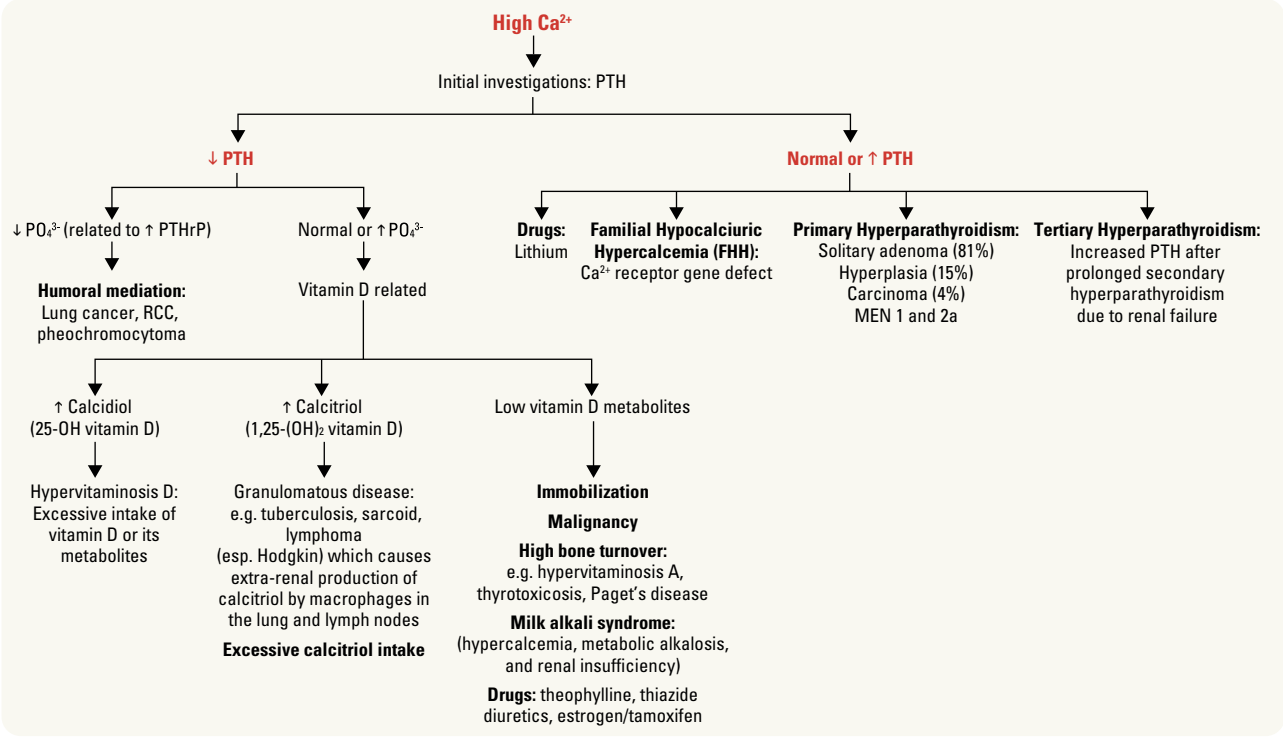

Figure 20. Differential diagnosis of hypercalcemia

Approach to Hypercalcemia

1. is the patient hypercalcemic?
2. is the PTH high/normal or low?
3. if PTH is low, is phosphate high/normal or low?
4. if phosphate is high/normal, is the level of vitamin D metabolites high or low?

Clinical Features

- symptoms depend on the absolute Ca^{2+} value and the rate of its rise (may be asymptomatic)

Table 28. Symptoms of Hypercalcemia

Cardiovascular	GI	Renal	Rheumatological	MSK	Psychiatric	Neurologic
HTN Arrhythmia Short QT Deposition of Ca^{2+} on valves, coronary arteries, myocardial fibres	Constipation Anorexia Nausea Vomiting **(groans)** PUD Pancreatitis	Polyuria (Nephrogenic DI) Polydipsia **Nephrolithiasis (stones)** Renal failure (irreversible) Dehydration	Gout Pseudogout Chondrocalcinosis	Weakness Bone pain **(bones)**	>3 mmol/L (12 mg/dL) Increased alertness Anxiety Depression Cognitive dysfunction Organic brain syndromes >4 mmol/L (16 mg/dL) **Psychosis (moans)**	Hypotonia Hyporeflexia Myopathy Paresis

** **Hypercalcemic crisis (usually >4 mmol/L or 16 mg/dL):** primary symptoms include oliguria/anuria and mental status changes including somnolence and eventually coma → this is a medical emergency and should be treated immediately!

Treatment

- <3.0 mmol/L: mild, often asymptomatic and does not usually require urgent correction
- 3.0-3.5 mmol/L: may be well tolerated chronically and may not require immediate treatment but may be symptomatic and prompt treatment is usually indicated
- >3.5 mmol/L: severe hypercalcemia requiring urgent correction due to risk of dysrhythmia and coma
- aggressive treatment of acute symptomatic hypercalcemia
- next treat the underlying cause
- mild asymptomatic hypercalcemia: monitor and avoid thiazide, volume depletion, high Ca^{2+} diet, lithium, and bed rest

Table 29. Treatment of Acute Hypercalcemia/Hypercalcemic Crisis

Increase Urinary Ca^{2+} Excretion	FLUIDS, FLUIDS, FLUIDS! Isotonic saline (4-6 L) over 24 h ± loop diuretic (e.g. furosemide) but only if hypervolemic (urine output >200 mL/h) Calcitonin: 4 IU/kg IM/SC q12 h 8 IU/kg IM/SC q6 h Only works for 48 h, can develop tachyphylaxis Rapid onset within 4-6 h Before prescribing calcitonin, remember to ask about fish allergies
Diminish Bone Resorption	Bisphosphonates (treatment of choice) Suggest zoledronic acid 4 mg IV over 15 min or pamidronate 60-90 mg IV over 2 h Inhibits osteoclastic bone resorption, preventing calcium release from bone Effects on calcium levels are typically seen at 24-48 h after administration Calcitonin often given in conjunction with bisphosphonate, given rapid onset of effect Indicated in malignancy-related hypercalcemia (IV pamidronate or zoledronic acid used) If bisphosphonates are contraindicated (i.e. severe renal impairment), denosumab can be administered concurrently with calcitonin
Decrease GI Ca^{2+} Absorption	Corticosteroids can be used in hypercalcemia mediated by 1,25 vitamin D. Corticosteroids are potent inhibitors of 1a-hydroxylase and therefore, decrease calcitriol production by activated mononuclear cells (e.g. in lymphoma, granuloma) Effects will be seen in 2-5 d
Dialysis	Treatment of last resort Indication: severe malignancy-associated hypercalcemia and renal insufficiency or heart failure

Hypocalcemia

Definition

- total corrected serum Ca^{2+} <2.2 mmol/L
- mild, asymptomatic: serum Ca^{2+} <1.9 mmol/L, ionized Ca^{2+} >0.8 mmol/L
- severe: serum Ca^{2+} <1.9 mmol/L and/or symptomatic

Treatment of Hypercalcemia in Clinical Practice
In clinical practice, treatment is required if the patient has a) symptomatic hypercalcemia or b) extremely high levels of corrected Ca^{2+}. Laboratory cutoffs may not always be used

The symptoms and signs of hypercalcemia include:
"Bones, stones, groans, and psychiatric overtones"

The most common cause of hypercalcemia in hospital is malignancy-associated hypercalcemia
- Usually occurs in the later stages of disease
- Most commonly seen in lung, renal, breast, ovarian, and squamous tumours, as well as lymphoma and multiple myeloma

Mechanisms:
- Secretion of PTHrP which mimics PTH action by preventing renal calcium excretion and activating osteoclast-induced bone resorption
- Cytokines in multiple myeloma
- Calcitriol production by lymphoma
- Osteolytic bone metastases direct effect
- Excess PTH in parathyroid cancer

Before prescribing calcitonin, remember to ask about fish allergies

Differential Diagnosis of Hypercalcemia
- Primary hyperparathyroidism
- Malignancy: hematologic, humoral, skeletal metastases (>90% from 1 or 2)
- Renal disease: tertiary hyperparathyroidism
- Drugs: calcium carbonate, milk alkali syndrome, thiazide, lithium, theophylline, vitamin A/D intoxication
- Familial hypocalciuric hypercalcemia
- Granulomatous disease: sarcoidosis, tuberculosis, Hodgkin's lymphoma
- Thyroid disease: thyrotoxicosis
- Adrenal disease: adrenal insufficiency, pheochromocytoma
- Immobilization

Signs and Symptoms of Acute Hypocalcemia
- Paresthesias: perioral, hands, and feet
- Chvostek's sign: percussion of the facial nerve just anterior to the external auditory meatus elicits ipsilateral spasm of the orbicularis oculi or orbicularis oris muscles
- Trousseau's sign: inflation of a blood pressure cuff above systolic pressure for 3 min elicits carpal spasm and paresthesia

Hypomagnesemia can impair PTH secretion and action

Table 30. Clinical Features of Hypocalcemia

Acute Hypocalcemia	Chronic Hypocalcemia
Paresthesia Laryngospasm (with stridor) Hyperreflexia Tetany Chvostek's sign (tap CN VII) Trousseau's sign (carpal spasm) ECG changes Delirium Psychiatric Sx: emotional instability, anxiety, and depression Seizure Note: tetany is a hallmark of hypocalcemia – can be mild or severe Mild: perioral numbness, paresthesia of hands and feet, muscle spasm Severe: carpopaedal spasm, laryngospasm, focal/generalized seizures	CNS: lethargy, seizures, psychosis, basal ganglia calcification, Parkinson's, dystonia, hemiballismus, papilledema, pseudotumour cerebri CVS: prolonged QT interval → Torsades de pointes (ventricular tachycardia) GI: steatorrhea ENDO: impaired insulin release SKIN: dry, scaling, alopecia, brittle and transversely fissured nails, candidiasis, abnormal dentition OCULAR: cataracts MSK: generalized muscle weakness and wasting

Approach to Hypocalcemia

1. is the patient hypocalcemic?
2. is the PTH high or low?
3. if PTH is high, is phosphate low or normal?
4. is the Mg^{2+} level low?

Approach to Treatment

1. rapidity of treatment depends on severity of symptoms and serum calcium level
   a) mild, asymptomatic
      - calcium supplementation (i.e. elemental calcium 1 g then 500 mg PO TID)
   b) severe and/or symptomatic
      - severe hypocalcemia is a medical emergency
      - IV calcium gluconate 1-2 g over 10-20 min followed by slow infusion
      - if positive Chvostek's and Trousseau or seizures, first give IV calcium bolus, i.e. 1 amp IV push, then run Ca^{2+} IV drip at 1-2 mg/kg/h
2. vitamin D replacement
   - needed for GI absorption of calcium; must use 1,25 vitamin D if PTH level low (hypoparathyroidism)
3. must treat concurrent hypomagnesemia or calcium will not normalize
4. if underlying cause is hypoparathyroidism, the goal is to raise Ca^{2+} to low normal range (2.0-2.1 mmol/L) to prevent symptoms but allow maximum stimulation of PTH secretion

Watch Out for:
- Volume depletion via diuresis
- Arrhythmias

Acute Management of Hypercalcemia/ Hypercalcemic Crisis
- Volume expansion (e.g. NS IV 300-500 cc/h): initial therapy
- Calcitonin: transient, partial response
- Bisphosphonate: treatment of choice, adjust dose if CrCl <30 ml/min
- Corticosteroid: most useful in vitamin D toxicity, granulomatous disease, some malignancies
- Saline diuresis + loop diuretic (for volume overload): temporary measure

Differential Diagnosis of Tetany
- Hypocalcemia
- Metabolic alkalosis (with hyperventilation)
- Hypokalemia
- Hypomagnesemia

Transient hypoparathyroidism (resulting in hypocalcemia) is common after subtotal thyroidectomy (permanent in <3% of surgeries)

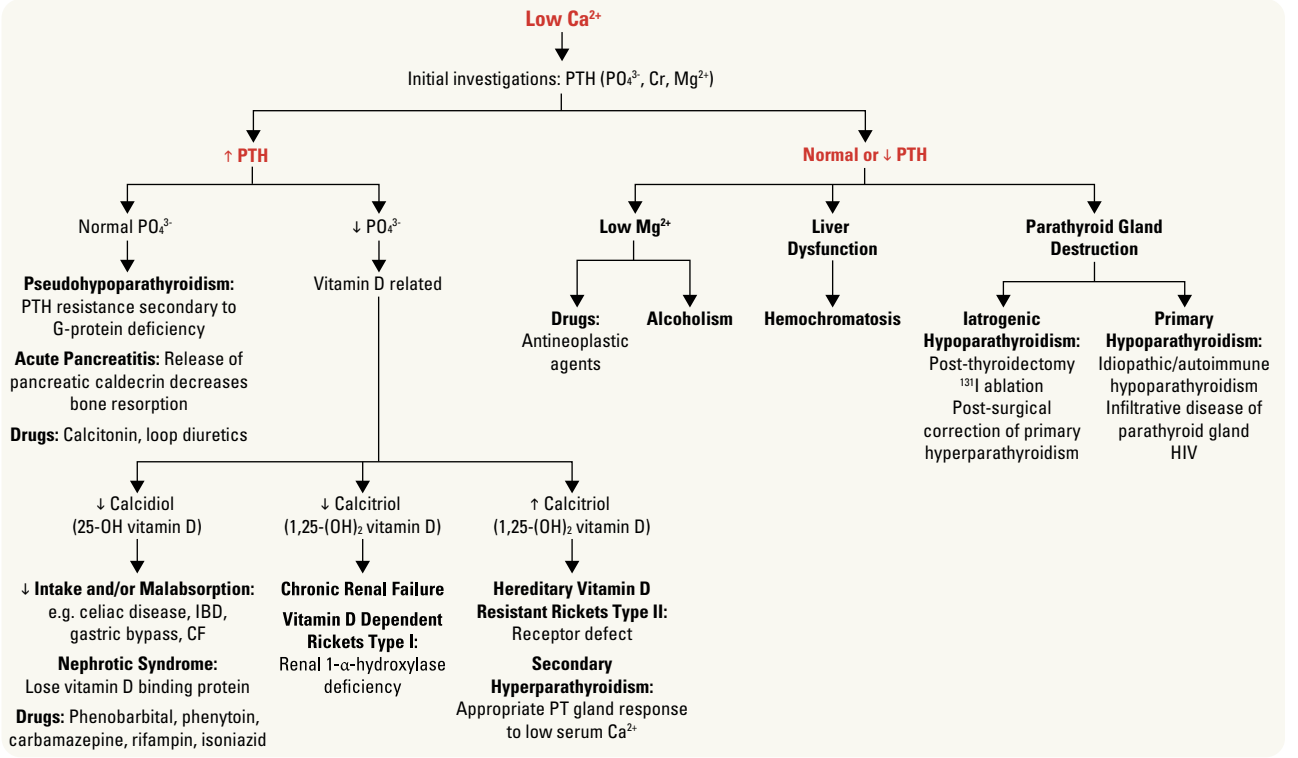

Figure 21. Etiology and clinical approach to hypocalcemia

Metabolic Bone Disease

- see 2010 Clinical Practice Guidelines for the Diagnosis and Management of Osteoporosis for details

Osteoporosis

Definition

- a condition characterized by decreased bone mass and microarchitectural deterioration with a consequent increase in bone fragility and susceptibility to fracture
- BMD is measured at hip and lumbar spine, BMD T-score ≤-2.5 is indicative of osteoporosis
- osteopenia (low bone mass): BMD with T-score between –1.0 and –2.5

ETIOLOGY AND PATHOPHYSIOLOGY

Secondary Osteoporosis

- gastrointestinal diseases
  - gastrectomy
  - malabsorption (e.g. celiac disease, IBD, bariatric surgery)
  - chronic liver disease
  - eating disorder
  - poor nutrition
- bone marrow disorders
  - multiple myeloma
  - lymphoma
  - leukemia
- endocrinopathies
  - Cushing's syndrome
  - hyperparathyroidism
  - hyperthyroidism
  - premature menopause
  - DM
  - hypogonadism
- malignancy
  - secondary to chemotherapy
  - myeloma
- rheumatologic disorders
  - rheumatoid arthritis
  - SLE
  - ankylosing spondylitis
- drugs and chemotherapy
  - corticosteroid therapy
  - anti-epileptic drugs
  - chronic heparin therapy
  - androgen deprivation therapy
  - aromatase inhibitors
- renal disease
- immobilization
- COPD (due to disease, tobacco, and glucocorticoid use)

Clinical Features

- commonly asymptomatic
- height loss due to collapsed vertebrae
- fractures: most commonly in hip, vertebrae, humerus, and wrist (see Figure 22, E49)
  - fragility fractures: fracture with fall from standing height or less (does not include fractures of fingers and toes)
  - Dowager's hump: collapse fracture of vertebral bodies in mid-dorsal region
  - x-ray: vertebral compression fractures (described as wedge fractures, require a minimum of 20% height loss), "codfishing" sign (weakening of subchondral plates and expansion of intervertebral discs)
- pain, especially backache, associated with fractures

Approach to Osteoporosis

1. assess risk factors for osteoporosis on Hx and physical
2. decide if patient requires BMD testing with dual-energy x-ray absorptiometry (DEXA): men and women ≥65 yr (or younger if presence of risk factors, see Table 32, E48)
3. initial investigations
   - all patients with osteoporosis: calcium corrected for albumin, CBC, creatinine, ALP, TSH
   - also consider serum and urine protein electrophoresis if vertebral fractures, celiac workup, and 24 h urinary Ca^{2+} excretion to rule out additional secondary causes
   - 25-OH-vitamin D level should only be measured after 3-4 mo of adequate supplementation and should not be repeated if an optimal level ≥75 nmol/L is achieved
   - lateral thoracic and lumbar x-ray if clinical evidence of vertebral fracture (or in individuals at moderate risk of fracture to help decide if they require medical therapy)
4. assess 10-yr fracture risk by combining BMD result and risk factors
   1). WHO Fracture Risk Assessment Tool (FRAX)
   2. Canadian Association of Radiologists and Osteoporosis Canada Risk Assessment Tool (CAROC)
      - approach to management guided by 10-yr risk stratification into low, medium, and high-risk
5. for all patients being assessed for osteoporosis, encourage appropriate lifestyle changes (see Table 33, E48)

Corticosteroid Therapy is a Common Cause of Secondary Osteoporosis
Individuals receiving ≥7.5 mg of prednisone daily for over 3 mo should be assessed for bone-sparing therapy
Mechanism: increased resorption + decreased formation + increased urinary calcium loss + decreased intestinal calcium absorption + decreased sex steroid production

Calcium plus Vitamin D Supplementation and Risk of Fractures
Osteoporosis Int 2015;27:367-376
Purpose: To review trials of vitamin D and calcium therapy for reducing fracture risk in osteoporosis.
Study: Systematic review searching 2011-2015, inclusive, identified 8 RCTs totaling 30970 participants. RCTs reviewed included healthy adults and ambulatory older adults with medical conditions (excluding cancer). Vitamin D and calcium combination therapy was compared to placebo.
Results: Analysis of RCT data revealed that calcium plus vitamin D supplementation produced a statistically significant reduction in risk of total fractures (0.85; CI:0.73-0.98) and in hip fractures (0.70; CI:0.56-0.87). Subgroup analysis was significant for community dwelling or institutionalized patients.
Conclusions: Systematic analysis suggests that vitamin D and calcium therapy significantly decreases fracture risk. This study did not specifically look at individuals with osteoporosis. However, it still supports that vitamin D and calcium should continue to be used as preventive treatment for individuals at increased risk of fractures.

Vitamin D and Calcium for the Prevention of Fracture: A Systematic Review and Meta-analysis
JAMA Netw Open 2019;2:e1917789
Purpose: To investigate if fracture risk is associated with supplementation with vitamin D alone or vitamin D in combination with calcium.
Study Selection: Observational studies with ≥200 fracture cases and RCTs with ≥500 participants that reported ≥10 incident fractures.
Results: Vitamin D supplementation alone was not associated with a reduced risk of any fracture or hip fracture (RR, 1.14; 95% CI, 0.98-1.32). However, combined supplementation with vitamin D (400-800 IU daily) and calcium (1000-1200 mg daily) was associated with a 6% reduction in fracture risk (RR, 0.94; 95% CI, 0.89-0.99) and a 16% reduction of hip fracture risk (RR, 0.84; 95% CI, 0.72-0.97).
Conclusion: Vitamin D alone was not associated with reduced fracture risk but daily supplementation with a combination of vitamin D and calcium was.

Clinical Signs of Fractures or Osteoporosis
- Height loss >3 cm (Sn 92%)
- Weight <51 kg (Sp 97%)
- Kyphosis (Sp 92%)
- Tooth count <20 (Sp 92%)
- Grip strength
- Armspan-height difference >5 cm (Sp 76%)
- Wall-occiput distance >4 cm (Sp 92%)
- Rib-pelvis distance ≤2 finger breadth (Sn 88%)

Table 31. Indications for BMD Testing

Older Adults (age ≥50 yr)	Younger Adults (age <50 yr)
All women and men age ≥65 yr Menopausal women, and men 50-64 yr with clinical risk factors for fracture: Fragility fracture after age 40 Prolonged glucocorticoid use Other high-risk medication use (aromatase inhibitors, androgen deprivation therapy) Parental hip fracture Vertebral fracture or osteopenia identified on x-ray Current smoking High alcohol intake Low body weight (<60 kg) or major weight loss (>10% of weight at age 25 yr) Rheumatoid arthritis Other disorders strongly associated with osteoporosis: primary hyperparathyroidism, T1DM, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause (<45 yr), Cushing's disease, chronic malnutrition or malabsorption, chronic liver disease, COPD, and chronic inflammatory conditions (e.g. inflammatory bowel disease)	Fragility fracture: Prolonged use of glucocorticoids Use of other high-risk medications (aromatase inhibitors, androgen deprivation therapy, anticonvulsants) Hypogonadism or premature menopause Malabsorption syndrome Primary hyperparathyroidism Other disorders strongly associated with rapid bone loss and/or fracture

Prevention - Hip

Alendronate	0.61 RR (0.42-0.90)
Risedronate	0.73 RR (0.58-0.92)
Denosumab	0.56 RR (0.35-0.90)
Teriparatide	0.64 RR (0.25-1.68)
Romosozumab	0.44 RR (0.24-0.79)

Prevention - Nonvertebral

Alendronate	0.84 RR (0.74-0.94)
Risedronate	0.78 RR (0.68-0.89)
Denosumab	0.80 RR (0.67-0.96)
Teriparatide	0.62 RR (0.47-0.80)
Romosozumab	0.67 RR (0.53-0.86)

Prevention - Vertebral

Alendronate	0.57 RR (0.45-0.71)
Risedronate	0.61 RR (0.48-0.78)
Denosumab	0.32 RR (0.22-0.45)
Teriparatide	0.27 RR (0.19-0.38)
Romosozumab	0.33 RR (0.22-0.49)

Table 32. Osteoporosis Risk Stratification

Low-Risk 10 yr fracture risk <10%	Unlikely to benefit from pharmacotherapy; encourage lifestyle changes Reassess risk in 5 yr
Medium-Risk 10 yr fracture risk 10-20%	Discuss patient preference for management and consider additional risk factors Factors that warrant consideration for pharmacotherapy: Additional vertebral fracture(s) identified on vertebral fracture assessment (VFA) or lateral spine x-ray Previous wrist fracture in individuals ≥65 yr or with T-score ≤−2.5 Lumbar spine T-score much lower than femoral neck T-score Rapid bone loss Men receiving androgen-deprivation therapy for prostate cancer Women receiving aromatase-inhibitor therapy for breast cancer Long-term or repeated systemic glucocorticoid use (oral or parenteral) that does not meet the conventional criteria for recent prolonged systemic glucocorticoid use Recurrent falls (defined as falling 2 or more times in the past 12 mo) Other disorders strongly associated with osteoporosis Repeat BMD and reassess risk every 1-3 yr initially
High-Risk 10 yr fracture risk >20%; OR Prior fragility fracture of hip or spine; OR More than one fragility fracture	Start pharmacotherapy (need to consider patient preference)

Factors Necessary for Mineralization

- Quantitatively and qualitatively normal osteoid formation
- Normal concentration of calcium and phosphate in ECF
- Adequate bioactivity of ALP
- Normal pH at site of calcification
- Absence of inhibitors of calcification

Treatment of Osteoporosis

Table 33. Treatment of Osteoporosis in Women and Men

Treatment for Both Men and Women	
Lifestyle	Diet: elemental calcium 1000-1200 mg/d; vitamin D 1000 IU/d Exercise: 3x30 min weight-bearing exercises, balance exercise, and aerobic exercise/wk Cessation of smoking, reduce caffeine intake Stop/avoid osteoporosis-inducing medications
Drug Therapy	
Bisphosphonate: inhibitors of osteoclasts	1st line in prevention of hip, nonvertebral, and vertebral fractures (Grade A): alendronate (PO), risedronate (PO), zoledronic acid (IV)
RANKL Inhibitors	Denosumab: 1st line in prevention of hip, nonvertebral, vertebral fractures (Grade A) *Denosumab should not be abruptly stopped/administration delayed. Increased risk of multiple vertebral fractures due to increased bone turnover on discontinuation. Used as an alternative initial treatment in postmenopausal women with osteoporosis who are at high risk for osteoporitic fractures.
Parathyroid Hormone Analogue	Teriparatide: 18-24 mo duration, followed by long-term anti-resorptive therapy with bisphosphonate or RANKL inhibitor
Sclerostin Inhibitors	Romosozumab: 12 mo duration
Treatment Specific to Post-Menopausal Women	
SERM (selective estrogen-receptor modulator): agonistic effect on bone but antagonistic effect on uterus and breast	Raloxifene: 1st line in prevention of vertebral fractures (Grade A) Advantages: prevents osteoporotic fractures (Grade A to B evidence), improves lipid profile, decreased breast cancer risk Disadvantages: increased risk of DVT/PE, stroke mortality, hot flashes, leg cramps
HRT: combined estrogen + progesterone (see Gynaecology, GY37)	Indicated for vasomotor symptoms of menopause For most women, risks > benefits Combined estrogen/progestin prevents hip, vertebral, total fractures Increased risks of breast cancer, cardiovascular events, and DVT/PE

Effect of High-Dose Vitamin D Supplementation on Volumetric Bone Density and Bone Strength: A Randomized Clinical Trial
JAMA 2019;322:736-45
Purpose: To investigate the effects of vitamin D supplementation on volumetric BMD and strength.
Methods: 311 healthy adults (ages 55-70) without osteoporosis, with baseline concentrations of 25-hydroxyvitamin D of 30-125 nmol/L, were randomized to receive daily doses of 400 IU, 4000 IU, or 10000 IU vitamin D3 for 3 years. For participants with calcium dietary intake <1200 mg/d, supplementation was provided. Primary Outcome: Total volumetric BMD at radius and tibia.
Results: Compared with the 400 IU group, radial volumetric BMD was significantly lower for the 4000 IU group (-3.9 mg HA/cm3; 95% confidence interval (CI), -6.5 to -1.3) and 10000 IU group (-7.5 mg HA/cm3; 95% CI, -10.1 to -5.0) with mean % change of -1.2% (400 IU), -2.4% (4000 IU), and -3.5% (10000 IU). Compared with the 400 IU group, tibial volumetric BMD differences were -1.8 mg HA/cm3 (95% CI, -3.7 to 0.1) (4000 IU) and -4.1 mg HA/cm3 (95% CI, -6.0 to -2.2) (10000 IU), with mean % change values of -0.4% (400 IU), -1.0% (4000 IU), and -1.7% (10000 IU).
Conclusion: In healthy adults, supplementation with daily 4000 IU or 10000 IU vitamin D for 3 years was associated with lower radial BMD compared with 400 IU. 10000 IU was associated with lower tibial BMD. There were no apparent benefits of high-dose vitamin D supplementation for bone health.

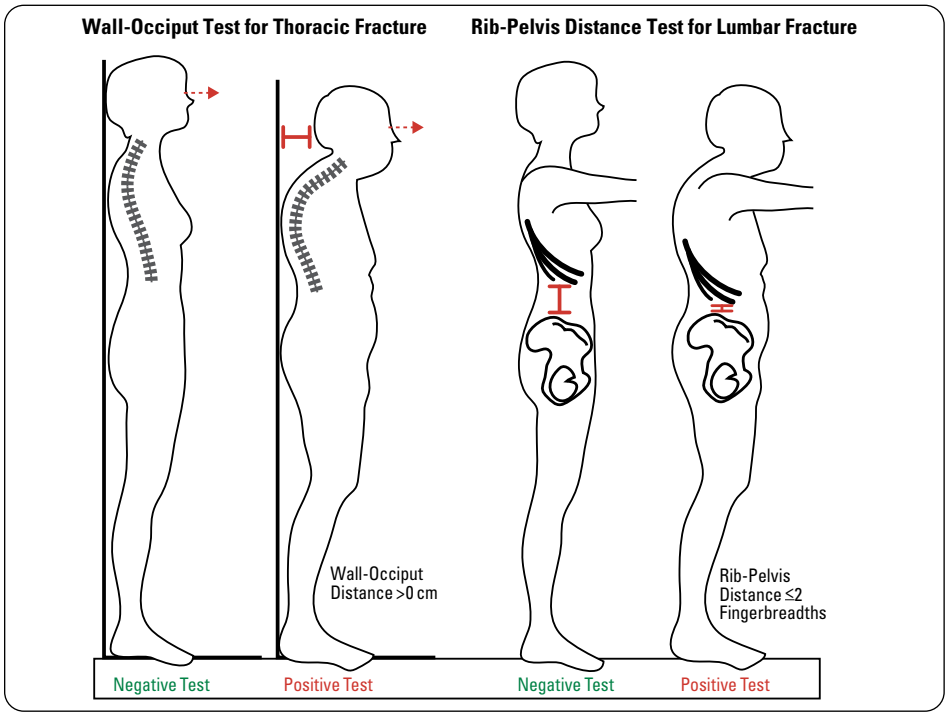

Figure 22. Physical examination test for vertebral fractures

Osteomalacia and Rickets

Definition

- osteopenia with disordered calcification leading to a higher proportion of osteoid (unmineralized) tissue prior to epiphyseal closure: rickets (in childhood), osteomalacia (in adulthood)

Etiology and Pathophysiology

Vitamin D Deficiency

- deficient uptake or absorption
  - nutritional deficiency
  - malabsorption: post-gastrectomy, small bowel disease (e.g. celiac sprue), pancreatic insufficiency
- defective 25-hydroxylation
  - liver disease
  - anticonvulsant therapy (phenytoin, carbamazepine, phenobarbital)
- loss of vitamin D binding protein
  - nephrotic syndrome
- decreased 1-α-25 hydroxylation
  - hypoparathyroidism
- renal failure

Mineralization Defect

- abnormal matrix
  - osteogenesis imperfecta
- enzyme deficiency
  - hypophosphatasia (inadequate ALP bioactivity)
- presence of calcification inhibitors
  - aluminum, high dose fluoride, anticonvulsants

Calcium Deficiency

- deficient uptake or absorption
  - nutritional deficiency
  - malabsorption
- hypercalciuria (in combination with renal phosphate wasting)

Hypophosphatemia

- gastrointestinal: poor nutritional intake, chronic diarrhea, excessive phosphate binders
- renal phosphate wasting
  - tumour-induced osteomalacia
  - Fanconi syndrome
  - X-linked/autosomal dominant/recessive hypophosphatemic rickets

Matrix Abnormalities
- type IV osteogenesis imperfecta
- fibrogenesis imperfecta ossium
- axial osteomalacia

Table 34. Clinical Features of Rickets and Osteomalacia

Rickets	Osteomalacia
Skeletal pain and deformities, bow-legged	Not as severe
Fracture susceptibility	Diffuse skeletal pain
Weakness and hypotonia	Bone tenderness
Disturbed growth	Fractures
Ricketic rosary (prominent costochondral junctions)	Gait disturbances (waddling)
Harrison's groove (indentation of lower ribs)	Proximal muscle weakness
Hypocalcemia	Hypotonia

Investigations

Table 35. Laboratory Findings in Osteomalacia and Rickets

Disorder	Serum Phosphate	Serum Calcium	Serum ALP	Other Features
Vitamin D Deficiency	Decreased	Decreased to normal	Increased	Decreased calcitriol
Hypophosphatemia	Decreased	Normal	Increased	
Proximal Renal Tubular Acidosis	Decreased	Normal	Normal	Associated with hyperchloremic metabolic acidosis
Conditions Associated with Abnormal Matrix Formation	Normal	Normal	Normal	

- radiologic findings
  - pseudofractures, fissures, narrow radiolucent lines – thought to be healed stress fractures or the result of erosion by arterial pulsation
  - loss of distinctness of vertebral body trabeculae; concavity of the vertebral bodies
  - changes due to secondary hyperparathyroidism: subperiosteal resorption of the phalanges, bone cysts, resorption of the distal ends of long bones
  - others: bowing of tibia, coxa profundus hip deformity
- bone biopsy: usually not necessary but considered the gold standard for diagnosis

KDIGO 2017 Clinical Practice Guideline for the Evaluation and Management of Chronic Kidney Disease
Kidney Inter Suppl 2017;7(1):1-60
Recommendations for Metabolic Bone Disease (MBD) in Chronic Kidney Disease (CKD)

Screening
- In CKD patients with evidence of CKD-MBD and/or risk factors for osteoporosis, perform BMD testing to assess fracture risk if results will impact treatment decisions
- In patients with CKD-BMD, it is reasonable to perform a bone biopsy if knowledge of the type of renal osteodystrophy will impact treatment decisions

Management
- Treatment of CKD-MBD should be based on serial assessments of PO_4^{3-}, Ca^{2+}, and PTH levels, considered together
- Suggest lowering elevated PO_4^{3-} levels towards the normal range
- Avoid hyperglycemia in adult patients and maintain serum Ca^{2+} in age-appropriate normal range in children

Treatment
- definitive treatment depends on the underlying cause
- vitamin D supplementation
- PO_4^{3-} supplements if low serum PO_4^{3-}, Ca^{2+} supplements for isolated calcium deficiency
- bicarbonate if chronic metabolic acidosis

Renal Osteodystrophy

Definition
- changes to mineral metabolism and bone structure secondary to CKD
- represents a mixture of four types of bone disease:
  - osteomalacia: low bone turnover combined with increased unmineralized bone (osteoid)
  - adynamic bone disease: low bone turnover due to excessive suppression of parathyroid gland
  - osteitis fibrosa cystica: increased bone turnover due to secondary hyperparathyroidism
  - mixed uremic osteodystrophy: both high and low bone turnover, characterized by marrow fibrosis and increased osteoids
- metastatic calcification secondary to hyperphosphatemia may occur

Pathophysiology
- metabolic bone disease secondary to chronic renal failure
- combination of hyperphosphatemia (inhibits $1,25(OH)_2$ vitamin D synthesis) and loss of renal mass (reduced 1-α-hydroxylase)

Clinical Features
- soft tissue calcifications, necrotic skin lesions if vessels involved
- osteodystrophy, generalized bone pain, and fractures
- pruritus
- neuromuscular irritability and tetany may occur (with low serum calcium)
- radiologic features of osteitis fibrosa cystica, osteomalacia, osteosclerosis, osteoporosis

Investigations
- serum Ca^{2+} corrected for albumin, PO_4^{3-}, PTH, ALP, ± imaging (x-ray, BMD), ± bone biopsy (gold standard; only done if results inform treatment)

Treatment
- prevention
- maintenance of normal serum Ca^{2+} and PO_4^{3-} by restricting PO_4^{3-} intake to 1 g once daily
- Ca^{2+} supplements; PO_4^{3-} binding agents (calcium carbonate, aluminum hydroxide)
- activated vitamin D (calcitriol) with close monitoring to avoid hypercalcemia and metastatic calcification
- bisphosphates and denosumab are not often used for treatment (can worsen the adynamic components of renal osteodystrophy); bone biopsy may indicate if there are signs of increased bone turnover amenable to bisphosphonates

Paget's Disease of Bone

Definition
- a metabolic disease characterized by excessive bone destruction and repair

Epidemiology
- 3% of the population, 10% of population >80 y/o
- consider Paget's disease of bone in older adults with elevated ALP but normal GGT

Etiology and Pathophysiology
- postulated to be related to a slowly progressing viral infection of osteoclasts, possibly paramyxovirus
- strong familial incidence
- initiated by increased osteoclastic activity leading to increased bone resorption; osteoblastic activity increases in response to produce new bone that is structurally abnormal and fragile

Differential Diagnosis
- osteogenic sarcoma
- multiple myeloma
- fibrous dysplasia
- osteitis fibrosa cystica
- metastases

Clinical Features
- usually asymptomatic (routine x-ray finding or elevated serum ALP with normal LFTs)
- 3 characteristic findings: osteolytic lesions, cortical thickening, pseudofractures (small fissures which develop in the convex surface of long bone)
- most commonly affects: skull, thoracolumbar spine, pelvis, and long bones of lower extremities
- severe bone pain (e.g. pelvis, femur, tibia)
- skeletal deformities: bowed tibias, kyphosis, frequent fractures
- increased risk of osteosarcoma and giant cell tumours

Investigations
- laboratory
  - high serum ALP, normal or high Ca^{2+}, normal PO_4^{3-}
  - normal tests LFTs (prothrombin time/international normalized ratio (PT/INR), activated partial thromboplastin time (aPTT), albumin, bilirubin)
  - elevated procollagen type I N-terminal propeptide (PINP) (bone formation marker)
- imaging
  - plain x-ray of skull and facial bones, abdomen, and tibiae are recommended as initial screening in patients suspected to have Paget's
  - confirmation on x-ray required for diagnosis
    - denser bone with cortical thickening
    - characteristic findings: osteolytic lesions, cortical thickening, and pseudofractures
    - burned-out Paget's disease: when the disease has been present for a long time
  - bone scan to evaluate the extent of disease and identify asymptomatic sites
  - radionuclide bone scintigraphy, in addition to targeted x-ray, are recommended as a means of fully and accurately defining the extent of metabolically active Paget's disease
  - MRI or CT are not recommended for diagnosis, but can be used to assess disease complications

Table 36. Paget's Disease-Related Signs

Signs	Descriptions
Tam o'Shanter	Appearance of advanced Paget's disease of the skull – overall enlargement of cranium, skull falling over the facial bones
Blade of grass	Lucent leading edge in a long bone seen in lytic phase of Paget's
Osteoporosis circumscripta	Radiolucent regions of the skull
Jigsaw pattern bone or mosaic pattern bone	Thickened, disorganized trabeculae lead to areas of sclerosis
Picture frame vertebra	Cortex of vertebral body is thickened
Cotton wool appearance of bone	Results from thickened, disorganized trabeculae that lead to areas of sclerosis
Banana fracture	Horizontal pathological fracture seen in bones deformed by Paget's
Looser zones	Wide, transverse lucencies traversing through a bone
Ivory vertebra	Diffuse and homogenous increase in opacity of a vertebral body

Complications

- local
  - fractures; osteoarthritis
  - cranial nerve compression and palsies (e.g. deafness), spinal cord compression
  - osteosarcoma/sarcomatous change in 1-3%
    - indicated by marked bone pain, new lytic lesions, and suddenly increased ALP
- systemic
  - hypercalcemia and nephrolithiasis
  - high output CHF due to increased vascularity

Treatment

- goals: decrease pain, decrease rate of remodelling
- weight-bearing exercise
- adequate calcium and vitamin D intake to prevent development of secondary hyperparathyroidism
- treat medically if symptomatic or asymptomatic with ALP >3x normal or planned surgery
  - bisphosphonates, e.g. zoledronic acid 5 mg IV per yr (preferred) OR alendronate 40 mg PO once daily x 6 mo OR risedronate 30 mg PO once daily x 3 mo
  - calcitonin 50-100 U/d SC if unable to tolerate bisphosphonates
- surgery for fractures, deformity, degenerative changes
- joint replacement surgery and osteotomy are recommended for the treatment of osteoarthritis resistant to medical therapy in patients with Paget's

Male Reproductive Endocrinology

Androgen Regulation

- testosterone (from Leydig cells) primarily involved in negative feedback on LH and GnRH, whereas inhibin (from Sertoli cells) suppresses FSH secretion

Tests of Testicular Function

- testicular size (lower limit = 4 cm x 2.5 cm in adult). Can use orchidometer to measure testicular volume (12-25 mL = adult size)
- LH, FSH, total, bioavailable, and/or free testosterone
- semen analysis
  - semen volume, sperm concentration, morphology, and motility are the most commonly used parameters
- testicular biopsy
  - indicated with normal FSH and azoospermia/oligospermia

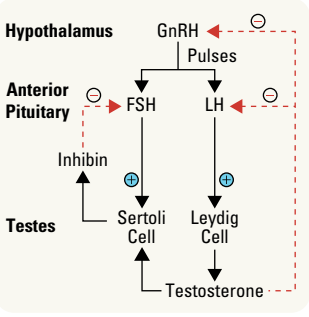

Figure 23. Hypothalamo-pituitary-gonadal axis

Hypogonadism and Infertility

- see Urology, U37
- deficiency in gametogenesis or testosterone production

Etiology

- causes include primary (testicular failure), secondary (hypothalamic-pituitary failure), and idiopathic

Two Distinct Features of Primary Hypogonadism

- The decrease in sperm count is affected to a greater extent than the decrease in serum testosterone level
- Likely to be associated with gynecomastia

Diagnosis of Testosterone Deficiency Syndrome (i.e. adult onset primary hypogonadism)

- requires clinical manifestations of testosterone deficiency (see sidebar) AND documented testosterone levels below the laboratory reference range (confirmed on 2 separate analyses, test needs to be done at 8-9 am when testosterone is usually at its peak)
- rule out secondary causes

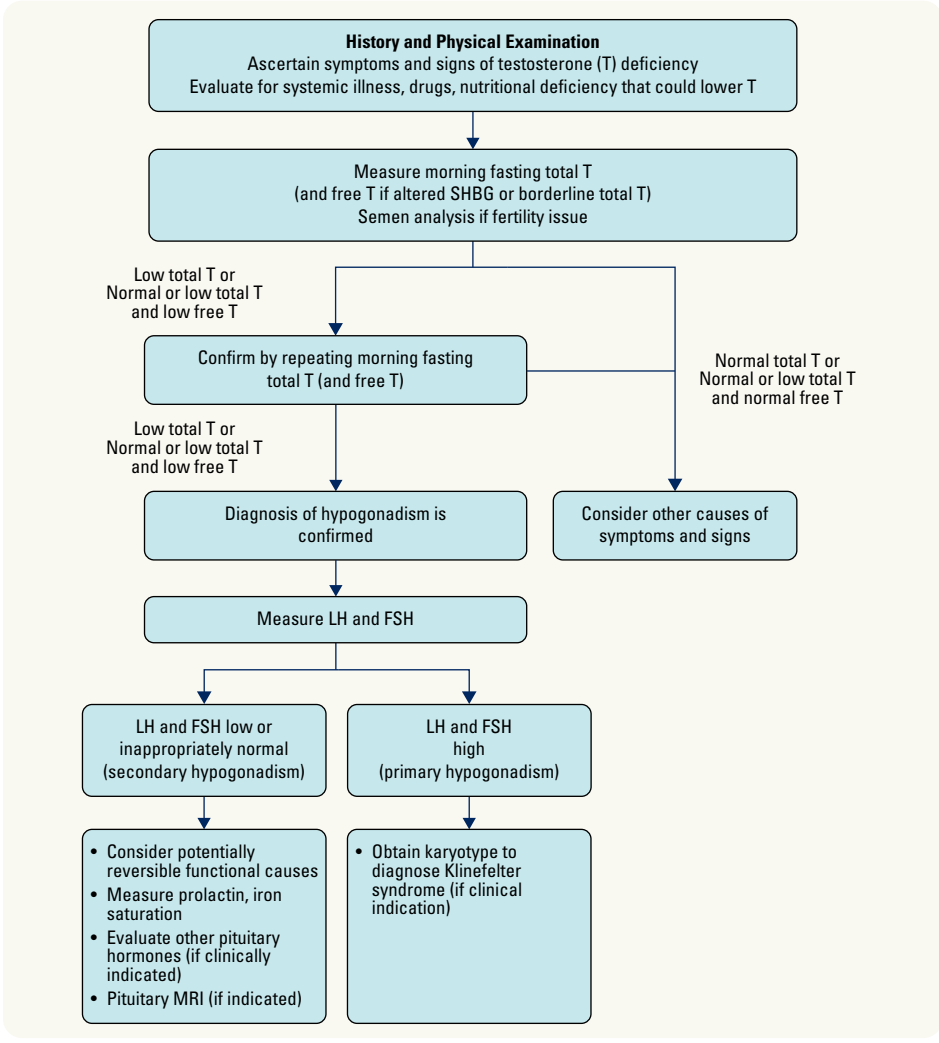

Figure 24. Diagnostic approach to testosterone deficiency

Approach to Male Infertility

Infertility: failure of a couple to conceive after 12 mo of regular intercourse without use of contraception in women <35 yr of age; after 6 mo of regular intercourse without use of contraception in women ≥35 yr

History

- Partner status regarding infertility
- Length of time for attempt to conceive
- Prior successes with other partners
- Ejaculation problems
- Frequency of intercourse
- Previous Surg, Med Hx, STI Hx
- Hx orchitis? Cryptorchidism?
- Hx toxic exposure?
- Medications
- Alcohol and illicit drug use
- Heat exposure: bath, sauna, whirlpool
- Smoking
- Other: validated questionnaires (e.g. ADAM questionnaire)

Physical Examination

- General (height, weight, gynecomastia, masculine)
- Testicular size and consistency
- Varicocele?
- Pituitary disease?
- Thyroid disease?

Investigations

- Semen analysis x 2 (sperm count, morphology, motility)
- Scrotal/testicular U/S (look for varicocele)
- Blood work: LH, FSH, testosterone, PRL, thyroid function tests, DNA fragmentation of sperm, karyotype, Y chromosome deletion
- Test female partner (see Gynaecology, GY23)

Treatment

- No specific therapy for majority of cases
- Treat specific causes
- Consider: intrauterine insemination, *in vitro* fertilization (IVF), therapeutic donor insemination, testicular aspiration of sperm, adoption

Table 37. Classification and Features of Hypogonadism

	Hypergonadotropic Hypogonadism (Primary Hypogonadism)	Hypogonadotropic Hypogonadism (Secondary Hypogonadism)
Definition	Primary testicular failure ↑ LH and FSH ↓ testosterone and sperm count	Hypothalamic-pituitary axis failure ↓ LH and FSH (LH sometimes inappropriately normal) ↓ testosterone and sperm count
Etiology	Congenital Chromosomal defects (Klinefelter, Noonan) Cryptorchidism Disorders of sexual development (DSD) Bilateral anorchia (vanishing testicle syndrome) Myotonic dystrophy Mutation of FSH or LH receptor gene Disorders of androgen synthesis Germ cell defects Sertoli cell only syndrome Leydig cell aplasia/failure Infection/Inflammation Orchitis – tuberculosis, lymphoma, mumps, leprosy Genital tract infection Physical factors Trauma, heat, irradiation, testicular torsion, varicocele Drugs Cannabis, alcohol, chemotherapy, ketoconazole, glucocorticoid, spironolactone	Congenital Kallman's syndrome Prader-Willi syndrome Abnormal subunit of LH or FSH Infection Tuberculosis, meningitis Endocrine Adrenal androgen excess Cushing's syndrome Hypo or hyperthyroidism Hypothalamic-pituitary disease (tumour, hyperprolactinemia, hypopituitarism) Drugs Alcohol, cannabis, spironolactone, ketoconazole, GnRH agonists, androgen/estrogen/progestin use, chronic narcotic use Chronic illness Cirrhosis, chronic renal failure, AIDS Sarcoidosis, Langerhan's cell histiocytosis, hemochromatosis Critical illness Surgery, MI, head trauma Obesity Idiopathic
Diagnosis	**Testicular size and consistency (soft/firm)** Sperm count LH, FSH, total, and/or bioavailable testosterone hCG stimulation (mainly used in paediatrics) Karyotype	**Testicular size and consistency (soft/firm)** Sperm count LH, FSH, total, and/or bioavailable testosterone Prolactin levels (and pituitary panel - T4/8 AM cortisol) Fe, transferrin MRI of hypothalamic-pituitary region

Treatment

- goal: testosterone replacement (improve libido, muscle mass, strength, body hair growth, bone mass)
  - IM injection, transdermal testosterone patch/gel, oral
  - side effects: acne, fluid retention, erythrocytosis, sleep apnea, benign prostatic hypertrophy, uncertain effects on cardiac events/mortality in older men
  - contraindicated in men with prostate or breast cancer, a palpable prostate nodule, prostate-specific antigen (PSA) >4 ng/mL, elevated hematocrit, untreated severe obstructive sleep apnea (OSA), severe lower urinary tract symptoms (LUTS), uncontrolled CHF, MI, or stroke in last 6 mo, or thrombophilia
  - not suggested in men >65 yr, in men with T2DM with low testosterone concentrations, or in men planning fertility in the near term
  - testosterone therapy only to treat symptoms of hypogonadism, often results in decreased spermatogenesis (and reduced sperm counts) by further suppression of hypothalamic-pituitary-gonadal axis and suppression of endogenous testosterone production
- goal: fertility
  - treat underlying cause
  - GnRH agonist if hypothalamic dysfunction with intact pituitary, administered SC in pulsatile fashion using an external pump
  - hCG ± recombinant follicular stimulating hormone (rFSH) in cases of either hypothalamic or pituitary lesions
  - dopamine agonist (e.g. bromocriptine, cabergoline) if prolactinoma
  - testicular sperm extraction (TESE) or microscopic sperm extraction (MICROTESE) – only if testicular tissues are not functioning

Other Causes of Male Infertility

- hereditary disorders: Kartagener syndrome (primary ciliary dyskinesia), cystic fibrosis (absence of the vas deferens)
- anatomy: hypospadias, retrograde ejaculation
- obstruction: vasal occlusion, vasal aplasia, vasectomy, seminal vesicle disease
- sexual dysfunction: erectile dysfunction, premature ejaculation, infrequent coitus
- surgery: transurethral resection of the prostate (TURP), radical prostatectomy, orchiectomy

DEFECTS IN ANDROGEN ACTION

Etiology

- complete androgen insensitivity (CAIS)
- partial androgen insensitivity (PAIS)
- 5-α-reductase deficiency
- mixed gonadal dysgenesis
- defects in testosterone synthesis
- infertile male syndrome
- undervirilized fertile male syndrome

Clinical Features
- depends on age of onset

Table 38. Effects of Testosterone Deficiency

First Trimester *in utero*	Incomplete virilization of external genitalia (ambiguous genitalia) Incomplete development of Wolffian ducts to form male internal genitalia (male pseudohermaphrodism)
Third Trimester *in utero*	Micropenis Cryptorchidism (failure of normal testicular descent)
Prepuberty	Incomplete pubertal maturation (high pitch voice, sparse pubic + axillary hair, absence of facial hair) Eunuchoidal body habitus (greater growth of extremity long bones relative to axial bones) Poor muscle development, reduced peak bone mass
Postpuberty	Decrease in energy, mood, and libido Fine wrinkles in corners of mouth and eyes Decrease in pubic/axillary hair, hematocrit, muscle mass, strength, and BMD

Adapted from: UpToDate, 2010; Cecil's Essentials of Medicine

Treatment
- hormone replacement or supplementation
- psychological support
- gonadectomy for cryptorchidism (due to increased risk for testicular cancer)

Erectile Dysfunction

- see Urology, U33

Gynecomastia

Definition
- true gynecomastia refers to benign proliferation of the glandular component of the male breast, resulting in the formation of a concentric, rubbery, firm mass extending from the nipple(s)
- pseudogynecomastia or lipomastia refers to enlargement of soft adipose tissue, especially seen in obese individuals

Etiology

Physiologic
- puberty
- elderly
- neonatal (maternal hormone)

Pathologic
- physiologic gynecomastia – trimodal distribution in neonatal, pubertal, and older males
- drugs – spironolactone, cimetidine, ketoconazole, recombinant human GH, hCG, estrogens, antiandrogens, GnRH agonists, 5-α-reductase inhibitors, androgen deprivation therapy (ADT)
- surgical ADT (orchiectomy) for prostate cancer
- starvation and refeeding
- male hypogonadism
- cirrhosis
- treatment of HIV infection – due to fat tissue as part of lipodystrophy
- herbal products – plant-derived oils such as lavender and tea tree oil
- idiopathic
- testicular neoplasms
- CKD
- other rare causes: feminizing adrenal tumours, disorders of sex development, ectopic hCG, familial prepubertal gynecomastia
- hyperthyroidism

Pathophysiology
- hormonal imbalance due to:
  - increased estrogen activity
    - increased production, or increased availability of estrogen precursors for peripheral conversion to estrogen
  - decreased androgen activity
    - decreased androgen production, binding of androgen to sex hormone binding globulin (SHBG), or androgen receptor blockage

Pubertal Gynecomastia
- This benign condition peaks between ages 13-14 and spontaneously regresses in 90% of cases within 2 yr
- Waiting is often the best approach

Causes of Gynecomastia

DOC TECH
Drugs (especially antiandrogens, i.e. spironolactone)
Other
Congenital (Klinefelter syndrome)
Tumour (especially germ cell tumours)
Endocrine (hyperthyroidism)
CHronic disease (cirrhosis, CKD)

Drugs Causing Gynecomastia

DISCKO
Digoxin
Isoniazid
Spironolactone
Cimetidine
Ketoconazole
Oestrogen/anti-testosterone

History
- recent change in breast characteristics
- pain
- trauma to testicles
- mumps
- alcohol and/or drug use
- FHx
- sexual dysfunction

Occurrence of Gynecomastia

3 Peaks	% Affected
Infancy	60-90
Puberty	4-69
Ages 50-80	24-65

Physical Exam
- signs of feminization
- breast
  - rule out red flags suggesting breast cancer: unilateral, eccentric, hard or fixed mass, skin dimpling or retraction, and nipple discharge (especially bloody) or crusting
  - gynecomastia occurs concentrically around nipple, is not fixed to underlying tissue
- genito-urinary exam
- stigmata of liver or thyroid disease

Investigations
- laboratory: serum TSH, PRL, LH, FSH, testosterone, estradiol, LFTs, creatinine, hCG (if hCG is elevated, need to locate the primary tumour); however not all investigations are required for every case of gynecomastia
- CXR and CT of chest/abdomen/pelvis (to locate neoplasm)
- testicular U/S (if primary hypogonadism suspected or mass on physical examination)
- MRI of hypothalamic-pituitary region if secondary hypogonadism or pituitary adenoma suspected

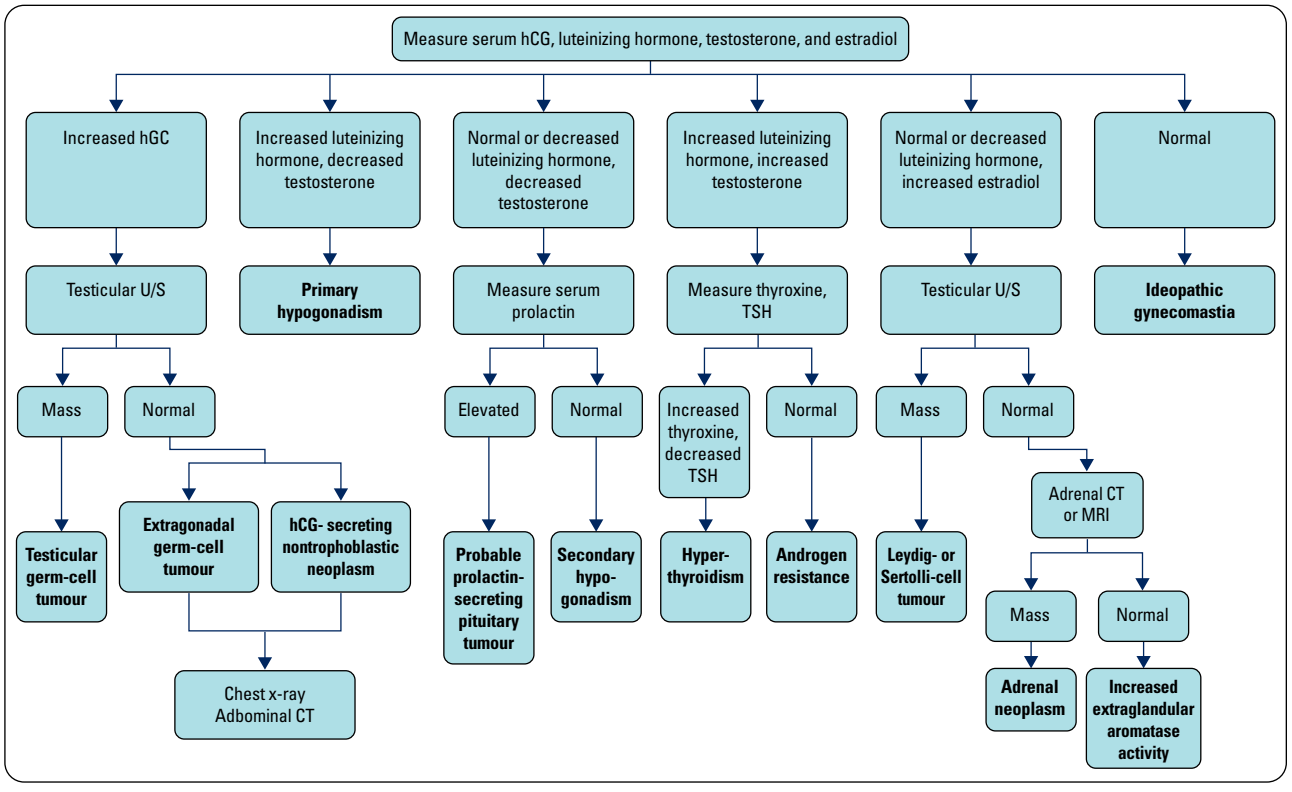

Figure 25. Approach to investigating gynecomastia

Treatment
- initial observation for most men with gynecomastia (after stopping offending medications and treating underlying cause)
- medical
  - correct the underlying disorder, discontinue responsible drug
  - androgens for hypogonadism
  - anti-estrogens: tamoxifen has most evidence for benefit
- surgical
  - longstanding (>12 mo, fibrotic), discomfort, or causing psychological distress

Female Reproductive Endocrinology

- see Gynaecology, GY23

Paraneoplastic Syndrome

- clinical syndromes involving non-metastatic systemic effects that accompany malignant disease
- triggered by antibodies against neoplasm cross-reacting with normal tissue or by production of a physiologically active substance by the neoplasm
- commonly present with cancers of lung, breast, ovaries, or lymphatic system

Table 39. Clinical Features

Syndrome Class	Symptoms/Syndrome	Associated Malignancies	Mechanism
Endocrine	Cushing's syndrome	Small-cell lung cancer Pancreatic carcinoma Neural tumours Thymoma	Ectopic ACTH and ACTH-mimicking substance secretion
	Syndrome of inappropriate ADH secretion (SIADH)	Small-cell lung cancer CNS malignancies	Antidiuretic hormone secretion
	Hypercalcemia	Lung cancer Breast carcinoma Renal cell carcinoma Multiple myeloma Ovarian carcinoma	PTH-related protein, transforming growth factor alpha (TGF-α), tumour necrosis factor (TNF) secretion
	Hypoglycemia	Hepatocellular carcinoma Fibrosarcoma insulinoma	Insulin or insulin-like substance secretion
	Carcinoid	Gastrointestinal neuroendocrine tumours	Serotonin, bradykinin secretion
Neurologic	Lambert-Eaton myasthenic syndrome (LEMS) Muscle weakness in limbs	Small-cell lung cancer	Ab interferes with acetylcholine (ACh) release
	Myasthenia gravis Fluctuating muscle weakness and fatigability	Thymoma	Ab interferes with ACh release
	Paraneoplastic limbic encephalitis Depression, seizures, short-term memory loss	Small-cell lung cancer	Unknown
Renal	Hypokalemic nephropathy	Small-cell lung cancer	Ectopic ACTH and ACTH-like substance secretion
	Nephrotic syndrome	Lymphoma Melanomas	Immunocomplex sedimentation in nephrons
GI	Watery diarrhea	MTC VIPoma	Calcitonin, prostaglandin secretion VIP secretion
Hematologic	Erythrocytosis	Renal cell carcinoma Hepatocellular carcinoma	Erythropoietin (EPO) production
Rheumatologic	SLE	Lymphomas Lung cancer Breast carcinoma Gonadal carcinoma	Anti-nuclear Ab production
	Scleroderma	Breast carcinoma Lung cancer Uterine cancer	Anti-nuclear Ab production

Investigations

- CBC, electrolytes, creatinine, LFTs, ALP, erythrocyte sedimentation rate (ESR), CRP, serum/urine electrophoresis
- serum autoantibodies, lumbar puncture
- imaging: skeletal survey, CT, MRI, positron emission tomography (PET) scan
- ± endoscopy

Treatment

- treat underlying tumour: surgery, radiation, chemotherapy
- treat immune-mediated disorder: intravenous immunoglobulin (IVIG), steroids, immunosuppressive drugs, plasmapheresis (reserved for patients with identifiable antibodies in serum)

Common Medications

Diabetes Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects	Comments
Biguanide	Sensitizes peripheral tissues to insulin → increases glucose uptake Decreases hepatic glucose production by simulation of hepatic AMP-activated protein kinase (AMPK)	metformin	Glucophage® Glumetza®		500 mg once daily titrated to 2000 mg/d maximum (split BID unless extended release)	T2DM Improves both fasting and postprandial hyperglycemia Also → TG	ABSOLUTE: Moderate to severe liver dysfunction Moderate renal dysfunction GFR <30 mL/min Cardiac dysfunction	GI upset (abdominal discomfort, bloating, diarrhea) Vitamin B_{12} deficiency	↓ A1c 1.0-1.5% Weight neutral Negligible risk of hypoglycemia as monotherapy
Insulin Secretagogue	Stimulates insulin release from β cells by causing K^+ channel closure → depolarization → Ca^{2+} mediated insulin release Use in nonobese T2DM	sulfonylureas: glyburide gliclazide glimepiride	 Diabeta® Euglucon® Diamicron® Diamicron® MR Amaryl®	 Micronase® Glynase PreTab®	 2.5-5.0 mg/d titrated to >5 mg BID Max: 20 mg/d 40-160 mg BID 30-120 mg once daily 1-8 mg once daily	T2DM, taken with meals	ABSOLUTE: Moderate to severe liver dysfunction RELATIVE (glyburide and glimepiride): Adjust dose in mild to moderate kidney dysfunction and avoid in severe kidney dysfunction Avoid glyburide in the elderly INTERACTIONS: Do not combine with a non-sulfonylurea insulin secretagogue or preprandial insulin	Hypoglycemia Weight gain	↓ A1c 0.8% Gliclazide lowest incidence of hypoglycemia
Meglitinides	Stimulates insulin release from β cells by causing K^+ channel closure → depolarization → Ca^{2+} mediated insulin release	non-sulfonylureas: repaglinide nateglinide	 GlucoNorm® Starlix®	 Prandin®	 0.5-4 mg TID 60-120 mg TID	Short t1/2 of 1 h causes brief but rapid ↑ in insulin, therefore effective for postprandial control	ABSOLUTE: Severe liver dysfunction INTERACTIONS: Do not combine with a sulfonylurea or preprandial insulin	Hypoglycemia (less than sulfonylurea) Weight gain	↓ A1c 0.7% for repaglinide and 0.5-1.0% for nateglinide Costly Must be dosed with meals
Insulin Sensitizers (thiazolidinedione)	Sensitizes peripheral tissues to insulin → increases glucose uptake Decreases FFA release from adipose Binds to nuclear receptor peroxisome proliferator-activated receptor gamma (PPAR-γ)	rosiglitazone pioglitazone	Avandia® Actos®		2-8 mg once daily 15-45 mg once daily	T2DM – not as initial therapy	ABSOLUTE: New York Heart Association (NYHA) > class II CHF, bladder cancer INTERACTIONS: Do not combine with insulin	Peripheral edema CHF Anemia Fluid retention and CHF Increased risk of cardiac events with rosiglitazone (requires written informed consent when prescribing) Increased risk of bladder cancer with pioglitazone Fractures Mild increase in LDL	↓ A1c 0.8% Delayed maximum efficacy (6-12 wk) NOTE: This class of medication is rarely used anymore due to side effects and concerns about potential increased cardiovascular (CV) mortality
α-Glucosidase Inhibitor	↓ carbohydrate GI absorption by inhibiting brush border α-glucosidase	acarbose	Glucobay®	Precose®	25 mg once daily titrated to 100 mg TID	↓ postprandial hyperglycemia	ABSOLUTE: Inflammatory bowel disease Severe liver dysfunction	Flatulence Abdominal cramps Diarrhea	↓ A1c 0.6% Not recommended as initial therapy in patients with HbA1c >8.5%
Dipeptidyl Peptidase-IV (DPP-IV) Inhibitor	Inhibits degradation of endogenous antihyperglycemic incretin hormones Incretin hormones stimulate insulin secretion, inhibit glucagon release, and delay gastric emptying	sitagliptin saxagliptin linagliptin	Januvia® Onglyza™ Trajenta®		100 mg once daily 2.5-5 mg once daily 5 mg once daily		ABSOLUTE (sitagliptin): T1DM DKA RELATIVE (sitagliptin and saxagliptin): Use with dose reduction in kidney dysfunction	Nasopharyngitis Upper respiratory tract infection (URTI) Headache Pancreatitis Stevens Johnson syndrome Bullous pemphigoid	↓ A1c 0.7% Weight neutral Expensive Negligible risk of hypoglycemia as monotherapy

Diabetes Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects	Comments
Glucagon-Like Peptide (GLP)-1 Analogue	Binds to GLP-1 receptor to promote insulin release Insulinotropic effect suppressed as plasma glucose <4 mmol/L Slows gastric emptying, suppresses inappropriately elevated glucagon levels Causes β-cell regeneration and differentiation *in vitro*	exenatide	Byetta®		5-10 µg SC BID 1 h before meals		ABSOLUTE: T1DM DKA Acute pancreatitis Hx Multiple endocrine neoplasia syndrome type 2 MTC RELATIVE: Gastroparesis End stage renal disease (ESRD) Personal or family history of MTC	N/V, diarrhea Dizziness, headache Muscle weakness Anti-exenatide antibodies Pancreatitis	↓ A1c 1.0% Weight loss Negligible risk of hypoglycemia as monotherapy Added CV mortality and CV outcomes benefit in patients with known CVD
		liraglutide	Victoza®		0.6-1.8 mg once daily SC				
		semaglutide	Rybelusus PO/ Ozempic SC®		3-14 mg once daily PO, 0.25-1 mg once weekly SC				
		dulaglutide	Trulicity®		0.75-1.5 mg/ wk SC				
Sodium-glucose linked transporter 2 (SGLT2) Inhibitor	Enhances urinary glucose excretion by inhibiting glucose reabsorption in the proximal renal tubule	canagliflozin	Invokana®		100 - 300 mg once daily before first meal of the day		ABSOLUTE: Severe renal impairment ESRD Patients on dialysis	UTI, genital infections Hypotension caution with concomitant loop diuretic use Caution with renal dysfunction Hyperlipidemia (raises LDL and HDL) Dapagliflozin not to be used in patients with active or history of bladder cancer Rare DKA (may occur with no hyperglycemia)	↓ A1c 0.7-1.0% Negligible risk of hypoglycemia as monotherapy Cause weight loss Added CV mortality, CV outcomes benefit in patients with known prior CVD Renal protection
		dapagliflozin	Forxiga®		5 - 10 mg once daily in the morning with or without food				
		empagliflozin	Jardiance®		10 - 25 mg once daily in the morning with or without food				

Dyslipidemia Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
HMG-CoA Reductase Inhibitor (statins)	Inhibits cholesterol biosynthesis, ↓ LDL synthesis, ↑ LDL clearance, modest ↑ HDL, limited ↓ VLDL	atorvastatin fluvastatin lovastatin pravastatin rosuvastatin simvastatin	Lipitor® Lescol® Mevacor® Pravachol® Crestor® Zocor®		10-80 mg/d 20-80 mg/d 20-80 mg/d 10-40 mg/d 5-40 mg/d 10-80 mg/d	1st line monotherapy Used for ↑ LDL, ↑ TG	Active liver disease	↑ liver enzymes Myositis (↑ risk if combined with fibrates) Rhabdomyolysis
Fibrates	Activate PPAR α, upregulate lipoprotein lipase + apo A1, ↓ VLDL, ↓ TG, modest ↓ LDL, modest ↑ HDL	bezafibrate fenofibrate gemfibrozil	Bezalip® Lipidil® Lopid®		400 mg/d 48-200 mg/d 600-1200 mg/d	Used for ↑ TG, hyperchylomicronemia	Hepatic disease Renal disease	GI upset Skin rashes ↑ risk of gallstone formation ↑ risk of rhabdomyolysis when combined with statins
Niacin	Inhibits secretion of hepatic VLDL via lipoprotein lipase (LPL) pathway → decreased VLDL and LDL; decreased clearance of HDL	nicotinic acid	Niaspan® generic niacin	Niacor®	0.5-2 g/d	Used for severe hypertriglyceridemia not controlled by fibrate	Hypersensitivity Hepatic dysfunction Active peptic ulcer disease (PUD) Hyperuricemia Severe hypotension	Generalized flushing Abnormal liver enzymes Pruritus IGT Watch glucose control with overt DM
Bile Acid Sequestrants	Resins that bind bile acids in intestinal lumen and prevent absorption thereby ↓ LDL	cholestyramine	Questran®		2-24 g/d	Used for ↑ LDL Use as adjunct with statins or fibrates	Complete biliary obstruction TG >3.5 mmol/L	Constipation, nausea Flatulence Bloating Rise in TG Binds other medications
		colestipol	Colestid®		5-30 g/d			

Dyslipidemia Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
Cholesterol Absorption Inhibitors	Inhibits cholesterol absorption at the small intestine brush border	ezetimibe	Ezetrol®	Zetia®	10 mg/d	Used for ↑ LDL	Hypersensitivity Hepatic dysfunction (when used with statin) Do not combine with fibrates or bile acid resins	Fatigue Pharyngitis Sinusitis Abdominal pain Diarrhea Arthralgia
Anti-PCSK9	Inhibits degradation of the LDL receptor by PCSK9 enzyme LDL clearance	evolocumab alirocumab	Repatha® Praluent®		140 mg q2 wk or 420 mg once monthly 75 mg q2 wk or 300 mg once monthly	Add-on to maximally tolerated statin therapy in heterozygous familial hypercholesterolemia (FH) (evolocumab, alirocumab) and homozygous FH (evolocumab) Consider in patients with atherosclerotic CVD and LDL-C not at target despite maximally tolerated statin ± ezetimibe	Hypersensitivity No studies regarding use in severe hepatic or renal impairment	Nasopharyngitis, URTI, influenza Sinusitis Back pain Myalgia Arthralgia Nausea

Thyroid Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
Antithyroid Agent (thionamides)	Decreases thyroid hormone production by inhibiting iodine and peroxidase from interacting with thyroglobulin to form T_4 and T_3 PTU also interferes with conversion of T_4 to T_3	propylthiouracil (PTU)	Propyl-Thyracil®		Start 100 mg PO TID, then adjust accordingly Thyroid storm: start 150-300 PO QID, then adjust accordingly	Hyperthyroidism, thyroid storm	Hypersensitivity PTU recommended in 1st trimester, MMI during 2nd and 3rd trimester Lactation: safe with PTU <300 mg/d and MMI <20-30 mg/d	N/V Rash Drug-induced hepatitis Agranulocytosis Hepatitis with PTU Cholestasis with MMI Vasculitis
		methimazole (MMI)	Tapazole®		Start 5-20 mg PO once daily, then adjust accordingly Up to 60 mg once daily may be required			
Thyroid Hormone	Synthetic form of thyroxine (T_4)	levothyroxine l-thyroxine	Synthroid® Eltroxin®	Levoxyl®	0.05-2.0 mg/d, usually 1.6x weight (kg) is dose in micrograms In elderly patients start at 0.025 mg/d	Hypothyroidism Post thyroidectomy	Recent MI, thyrotoxicosis	If wrong dosing: symptoms of hypothyroidism or hyperthyroidism Skin rash from dye in pill
Antithyroid Agent Radiopharmaceutical	Radioactive isotope of iodine that is incorporated into the thyroid gland irradiating the area and destroying local glandular tissue	sodium iodide I-131	Iodotope®		Dose corrected for 24 h radioactive iodine uptake Hyperthyroidism 4-12 millicuries (mCi) Thyroid Ca 50-150 mCi	Hyperthyroidism Thyroid malignancy	Hypersensitivity Concurrent antithyroid medication Pregnancy, lactation	N/V Bone marrow suppression Sialadenitis Thyroiditis

Metabolic Bone Disease Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
Bisphosphonates	Inhibits osteoclast-mediated bone resorption	alendronate	Fosamax®		Osteoporosis: 5-10 mg once daily 70 mg once weekly Paget's: 40 mg once daily for 6 mo	Prevention of postmenopausal osteoporosis Treatment of osteoporosis Glucocorticoid-induced osteoporosis Paget's disease	Esophageal stricture or achalasia (oral) Unable to stand or sit upright for >30 min (oral) Hypersensitivity Hypocalcemia Renal insufficiency (CrCl <35 mL/min) History or atypical femoral fracture or osteonecrosis of the jaw	GI Musculoskeletal (MSK) pain Headache Osteonecrosis of the jaw Atypical femur fractures
		risedronate	Actonel®		Osteoporosis: 5 mg once daily 35 mg once weekly 150 mg once monthly Paget's: 30 mg once daily for 2 mo	Treatment and prevention of postmenopausal osteoporosis Treatment and prevention of glucocorticoid-induced osteoporosis Paget's disease	Renal insufficiency (CrCl <30 mL/min)	
		pamidronate	Aredia®		Hypercalcemia of malignancy: 60-90 mg IV over 2-24 h Wait at least 7 d before considering retreatment	Hypercalcemia of malignancy Paget's disease Osteolytic bone metastases of breast cancer Osteolytic lesions of multiple myeloma	Renal insufficiency (CrCl <30 mL/min)	
		zoledronate	Zometa® Aclasta®	Reclast®	5 mg IV once yearly 5 mg IV	Treatment of osteoporosis Hypercalcemia of malignancy Treatment and prevention of skeletal complications related to cancer	Renal insufficiency (CrCl <35 mL/min)	
Selective Estrogen Receptor Modulators	Decreases resorption of bone through binding to estrogen receptors	raloxifene	Evista®		60 mg once daily	Treatment and prevention of postmenopausal osteoporosis (2nd line)	Lactation Pregnancy Active or past history of DVT, PE, or retinal vein thrombosis	Hot flashes Leg cramps Increased risk of fatal stroke, venous thromboembolism
Anti-RANKL Monoclonal Ab	Inhibits RANKL (osteoclast differentiating factor) → inhibits osteoclast formation and decreases bone resorption	denosumab	Prolia™	Xgeva™	60 mg SC q6 mo	Treatment for postmenopausal women at high-risk of fracture Prevent skeletal-related events in patients with bone metastasis from solid tumours Also approved for glucocorticoid-induced osteoporosis, and for men	Hypocalcemia Vitamin D insufficiency	Fatigue/headache/GI injection site reaction Hypocalcemia Atypical femur fractures Osteonecrosis of the jaw
PTH analog	Stimulates new bone formation by preferential stimulation of osteoblastic activity over osteoclastic activity	teriparatide	Forteo®		20 µg SC once daily x 18-24 mo	Treatment for postmenopausal women with osteoporosis who are at high-risk for fracture Treatment for men with primary or hypogonadal osteoporosis who are at high-risk for fracture Also approved for glucocorticoid-induced osteoporosis	Paget's disease Prior external beam or implant radiation therapy involving the skeleton Bone metastases Metabolic bone diseases other than osteoporosis	Orthostatic hypotension Hypercalcemia Dizziness Leg cramps
Calcium	Inhibits PTH secretion				1200 mg/d (including diet) Divided in 3 doses	Osteopenia Osteoporosis Prevention of metabolic bone disease	Caution with renal stones	Vomiting Constipation Dry mouth

Metabolic Bone Disease Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
Anti-sclerostin Monoclonal Ab	Binds to and inhibits sclerostin (inhibitor of Wnt β-Catenin pathway) → increased bone formation and reduced bone resoprtion	Romosozumab	Evenity®		210 mg SC qMonth x 12 mo	Treatment of osteoporosis in postmenopausal women at high risk for fracture (defined as history of osteoporotic fracture or multiple risk factors for fracture)	Hypocalcemia Hypersensitivity	Headache, joint pain, pain at injection site May increase risk of MI/stroke/CV death Osteonecrosis of jaw Atypical femur fractures
Vitamin D	Regulation of calcium and phosphate homeostasis	cholecalciferol (vitamin D_3)			800 -2000 IU/d (higher doses required in Insufficiency or deficiency)	Osteopenia Osteoporosis Prevention of metabolic bone disease	Caution in patients on digoxin (risk of hypercalcemia which may precipitate arrhythmia)	Hypercalcemia Headache N/V Constipation
		ergocalciferol (vitamin D_2)	Drisdol® Erdol®		50000 IU/wk	Osteoporosis in patients with liver dysfunction, refractory rickets, hypoparathyroidism	Hypercalcemia Malabsorption syndrome Decreased renal function	
		calcitriol ($1,25(OH)_2$-D)	Rocaltrol®		Start 0.25 µg/d Titrate up by 0.25 µg/d at 4-8 wk intervals to 0.5-1 µg/d	Hypocalcemia and osteodystrophy in patients with chronic renal failure on dialysis Hypoparathyroidism	Hypercalcemia Vitamin D toxicity	
			Calcijex®		Start 0.25 µg/d Titrate up by 0.25 µg/d at 2-4 wk intervals to 0.5-2 µg/d			

Adrenal Medications

Drug Class	Mineralocorticoid Activity	Generic Drug Name	Potency Relative to Cortisol	Equivalent Dose (mg)	Duration of Action (t1/2 in h)	Dosing	Comments
Hydrocortisone	Yes	cortef solu-Cortef	1.0	20	8	Adrenal Crisis: 50-100 mg IV bolus, then 50-100 mg q8 h (continuous infusion x 24-48 h) PO once stable (50 mg q8 h x 48 h, then taper over 14 d) Chronic AI: 15-20 mg PO BID-TID (2/3 AM, 1/3 PM)	In high doses, mineralocorticoid side effects may emerge (salt + water retention, ECF volume expansion, HTN, low K^+ metabolic alkalosis)
Cortisone Acetate	Yes	cortisone acetate	0.8	25	oral = 8 IM = 18+	Adrenal Crisis: 75-300 mg/d PO/IM divided q12-24 h Chronic AI: 25 mg/d divided BID-TID	Pro-drug which is converted to active form as hydrocortisone High doses can result in mineralocorticoid side effects (see above)
Mineralocorticoid							
Fludrocortisone	100%	—	—			Chronic: 0.1 mg daily	Replaces aldosterone in primary adrenal insufficiency
Prednisone	Yes	prednisone	4	5	16-36	Adrenal Crisis: 15-60 mg/d PO once daily or divided BID/QID Chronic AI: 5 mg daily	Pro-drug which is converted to active form as prednisolone
Dexamethasone	No	dexamethasone	30	0.75	36-54	Adrenal Crisis: 4 mg IV; repeat q2-6 h if necessary	

Landmark Endocrinology Trials

Trial Name	Reference	Clinical Trial Details
DIABETES		
GLP-1 Agonists		
LEADER	NEJM 2016;375:311-22	**Title:** Liraglutide and Cardiovascular Outcomes in Type 2 Diabetes **Purpose:** To investigate the cardiovascular effects of liraglutide (GLP1 analogue) when added to standard care in patients with T2DM. **Methods:** 9340 patients with T2DM at high cardiovascular risk were randomly assigned to receive liraglutide or placebo. **Results:** The primary outcome (first occurrence of death from cardiovascular causes, nonfatal MI, or nonfatal stroke) was observed in significantly less patients on liraglutide (13.0%) than placebo (14.9%) (hazard ratio, 0.87; 95% confidence interval, 0.78-0.97; P<0.001 for noninferiority; P=0.01 for superiority). **Conclusion:** In patients with T2DM, liraglutide reduced the rate of first occurrence of death from cardiovascular causes, nonfatal MI, or nonfatal stroke.
REWIND	Lancet 2019;394:121-30	**Title:** Dulaglutide and Cardiovascular Outcomes in T2DM (REWIND): A Double-Blind, Randomized Placebo-Controlled Trial **Purpose:** To assess the effects of adding the GLP-1 receptor agonist dulaglutide to existing antihyperglycemic regimens on major cardiovascular events in patients with T2DM. **Methods:** 9901 patients with T2DM ≥50 years old with previous CVD or cardiovascular risk factors were randomly assigned to receive dulaglutide (1.5 mg weekly) or placebo. Primary composite outcome was first occurrence of non-fatal MI, non-fatal stroke, or death from cardiovascular causes. **Results:** During median follow-up of 5.4 years, the primary composite outcome occurred in 12.0% of patients on dulaglutide vs. 13.4% of patients on placebo (hazard ratio (HR), 0.88; 95% CI 0.79-0.99; P=0.026). There was no significant difference in all-cause mortality between groups (10.8% in the dulaglutide group vs. 12% in the placebo group; HR, 0.90; 95% CI, 0.80-1.01; P=0.067). **Conclusion:** In middle-aged and older adults with T2DM with previous CVD or cardiovascular risk factors, dulaglutide could be considered for managing glycemic control.
SGLT2 Inhibitors		
EMPA-REG OUTCOME	NEJM 2015;373:2117-28	**Title:** Empagliflozin, Cardiovascular Outcomes, and Mortality in Type 2 Diabetes **Purpose:** To investigate the effects of empagliflozin on cardiovascular morbidity and mortality in patients with T2DM at high cardiovascular risk. **Methods:** 7020 patients were randomly assigned to receive empagliflozin (10 mg or 25 mg) or placebo daily. **Results:** Risk of hospitalization from heart failure, death from any cause, or cardiovascular causes was significantly lower in the pooled empagliflozin group as compared to placebo. There were no significant differences in the rates of MI or stroke. There were increased rates of genital infection with empagliflozin. **Conclusion:** Empagliflozin reduced rates of death from any cause and death from CVD in patients with T2DM at high risk for cardiovascular events.
CANVAS	NEJM 2017;377:644-57	**Title:** Canagliflozin and Cardiovascular and Renal Events in Type 2 Diabetes **Purpose:** To assess the effects of canagliflozin on cardiovascular, renal, and safety outcomes in patients with T2DM. **Methods:** 10142 patients with T2DM at high cardiovascular risk were randomly assigned to receive canagliflozin or placebo. Primary outcome was a composite of death from cardiovascular causes, nonfatal MI, or nonfatal stroke. **Results:** Canagliflozin was associated with significantly lower rates of the primary outcome as compared to placebo (26.9 vs. 31.5 participants per 1000 patient-years; hazard ratio (HR), 0.86; 95% CI, 0.75-0.97; P<0.001 for noninferiority; P=0.02 for superiority). However, canagliflozin was associated with a greater risk of amputation (6.3 vs. 3.4 participants per 1000 patient-years; HR, 1.97; 95% CI, 1.41-2.75). **Conclusion:** Canagliflozin lowered the risk of cardiovascular events but increased the risk of amputation in patients with T2DM at high cardiovascular risk.
DECLARE-TIMI 58	NEJM 2019;380:347-57	**Title:** Dapagliflozin and Cardiovascular Outcomes in Type 2 Diabetes **Purpose:** To assess the safety and efficacy of the SGLT2i dapagliflozin in patients with T2DM who had or were at risk for atherosclerotic CVD. **Methods:** 17160 patients were randomly assigned to receive 10 mg dapagliflozin daily or placebo. Primary composite safety outcome was MACE (major adverse cardiovascular events), defined by cardiovascular death, MI, or ischemic stroke. The primary efficacy outcomes were MACE and a composite of cardiovascular death or hospitalization for heart failure. **Results:** For the primary safety outcome, dapagliflozin was noninferior to placebo (P<0.001 for noninferiority). In the efficacy analyses, dapagliflozin was associated with a lower rate of cardiovascular death or hospitalization for heart failure (4.9% vs. 5.8%; hazard ratio, 0.83; 95% CI, 0.73-0.95; P=0.005), but it did not significantly lower rates of MACE (8.8% vs. 9.4%; hazard ratio, 0.93; 95% CI, 0.84-1.03; P=0.17). **Conclusion:** Dapagliflozin was noninferior to placebo with respect to MACE but was associated with lower rates of cardiovascular death or hospitalization for heart failure in patients with T2DM who had or were at risk for atherosclerotic CVD.

Trial Name	Reference	Clinical Trial Details
SGLT2 Inhibitors - Renal		
CREDENCE	NEJM 2019;380:2295-2306	**Title:** Canagliflozin and Renal Outcomes in Type 2 Diabetes and Nephropathy **Purpose:** To investigate if an SGLT2i improves renal outcomes in patients with T2DM. **Methods:** 4401 patients with T2DM and chronic kidney disease (CKD) were randomly assigned to receive either 100 mg canagliflozin (oral SGLT2i) daily or placebo. **Results:** Trial was stopped early after median follow-up of 2.6 yr. Canagliflozin significantly lowered the relative risk of the primary composite outcome (end-stage kidney disease, doubling of serum creatinine, or death from renal or cardiovascular causes) by 30% (hazard ratio, 0.70; 95% confidence interval, 0.59-0.82; P=0.00001). **Conclusion:** Canagliflozin therapy resulted in a lower risk of kidney failure and cardiovascular events in patients with T2DM and CKD.
DAPA-CKD	NEJM 2020;383:1436-46	**Title:** Dapagliflozin in Patients with Chronic Kidney Disease **Purpose:** To assess the effects of SGLT2is in patients with CKD with or without T2DM. **Methods:** 4304 patients with estimated GFR (eGFR) = 25 to 75 mL/min/1.73m^2 and urinary ACR = 200 to 5000 were randomly assigned to receive dapagliflozin (10 mg/d) or placebo. **Results:** Over a median of 2.4 yr, dapagliflozin was associated with significantly lower rates of the primary composite outcome (sustained decline in eGFR ≥50%, end-stage kidney disease, or death from renal or cardiovascular outcomes) as compared to placebo (9.2% vs. 14.5%; hazard ratio, 0.61; 95% CI, 0.51-0.72; P<0.001). Effects were similar in patients with and without T2DM. **Conclusion:** Dapagliflozin therapy resulted in a lower risk of kidney failure and cardiovascular events in patients with CDK, with or without T2DM.
SGLT2 Inhibitors - Cardiac		
DAPA-HF	NEJM 2019;381:1995-2008	**Title:** Dapagliflozin in Patients with Heart Failure and Reduced Ejection Fraction **Purpose:** To assess the effects of SGLT2is in patients with heart failure and reduced ejection fraction, with or without T2DM. **Methods:** 4744 patients with New York Heart Association class II, III, or IV heart failure and ejection fraction ≤40% were randomly assigned to receive dapagliflozin (10 mg/d) or placebo, in addition to recommended therapy. **Results:** Over a median of 18.2 months, dapagliflozin was associated with significantly lower rates of the primary composite outcome (worsening heart failure or cardiovascular death) as compared to placebo (16.3% vs. 21.2%; hazard ratio, 0.74; 95% CI, 0.65-0.85; P<0.001). Effects were similar in patients with and without T2DM. **Conclusion:** Dapagliflozin therapy resulted in a lower risk of worsening heart failure or cardiovascular death in patients with heart failure and reduced ejection fraction, with or without T2DM.
EMPEROR-Reduced	NEJM 2020;383:1413-24	**Title:** Cardiovascular and Renal Outcomes with Empagliflozin in Heart Failure **Purpose:** To assess the effects of SGLT2is in patients with heart failure, including those with a markedly reduced ejection fraction. **Methods:** 3730 patients with New York Heart Association class II, III, or IV heart failure and ejection fraction ≤40% were randomly assigned to receive empagliflozin (10 mg/d) or placebo, in addition to recommended therapy. **Results:** Over a median of 16 months, empagliflozin was associated with significantly lower rates of the primary composite outcome (hospitalization for worsening heart failure or cardiovascular death) as compared to placebo (19.4% vs. 24.7%; hazard ratio, 0.75; 95% CI, 0.65-0.86; P<0.001). Effects were similar in patients with and without T2DM. Empagliflozin was also associated with a slower annual rate of decline in estimated GFR (-0.55 vs. -2.28 ml/min/1.73m^2/yr; P<0.001). **Conclusion:** Empagliflozin therapy resulted in a lower risk of hospitalization for worsening heart failure or cardiovascular death in patients receiving recommended therapy for heart failure, with or without T2DM.
A1c Targets		
ADVANCE	NEJM 2008;358:2560-72	**Title:** Intensive Blood Glucose Control and Vascular Outcomes in Patients with Type 2 Diabetes **Purpose:** To investigate the effects of intensive glucose control on vascular outcomes in patients with T2DM. **Methods:** 11140 patients with T2DM received intensive glucose control with modified release gliclazide (and other drugs necessary to reach target HbA1c ≤6.5%) or standard glucose control (target HbA1c defined by local guidelines). **Results:** Intensive glucose control reduced the incidence of nephropathy (4.1% vs. 5.2%; hazard ratio, 0.79; 95% confidence interval [CI], 0.66-0.93; P=0.006), but did not significantly reduce major macrovascular events or death from any cause. Severe hypoglycemia was more common in the intensive control group (2.7%, vs. 1.5%; 1.86 CI [1.42 to 2.40]; P<0.001). **Conclusion:** Intensive glucose control targeting HbA1c ≤6.5% significantly reduces the incidence of nephropathy but not major macrovascular events or death.
ACCORD	NEJM 2008;358:2545-59	**Title:** Effects of Intensive Glucose Lowering in Type 2 Diabetes **Purpose:** To investigate if intensive glucose control targeting normal HbA1c levels reduces cardiovascular events in patients with T2DM with established CVD or CVD risk factors. **Methods:** 10251 patients (mean age 62.2) were randomly assigned to receive intensive therapy targeting a HbA1c level of <6.0% or standard therapy targeting 7.0-7.9%. **Results:** The intensive therapy arm was stopped early due to evidence of increased mortality. There was no difference in cardiovascular events or death from cardiovascular events. There were increased rates of hypoglycemia, fluid retention, and weight gain >10 kg in the intensive therapy group. **Conclusion:** Intensive glucose lowering therapy in T2DM does not improve clinical outcomes and increases mortality with more adverse events.

Trial Name	Reference	Clinical Trial Details
VADT	NEJM 2009;129-39	**Title:** Glucose Control And Vascular Complications In Veterans With Type 2 Diabetes **Purpose:** To investigate effects of intensive glucose control on cardiovascular events in patients with long-standing T2DM. **Methods:** 1791 military veterans who had suboptimal responses to therapy for T2DM were randomly assigned to intensive control (absolute reduction in HbA1c by 1.5% relative to standard) or standard glucose control. **Results:** Median HbA1c was 6.9% in the intensive-therapy group and 8.4% in the standard-therapy. Risk of major cardiovascular events, microvascular complications, or death from any cause were not significantly different between groups. Adverse events, predominantly hypoglycemia, were more common in the intensive control group. **Conclusion:** Rates of major cardiovascular events, death, or microvascular complications were not reduced by intensive glucose control in patients with poorly controlled T2DM.
Treating Diabetes		
DCCT	NEJM 1993;329:977-986	**Title:** The Effect of Intensive Treatment of Diabetes on the Development and Progression of Long-term Complications in Insulin-dependent Diabetes Mellitus **Purpose:** To investigate whether intensive treatment to maintain normal blood glucose reduces the frequency and severity of microvascular complications in T1DM. **Methods:** 1441 patients with T1DM received intensive therapy (≥3 daily insulin injections or insulin pump, BG monitoring QID with strict targets) or conventional therapy (1-2 insulin injections daily, BG monitoring daily). **Results:** Intensive treatment of T1DM significantly reduced the risk for the development and progression of retinopathy in primary- and secondary-intervention cohorts, respectively. Intensive therapy also reduced the occurrence of microalbuminuria, albuminuria, and clinical neuropathy. Intensive therapy was associated with an increase in the occurrence of severe hypoglycemia. **Conclusion:** Intensive treatment significantly reduces the development and progression of microvascular complications in T1DM.
EDIC	NEJM 2005;353:2644-53	**Title:** Intensive Diabetes Treatment and Cardiovascular Disease in Patients with Type 1 Diabetes **Purpose:** To investigate whether intensive vs. conventional therapy during the DCCT trial influenced the long-term incidence of CVD. **Methods:** The DCCT trial randomly assigned 1441 patients with T1DM to intensive or conventional therapy for a mean of 6.5 years from 1983-1993. 93% were followed until 2005 (EDIC) for cardiovascular events. **Results:** During the mean 17-year follow-up, intensive treatment reduced the risk of any cardiovascular event by 42% (95% confidence interval (CI), 9-63%; P=0.02) and of nonfatal MI, stroke, or death from CVD by 57% (CI, 12-79%; P=0.02). **Conclusion:** Long-term risk of CVD in patients with T1DM is reduced by intensive therapy.
UKPDS 33	Lancet 1998;352:837-53	**Title:** Intensive Blood-Glucose Control With Sulphonylureas or Insulin Compared With Conventional Treatment and Risk of Complications In Patients With Type 2 Diabetes (UKPDS 33) **Purpose:** To investigate the effects of intensive blood-glucose control with sulphonylurea or insulin vs. conventional treatment on the risk of complications in T2DM. **Methods:** 3867 patients with newly diagnosed T2DM were received intensive treatment with a sulfonylurea or insulin (target FPG <6 mmol/L) vs. conventional treatment with diet alone (target FPG <15 mmol/L without hyperglycemic symptoms). **Results:** Patients allocated to intensive treatment had lower median HbA1c levels (P<0.0001), and their risk was reduced by 12% for any diabetes-related endpoint (95% confidence interval [CI], 1-21, P=0.029), by 10% for any diabetes-related death (CI, -11-27, P=0.34), and by 6% for all-cause mortality (CI, -10-20, P=0.44). Intensive therapy induced more hypoglycemic episodes and weight gain. **Conclusion:** In T2DM, sulphonylurea or insulin-mediated intensive glucose control reduced microvascular but not macrovascular complications.
UKPDS 34	Lancet 1998;352:854-65	**Title:** Effect of Intensive Blood-Glucose Control With Metformin On Complications In Overweight Patients With Type 2 Diabetes (UKPDS 34) **Purpose:** To investigate the effects of intensive glucose control with metformin on rates of microvascular and macrovascular complications in overweight patients with T2DM. **Methods:** 753 patients were randomised to receive conventional management with diet alone or intensive blood-glucose control regimen with metformin targeting FPG<6 mmol/L. **Results:** Patients allocated metformin had reduced HbA1c (7.4% vs. 8.0%), and risk reductions of 32% for any diabetes-related endpoint (P=0.002), 42% for diabetes-related death (P=0.017), and 36% for all-cause mortality (P=0.011). Among various intensive blood-glucose control regimens, metformin was superior to sulphonylureas or insulin for any diabetes-related endpoint (P=0.0034), all-cause mortality (P=0.021), and stroke (P=0.032). **Discussion:** Metformin decreases risk of diabetes-related endpoints in overweight patients with less weight gain and hypoglycemia than insulin and sulphonylureas. Consider for first line therapy.

Trial Name	Reference	Clinical Trial Details
UKPDS Extension	NEJM 2008;359:1577-89	**Title:** 10-Year Follow-Up of Intensive Glucose Control in Type 2 Diabetes **Purpose:** Post-trial monitoring of UKPDS to determine whether improved glucose control persisted and if there were long-term effects on macrovascular outcomes. **Methods:** 3277 patients were assessed through annual UKPDS clinics or annual questionnaires for up to 10 yr. **Results:** After 1 yr, between-group differences in HbA1c were lost. Relative risk reductions in the sulfonylurea-insulin group persisted for any diabetes-related end point (9%, P=0.04) and microvascular disease (24%, P=0.001), in addition to the emergence of risk reductions for MI (15%, P=0.01) and death from any cause (13%, P=0.007). Risk reductions persisted in the metformin group for any diabetes-related end point (21%, P=0.01), MI (33%, P=0.005), and death from any cause (27%, P=0.002). **Conclusion:** Glycemic differences were lost early, but sustained reductions in microvascular risk and emergent risk reductions for MI and death were evident during 10 years of post-trial follow-up.
Diabetes Prevention		
DPP Research Group: Lifestyle	NEJM 2002;346:393-403	**Title:** Reduction in the Incidence of Type 2 Diabetes with Lifestyle Intervention or Metformin **Purpose:** To investigate whether lifestyle interventions or metformin could prevent or delay the development of T2DM. **Methods:** 3234 nondiabetic persons with elevated fasting and post-load plasma glucose were randomly assigned to placebo, metformin (850 mg BID), or a lifestyle-modification program (min 7% weight loss and 150 min of physical activity/wk). **Results:** Lifestyle interventions and metformin reduced the incidence of T2DM by 58% (95% confidence interval [CI], 48-66%) and 31% (CI, 17-43%), respectively, as compared with placebo. Lifestyle interventions were significantly more effective than metformin. **Conclusion:** Metformin and lifestyle modifications reduced the incidence of diabetes in high-risk individuals but lifestyle modifications were more effective.
Look AHEAD	NEJM 2013;369:145-54	**Title:** Cardiovascular Effects of Intensive Lifestyle Intervention in Type 2 Diabetes **Purpose:** To investigate if an intensive lifestyle intervention for weight loss would decrease cardiovascular morbidity and mortality among overweight or obese patients with T2DM. **Methods:** 5145 patients were randomly assigned to receive weight loss lifestyle interventions (decreased caloric intake and increased physical activity) or diabetes support and education (control). **Results:** Trial was stopped early on the basis of futility. As compared to control, lifestyle interventions reduced weight, HbA1c and cardiovascular risk factors, but the incidence of the primary composite outcome (death from cardiovascular causes, nonfatal myocardial infarction, nonfatal stroke, or hospitalization for angina) was not significantly different between the groups. **Conclusion:** Rate of cardiovascular events in overweight or obese adults with T2DM were not reduced by an intensive lifestyle intervention focusing on weight loss.
Multifactorial Diabetes Treatment		
Steno-2	NEJM 2008;358:580-91	**Title:** Effect of a Multifactorial Intervention on Mortality in Type 2 Diabetes **Purpose:** To investigate if intensified multifactorial interventions would influence rates of death in patients with T2DM and microalbuminuria. **Methods:** 160 patients received either conventional multifactorial treatment or intensified, target-driven therapy involving a combination of medications and focused behaviour modification. **Results:** A lower risk of death from any cause, death from cardiovascular causes, cardiovascular events, and progression to end-stage renal disease was seen in intensive therapy, and fewer patients in this group required retinal photocoagulation. **Conclusion:** Vascular complications and death rates were significantly improved by multifactorial interventions in at-risk patients with T2DM.
LIPIDS		
IMPROVE-IT	NEJM 2015;372:2387-97	**Title:** Ezetimibe Added to Statin Therapy after Acute Coronary Syndromes **Purpose:** To assess whether the addition of ezetimibe to statin therapy can further reduce the rate of cardiovascular events. **Methods:** 18144 patients who had been hospitalized within the previous 10 days for acute coronary syndrome (ACS) with LDL cholesterol = 1.3 to 2.6 mmol/L (if on lipid lowering therapy) or 1.3 to 3.2 mmol/L (if not on lipid lowering therapy) were randomly assigned to receive a combination of either simvastatin (40 mg) and ezetimibe (10 mg) (simvastatin-ezetimibe) or simvastatin (40 mg) and placebo (monotherapy). **Results:** Median time-weighted average LDL cholesterol was significantly lower in the simvastatin-ezetimibe group as compared to monotherapy (1.4 vs. 1.8 mmol/L; P<0.001). At 7 yr, the simvastatin-ezetimibe group was associated with significantly lower Kaplan-Meier event rates of the primary composite outcome (cardiovascular death, nonfatal MI, unstable angina, coronary revascularization, or nonfatal stroke) (32.7% vs. 34.7%; hazard ratio, 0.936; 95% CI, 0.89-0.99; P=0.016). **Conclusion:** Ezetimibe, when added to statin therapy, resulted in lower LDL cholesterol and improved cardiovascular outcomes. Additional benefit was conferred by lowering LDL cholesterol below previous targets.

Trial Name	Reference	Clinical Trial Details
FOURIER	NEJM 2017;376:1713-22	**Title:** Evolocumab and Clinical Outcomes in Patients with Cardiovascular Disease **Purpose:** To assess if the PCSK9 inhibitor evolocumab prevents cardiovascular events. **Methods:** 27564 patients with atherosclerotic CVD and LDL cholesterol ≥1.8 mmol/L who were on statin therapy were randomly assigned to receive evolocumab (140 mg every 2 weeks or 420 mg monthly) or matching placebo. **Results:** At 48 weeks, evolocumab was associated with a least-squares mean percentage reduction in LDL cholesterol of 59% relative to placebo, from a median baseline of 2.4 mmol/L to 0.78 mmol/L (P<0.001). Patients in the evolocumab group experienced significantly lower rates of the primary composite outcome (cardiovascular death, MI, stroke, hospitalization for unstable angina, or coronary revascularization) as compared to placebo (9.8% vs. 11.3%, respectively; hazard ratio, 0.85; 95% CI, 0.79-0.92; P<0.001). **Conclusion:** Evolocumab lowers LDL cholesterol and reduces the risk of cardiovascular events in patients with atherosclerotic CVD.
ODYSSEY OUTCOMES	NEJM 2018;379:2097-107	**Title:** Alirocumab and Cardiovascular Outcomes after Acute Coronary Syndrome **Purpose:** To determine if the PCSK9 inhibitor alirocumab improves cardiovascular outcomes following acute coronary syndromes (ACS) in patients on high-intensity statin therapy. **Methods:** 18924 patients on high-intensity statin therapy who experienced ACS 1-12 months prior with LDL cholesterol ≥ 1.8 mmol/L and non-HDL-C ≥ 2.6 mmol/L or ApoB ≥ 80 mg/dL were randomly assigned to receive SC alirocumab (75 mg) or matching placebo every two weeks. **Results:** At median follow-up of 2.8 months, the composite primary outcome (death from coronary heart disease, non-fatal MI, ischemic stroke, or hospitalization for unstable angina) occurred in 9.5% and 11.1% of patients on alirocumab and placebo, respectively (hazard ratio, 0.85; 95% CI 0.78-0.93; P<0.001). Alirocumab was associated with greater absolute benefit with respect to the primary outcome in patients with higher baseline LDL cholesterol. **Conclusion:** Alirocumab reduces the risk of recurrent ischemic cardiovascular events in patients who had a previous ACS on high-intensity statin therapy.
REDUCE-IT	NEJM 2019;380:11-22	**Title:** Cardiovascular Risk Reduction with Icosapent Ethyl for Hypertriglyceridemia **Purpose:** To assess the effects of icosapent ethyl on the rate of ischemic events. **Methods:** 8179 patients with established CVD or diabetes and other risk factors, who were on statin therapy with fasting TG 1.52-5.63 mmol/L and LDL cholesterol 1.06-2.59 mmol/L were randomly assigned to receive icosapent ethyl (2 g BID) or placebo. **Results:** At median follow-up of 4.9 yr, the primary composite end point (cardiovascular death, nonfatal MI, nonfatal stroke, coronary revascularization, or unstable angina) occurred in significantly less patients in the icosapent ethyl group as compared to placebo (17.2% vs. 22.0%, respectively; hazard ratio, 0.75; 95% CI, 0.68-0.83; P<0.001). Icosapent ethyl was associated with significantly higher rates of hospitalization for atrial fibrillation or flutter as compared to placebo (3.1% vs. 2.1%; P=0.004). **Conclusion:** Icosapent ethyl therapy was associated with a significantly lower risk of ischemic events in patients with elevated TGs despite the use of statins.
4S	Lancet 1994;344:1383-1389	**Title:** Randomised Trial of Cholesterol Lowering In 4444 Patients With Coronary Heart Disease: The Scandinavian Simvastatin Survival Study (4S) **Purpose:** To investigate if cholesterol lowering with simvastatin alters mortality and morbidity in patients with coronary heart disease (CHD). **Methods:** 4444 patients with CHD and serum cholesterol 5.5-8.0 mmol/L on a lipid-lowering diet received simvastatin or placebo. **Results:** In the simvastatin group, mean changes in total cholesterol, LDL, and HDL of -25%, -35%, and +8%, respectively, were observed with few adverse effects. The relative risk of coronary events in the simvastatin group was 0.66 (95% confidence interval [CI], 0.59-0.75, P<0.00001) and relative risk of death was 0.70 (CI, 0.58-0.85, P=0.0003). **Conclusion:** In CHD patients, long-term treatment with simvastatin safely improves survival.
HPS	Lancet 2002;360:7-22	**Title:** MRC/BHF Heart Protection Study Of Cholesterol Lowering With Simvastatin In 20536 High-Risk Individuals: A Randomised Placebo-Controlled Trial **Purpose:** To investigate the effects of reducing LDL cholesterol on the development of vascular disease. **Methods:** 20536 adults with coronary disease, other occlusive arterial disease, or diabetes received 40 mg simvastatin daily or placebo. **Results:** As compared to placebo, simvastatin significantly reduced all-cause mortality (12.9% vs.14.7%; P=0.0003), mainly due to an 18% reduction in the coronary death rate (5.7% vs. 6.9%; P=0.0005). There were significant reductions in the first event rate for non-fatal MI or coronary death (8.7% vs. 11.8%; P<0.0001), for non-fatal or fatal stroke (4.3% vs. 5.7%; P<0.0001), and for coronary or non-coronary revascularisation (9.1% vs. 11.7%; P<0.0001). **Conclusion:** Adding simvastatin treatment safely protects against vascular disease in a variety of high-risk patients.

Trial Name	Reference	Clinical Trial Details
FIELD	Lancet 2005;366:1849-61	**Title:** Effects of Long-Term Fenofibrate Therapy on Cardiovascular Events In 9795 People With Type 2 Diabetes Mellitus (The FIELD Study): Randomised Controlled Trial **Purpose:** To assess the effect of fenofibrate on cardiovascular events in patients with T2DM at high risk for CVD. **Methods:** 9795 patients with T2DM not taking statin therapy were randomly assigned to micronized fenofibrate 200 mg daily or placebo. **Results:** Fenofibrate significantly reduced the relative risk of non-fatal MI (hazard ratio [HR], 0.76, 95% confidence interval [CI], 0.62-0.94; P=0.010) and total cardiovascular events (HR, 0.89; CI, 0.80-0.99; P=0.035), but there was no significant difference in the risk of coronary events or CHD mortality between groups. **Conclusion:** Fenofibrate did not significantly reduce the risk of coronary events, but rates of total cardiovascular events (mainly non-fatal MIs and revascularizations) were reduced.
TNT	NEJM 2005;352:1425-35	**Title:** Intensive Lipid Lowering With Atorvastatin In Patients With Stable Coronary Disease **Purpose:** To assess the efficacy and safety of reducing LDL to <2.6 mmol/L in patients with stable coronary heart disease (CHD). **Methods:** 10001 patients with CHD and LDL<3.4 mmol/L were randomly assigned to receive either 10 mg or 80 mg of atorvastatin daily. **Results:** Mean LDL was 2.0 mmol/L and 2.6 mmol/L during treatment with 80 mg and 10 mg of atorvastatin, respectively. Major cardiovascular events occurred in 8.7% receiving 80 mg vs. 10.9% receiving 10 mg, indicating a 22% relative risk reduction (hazard ratio, 0.78; 95% confidence interval, 0.69-0.89; P<0.001). **Conclusion:** In patients with stable CHD, intensive lipid-lowering treatment with 80 mg atorvastatin daily has greater clinical efficacy than 10 mg of atorvastatin daily.
Jupiter	NEJM 2008;359:2195-207	**Title:** Rosuvastatin to Prevent Vascular Events in Men and Women with Elevated C-Reactive Protein **Purpose:** To investigate if statins reduce cardiovascular events in patients with elevated CRP but without hyperlipidemia. **Methods:** 17802 healthy men and women with LDL<130 mg/dL and CRP>2.0 mg/L were randomly assigned to receive rosuvastatin 20 mg daily or placebo. **Results:** Rosuvastatin reduced LDL and CRP levels by 50% and 37%, respectively. In the rosuvastatin and placebo groups, the rates of the primary outcomes (MI, stroke, arterial revascularization, hospitalization for unstable angina, or death from CVD) were 0.77 and 1.36 per 100 person-years of follow-up, respectively (P<0.00001). **Conclusion:** Statins reduce the incidence of major cardiovascular events in healthy people without hyperlipidemia but with an elevated CRP.

Acronyms

ABG	arterial blood gas
ACR	albumin:creatinine ratio
ACEI	angiotensin converting enzyme inhibitors
AIN	anal intraepithelial neoplasia
AKI	acute kidney injury
AMC	another medical condition
AR	absolute reduction
ARB	angiotensin receptor blockers
BPH	benign prostatic hyperplasia
BPPV	benign paroxysmal positional vertigo
BRBPR	bright red blood per rectum
CA	cancer
CABG	coronary artery bypass graft
CAM	complementary and alternative medicine
CANRISK	Canadian Diabetes Risk Questionnaire
CBT	cognitive behavioural therapy
CCB	calcium channel blockers
CCS	Canadian Cancer Society
CF	cystic fibrosis
CHEP	Canadian Hypertension Education Program
CK	creatine kinase
CNS	central nervous system
CPAP	continuous positive airway pressure
CRC	colorectal cancer
CrCl	creatinine clearance
CRP	C-reactive protein
CSEP	Canadian Society for Exercise Physiology
CV	cardiovascular
CVA	costovertebral angle
CVD	cardiovascular disease
DASH	Dietary Approaches to Stop Hypertension
DHP	dihydropyridine
DKA	diabetic ketoacidosis
DMPA	depot medroxyprogesterone
DRE	digital rectal exam
DS	double strength
EC	emergency contraception
ER	extended release
F/U	follow-up
FAP	familial adenomatous polyposis
FBG	fasting blood glucose
FHT	family health team
FIT	fecal immunochemical testing
FOBT	fecal occult blood test
FP	family physician
FRS	Framingham Risk Score
GAD	generalized anxiety disorder
GERD	gastroesophageal reflux disease
GP	general practitioner
HAART	highly active anti-retroviral therapy
HDL-C	high density lipoprotein cholesterol
HEENT	head, ears, eyes, nose, and throat
HF	heart failure
HNPCC	hereditary non-polyposis colon cancer
hs-CRP	high sensitivity C-reactive protein
HSIL	high-grade squamous intraepithelial lesion
HPV	human papillomavirus
HRT	hormone replacement therapy
IBD	inflammatory bowel disease
IBS	irritable bowel syndrome
ICS	inhaled corticosteroids
IFG	impaired fasting glucose
IGT	impaired glucose tolerance
IHD	ischemic heart disease
INH	isoniazid
IPT	interpersonal therapy
IVP	intravenous pyelogram
KUB	kidneys, ureter, bladder x-ray
LDCT	low dose computed tomography
LDL-C	low density lipoprotein cholesterol
LMWH	low molecular weight heparin
LSIL	low-grade squamous intraepithelial lesion
LV	left ventricle
LVH	left ventricle hypertrophy
MCV	mean corpuscular volume
MMSE	mini mental status examination
MOCA	Montreal cognitive assessment
MS	multiple sclerosis
MSM	men who have sex with men
MUFA	monounsaturated fatty acids
NHP	natural health product
NNT	number needed to treat
NNH	number needed to harm
NP	nurse practitioner
NPH	human insulin isophane
NRT	nicotine replacement therapy
NTD	neural tube defects
NTG	nitroglycerin
O&P	ova and parasites
OA	osteoarthritis
OCD	obsessive compulsive disorder
OCP	oral contraceptive pill
OCPD	obsessive compulsive personality disorder
OD	once a day
OGTT	oral glucose tolerance test
OSA	obstructive sleep apnea
PCOS	polycystic ovarian syndrome
PCSK9	proprotein convertase subtilisin kexin 9
PFT	pulmonary function test
PHE	periodic health examination
PID	pelvic inflammatory disease
PMS	premenstrual syndrome
PND	paroxysmal nocturnal dyspnea
PPD	purified protein derivative
PSA	prostate specific antigen
PTSD	post-traumatic stress disorder
PUD	peptic ulcer disease
PUFA	polyunsaturated fatty acids
PVD	peripheral vascular disease
QHS	quaque hora somni (i.e. every night at bedtime)
R&M	routine and microscopic
RA	rheumatoid arthritis
RN	registered nurse
ROM	range of motion
RR	relative risk
RSV	respiratory syncytial virus
SAH	subarachnoid hemorrhage
SDRI	serotonin dopamine reuptake inhibitor
SIDS	sudden infant death syndrome
SNRI	serotonin norepinephrine reuptake inhibitor
SOB	shortness of breath
SSRI	selective serotonin reuptake inhibitor
TC	total cholesterol
TCA	tricyclic antidepressant
TDEE	total daily energy expenditure
TG	triglyceride
TIA	transient ischemic attack
TM	tympanic membrane
TMJ	temporomandibular joint
TUIP	transurethral incision of the prostate
TURP	transurethral resection of the prostate
UC	ulcerative colitis
URTI	upper respiratory tract infection
VAIN	vaginal intraepithelial neoplasia
VIN	vulvar intraepithelial neoplasia
VBI	vertebrobasilar insufficiency
WC	waist circumference
WSIB	Workplace Safety and Insurance Board

Four Principles of Family Medicine

College of Family Physicians of Canada

1. the family physician is a skilled clinician
   - works with patients to understand their illness experience and collaborate on shared management plans
   - uses expert generalist knowledge to develop a comprehensive approach to management of undifferentiated disease, multimorbidity, and chronic disease
2. family medicine is a community-based discipline
   - responds/adapts to changing needs and circumstances of the community, with emphasis on injury/disease prevention and health promotion
   - sees patients across their lifespan, with a variety of diseases, in a variety of clinical contexts, collaboratively with a network of multidisciplinary community healthcare providers
3. the family physician is a resource to a defined practice population
   - engages in self-directed, lifelong learning to ensure relevance of practice in maintaining patient health
   - advocates for public policy to promote health, resource stewardship, and care continuity and coordination
4. the patient-physician relationship is central to the role of the family physician
   - commits to the whole person, not just the disease, in the context of the patient's family and wider social environment
   - promotes continuity of patient care, respecting patient privacy and the physician-patient relationship

Experts in Generalism

Generalism is a professional philosophy of care, distinguished by a commitment to holistic, integrated, person-centred care, the broadest scope of practice and collaboration with the larger health care team in order to respond to patient and community health needs. Family physicians are the quintessential experts in generalism with an emphasis on patient- and family-centred care, community adaptiveness, undifferentiated problems, management of uncertainty, prevention and health promotion, multimorbidity/chronic disease, and longitudinal aspects of health and illness

Periodic Health Examination

- Canadian Task Force on Preventive Health Care was established in 1976 to develop and disseminate clinical practice guidelines for primary and preventive care, and provides:
  - recommendations based on systematic analysis of scientific evidence
  - periodic preventive health visits are recommended instead of annual physical examinations (sometimes called "yearly physicals")

Purpose of the Periodic Health Examination

- primary prevention: identify risk factors for common diseases; counsel patients on health-promoting practices (e.g. vaccinations)
- secondary prevention: early detection of disease to allow prompt treatment and to prevent disease progression (e.g. screening programs)

Classification of Recommendations (GRADE)

Strength of Recommendation

- **strong**: confidence that desirable effects outweigh undesirable effects (strong recommendation for an intervention) or that the undesirable effects outweigh desirable effects (strong recommendation against an intervention)
  - implies that most individuals will be best served by the recommended course of action
- **conditional**: desirable effects probably outweigh the undesirable effects (conditional recommendation for an intervention) or undesirable effects probably outweigh the desirable effects (conditional recommendation against an intervention)
  - implies that most people would want the recommended course of action but that many would not
  - different choices will be appropriate for different individuals, patients require support in reaching a management decision consistent with his/her values and preferences

Quality of Evidence

- high: high level of confidence that true effect lies close to the estimate of the effect
- moderate: true effect likely to be close to the estimate of the effect, but there is a possibility that it is substantially different
- low or very low: true effect may be substantially different from the estimate of the effect

Table 1. Periodic Health Exam

	General Population	Special Population
Discussion	Dental hygiene (community fluoridation, brushing, flossing) (A) Noise control and hearing protection (A) Screen for poverty Counsel on smoking cessation and provide nicotine replacement therapy (A), referral to smoking cessation program (B) Dietary advice on leafy green vegetables and fruits (B) Seat belt use (B) Moderate physical activity (B) Avoid sun exposure and wear protective clothing (B) Problem drinking screening and counselling (B) Counselling to protect against STIs (B) Nutritional counselling, dietary advice on fat, and cholesterol (B) Dietary advice on calcium and vitamin D requirements (B)	**Paediatrics**: home visits for high-risk families (A), injury prevention (poison control, smoke detectors, non-flammable sleepwear, hot water thermostat settings) (B), inquiry into developmental milestones (B) **Adolescents**: counsel on sexual activity and contraceptive methods (B), counsel to prevent smoking initiation and substance use (B) **Perimenopausal Women (>50):** assess for risk factors for: osteoporosis and fracture (A), counsel on osteoporosis, counsel on risks/benefits of hormone replacement therapy (B) **Adults >65:** follow-up on caregiver concern of cognitive impairment (A), multidisciplinary post-fall assessment (A)
Physical	Blood pressure measurement, using techniques described in CHEP guidelines (A) Measure height, weight, and calculate BMI for adults ≥18 (B)	**Paediatrics**: repeated examinations of hips, eyes, and hearing (especially in first year of life) (A), serial height, weight, and head circumference (B), visual acuity testing after age 2 (B) **Adults** >65: hearing impairment (inquiry, whispered voice test, audioscope) (B) **First-Degree Relative with Melanoma**: full body skin exam (B)

Classification of recommendation in brackets: A – high quality of evidence; B – moderate quality of evidence. For up-to-date guidelines, see: www.canadiantaskforce.ca.

Adult Periodic Health Exam
Male and female evidence-based preventive care checklist forms are available online at http://www.cfpc.ca, most recently updated in 2018, re-endorsed in 2019.

Choosing Wisely Canada
http://www.choosingwiselycanada.org/
A campaign to help clinicians and patients engage in conversations about unnecessary tests and treatments and make smart and effective choices to ensure high quality care

Folic Acid Supplementation in Pregnancy (Joint SOGC-Motherisk Clinical Guideline May 2015)

- To prevent neural tube defects in all women capable of becoming pregnant
- Low-risk women (no personal health risks, planned pregnancy): diet of folate-rich foods and a daily oral multivitamin supplement containing 0.4-1.0 mg folic acid for at least 2-3 mo before conception, throughout pregnancy, and 4-6 wk postpartum or as long as breast-feeding continues
- High-risk women (health risks including epilepsy, insulin-dependent diabetes, BMI >35, family history of NTD, high-risk ethnic group): diet of folate-rich foods and daily supplementation with multivitamins with 5 mg folic acid at least 3 mo prior to conception until 12 wk post-conception
- From wk 12 post-conception until postpartum period (4-6 wk or as long as breastfeeding continues): 0.4-1.0 mg of folic acid supplementation is sufficient
- Women with additional lifestyle issues (poor compliance with medications, no consistent birth control, taking possible teratogenic substances): higher folic acid dose of 5 mg and counselling about prevention of birth defects

Table 1. Periodic Health Exam

	General Population	Special Population
Tests	See recommendations below for age and gender specific screening for diabetes, dyslipidemia, HTN, and cancer screening (colon, prostate, cervical, lung, and breast) One-time screening ultrasound for abdominal aortic aneurysm in men aged 65–80 yr (B)	**Paediatrics**: routine hemoglobin for high-risk infants (B), blood lead screening of high-risk infants (B) **TB High-Risk Groups**: Mantoux skin testing (A) **STI High-Risk Groups**: voluntary HIV antibody screening (A), gonorrhea screening (A), chlamydia screening in women (B), syphilis screening (A) **Syphilis High-Risk Group**: VDRL test (A)
Therapy	Folic acid supplementation for women of child-bearing age (A) Pharmacologic treatment of HTN (refer to CHEP Guidelines) (A) Varicella vaccine for children ages 1-12 and susceptible adolescents/adults (A) Rubella vaccine for all non-pregnant women of child-bearing age unless there is proof of immunity via immunization records or serology (B) Tetanus vaccine: routine booster q10 yr if had 1° series (A) Pertussis vaccine: adults <65 should receive one booster given as Tdap– Adacel® or Boostrix® (A) Herpes zoster vaccine for adults ≥50	**Paediatrics**: routine immunizations (A) **Influenza High-Risk Groups**: outreach strategies for vaccination (A), annual immunization (B), now recommended for all **HPV High-Risk Groups**: vaccination for males and females from age 9 with no upper age limit, if ongoing risk **TB High-Risk Groups**: INH prophylaxis for household contacts or skin test converters (B), INH prophylaxis for high-risk sub-groups (B) **Immunocompromised/Ages ≥65/COPD/Asthma/CHF/Asplenia/Liver Disease/Renal Failure/DM:** pneumococcal vaccine (Pneumovax®23) for all ≥65 or high-risk, add Prevnar®13 if ≥65 and high-risk (A)

Classification of recommendation in brackets: A – high quality of evidence; B – moderate quality of evidence. For up-to-date guidelines, see: www.canadiantaskforce.ca.

Breast Cancer Screening Guidelines

2018 Canadian Task Force on Preventive Care Recommendations

- for women ages 50-74, recommend screening with mammography every 2-3 yr; the decision to undergo screening is conditional on the relative value that a woman places on possible benefits and harms from screening (conditional recommendation; very low certainty evidence)
- for women ages 40-49, recommend not screening with mammography; the decision to undergo screening is conditional on the relative value a woman places on possible benefits and harms from screening (conditional recommendation; low-certainty evidence)
- recommend not performing clinical breast examinations to screen for breast cancer (conditional recommendation; no evidence)
- recommend not advising women to practice breast self-examination to screen for breast cancer (conditional recommendation; low certainty evidence)
- recommend not using magnetic resonance imaging (MRI), tomosynthesis or ultrasound to screen for breast cancer in women not at increased risk (strong recommendation; no evidence)
- for more information on benign breast lesions and breast cancer, see General and Thoracic Surgery, GS65

Lung Cancer Screening Guidelines

2016 Canadian Task Force on Preventive Health Care Recommendations

- for adults ages 55-74 with ≥30 pack-yr smoking history who currently smoke or quit ≤15 yr ago, recommend annual screening with LDCT up to three consecutive times; screening should ONLY be carried out in health care settings with expertise in early diagnosis and treatment of lung cancer (weak recommendation; low quality evidence)
- for all other adults, regardless of age, smoking history or other risk factors, recommend not screening for lung cancer with LDCT (strong recommendation; very low quality evidence)
- recommend that chest x-ray not be used to screen for lung cancer, with or without sputum cytology (strong recommendation; low quality evidence)

Colorectal Cancer Screening Guidelines

2016 Canadian Task Force on Preventive Health Care Recommendations

- recommend screening adults ages 60-74 for CRC with FOBT (either gFOBT or FIT) q2 yr OR flexible sigmoidoscopy q10 yr (strong recommendation; moderate quality evidence)
- recommend screening adults ages 50-59 for CRC with FOBT (either gFOBT or FIT) q2 yr OR flexible sigmoidoscopy q10 yr (weak recommendation; moderate quality evidence)
- recommend not screening adults ages ≥75 for CRC (weak recommendation; low quality evidence)
- recommend not using colonoscopy as a screening test for CRC (weak recommendation; low quality evidence)

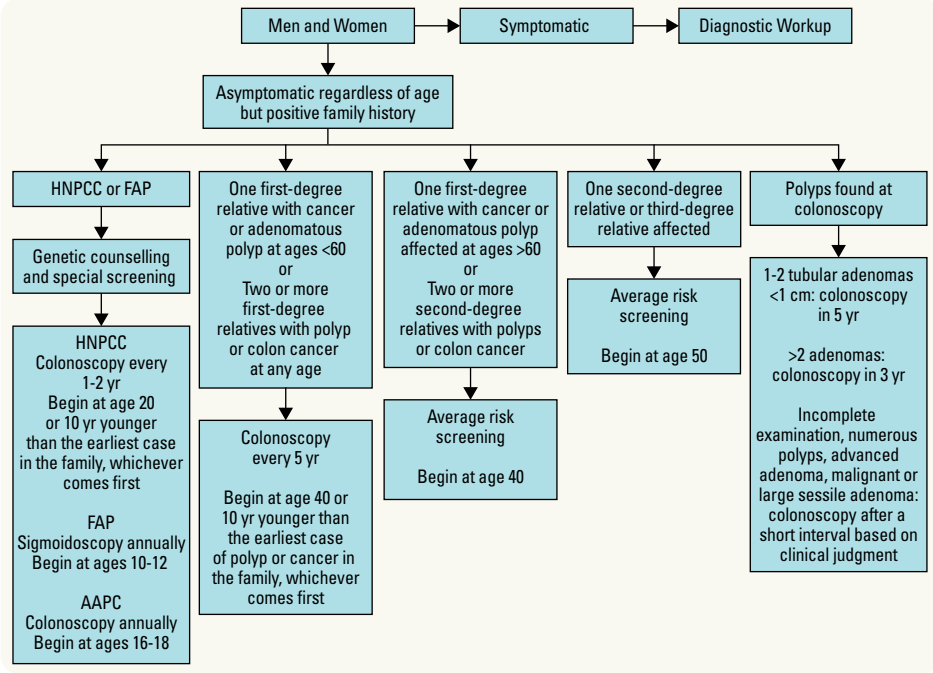

Figure 1. Approach to higher risk screening

AAPC = attenuated adenomatous polyposis; FAP = familial adenomatous polyposis; HNPCC = hereditary nonpolyposis colorectal cancer; 1st degree relatives: parents, siblings, children; 2nd degree relatives: grandparents, aunts, uncles; 3rd degree relatives: great grandparents or cousins. Figure printed with permission from Can J Gastroenterol 2004;18:93-99. Also see: BC Guidelines [Internet]. Victoria (BC): Guidelines and Protocols Advisory Committee. Colorectal Screening for Cancer Prevention in Asymptomatic Patients; 2013 Mar 1 [revised 2016 Jun 22; cited 2021 May 27]. Available from: https://www2.gov.bc.ca/gov/content/health/practitioner-professional-resources/bc-guidelines/colorectal-cancer-screening

Cervical Cancer Screening Guidelines

2013 Canadian Task Force for Preventive Care Guidelines Recommendations

- for women ages 30-69, recommend Papanicolaou (Pap) smear or liquid based cytology for cervical cancer q3 yr (strong recommendation; high quality evidence)
- for women ages 25-29, recommend Pap smear or liquid based cytology for cervical cancer q3 yr (weak recommendation; moderate quality evidence)
- for women ages ≥70 who have not been adequately screened, recommend continued screening until 3 negative test results have been obtained (weak recommendation; low quality evidence)
- for women ages ≥70 who have been adequately screened (i.e. 3 successive negative Pap tests in the last 10 yr), recommend that routine screening may cease
- for more information on cervical cancer (see Gynaecology, GY48)
- note: provincial/territorial guidelines vary, e.g. Ontario guidelines:
  - women ages ≥21 (to be updated to 25) who are or have ever been sexually active, recommend screening q3 yr (if cytology normal); women who are not sexually active by this age should delay cervical cancer screening until sexually active
  - a woman may discontinue screening at age 70 if she has an adequate and negative cytology screening history in the previous 10 yr (i.e. three or more negative cytology tests)

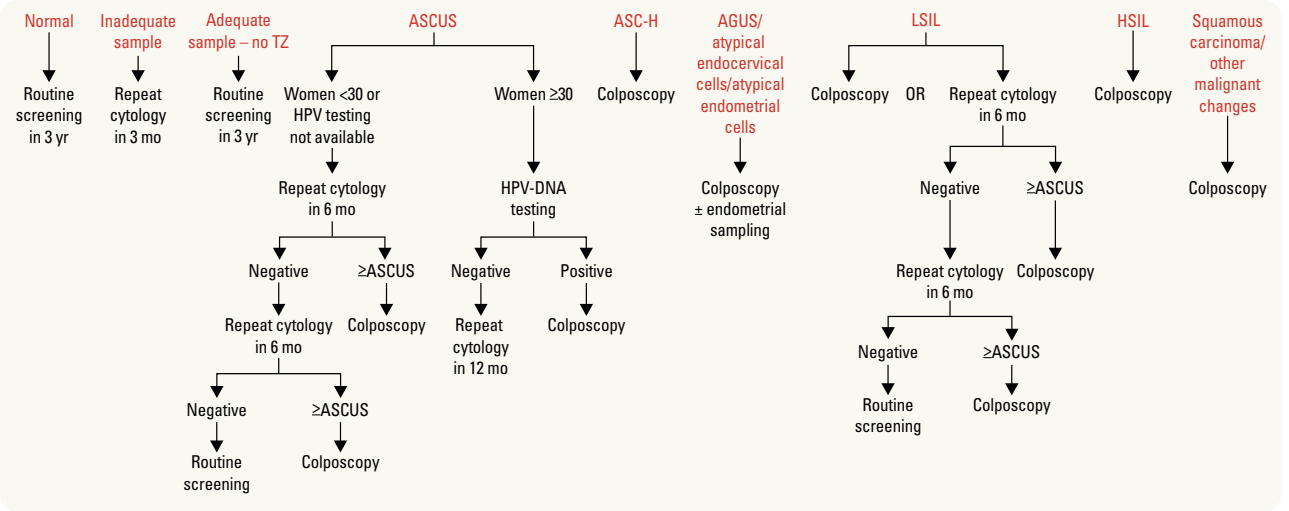

Figure 2. Decision making chart for cervical cancer screening (not applicable to adolescents)

AGUS = atypical glandular cells of unknown significance; ASCUS = abnormal squamous cells of unknown significance; ASC-H = abnormal squamous cells cannot rule out HSIL; HSIL = high grade squamous intraepithelial lesion; LSIL = low grade squamous intraepithelial lesion; TZ = transitional zone

Adapted from: Ontario Cervical Screening Cytology Guidelines, May 2012

Prostate Cancer Screening Guidelines

2014 Canadian Task Force for Preventive Care Guidelines Recommendations

- for men ages 55-69, recommend not screening for prostate cancer with the PSA test (weak recommendation; moderate quality evidence); clinicians should discuss the risks and benefits of screening and its potential consequences with each man in the context of his preferences
- for men ages ≤55, recommend not screening for prostate cancer with the PSA test (strong recommendation; low quality evidence)
- for men ages ≥70, recommend not screening for prostate cancer with the PSA test (strong recommendation; low quality evidence)

Basis of Recommendation

- the potential small benefit from PSA screening is outweighed by the potential significant harms of the screening and associated follow-up treatment
  - for men ages ≤55 or ≥70, there is no evidence that screening with the PSA test reduces mortality, whereas there is evidence of harms
  - for men ages 55-69, there is inconsistent evidence of a small potential benefit of screening, and evidence of harms

Prostate Cancer Screening Scenario

- If 1,000 men ages 55-59 were screened for 13 yr
- 178 men (approx. 20%) would have a false positive PSA test, meaning an unnecessary prostate biopsy; 4 of 178 would experience biopsy complications severe enough to require hospitalization
- 33 of 102 men diagnosed with prostate cancer would not experience symptoms or mortality in their lifetime (over-diagnosed cases) and 11–21% of treated men would suffer short-term complications
- 1 man would avoid death due to prostate cancer

Data accessed from: https://canadiantaskforce.ca/prostate-cancer-clinician-summary/

Health Promotion and Counselling

- health promotion is the most effective preventive strategy
- initial steps should include respectfully explore the values and purposes of the patient's habits or behaviours
- it is helpful to be guided by a patient's present stage of change when having discussions around healthy behaviours
- for more information, see www.motivationalinterviewing.org

Motivational Strategies for Behavioural Change

Table 2. Motivational Strategies for Behavioural Change

Patient's Stage of Change	Physician's Aim	Physician's Plan
Pre-Contemplation	Encourage patient to consider the possibility of change Assess readiness for change Increase patient's awareness of the problem and its risks	Raise issue in a sensitive manner Offer (not impose) a neutral exchange of information to avoid resistance
Contemplation	Understand patient's ambivalence and encourage change Build confidence and gain commitment to change	Offer opportunity to discuss pros and cons of change using reflective listening
Preparation	Explore options and choose course most appropriate for the patient Identify high-risk situations and develop strategies to prevent relapse Continue to strengthen confidence and commitment	Offer realistic options for change and opportunity to discuss inevitable difficulties
Action	Help patients design rewards for success Develop strategies to prevent relapse Support and reinforce convictions towards long-term change	Offer positive reinforcement and explore ways of coping with obstacles Encourage self-rewards to positively reinforce change
Maintenance	Help patient maintain motivation Review identified high-risk situations and strategies for preventing relapse Increase self-belief in ongoing change	Discuss progress and signs of impending relapse
Relapse	Help patient view relapse as a learning experience Provide support appropriate to re-entry into the change cycle at the patient's present level of readiness, post-relapse	Offer a non-judgmental discussion about circumstances surrounding relapse and how to avoid relapse in the future Reassess patient's readiness to change

Adapted from: Hunt P. Motivating Change. Nurs Stand 2001;16:45-52, 54-55

Canadian Cancer Society Recommendations for Vitamin D Use

- Based on CCS research on Vitamin D and the prevention of colorectal and breast cancers
- In consultation with their healthcare provider, the Society recommends that:
- Adults living in Canada should consider taking Vitamin D supplementation of 1000 IU a day during the fall and winter
- Adults at higher risk of having lower Vitamin D levels should consider taking Vitamin D supplementation of 1000 IU/d all year round. This includes people: who are older, with dark skin, who do not go outside often, and who wear clothing that covers most of their skin
- Babies who are exclusively breast-fed: 400 IU/d

Nutrition

General Population

- Canada's Food Guide is appropriate for individuals ages ≥2 yr
- counsel on variety, portion size, and plate layout
- guideline 1: nutritious foods are the foundation for healthy eating. Vegetables, fruits, whole grains, and proteins should be consumed regularly. Among protein foods, consume plant-based more often (e.g. legumes, nuts, seeds, tofu, fortified soy beverage). Foods with mostly unsaturated fat should replace those that contain mostly saturated fat. Water should be beverage of choice
  - nutritious foods to consume regularly can be fresh, frozen, canned, or dried
  - consider cultural preferences and food traditions. Traditional food improves diet quality among Indigenous peoples
- guideline 2: processed or prepared foods and beverages that contribute to excess sodium, free sugars, or saturated fat undermine healthy eating, and should not be consumed regularly
- guideline 3: food skills are needed to navigate the complex food environment and support healthy eating. Cooking and food preparation using nutritious foods should be promoted. Food labels should be promoted as a tool to help make informed choices

Energy Content of Food

- Carbohydrates: 4 kcal/g
- Protein: 4 kcal/g
- Fat: 9 kcal/g
- Ethanol: 7 kcal/g

Calculating Total Daily Energy Expenditure

- Roughly 35 kcal/kg/d
- Varies by age, weight, height, sex, and activity level
- Average 2000-2100 kcal/d for women, 2700-2900 kcal/d for men

Handy Serving Size Comparisons

- 85 g meat, fish, poultry → palm of hand
- 250 ml dairy (milk/yogurt) → size of fist
- 1 serving of bread/grains → one slice, palm of hand
- 125 g rice/pasta → one hand cupped
- 250 g of fruit/vegetables → two cupped hands
- 28 g cheese → full length of thumb
- 5 g oil/butter → tip of thumb
- 28-57 g nuts/chips/snacks→ palm covered

Osteoporosis Canada Recommendations for Calcium and Vitamin D Daily Requirements
- Vitamin D: 400-1000 IU for individuals 19-50 yr, 800-2000 IU for individuals ≥50 yr or younger adults at high-risk (osteoporosis, multiple fractures, inadequate vitamin D absorption)
- Calcium: 1000 mg daily from all sources for individuals 19-50 yr and pregnant/lactating women; 1200 mg daily for individuals >50 yr (recommended to obtain calcium from diet whenever possible vs. supplementation)

Cardiovascular Disease Prevention

Table 3. Dietary Guidelines for Reducing Risk of Cardiovascular Disease

	Recommendations
Carbohydrates	Complex carbs (legumes, whole grains) should be favoured over simple carbs (white flour/rice, table sugar) Eliminate sugar-sweetened beverages in favour of water
Fruits and Vegetables	Consume a higher proportion of whole, fresh fruits and vegetables Consume leafy green vegetables and berries at least 3 times/wk Consume starchy vegetables (white potatoes, corn, green peas) in moderation
Fats	Consume mono- and polyunsaturated fats in moderation (non-tropical vegetable fats, liquid fats) Minimize trans fat intake (processed/snack foods) Limit saturated fats (processed foods, red meat, cheese, whole milk, butter) Olive and canola oil are recommended over butter/margarine/coconut oil Skim or 1% milk is recommended over whole milk
Protein	Consume fish with higher levels of omega-3 fatty acids (salmon, tuna, mackerel) Moderate consumption of lean poultry, seafood, and nuts Limit red meat Minimize consumption of processed meats (deli/cold cuts, sausage, bacon)
Salt	≤2000 mg/d
Alcohol	≤3 drinks/d on most days for men, max 15/wk ≤2 drinks/d on most days for women, max 10/wk
Dietary Approaches	**Mediterranean diet:** High intake of leafy green vegetables, fruits, whole grains, nuts, legumes, extra virgin olive oil Moderate intake of fish, lean meats, low fat dairy, poultry Low intake of red meats and sweets Wine in moderation **DASH diet:** High in vegetables/fruits, no or low-fat dairy, whole grains, poultry, fish, beans, seeds, and nuts Low in sodium, sweets, added sugars, sugar-sweetened beverages, fats, and red meats Lower in saturated fat, trans fat, and cholesterol High in potassium, magnesium, calcium, protein, and fibre **Vegetarian diet:** Substitute meat/seafood/poultry with soy products, legumes, nuts, and whole grains

Obesity

Definition
- prevalent, complex, progressive, and relapsing chronic disease that is characterized by abnormal/excessive body fat (adiposity)
- impairs health, increases risk of long-term medical complications, and reduces lifespan

Epidemiology
- in Canada, the prevalence of obesity has tripled and severe obesity has more than quadrupled since 1985
- obesity remains higher in populations which face multiple socioeconomic barriers such as geographic isolation, poverty, and lack of access to nutritious (and more expensive) food
- for example, First Nations living on reserve had higher rates of obesity (30-51%) than non-Indigenous populations (12-31%)
- close to 1/3 of Canadians ages 5-17 yr were identified as having a BMI classified as overweight or obese
- screen time ≥2 h/d (total screen time, television time, and computer time) is likely associated with an increased risk of children having a BMI classified as overweight or obese

2015 Canadian Task Force on Preventive Health Care Recommendations
- for apparently healthy adults ≥18 yr, it is recommended to measure height, weight, and calculate BMI at appropriate primary care visits
  - BMI = weight (kg)/height^2 (m^2) = weight (lbs)/height^2 (in^2) x 703
  - note: this recommendation does not apply to people with eating disorders or who are pregnant
- for those with increased BMI (25.0-34.9 kg/m^2), WC should be measured regularly to identify patients with increased visceral adiposity and related health risks

Table 4. Classification of Weight by Body Mass Index and Associated Disease Risks in Adults

	BMI (kg/m^2)	Risk of Developing Health Problems
Underweight	<18.5	Increased
Normal	18.5-24.9	Least
Overweight	25.0-29.9	Increased
Obesity Class I	30.0-34.9	High
Obesity Class II	35.0-39.9	Very high
Obesity Class III (Extreme Obesity)	≥40.0	Extremely high

Body Mass Index (BMI) Nomogram, Government of Canada: Health Canada, available from: https://www.canada.ca/en/health-canada/services/food-nutrition/healthy-eating/healthy-weights/canadian-guidelines-body-weight-classification-adults/body-mass-index-nomogram.html

Management
Canadian Adult Obesity Clinical Practice Guidelines (Obesity Canada, 2020)
- recognize that people with obesity experience weight bias and stigma, which contributes to increased complications and mortality independent of weight or BMI
- **Step 1** - Ask: recognize obesity as a chronic disease and obtain patient permission to discuss and help treat this disease in an unbiased manner
- **Step 2** - Assess: assess the patient using appropriate measures (i.e. height, weight, WC, and BMI calculation) and identifying root causes (e.g. biological factors, individual life experiences, psychological factors), complications, and barriers to treatment
- **Step 3** - Advise: discuss treatment options and work with the patient to create individualized care plans that address root causes of obesity and supports behaviour change
  - nutrition:
    - all individuals can benefit from adopting a healthy, well-balanced diet
    - weight loss requires long-term reduction in caloric intake, encouraged by a personalized eating pattern that meets the patient's values, preferences, and nutritional needs
    - medical nutrition therapy should not be used in isolation (may promote compensatory mechanisms that promote positive caloric intake by increasing hunger), but instead should be used in combination with other interventions (e.g. psychological, pharmacological, surgical)
  - physical activity:
    - consider aerobic physical activity (30-60 min of moderate to vigorous intensity most d/wk) for adults who wish to achieve small amounts of body weight and fat loss, reduce abdominal visceral fat, maintain weight loss, and/or increase cardiorespiratory fitness
    - resistance training may promote weight maintenance, increased muscle mass, fat-free mass, and mobility in adults with overweight/obesity
    - regular physical activity can improve cardiometabolic risk factors and improve health-related quality of life
  - psychological and behavioural interventions:
    - multicomponent psychological intervention (behaviour modification, cognitive therapy, and values-based strategies to alter diet/activity) should be incorporated into care plans for weight loss

Effectiveness of Behavioural and Pharmacologic Treatment for Overweight and Obesity in Adults
CMAJ Open 2014;2:E306-317
Purpose: To evaluate the effectiveness of behavioural and pharmacological treatments for overweight and obese adults.
Methods: Review of RCTs of primary-care-relevant behavioural (diet, exercise, lifestyle) and pharmacological (orlistat, metformin) treatments with or without behavioural interventions in overweight or obese adults with 12 mo follow-up from baseline for weight outcomes or harms. Secondary health outcomes (TCl, LDL, FBG, incidence of T2DM, sBP and dBP) were also studied.
Results: 68 RCTs were included and showed that intervention participants had greater weight loss (-3.02 kg, 95% CI -3.52 to -2.52), waist circumference reduction (-2.78 cm, 95% CI -3.34 to -2.22) and BMI reduction (-1.11 kg/m^2, 95% CI -1.39 to -0.84). Relative risk for weight loss of ≥5% body weight was 1.77 (95% CI 1.58 to 1.99; NNT 5, 95% CI 4-7). Relative risk for loss of ≥10% body weight was 1.91 (95% CI 1.69 to 2.16; NNT 9, 95% CI 7-12). Incidence of T2DM was lower among pre-diabetic intervention participants (RR 0.62, 95% CI 0.50 to 0.77; NNT 17, 95% CI 13-29).
Conclusion: Behavioural and pharmacological treatments for overweight and obese adults may lead to clinically important reductions in weight and incidence of T2DM in pre-diabetic populations.

Adverse Medical Consequences of Obesity
- T2DM
- Dyslipidemia
- CAD
- Osteoarthritis
- Stroke
- OSA
- HTN
- Certain cancers
- Gallbladder disease
- CHF
- Low back pain
- Non-alcoholic statohepatitis
- Increased total mortality
- Pregnancy complications

Associations with Low BMI
- Osteoporosis
- Eating disorders
- Under-nutrition
- Pregnancy complications

Pharmacotherapy for Obesity
- There are currently 3 prescription medications available in Canada that are approved for use in adult patients with BMI ≥30 kg/m2 or BMI ≥27 kg/m2 and ≥1 weight-related condition (e.g. HTN, T2DM, dyslipidemia)
- Note: these medications should be used alongside a reduced-calorie diet and increased physical activity
- Contrave® (naltrexone and bupropion): controls hunger and cravings
- Saxenda® (liraglutide): decreases appetite and therefore, food intake
- Xenical® (orlistat): reduces dietary fat absorption by 30% through inhibition of pancreatic and gastric lipases

- pharmacotherapy:
  - liraglutide, naltrexone-bupropion combination, or orlistat (see sidebar *Pharmacotherapy for Obesity*, FM9)
  - can be used for patients with BMI ≥30 kg/m² or ≥27 kg/m² with adiposity-related complications, in combination with medical nutrition therapy, physical activity, and psychological interventions
  - can be used to maintain weight loss achieved by behaviour changes and to prevent weight regain
- bariatric surgery:
  - consider for patients with BMI ≥40 kg/m² or BMI ≥35 kg/m² with ≥1 adiposity-related disease (e.g. T2DM)
  - consider for weight loss and/or to control adiposity-related diseases where optimal medical and behavioural management has been insufficient to produce significant weight loss
  - choice of bariatric procedure should be decided according to the patient's needs, in collaboration with an experienced interprofessional team (suggest against adjustable gastric banding and single anastomosis gastric bypass, due to unacceptable complications and long-term failure)

- **Step 4** - Agree: agree on goals of therapy with the patient, focusing on the patient's values to ensure realistic expectations and sustainable behaviour change and health outcomes
- **Step 5** - Assist: follow-up and reassess the patient regularly to assist with drivers/barriers and advocate for improved obesity care

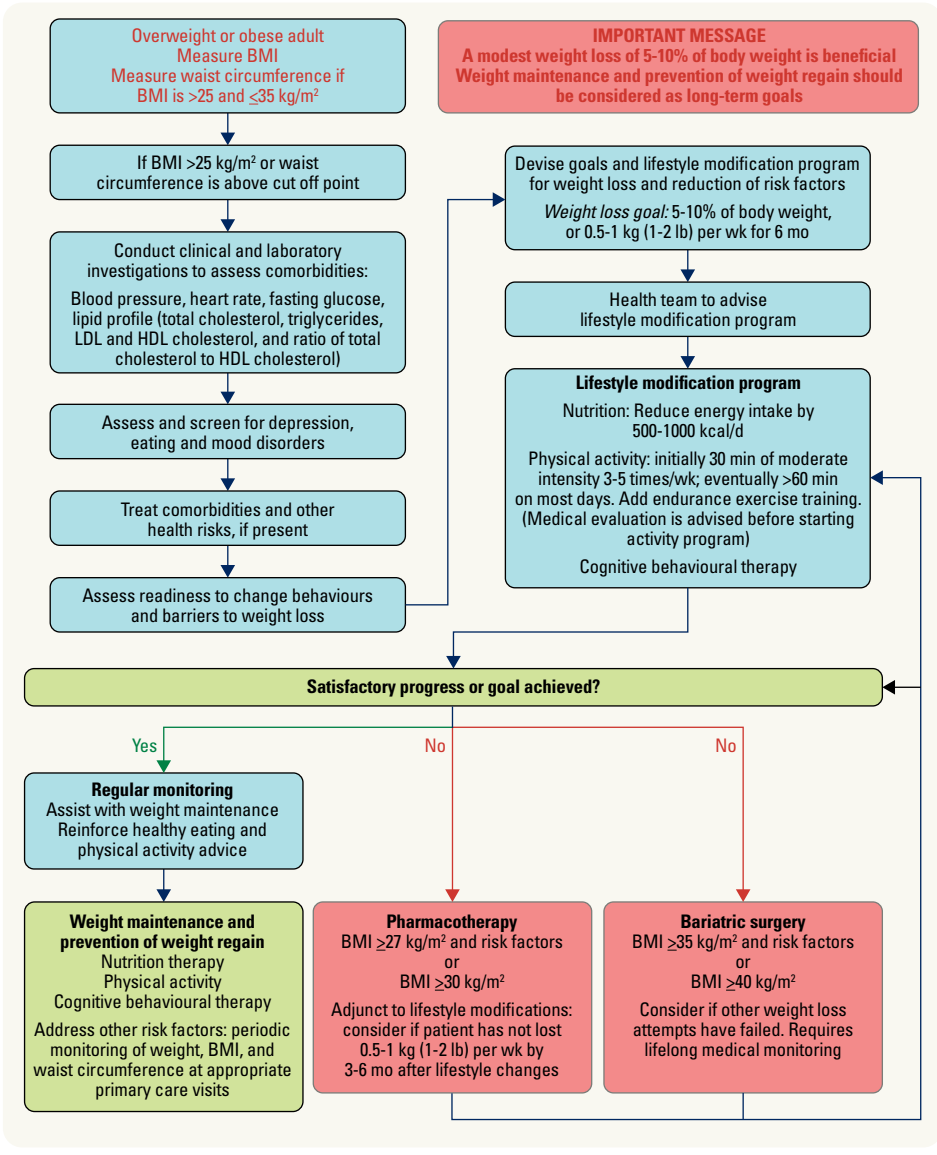

Figure 4. 2006 Canadian clinical practice guidelines on the management and prevention of obesity in adults and children

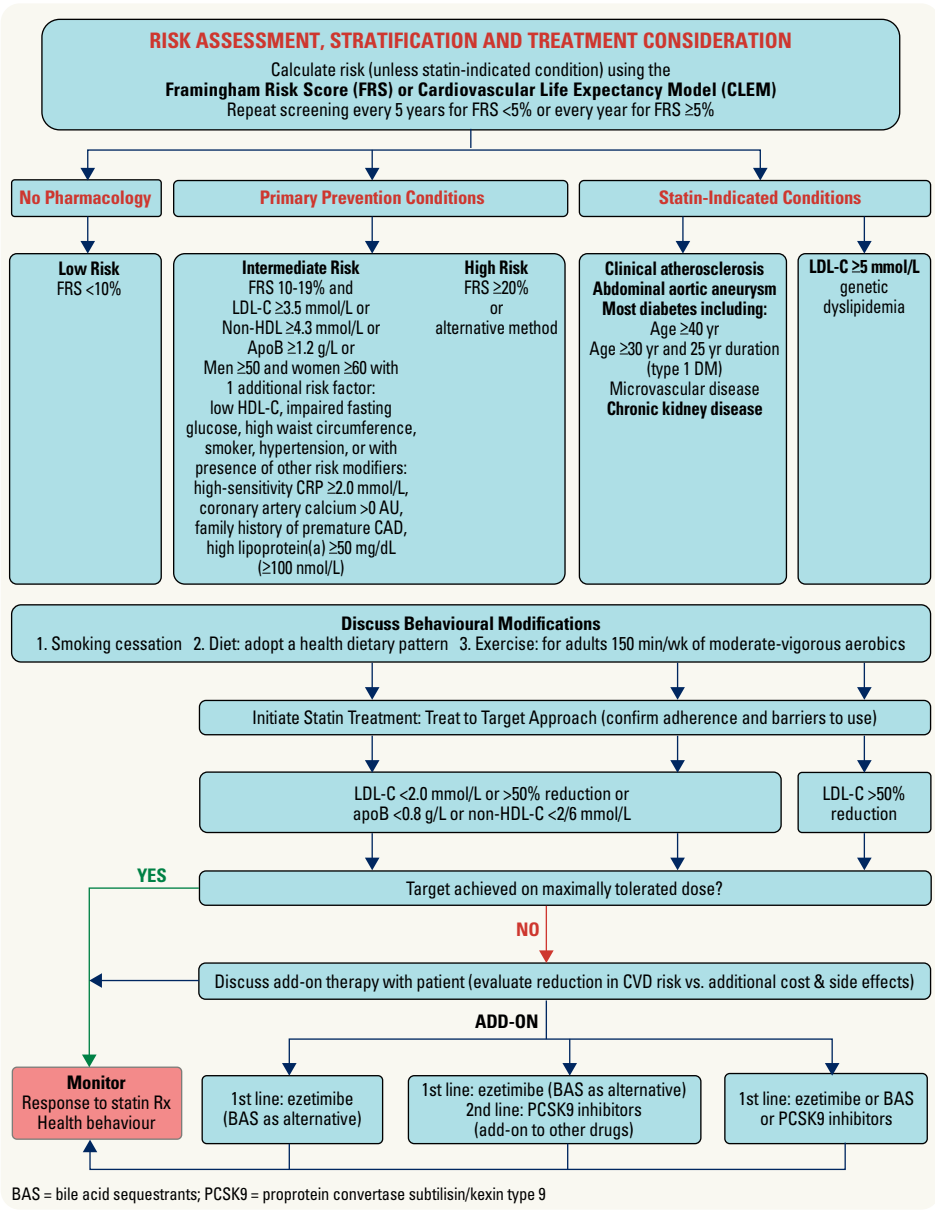
Adapted from: Lau DCW, et al. 2006 Canadian clinical practice guidelines on the management and prevention of obesity in adults and children [summary]. CMAJ 2007;176:S1-S13

Effects of Popular Diets without Specific Calorie Targets on Weight Loss Outcomes: Systematic Review of Findings from Clinical Trials
Nutrients 2017;9:E822
Purpose: To assess the short term (≤6 mo) and long term (≥6 mo) weight loss outcomes for current popular diets in overweight and obese adults.
Methods: A systematic review was conducted. All diets in the 2016 U.S. News & World Report Rankings for "Best Weight-Loss Diets" were examined. From the potential 38 diets, eligible studies included trials with a sample size ≥15 per group, interventional clinical trials, intervention periods ≥12 wk, BMI ≥25 mg/m2, participants ages ≥18 yr and objective measures of pre- and post-intervention.
Results: Sixteen articles were included in the review. Diets included the Atkins, DASH, Glycemic-Index, Mediterranean, Ornish, Paleolithic, and Zone diets. The Atkins diet showed the most clinically significant reduction in weight loss in both the short-term and long-term.
Conclusion: Other diets had limited evidence supporting their effectiveness in producing clinically significant short-term and long-term weight loss. Future studies are needed to compare and evaluate the efficacy of these other diets.

Effect of Intermittent Energy and Carbohydrate Restriction vs. Daily Energy Restriction on Weight Loss and Metabolic Disease Risk Markers in Overweight Women
Br J Nutr 2013;110:1534-1547
Purpose: To determine if intermittent energy and carbohydrate restriction (IECR) may result in greater improvements in insulin sensitivity and weight control than daily energy restriction (DER).
Methods: Two IECR regimens were tested, including one which allowed ad libitum protein and fat (IECR + PF). Overweight women (n=115) ages 20-69 with a family history of breast cancer were randomised to an overall 25% energy restriction, or a 25% DER, or an IECR + PF for a 3 mo weight-loss period and 1 mo of weight maintenance (IECR or IECR + PF for 1 d/wk).
Results: Insulin resistance reduced with the IECR diets and the IECR + PF diet. Reductions with the IECR diets were significantly greater compared with the DER diet. Both IECR groups had greater reductions in body fat compared with the DER group. During the weight maintenance phase, 1 day of IECR or IECR + PF per week maintained the reductions in insulin resistance and weight.
Conclusion: In the short term, IECR is superior to DER with respect to improved insulin sensitivity and body fat reduction.

Dyslipidemia



BAS = bile acid sequestrants; PCSK9 = proprotein convertase subtilisin/kexin type 9

Figure 5. Approach to primary prevention of CVD (2021 Canadian Cardiovascular Society Guidelines)
Pearson GJ, Thanassoulis G, Anderson T, et al. 2021 Canadian Cardiovascular Society Guidelines for the Management of Dyslipidemia for the Prevention of Cardiovascular Disease in the Adult. Can J Cardiol. 2021 Aug;37(8):1129-1150.

- see Endocrinology, E3

Definition

- abnormal elevation of plasma cholesterol or TG levels

Assessment

- screen with full lipid profile every 1-3 yr in males and females ≥40 yr or who are menopausal, or at any age for adults with additional dyslipidemia risk factors (see Clinical Pearl), and in the late postpartum period for women who have had a pregnancy-related complication (e.g. hypertensive disorders of pregnancy, gestational diabetes, preterm birth, stillbirth, low birthweight infant, placental abruption)
- history and physical examination
- measure standard lipid panel (TC, LDL-C, HDL-C, TG, calculated HDL-C), glucose, and eGFR (optional: apolipoprotein B, urine ACR)
- screen for secondary causes: hypothyroidism, CKD, DM, nephrotic syndrome, liver disease

Signs of Hyperlipidemia

- Atheromata: plaques in the intimal layer of arterial walls
- Xanthelasmata: a sharply demarcated yellowish deposit of cholesterol underneath the skin, usually on or around the eyelid
- Tendinous xanthoma: lipid deposit in tendon (especially Achilles)
- Eruptive xanthoma: hypertriglyceridemia-induced reddish yellow, pruritic, and painful papular or nodular rash
- Lipemia retinalis: characterized by creamy, white-coloured retinal blood vessels, occurs only with extreme hypertriglyceridemia
- Corneal arcus (arcus senilis): lipid deposit in cornea

To calculate FRS go to https://www.framinghamheartstudy.org/fhs-risk-functions/cardiovascular-disease-10-year-risk/

Risk Factors for Screening for Dyslipidemia

- Men and women ages ≥40 (or postmenopausal)
- Increased incidence in Indigenous individuals or individuals of South Asian ancestry
- Current cigarette smoking
- T2DM
- Arterial HTN
- Family history of premature CVD (men <55, women <65 in 1st-degree relative)
- Family history of dyslipidemia
- Erectile dysfunction
- CKD
- Inflammatory disease (lupus, RA, psoriatic arthritis, IBD)
- HIV infection
- COPD
- Clinical evidence of atherosclerosis or AAA
- Stigmata of dyslipidemia (arcus cornea, xanthelasma, or xanthoma)
- Obesity (BMI ≥30 kg/m2)
- Hypertensive diseases of pregnancy

Non-Fasting Lipids vs. Fasting Lipids
Non-fasting (TC and non-HDL cholesterol) can be used for Framingham Risk Assessment and hold same prognostic value as fasting lipids
In fasted vs. non-fasted samples, HDL-C and TC vary by <2%, LDL-C varies by <10% and TG varies by <20%
Recently, non-fasting LDL-C has the same prognostic value as fasting LDL-C
Ontario Association of Medical Laboratories Guidelines for Lipid Testing in Adults 2013. Accessed from: https://oaml.com/wp-content/uploads/2016/05/OAMLGuidelineforAdultLipidTestingFinal2013.pdf

LDL cannot be calculated when TG ≥4.5 mmol/L

- risk category
  - estimate using the FRS for assessing 10 yr risk of developing CAD
    - FRS is calculated based on gender, age, HDL-C, TC, sBP, smoking, DM
    - family history of premature CVD (<55 in 1st degree male relative or <65 in 1st degree female relative) doubles FRS
    - to be completed for men and women ages 40-75 every 3-5 yr
    - CV age is calculated as patient's age minus the difference between his or her estimated remaining life expectancy (adjusted for coronary and stroke risk) and the average remaining life expectancy of Canadians of the same age and sex
- used to increase adherence to therapy and reaffirm positive effect of following therapy
  - treatment decisions focus on LDL-C level and/or FRS risk; the alternate primary targets are apolipoprotein B and non-HDL-C
  - if moderate risk and LDL-C <3.5, treatment decision thresholds shifted to apolipoprotein B >1.2 g/L or non-HDL-C >4.3 mmol/L
  - other targets include: TC:HDL-C ratio, apolipoprotein B:apolipoprotein A1 ratio, high-sensitivity CRP (used more for risk stratification of CAD), non-HDL-C, and serum TG levels

Management

- intensity and type of treatment is guided by "risk category" assigned (see Figure 5, FM11)
- use decision-making aids such as http://chd.bestsciencemedicine.com/calc2.html

1. Health behaviour interventions (can decrease LDL-C by up to 10%)
   - smoking cessation: likely the most important for preventing CAD
   - dietary modification: reduce saturated fat, red meat, refined sugar, alcohol; consume nuts, fruits/vegetables, poultry, fish
   - physical activity: at least 150 min of moderate to vigorous intensity aerobic exercise per wk, in bouts of ≥10 min to reduce CVD risk (see Table 5, FM13)
   - employ consistent lifestyle modifications for at least 3 mo before considering drug therapy; high-risk patients should start treatment immediately with concurrent health behaviour interventions
2. Pharmacologic therapy (can decrease LDL-C by up to 40%)
   - for a comparison of dyslipidemia medications, see Endocrinology, E6
   - 1st line monotherapy: statins (HMG-CoA reductase inhibitors)
     - risks: myopathy (myalgia, rhabdomyolysis)
     - if severe side effects: ezetimibe (cholesterol absorption inhibitor) can be used for 19% reduction in LDL-C
     - post-acute coronary syndrome: cholesterol absorption inhibitors (e.g. ezetimibe) in addition to simvastatin reduced mortality, attained lipid targets <1.8, and improved outcomes in high-risk individuals

- lower evidence for other agents: bile acid sequestrants, niacin, fibrates, PCSK9 inhibitors
- monitoring
  - ALT, CK, Cr at baseline then 6 wk later for signs of transaminitis or myositis; tolerate rise in CK up to 10 times upper limit of normal vs. 2-3 times if symptomatic, or serum Cr rise of ≤25%
  - no routine repeated measures of ALT and CK necessary in asymptomatic patients using statin therapy
  - if adequate response is achieved, evaluate fasting lipids every 6-12 mo

Isolated Hypertriglyceridemia

- does not increase cardiovascular risk
- normal HDL-C and TC, elevated TG
- mild ≥2.2 mmol/L (≥200 mg/dL); marked ≥5.6 mmol/L (≥500 mg/dL)
- principal therapy is lifestyle modification
  - weight loss, exercise, avoidance of smoking and alcohol, effective blood glucose control in those with DM, increased omega-3 fatty acid intake
  - severe hypertriglyceridemia (typically >10 mmol/L) is associated with an increased risk of acute pancreatitis
- drug therapy (lowers risk for pancreatitis, not CAD)
  - nicotinic acid
  - fibrates

Safety of Statins: An Update
Therapeutic Advances in Drug Safety 2012;3:133-144
Trials have shown that statin therapy slightly increases the incidence of T2DM and hemorrhagic stroke; however, the absolute risk is small. Relative to the reduction in coronary events, their clinical significance is not great enough to recommend against statin use.

Use with caution when prescribing combined statin and fibrate therapy as there has been concern regarding the safety of certain combinations (potential increased risk of myalgias, CK elevations, myopathy, and/or rhabdomyolysis)

Clinical Definition of Metabolic Syndrome
Central obesity
Men – WC ≥94 cm
Women – WC ≥80 cm

Plus any TWO of the following four factors:

Risk Factor	Defining Level
TG level	≥1.7 mmol/L (150 mg/dL)
HDL-C level:	
Men	<1.0 mmol/L (40 mg/dL)
Women	<1.3 mmol/L (50 mg/dL)
BP	≥130/85 mmHg or taking BP medications
Fasting glucose level	≥5.6 mmol/L (100 mg/dL)

Statin-Related Adverse Events: A Meta-Analysis
Clin Ther 2006;28:26-35
Purpose: To synthesize adverse event data with statin use based on RCT data.
Methods: Meta-analysis of RCTs focused on adverse effects of statins. Eligible patients were those taking statin monotherapy for primary or secondary prevention of CVD, compared to placebo. Adverse events including elevated liver enzymes or myopathy (myalgias, elevated CK, rhabdomyolysis) were the main outcomes.
Results: Statin therapy increased the risk of any adverse event by 39% (OR 1.4; 95% CI 1.09-1.80; P=0.008) compared with placebo. Treating 1000 patients with a statin would cause 5 adverse events. Serious events (CK >10 times the upper limit of normal or rhabdomyolysis) are infrequent (NNH 3400) and rhabdomyolysis, although serious, is rare (NNH 7428).
Conclusion: Statin therapy was associated with greater odds of adverse events compared with placebo but with substantial clinical benefit. Similar rates of serious adverse events were observed between statin and placebo.

Exercise

Table 5. Canadian 24 Hour Movement Guidelines (2020 CSEP Guidelines)

Age Category	Physical Activity Guidelines	Example Activities	Sleep/Sit Guidelines
Infant (<1)	Active several times daily in a variety of ways Accumulate >30min/day of tummy time while awake	Interactive floor-based play including tummy time, reaching for toys, crawling	**Sleep**: 14-17 h/d (0-3 mo), 12-16 h/d (4-11 mo) of good quality sleep including naps, with consistent bed and wake up times **Sit**: not restrained (i.e. in a stroller) for >1 h, screen time not recommended, engage in reading/storytelling while sedentary
Toddler (1-2)	Accumulate >180 min of physical activity at any intensity spread throughout the day including energetic play	Moving around the home Climbing stairs Exploring environment Brisk walking, running, dancing	**Sleep**: 11-14 h/d of good quality sleep including naps, with consistent bed and wake up times **Sit**: not restrained (i.e. in a stroller) for >1 h, sedentary screen time not recommended if <2 yr (<1 h screen time for those ages 2 yr), engage in reading/storytelling while sedentary
Preschool (2-4)	Accumulate >180 min in a variety of activities at any intensity, including ≥60 min of energetic play throughout the day	Moving around the home Climbing stairs Exploring environment Brisk walking, running, dancing	**Sleep**: 10-13 h/d of good quality sleep which may include a nap **Sit**: not restrained (i.e. in a stroller) for >1 h, sedentary screen time <1 h (less is better), engage in reading/storytelling while sedentary
Children (5-11) and Youth (12-17)	Accumulate >60min/d of moderate to vigorous aerobic physical activity Muscle/bone strengthening exercises 3 d/wk A variety of structured/unstructured light physical activities for several h/d	Moderate: bike riding, playground playing Vigorous: running, swimming	**Sleep**: 9-11 h/d (5-13 yr), 8-10 h/d (14-17 yr) uninterrupted, with consistent bed and wake up times **Sit**: no more than 2 h/d of recreational screen time, limit sitting for extended periods
Adults (18-64)	Accumulate 150 min/wk of moderate to vigorous intensity aerobic physical activity, in bouts of ≥10 min Muscle/bone strengthening activities using major muscle groups, ≥2 d/wk	Moderate: brisk walking, bike riding Vigorous: jogging, cross country skiing	**Sleep**: 7-9 h/d of good quality sleep, with consistent bed and wake up times **Sit**: limit sedentary time to 8 h or less, no more than 3 h/d of recreational screen time, break up long periods of sitting as often as possible
Older Adults (≥65)	Same as Adults above Physical activities that challenge balance	Same as Adults above Those with poor mobility should perform physical activities to enhance balance and prevent falls	Same as Adults above

Epidemiology
- 25% of the population exercises regularly, 50% occasionally, 25% are sedentary

Management
- assess current level of fitness, motivation, and access to exercise
- encourage warm up and cool down periods to allow transition between rest and activity and to avoid injuries
- exercise with caution for patients with CAD, DM (risk of hypoglycemia), exercise-induced asthma
- patients with known CAD should have cardiac assessment prior to commencing exercise
- benefits of exercise
  - reduces risk of premature death, heart disease, stroke, HTN, certain types of cancer, T2DM, osteoporosis, and overweight/obesity
  - leads to improved fitness, strength, mobility, functional independence, and mental health (morale and self-esteem)

Smoking Cessation

Epidemiology
- smoking is the single most preventable cause of premature illness and death
- 70% of smokers see a physician each year
- 2012 Canadian Tobacco Use Monitoring Survey on population ages ≥15
  - 16% are current smokers (lowest since 1985)
  - highest prevalence in those ages 20-24 (20%)
  - 11% of youth ages 15-19 smoke (decreased from 25% in 2000): more males (18%) smoke than females (14%); number of cigarettes consumed per day is also decreasing (15.0 per day in 2012 vs. 16.2 per day in 2001)

Doses, Durations, and Modes of Delivery of Nicotine Replacement Therapy for Smoking Cessation
Cochrane DB Syst Rev 2019;4:CD013308
Purpose: NRT helps with smoking cessation but it is unclear what NRT routines and dosages are most helpful. The aim was to establish efficacy of different forms, deliveries, dosages, and duration of treatment.
Methods: Meta-analysis including RCTs of people motivated to quit smoking, comparing one type of NRT vs. another.
Results: High-certainty evidence that combination NRT (fast-acting form + patch) results in higher long-term quit rates than single form. Moderate-certainty evidence dosages ≥21/22 mg are equally effective. Five studies comparing 4 mg gum to 2 mg gum found a benefit of the higher dose. Nine studies tested the effect of using NRT prior to quit day (preloading) in comparison to using it from quit day onward; there was moderate-certainty evidence of a favourable effect of preloading on abstinence.
Conclusions: There is high-certainty evidence that using combination NRT vs. single-form NRT can increase the chances of successfully stopping smoking. Higher dosed patches and gum seemed to result in higher long term quit rates with moderate quality evidence.

Management

- general approach
  - identify tobacco users; elicit smoking habits, previous quit attempts, and results
  - be curious about how the patient relates to smoking. Ask: what purpose does smoking serve in their life at the moment?
  - 2012 Canadian Action Network for the Advancement, Dissemination and Adoption of Practice-informed Tobacco Treatment (CAN-ADAPTT) Guidelines
    - tobacco use status should be updated for all patients regularly
    - health care providers should clearly advise patients to quit
    - health care providers should assess patient willingness to quit and offer assistance to those who express interest
    - health care providers should conduct regular follow-up to assess response and monitor the patient's mental health status/other addictions while quitting smoking
- medication dosage should be monitored and adjusted as necessary
  - every smoker should be offered treatment
- educate patient to watch for withdrawal symptoms: low mood, insomnia, irritability, anxiety, difficulty concentrating, restlessness, decreased heart rate, increased appetite
- combining counselling/behavioural therapies and smoking cessation medication is more effective than either alone
  - ≥4 counselling sessions, >10 min each, with 6-12 mo follow-up yields better results
  - 14% abstinent with counselling vs. 10% without counselling
  - approach depends on patient's stage of change (see *Motivational Strategies for Behavioural Change*, FM7)
- willing to quit
  - provision of social support, community resources (self-help, group, helpline, web-based strategies)
  - pregnant patients: counselling is recommended as first line treatment
    - NRT should be made available to pregnant women who are unable to quit using non-pharmacologic methods
    - intermittent NRT use (lozenges, gum) is preferred over continuous dosing of the patch
    - no strong evidence that either major positive or negative outcomes were associated with gestational use of bupropion or varenicline; consider using only if benefits outweigh risks
- pharmacologic therapy
  1. NRT
     - 19.7% abstinent at 12 mo with NRT vs. 11.5% for placebo
     - no difference in achieving abstinence for different forms of NRT
     - reduces cravings and withdrawal symptoms without other harmful substances contained in cigarettes
     - cost of NRT is comparable, and often lower than cigarettes
     - use with caution: immediately post-MI, worsening angina, arrhythmia
     - advise no smoking while using NRT
     - public reimbursement for smoking cessation treatment varies across Canada – see https://www.helpthemquit.ca/treatment/costs-coverage for more details
  2. Antidepressants (mechanism of action appears to be independent of antidepressant effect)
     - bupropion SR (Zyban®)
     - 21% abstinent at 12 mo vs. 8% for placebo
     - bupropion has similar effectiveness to NRT
  3. Varenicline (Champix®)
     - partial nicotinic receptor agonist (to reduce cravings) and partial competitive nicotinic receptor antagonist (to reduce response to smoked nicotine)
     - more effective than bupropion (23% abstinent from 9-52 wk with varenicline vs. 16% with bupropion vs. 9% with placebo)
     - significant side effects (including nausea, headache, drowsiness, unusual dreams, neuropsychiatric symptoms) may lower patient compliance

Table 6. Types of Nicotine Replacement Therapy

Type	Dosage	Comment	Side Effects
Nicotine Gum (OTC)	2 mg if <25 cig/d 4 mg if >25 cig/d 1 piece q1-2 h for 1-3 mo (max 24 pieces/d)	Chew until "peppery" taste then "park" between gum and cheek to facilitate absorption Continue to chew-park intermittently for 30 min	Mouth soreness Hiccups Dyspepsia Jaw ache (Most are transient)
Nicotine Patch (OTC)	Use for 8 wk 21 mg/d x 6 wk 14 mg/d x 2 wk 7 mg/d x 2 wk	Start with lower dose if <10 cig/d Change patch q24 h and alternate sides	Skin irritation Insomnia Palpitations Anxiety
Nicotine Inhaler (OTC)	6-16 cartridges/d up to 12 wk	Nicotine inhaled through mouth, absorbed in mouth and throat (not in lungs)	Local irritation Cough
Nicotine Nasal Spray (Rx)		Newer form of NRT	Local irritation Cough

Antidepressants for Smoking Cessation
Cochrane DB Syst Rev 2020;4:CD000031
Purpose: To assess evidence for the efficacy, safety, and tolerability of medications with antidepressant properties in assisting long-term tobacco smoking cessation.
Methods: Meta-analysis of RCTs comparing antidepressant medications to placebo or alternative pharmacotherapy, or the same medication used in a different way for smoking cessation. Safety analyses with any follow-up length was also conducted
Results: Compared to placebo, bupropion was associated with increased long-term smoking cessation rates (RR 1.64, 95% CI 1.52 to 1.77), higher risk of reported psychiatric adverse events (RR 1.25, 95% CI 1.15 to 1.37), and higher dropout rate due to adverse events of the drug (RR 1.37, 95% CI 1.21 to 1.56). Bupropion resulted in inferior cessation rates to varenicline (RR 0.71, 95% CI 0.64 to 0.79), however no difference in efficacy between bupropion and NRT was found. Additionally, nortriptyline aided smoking cessation when compared with placebo (RR 2.03, 95% CI 1.48 to 2.78). There was insufficient evidence to establish whether combination bupropion and NRT resulted in superior quit rates to NRT alone, or whether combination bupropion and varenicline resulted in superior quit rates to varenicline alone.
Conclusion: Evidence suggests that bupropion may be helpful and as successful as NRT and nortriptyline in helping people to quit smoking, but that it is less effective than varenicline.

The 5 A's for Patients Willing to Quit
Ask if the patient currently smokes and is willing to discuss cessation
Advise the patient to quit
Assess willingness to quit
Assist in quit attempt(s)
Arrange follow-up

The 2-3 Pattern of Smoking Cessation
- Onset of withdrawal is 2-3 h after last cigarette
- Peak withdrawal is at 2-3 d
- Expect improvement of withdrawal symptoms at 2-3 wk
- Resolution of withdrawal at 2-3 mo
- Highest relapse rate within 2-3 mo

Assist Patient in Developing Quit Plan

STAR
Set quit date
Tell family and friends (for support)
Anticipate challenges (e.g. withdrawal)
Remove tobacco-related products (e.g. ashtrays/lighters)

Table 7. Pharmacologic Treatments for Smoking Cessation

Drug	Mechanism	Dosage	Prescribing*	Contraindications
Bupropion	Inhibits re-uptake of dopamine and/or norepinephrine Side effects: insomnia, dry mouth	1. 150 mg qAM x 3 d 2. Then 150 mg BID x 7-12 wk 3. For maintenance consider 150 mg bid for up to 6 mo	1. Decide on a quit date 2. Continue to smoke for first 1-2 wk of treatment and then completely stop (therapeutic levels reached in 1 wk)	Seizure disorder Eating disorder MAOI use in the past 14 d Simultaneous use of bupropion (Wellbutrin®) for depression
Varenicline	Partial nicotinic receptor agonist, and partial competitive antagonist of nicotinic receptor Side effects: nausea, vomiting, constipation, headache, dream disorder, insomnia, increased risk of psychosis, depression, suicidal ideation	1. 0.5 mg qAM x 3 d 2. Then 0.5 mg BID x 4 d 3. Continue 1 mg BID x 12 wk ± additional 12 wk as maintenance	1. Decide on a quit date 2. Continue to smoke for first wk of treatment and then completely stop	Caution with pre-existing psychiatric condition

*Bupropion and varenicline may be used in combination with NRT

- unwilling to quit
  - motivational intervention (**5 Rs**)
    1. **R**elevance to patient
       - relevance to patient's disease status or risk, family or social situation (e.g. having children in the home), health concerns, age, gender
    2. **R**isks of smoking
       - short-term: SOB, asthma exacerbation, impotence, infertility, pregnancy complications, heartburn, URTI
       - long-term: MI, stroke, COPD, lung cancer, other cancers
       - environmental: higher risk in spouse/children for lung cancer, SIDS, asthma, respiratory infections
    3. **R**ewards: (benefits)
       - improved health, save money, food tastes better, good example for children
    4. **R**oadblocks: (obstacles)
       - fear of withdrawal, weight gain, failure, lack of support
    5. **R**epetition
       - reassure unsuccessful patients that most people try many times before successfully quitting (average number of attempts before success is 7)
- recent quitter
  - highest relapse rate within 3 mo of quitting
    - minimal practice: congratulate success, encourage ongoing abstinence, review benefits and risks
    - prescriptive interventions: address problem(s) of weight gain, negative mood, withdrawal, lack of support

Physician Advice for Smoking Cessation
Cochrane DB Syst Rev 2013;5:CD000165
Purpose: To assess the effectiveness of physician advice in promoting smoking cessation, compare minimal physician interventions with more intensive interventions, assess the effectiveness of various aids in smoking cessation, and determine the effect of anti-smoking advice on mortality.
Methods: Systematic review of RCTs of smoking cessation advice from a medical practitioner. Abstinence was assessed ≥6 mo after advice was first provided.
Results: 42 trials with over 31,000 smokers were identified. Most common setting for advice delivery was primary care. A significant increase in quitting rates was noted with advice vs. no advice (RR 1.66, 95% CI 1.42-1.94), which was further increased where the intervention was considered more intensive (RR 1.84, 95% CI 1.60-2.13; n.s.). Intensive advice showed a small, non-significant advantage vs. minimal advice when directly compared (RR 1.37, 95% CI 1.20-1.56). A small benefit with follow-up visits was also noted. No statistically significant difference in mortality at 20 yr follow-up was found.
Conclusion: Simple advice can increase smoking cessation rates by 1-3% on top of the unassisted quit rate. More intensive advice and providing follow-up support may further increase quit rates.

Alcohol Use

- see Psychiatry, PS28

Definition
- alcohol use disorder diagnostic categories occur along a continuum

Epidemiology
- 10-15% of patients in family practice misuse alcohol
- 20-50% of hospital admissions, 10% of premature deaths, 30% of suicides, and 50% of fatal traffic accidents in Canada are alcohol-related
- more likely to miss diagnosis in women, elderly, and patients with high socioeconomic status

Assessment
- screen for alcohol dependence with CAGE questionnaire
  - if CAGE is positive, further explore for the possibility of alcohol misuse or dependence
- assess drinking profile
  - setting, time, place, occasion, with whom
  - impact on family, work, social life
  - quantity-frequency history
    - how many drinks per day?
    - how many days per week?
    - maximum number of drinks on any one day in the past month?
- if identified positive for alcohol use disorder:
  - screen for other drug use
  - identify any medical/psychiatric complications (e.g. delirium tremens or withdrawal seizures)
  - ask about drinking and driving
  - ask about past recovery attempts and assess current readiness to change

Standard Drink Equivalents
- One standard drink = 13.64 g of pure alcohol
- Beer/Cider/Cooler (5% alcohol) = 12 oz
- Malt liquor (7% alcohol) = 8-9 oz
- Wine (12-17% alcohol) = 5 oz
- Fortified wine = 3 oz
- Hard liquor (40%) = 1.5 oz

CAGE Questionnaire
- Have you ever felt you needed to **C**ut down on your drinking?
- Have people **A**nnoyed you by criticizing your drinking?
- Have you ever felt **G**uilty about drinking?
- Have you ever felt you needed a drink first thing in the morning (**E**ye-opener) to steady your nerves or to get rid of a hangover?

Two "yes" responses is considered positive

Investigations
- GGT and MCV for baseline and follow-up monitoring
- AST, ALT (usually AST:ALT approaches 2:1 in persons with alcohol use disorder)
- CBC (anemia, thrombocytopenia), INR (decreased clotting factor production by the liver)

Management
- intervention should be consistent with patient's motivation for change
- individualized counselling and regular follow-up is crucial
- 10% of patients in alcohol withdrawal will have seizures or delirium tremens
- Alcoholics Anonymous/12-step program
  - outpatient/day programs for those with chronic, resistant alcohol use disorder
  - family treatment (Al-Anon, Alateen, screen for spousal/child abuse)
- refer to specialist or inpatient program if:
  - dangerous or highly unstable home environment
  - severe medical/psychiatric concern
  - addiction to drug that may require in-patient detoxification
  - refractory to other treatment programs
- pharmacologic
  - diazepam for withdrawal
  - disulfiram (Antabuse®): impairs metabolism of alcohol by blocking conversion of acetaldehyde to acetic acid, leading to flushing, headache, N/V, hypotension if alcohol is ingested (available in U.S., but no longer available in Canada)
  - naltrexone: competitive opioid antagonist that reduces cravings and pleasurable effects of drinking
    - may trigger withdrawal in opioid-dependent patients
  - acamprosate: glutamate receptor modulator that also reduces craving
- see Psychiatry, PS29

Prognosis
- relapse is common and should not be viewed as failure
- monitor regularly for signs of relapse
- 25-30% of persons with alcohol use disorder exhibit spontaneous improvement over 1 yr
- 60-70% of individuals with jobs and families have improved quality of life 1 yr post-treatment

Figure 6. Continuum of alcohol use
Butt P, Gliksman L, Beirness D, et al. Alcohol and health in Canada: A summary of evidence and guidelines for low-risk drinking. Ottawa, ON: Canadian Centre on Substance Abuse, 2011.

Some Adverse Medical Consequences of Problem Drinking
- **GI**: gastritis, dyspepsia, pancreatitis, liver disease, bleeds, diarrhea, oral/esophageal cancer
- **Cardiac**: HTN, alcoholic cardiomyopathy
- **Neurologic**: Wernicke-Korsakoff syndrome, peripheral neuropathy
- **Hematologic**: anemia, coagulopathies
- **Other**: trauma, insomnia, family violence, anxiety/depression, social/family dysfunction, sexual dysfunction, fetal damage

Common Presenting Problems

Abdominal Pain

- see Gastroenterology, G4, General and Thoracic Surgery, GS4, and Emergency Medicine, ER18

Epidemiology
- 20% of individuals have experienced abdominal pain within the last 6-12 mo
- 90% resolve in 2-3 wk
- only 10% are referred to specialists, of those <10% admitted to hospital

Etiology
- most common diagnosis in family medicine at 28% is "nonspecific abdominal pain," which has no identifiable cause and is usually self-limited
- GI disorders (e.g. PUD, pancreatitis, IBD, appendicitis, gastroenteritis, IBS, diverticular disease, biliary tract disease)
- urinary tract disorders (e.g. UTI, renal calculi)
- gynaecological disorders (e.g. PID, ectopic pregnancy, endometriosis)
- cardiovascular disorders (e.g. CAD, AAA, ischemic bowel)
- other: DKA, porphyria, hypercalcemia, medications (e.g. NSAIDs), alcohol, toxic ingestion, foreign body, psychogenic

Pathophysiology
- type of pain
  - somatic pain: sharp, localized pain
  - visceral pain: dull, generalized pain
- location of pain
  - epigastric (foregut): distal esophagus, stomach, proximal duodenum, biliary tree, pancreas, liver
    - right upper quadrant (RUQ): biliary, hepatic, colonic, pulmonary, renal
    - left upper quadrant (LUQ): cardiac, gastric, pancreatic, renal, vascular
  - periumbilical (midgut): distal duodenum to proximal 2/3 of transverse colon

If pain precedes nausea/vomiting, cause of abdominal pain is more likely to require surgery

Abdominal Pain Red Flags
- Severe pain
- Signs of shock
- Peritoneal signs
- Abdominal distention
- Pain out of proportion to clinical findings
- New onset pain, change in pain, or altered bowel habits in elderly
- Weight loss
- Blood per rectum/melena
- Anemia
- Supraclavicular nodes
- Family history of serious bowel disease

In patients >50, keep a high index of suspicion for AAA – its presentation may mimic renal colic or diverticulitis

- hypogastric (hindgut): distal 1/3 of transverse colon to rectosigmoid region
  - right lower quadrant (RLQ): colonic, appendix, gynaecologic, renal
  - left lower quadrant (LLQ): colonic, gynaecologic, renal
- any location: aneurysm, dissection, ischemia, zoster, muscle strain, hernia, bowel obstruction, peritonitis, porphyria, DKA

Investigations
- guided by findings on history and physical
- possible blood work: CBC, electrolytes, BUN, Cr, amylase, lipase, AST, ALT, ALP, bilirubin, glucose, INR/PTT, toxicology screen, β-hCG
- imaging
  - CXR (for free air under the diaphragm) in setting of perforation in surgical abdomen
  - abdominal x-ray, KUB (consider: gas pattern, free air, kidney stones, constipation)
  - ultrasound (renal stones, gallbladder disease, gynaecological problems, liver disease, pancreatitis, diverticular disease, appendicitis)
  - CT-scan (AAA, appendicitis), non-contrast helical CT-scan (first choice for renal stones)
- other tests
  - urinalysis
  - endoscopy (for peptic ulcers, gastritis, tumours, etc.)
  - H. pylori testing (urea breath test, serology, biopsy)

Allergic Rhinitis

- see Otolaryngology, OT24

Definition
- inflammation of the nasal mucosa that is triggered by an allergic reaction
- classification
  - seasonal
    - symptoms during a specific time of the year
    - common allergens: trees, grass and weed pollens, airborne moulds
  - perennial
    - symptoms throughout the year with variation in severity
    - common allergens: dust mites, animal dander, moulds
- persistent allergic rhinitis may lead to chronic rhinosinusitis

Epidemiology
- affects approximately 40% of children and 20-30% of adults
- prevalence has increased in developed countries, particularly in the past two decades
- associated with asthma, eczema, sinusitis, and otitis media

Etiology
- increased IgE levels to certain allergens ➔ excessive degranulation of mast cells ➔ release of inflammatory mediators (e.g. histamine) and cytokines ➔ local inflammatory reaction

Assessment
- identify allergens
- take an environmental/occupational history
- ask about related conditions (e.g. atopic dermatitis, asthma, sinusitis, and family history)

Management
- conservative
  - minimize exposure to allergens
    - most important aspect of management, often sufficient (may take months)
  - maintain hygiene, saline nasal rinses
- pharmacologic agents
  - oral second-generation antihistamines – first line therapy for mild symptoms
    - e.g. cetirizine (Reactine®), fexofenadine (Allegra®), loratadine (Claritin®)
  - intranasal corticosteroids for moderate/severe or persistent symptoms (expect >1 mo of consistent use to see results)
  - intranasal decongestants (use must be limited to <5 d to avoid rhinitis medicamentosa)
- allergy skin testing
  - for patients with chronic rhinitis whose symptoms are not controlled by conservative and pharmacological therapy
  - may identify allergens to include in immunotherapy treatment
- immunotherapy (allergy shots)
  - reserved for severe cases unresponsive to pharmacologic agents
  - consists of periodic (usually weekly) subcutaneous injections of custom prepared solutions of one or more antigens to which the patient is allergic

Differential Diagnosis
- Acute viral infection
- Vasomotor rhinitis
- Deviated septum
- Nasal polyps
- Acute/chronic sinusitis
- Drug-induced rhinitis

Rhinitis Medicamentosa
Rebound nasal congestion. Occurs with prolonged use (>5-7 d) of vasoconstrictive intranasal medications. Patient may become dependent, requiring more frequent dosing to achieve the same decongestant effect

Symptoms of GAD

AND I C REST
Anxious, nervous, or worried
No control over the worry
Duration >6 mo
Irritability
Concentration impairment
Restlessness
Energy decreased
Sleep impairment
Tension in muscles
Can Fam Physician 2005;51:1340-42

Differential Diagnosis of Anxiety Disorders
- Panic disorder
- GAD
- Social anxiety disorder (previously Social Phobia)
- Agoraphobia
- Specific phobia
- Selective mutism
- Separation anxiety disorder
- Other: general medical condition, AMC, mood disorder, psychotic disorder, OCD, PTSD

Rule Out
- Cardiac (post MI, arrhythmias)
- Endocrine (hyperthyroidism, diabetes, pheochromocytoma)
- Respiratory (asthma, COPD)
- Somatoform disorders
- Psychotic disorders
- Mood disorders (depression, bipolar)
- Personality disorder (OCPD)
- Drugs (amphetamines, thyroid preparations, caffeine, OTC for colds/decongestants, alcohol/benzodiazepine withdrawal)

Self-Management Asthma and COPD Education and Written Action Plan
- Education is a key component in management of asthma and COPD
- Guided self-management combining education, regular medical review, self-assessment, and written action plans have been shown to reduce hospitalizations, ER visits, and missed days at work or school

Sample action plans available online: http://www.respiratoryguidelines.ca

Amenorrhea

- see Gynaecology, GY7
- absence of menses due to dysfunction of the hypothalamus, pituitary, ovaries, uterus, and/or vagina. Classified as either primary (absence of menarche by age 15 or thereafter) or secondary (absence of menses >3 mo in women who previously had regular menstrual cycles)

Anxiety

- see Psychiatry, PS16

Epidemiology

- 25-30% of patients in primary care settings have psychiatric disorders
- many are undiagnosed or untreated; hence the need for good screening
- high rate of coexistence of anxiety disorders and depression

Screening

- screening tools such as the Generalized Anxiety Disorder 7-item (GAD-7) tool
- screening questions
  - do you tend to be an anxious or nervous person?
  - have you felt unusually worried about things recently?
  - has this worrying affected your life? How?

Assessment

- identify associated symptoms on history and physical to rule-out organic medical causes (e.g. hyperthyroidism, cardiopulmonary disorder, traumatic brain injury)
- risk factors: past history of anxiety, stressful life event, trauma, social isolation, female , LGBTQ2S+, comorbid psychiatric diagnosis (e.g. depression), family history of anxiety or depression
- assess substance misuse, suicidal ideation/self-harm
- to differentiate anxiety disorders, consider symptoms and their duration
- use the GAD-7 tool to assess and monitor levels of anxiety
- ask patients about experiences that may impact current situation and intersectionality

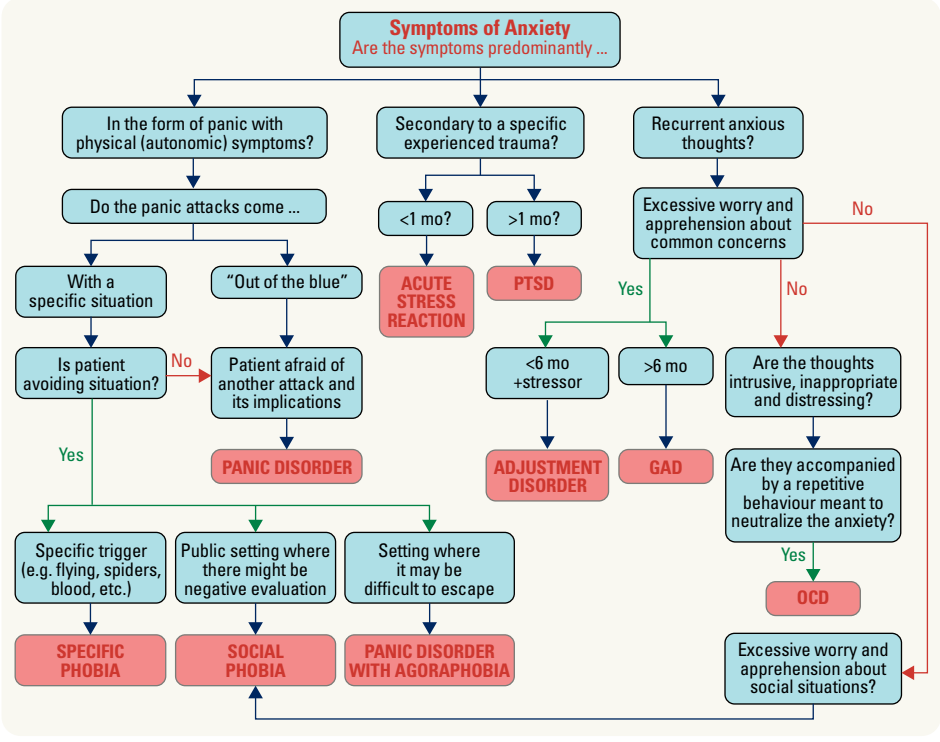


Figure 7. Differentiating anxiety disorders using the DSM V diagnostic criteria
Adapted from: Evans M, Bradwejn J, Dunn L. Anxiety Review Panel. Guidelines for the treatment of anxiety disorders in primary care. Toronto: Queen's Printer of Ontario, 2000.41

Management
- patient education: emphasize prevalence, good recovery rate of anxiety conditions
- with consent, explore lifestyle habits: exercise, caffeine and alcohol intake etc. and collaboratively develop a person-centered plan (eg. reduce caffeine at a particular pace)
- psychological: psychotherapy including CBT, exposure therapy, relaxation techniques, and mindfulness strategies
- pharmacotherapy: see Psychiatry, PS60
- offer self-help materials, connect with community resources (e.g. support groups), and provide support to family and caregivers

Asthma/COPD

- see Respirology, R7

Definition
- asthma
  - chronic, reversible airway inflammation characterized by periodic attacks of wheezing, dyspnea, chest tightness, and coughing
  - airways are hyper-responsive to triggers/antigens leading to acute obstructive symptoms by bronchoconstriction, mucous plugs, and increased inflammation
  - cannot be diagnosed at first presentation
  - PFTs can be done starting at age 6 or when child is able to follow testing instructions
  - peak flow metres are useful in the office and at home for monitoring
- COPD
  - group of chronic, progressive, non-reversible lung diseases characterized by limited airflow with variable degrees of air sac enlargement and lung tissue destruction
  - emphysema and chronic bronchitis are the most common forms

Table 8. Differentiating COPD from Asthma

	COPD	Asthma
Age of Onset	Usually in 6th decade	Any age (but 50% of cases are diagnosed in children ages <10)
Role of Smoking	>10 pack yr	Not causal, known trigger
Reversibility of Airflow Obstruction	Airflow obstruction is chronic and persistent	Airflow obstruction is episodic and usually reversible with therapy
Evolution	Slow, progressive worsening (with periodic exacerbations)	Stable, episodic, <50% will outgrow
History of Allergy	Infrequent	>50% patients
Precipitators	Environmental irritants (air pollution), cigarette smoking, α-1 antitrypsin deficiency, viral infection, occupational exposure (firefighters, dusty jobs)	Environmental irritants (dust, pollen), animal fur, cold air, exercise, URTIs, cigarette smoke, use of β-blockers/ASA
Symptoms/Signs	Chronic cough, sputum, and/or dyspnea	Wheeze (hallmark symptom), dyspnea, chest tightness, prolonged expiration, cough which is worse in the cold, at night, and in the early AM
Diffusion Capacity	Decreased (more so in pure emphysema)	Normal (for pure asthma)
Hypoxemia	Chronic in advanced stages	Not usually present Episodic with severe attacks
Spirometry	May have improvement with bronchodilators but not universally seen	Marked improvement with bronchodilators or steroids
Chest X-Ray	Often normal Increased bronchial markings (chronic bronchitis) and chronic hyperinflation (emphysema) often co-exist, bullae	Often normal or episodic hyperinflation Hyperinflation during asthma attack
Management	**All: Smoking Cessation** **Mild** Step 1: SABA prn (salbutamol) Step 2: SABA prn + LAAC (i.e. tiotropium) or + LABA (e.g. salmeterol) **Moderate** Step 3: SABA/SAMA + LABA or SABA + LABA or LAAC; consider inhaled vs. oral steroids **Severe** Step 4: Pneumococcal vaccination, annual influenza immunization	Ongoing patient education, and environmental control SABA taken prn as rescue medication + maintenance meds Maintenance medications **Mild** Step 1: Low-dose ICS Step 2: Medium/high-dose ICS or low-dose ICS plus either LABA, LTRA modifier **Moderate** Step 3: Medium/high-dose ICS + either LABA, LT modifier **Severe** Step 4: As above + immunotherapy ± oral glucocorticosteroids + pneumococcal vaccination, annual influenza immunization

ICS = inhaled corticosteroids; LAAC = long-acting anticholinergic; LABA = long-acting β-agonist; LT modifier = leukotriene modifier; SABA = short-acting β-agonist, SAMA = short acting muscarinic antagonist

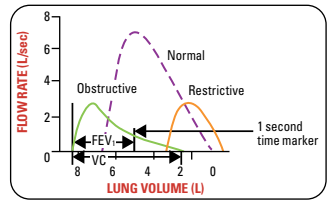

Figure 8. Expiratory flow volume curves (obstructive, normal, and restrictive disease) See Respirology, R4
Adapted from: Weinberger SE. Principles of pulmonary medicine, 5th ed. With permission from Elsevier. ©2008

Signs of Poorly Controlled Asthma
- β2-agonist use >4x/wk
- Asthma-related absence from work/ school
- Exercise induced asthma
- Night-time symptoms >1x/wk

What Colour is Your Inhaler?

Name	Body/Cap Colour
β2-Agonists	
salbutamol – Ventolin®	Light blue/navy
salmeterol – Serevent®	Teal/light teal
terbutaline – Bricanyl®	Blue/white
ICS	
fluticasone – Flovent®	Orange/peach
budesonide – Pulmicort®	White/brown
Combined Long-Acting β2-Agonist + ICS	
fluticasone/salmeterol – Advair®	Purple discus
budesonide/formoterol– Symbicort®	Red/white
fluticasone/ vilanterol– Breo®	grey/blue
Anticholinergics	
umeclidinium - Incruse®	White/green
ipratropium – Atrovent®	Clear/green
tiotropium – Spiriva®	White/turquoise

More About Inhalers
- Aerosols (puffers = MDI, MDI + spacer) MDIs should be used with spacers to:
- Reduce side effects
- Improve amount inhaled
- Increase efficiency of use
- Dry Powder Inhalers (discus, turbuhaler, and diskhaler) require deep and fast breathing (may not be ideal for children)
- Nebulizers can be used to convert liquid medications into a fine mist: recommended for use if contraindications to MDIs

Differential Diagnosis of Wheezing
- Allergies, anaphylaxis
- Asthma, reactive airway disease
- GERD
- Infections (bronchitis, pneumonia)
- Obstructive sleep apnea
- COPD
- Less common: congestive heart disease, foreign body, malignancy, cystic fibrosis, vocal cord dysfunction

When prescribing salbutamol, watch out for signs of **hypokalemia**: lethargy, irritability, paresthesias, myalgias, weakness, palpitations, N/V, polyuria

Benign Prostatic Hyperplasia

- see Urology, U7

Definition
- hyperplasia of the stroma and epithelium in the periurethral transition zone

History and Physical
- include current/past health, surgeries, trauma, current medications including OTC
- specific urinary symptoms
- physical exam must include DRE for size, symmetry, nodularity, and texture of prostate (prostate is symmetrically enlarged, smooth, and rubbery in BPH)

Investigations
- urinalysis to exclude UTI and for microscopic hematuria (common sign)
- serum PSA: protein produced by prostatic tissue
  - PSA to screen/test for BPH is no longer used due to the high false positive rate, and is instead used as a marker to guide treatment once diagnosis has been made
  - PSA testing is inappropriate in men with a life expectancy less than 10 yr or patients with prostatitis, UTI
  - increased PSA in a younger man is more often due to cancer than other causes
  - abnormal DRE or PSA should trigger further assessment
  - discuss test with men at increased risk of prostate cancer (FHx, Black men) or who are concerned about development of prostate cancer
  - decision to test PSA in an asymptomatic man (see *Prostate Cancer Screening*, FM6)
- other tests
  - Cr, BUN, PVR volume by ultrasound, urodynamic studies, renal ultrasound, patient voiding diary
- tests NOT recommended as part of routine initial evaluation include:
  - cystoscopy, cytology, prostate ultrasound or biopsy, IVP, urodynamic studies

Table 9. Symptoms and Complications of BPH

Obstructive Symptoms	Irritative Symptoms	Late Complications
Hesitancy (difficulty starting urine flow)	Urgency	Hydronephrosis
Diminution in size and force of urinary stream	Frequency	Loss of renal concentrating ability
Stream interruption (double voiding)	Nocturia	Systemic acidosis
Urinary retention (bladder does not feel completely empty)	Urge incontinence	Renal failure
Post-void dribbling	Dysuria	
Overflow incontinence		
Nocturia		

Management
- referral to urologist if moderate/severe symptoms
- conservative: for patients with mild symptoms or moderate/severe symptoms considered by the patient to be non-bothersome
  - fluid restriction (avoid alcohol and caffeine)
  - avoidance/monitoring of certain medications (e.g. antihistamines, diuretics, antidepressants, decongestants)
  - pelvic floor/Kegel exercises; consider referral to pelvic physiotherapist
  - bladder retraining (scheduled voiding)
- pharmacological: for moderate/severe symptoms
  - α-receptor antagonists (e.g. terazosin (Hytrin®), doxazosin (Cardura®), tamsulosin (Flomax®), alfuzosin (Xatral®))
    - relax smooth muscle around the prostate and bladder neck
  - 5-α reductase inhibitors (e.g. finasteride (Proscar®))
    - only for patients with demonstrated prostatic enlargement due to BPH
    - inhibit the enzyme responsible for conversion of testosterone to dihydrotestosterone (DHT) thus reducing growth of prostate
  - antimuscarinic and beta-3 agonists
    - recommended for storage symptoms, but avoid in patients with bladder outlet obstruction and/or elevated post-void residual
  - long-acting phosphodiesterase inhibitor
    - recommended in patients with erectile dysfunction
  - desmopressin
    - recommended for nocturia as a result of nocturnal polyuria (watch for hyponatremia in older adults)
- surgical
  - TURP , TUIP (for prostate <30 g)
  - absolute indications: failed medical therapy, intractable urinary retention, benign prostatic obstruction leading to renal insufficiency
  - complications: impotence, incontinence, ejaculatory difficulties (retrograde ejaculation), decreased libido

Differential Diagnosis
- Prostate cancer
- Urethral obstruction
- Bladder neck obstruction
- Neurogenic bladder
- Overactive bladder
- Cystitis
- Prostatitis

Red Flags for Urology Referral
- Severe symptoms or pain
- Men < 45 years old
- Abnormality on digital rectal examination
- Hematuria
- Elevated prostate-specific antigen (PSA)
- Incontinence
- Neurologic disease known to impact lower urinary tract symptoms (LUTS)
- Urinary retention (post-void residual [PVR] urine volume >250 mL, or a palpable bladder)

Bronchitis (Acute)

Definition
- acute infection of the tracheobronchial tree causing inflammation leading to bronchial edema and mucus formation

Epidemiology
- 5th most common diagnosis in family medicine, and most common is URTI

Etiology
- 80% viral: rhinovirus, coronavirus, adenovirus, influenza, parainfluenza, and RSV
- 20% bacterial: *M. pneumoniae, C. pneumoniae, S. pneumoniae*

Investigations
- acute bronchitis is typically a clinical diagnosis
- sputum culture/Gram stain is not useful
- CXR if suspect pneumonia (cough >3 wk, abnormal vital signs, localized chest findings) or HF
- PFT with methacholine challenge if suspect asthma

Management
- primary prevention: frequent hand washing, smoking cessation, avoid irritant exposure
- symptomatic relief: rest, fluids (3-4 L/d when febrile), humidity, analgesics, and antitussives as required
- bronchodilators may offer improvement of symptoms (e.g. salbutamol)
- current literature does not support routine antibiotic treatment for the management of acute bronchitis because it is most likely to be caused by a viral infection
  - antibiotics may be useful if elderly, comorbidities, suspected pneumonia, or if the patient is toxic (see *Antimicrobial Quick Reference*, FM54)
  - antibiotics in children show no benefit

Differential Diagnosis of Bronchitis
- URTI
- Asthma
- Acute exacerbation of chronic bronchitis
- Sinusitis
- Pneumonia
- Bronchiolitis
- Pertussis
- Environmental/occupational exposures
- Post-nasal drip
- Others: GERD, CHF, cancer, aspiration syndromes, CF, foreign body

How to Tell if Viral or Bacterial?
Bacterial infections tend to give a higher fever, excessive amounts of purulent sputum production, and may be associated with concomitant COPD

Chest Pain

- see Cardiology and Cardiac Surgery, C5 and Emergency Medicine, ER21

Differential Diagnosis

Table 10. Differential Diagnosis of Chest Pain

Diagnosis	Clinical Findings	LR+	LR–
Acute MI	Chest pain radiates to both arms	7.1	0.67
	Third heart sound on auscultation	3.2	0.88
	Hypotension	3.1	0.96
Chest Wall Pain	>2 of: localized muscle tension, stinging pain, pain reproducible by palpation, absence of cough	3.0	0.47
GERD	Burning retrosternal pain, acid regurgitation, sour or bitter taste in the mouth; 1 wk trial of high-dose proton pump inhibitor relieves symptoms	3.1	0.30
Panic Disorder/Anxiety State	Single question: In the past 4 wk, have you had an anxiety attack (suddenly feeling fear or panic)?	4.2	0.09
Pericarditis	Clinical triad of pleuritic chest pain (increases with inspiration or when reclining, and is lessened by leaning forward), pericardial friction rub, and electrocardiographic changes (diffuse ST segment elevation and PR interval depression without T wave inversion)	N/A	N/A
Pneumonia	Egophony	8.6	0.96
	Dullness to percussion	4.3	0.79
	Fever	2.1	0.71
	Clinical impression	2.0	0.24
Heart Failure	Pulmonary edema on chest radiography	11.0	0.48
	Clinical impression/judgment	9.9	0.65
	History of heart failure	5.8	0.45
	History of acute myocardial infarction	3.1	0.69
Pulmonary Embolism	High pretest probability based on Wells criteria	6.8	1.8
	Moderate pretest probability based on Wells criteria	1.3	0.7
	Low pretest probability based on Wells criteria	0.1	7.6
Acute Thoracic Aortic Dissection	Acute chest or back pain and a pulse differential in the upper extremities	5.3	N/A

Adapted from: McConaghy J, Rupal S. Outpatient diagnosis of acute chest pain in adults. Am Fam Physician. 2013 Feb 1; 87(3): 177.182

Risk Factors for CAD
Major
- Smoking
- Diabetes
- HTN
- Hyperlipidemia
- Family history of early CAD in first degree relative (males <55 yr, females <65 yr)
- Untreated obstructive sleep apnea
- CKD

Minor
- Obesity
- Sedentary lifestyle
- Age

Red Flags
- Severe pain
- Pain for >20 min
- New onset pain at rest
- Severe SOB
- Loss of consciousness
- Hypotension
- Tachycardia
- Bradycardia
- Cyanosis

MI in Elderly Women
Elderly women can often present with dizziness, back pain, lightheadedness, or weakness in the absence of chest pain

MI in Diabetics
May present with dyspnea, syncope, and fatigue in the absence of chest pain

Investigations
- ECG, CXR, and others if indicated (cardiac enzymes, d-dimers, liver function tests, etc.)
- refer to ED if suspect serious etiology (e.g. aortic dissection, MI)

Management of Common Causes of Chest Pain
- angina/ischemic heart disease
  - NTG: wait 5 min between sprays and if no effect after 3 sprays, send to ED
- MI
  - ASA (160-325 mg, chewed stat), clopidogrel (Plavix®) or ticagrelor (Brilinta), LMWH (enoxaparin), morphine, oxygen, NTG
  - ± reperfusion therapy with fibrinolytics (e.g. tissue plasminogen activator (tPA), reteplase (rPA), tenecteplase (TNK), or streptokinase (SK)) if within 12 h (ideally <30 min) or time from First Medical Contact to percutaneous intervention (cath lab) if <30 min
  - start β-blocker (e.g. metoprolol starting dose 25 mg PO q6 h or BID, titrating to HR goal of 55-60 bpm)
- endocarditis: antibiotic choice is based on whether patient has a native or prosthetic heart valve as well as culture and sensitivity results
- GERD: antacids, H2-blockers, PPIs, patient education
- costochondritis: NSAIDs

Ruling Out Coronary Artery Disease in Primary Care
CMAJ 2010;182(12):1295-1300
Components of the prediction rule used to determine the presence or absence of CAD in patients with chest pain in primary care:
- Age/sex (female ≥65, male ≥55): 1 pt
- Known clinical vascular disease (coronary artery disease, occlusive vascular disease, or cerebrovascular disease): 1 pt
- Pain worse during exercise: 1 pt
- Pain not reproducible by palpation: 1 pt
- Patient assumes pain is of cardiac origin: 1 pt

Positive result: 3-5 pts; negative result: ≤2 pts (sensitivity: 87.1%, specificity: 80%)

Common Cold (Acute Rhinitis)

- see Infectious Diseases, *Pneumonia*, ID7 and *Influenza*, ID9

Definition
- viral URTI with inflammation

Epidemiology
- most common diagnosis in family medicine, peaks in winter months
- incidence: adults = 2-4/yr, children = 6-10/yr
- organisms
  - mainly rhinoviruses (30-35% of all colds)
  - others: coronavirus, adenovirus, RSV, influenza, parainfluenza, coxsackie virus
- incubation: 1-5 d
- transmission: person-person contact via secretions on skin/objects and by aerosol droplets

Risk Factors
- psychological stress, excessive fatigue, allergic nasopharyngeal disorders, smoking, sick contacts

Clinical Features
- symptoms
  - local: nasal congestion, clear to mucopurulent secretions, sneezing, sore throat, conjunctivitis, cough
  - general: malaise, headache, myalgias, mild fever
- signs
  - erythematous nasal/oropharyngeal mucosa, enlarged lymph nodes
  - normal chest exam
- complications
  - secondary bacterial infection: otitis media, sinusitis, bronchitis, pneumonia
  - asthma/COPD exacerbation

Differential Diagnosis
- allergic rhinitis, pharyngitis, influenza, laryngitis, croup, sinusitis, bacterial infections

Management
- patient education
  - symptoms peak at 1-3 d and usually subside within 1 wk
  - cough may persist for days to weeks after other symptoms disappear
  - no antibiotics indicated because of viral etiology
  - secondary bacterial infection can present within 3-10 d after onset of cold symptoms
- prevention
  - frequent hand washing, avoidance of hand to mucous membrane contact, use of surface disinfectant
  - yearly influenza vaccination

Influenza vs. Colds: A Guide to Symptoms

Features	Flu	Cold
Onset of illness	Sudden	Slow
Fever	High fever	None
Exhaustion level	Severe	Mild
Cough	Dry severe or hacking	±
Throat	Fine	Sore
Nose	Dry and clear	Runny
Head	Achy	Headache-free
Appetite	Decreased	Normal
Muscles	Achy	Fine
Chills	Yes	No

Echinacea for Preventing and Treating the Common Cold
Cochrane DB Syst Rev 2014;2:CD000530
Purpose: To assess whether echinacea preparations are effective and safe for the prevention and treatment of the common cold.
Methods: Meta-analysis of RCTs comparing mono-preparations of echinacea with placebo. Primary efficacy outcome was number of individuals with at least one cold in prevention trials and duration of colds in treatment trials. Primary safety and acceptability outcome was number of participants dropping out due to adverse events.
Results: 24 double-blind trials with 4631 participants were included. No prevention study comparisons comparing echinacea and placebo found a statistically significant difference in terms of number of patients with at least one cold episode, though a relative risk reduction of 10% to 20% was identified. Of treatment trials reporting on duration of colds, only 1 study of 7 showed a significant effect favouring echinacea over placebo. No significant differences were found between echinacea and placebo groups in number of dropouts due to adverse events, though prevention trials showed a trend towards higher dropout numbers due to adverse events in treatment groups.
Conclusions: Echinacea products have not been shown to provide benefits for treating colds, although it is possible there is a weak benefit from some echinacea products. Individual prophylaxis trials consistently show positive (if non-significant) trends, although potential effects are of questionable clinical relevance.

- symptomatic relief
  - rest, hydration, gargling warm salt water, steam, nasal irrigation (spray/pot)
  - analgesics and antipyretics: acetaminophen, ASA (contraindicated in children because risk of Reye's syndrome), ibuprofen
  - cough suppression: dextromethorphan or codeine if necessary (children <6 yr of age should not use any cough/cold medications)
  - decongestants, antihistamines
- patients with asthma will require increased use of bronchodilators and inhaled steroids

Concussion/Mild Traumatic Brain Injury

- see Neurosurgery, NS37 and Emergency Medicine, ER9
- a useful tool for the assessment of individuals and athletes with concussion is the Sport Concussion Assessment Tool, 5th edition (SCAT5), Br J Sports Med 2017;0:1-8
- Parachute Canada concussion guidelines including return to play/return to sports: https://parachute.ca/en/injury-topic/concussion/

Contraception

- see Gynaecology, GY15

Emergency Contraception

- hormonal emergency contraception (EC) (Yuzpe® or Plan B®, usually 2 doses taken 12 h apart) or post-coital copper IUD (intrauterine device) insertion
- hormonal EC is effective if taken within 72 h of unprotected intercourse (reduces chance of pregnancy by 75-85%), most effective if taken within 24 h, does not affect an established pregnancy
- copper IUDs inserted within 5 d of unprotected intercourse are significantly more effective than hormonal EC (reduces chance of pregnancy by ~99%)
- pregnancy test should be performed if no menstrual bleeding within 21 d of either treatment
- advance provision of hormonal EC increases the use of EC without decreasing the use of regular contraception
- pharmacists across Canada can dispense Plan B® OTC

Cough

History and Physical

- duration (chronic-8 wk), onset, frequency, quality (dry vs. productive), sputum characteristics, provoking/relieving factors, recent changes
- associated symptoms: fever, dyspnea, hemoptysis, wheezing, chest pain, orthopnea, PND, rhinitis, reflux, post-nasal drip
- constitutional symptoms: fever, chills, fatigue, night sweats
- risk factors: smoking, environmental allergies, occupation, exposure, family history of lung CA or other CA, TB status, recent travel
- medications (e.g. ACEI, β-blockers), allergies
- PMH: lung (asthma, COPD, CF), heart (HF, MI, arrhythmias), chronic illness, GI (reflux)
- vitals including O_2 saturation, respiratory exam, HEENT, and precordial exam

Investigations

- guided by findings on history and physical
  - consider throat swab, CXR, PFTs, upper GI series, sputum culture test for acid-fast bacilli (if TB is suspected)

Differential Diagnosis
Common Causes
- Upper airway cough syndrome (post-nasal drip)
- Asthma/COPD
- GERD
- Non-asthmatic eosinophilic bronchitis
- Other Causes
- ACEI
- Aspiration
- Bronchiectasis
- Cystic fibrosis
- Chronic interstitial lung disease
- CHF
- Lung/laryngeal cancer
- Pertussis
- Psychogenic
- Restrictive lung disease
- TB, atypical mycobacterium, and other chronic lung infections

Dementia (Major Neurocognitive Disorder)

- see Psychiatry, PS24

Epidemiology
- 15% of Canadians ≥65 yr are living with dementia; risk for dementia doubles every 5 yr after age 65
- prevalence of depression in dementia is 20-60%; major depression decreases as dementia severity increases; vascular and mixed dementias have a higher prevalence of depression
- leading types of dementia: Alzheimer's (40-50%), Mixed (20-25%), Lewy-Body (5-15%), Vascular (5-10%), Frontotemporal (5-10%)

Investigations
- history, physical exam, MMSE (limited accuracy), MOCA (best screening test), Dementia Quick Screen (see sidebar)
- investigations are completed to exclude reversible causes of dementia and should be selected based on the clinical circumstances
- CBC, liver enzymes, TSH, renal function tests, serum electrolytes, serum calcium, serum glucose, vitamin B_{12}, folate, VDRL, HIV, head CT

Management
- treat and prevent reversible causes
- provide orientation cues (e.g. calendars, clocks) and optimize vision and hearing
- family education, counselling, and support (alternative levels of care)
- pharmacologic therapy: N-methyl-d-aspartate receptor antagonists and cholinesterase inhibitors slow rate of cognitive decline; low-dose antipsychotics and antidepressants can be used to treat behavioural and emotional symptoms
- 20% of patients develop clinical depression, most commonly seen in vascular dementia

Dementia Quick Screen = Mini Cog + Animal Naming
- 3 simple tests, takes about 2 min
- Use when suspect mild cognitive impairment or when patient is at high-risk
- Mini Cog = 3 words recalled + clock drawing
  - Clock Drawing – including numbers and hands so time shows 10 min past 11 (normal = correct number/ hand placing or only minor spacing problems)
  - 0 word recall = impairment
  - 1-2 words and clock drawing abnormal = impairment
  - 3 words recalled = normal
  - Naming animals in 1 min (normal = >15 in one min)
- Interpretation: If all 3 results within normal range, cognitive impairment unlikely
- Return for further evaluation if:
  - <15 animals named
  - 0-1 words recalled
  - Clock drawing abnormal

Depression

- see Psychiatry, PS12

Etiology
- often presents as non-specific complaints (e.g. sleep disturbance, chronic fatigue, pain); can be associated with triggers (e.g. major life events)
- depression is a clinical diagnosis and tests are done in order to rule out other causes of symptoms
- 2/3 of patients may not receive appropriate treatment for their depression
- early diagnosis and treatment improve outcomes

Screening Questions
- Canadian Task Force on Preventive Health Care (2013) recommends not routinely screening for depression
- if screening indicated, use the Patient Health Questionnaire-2 (PHQ-2)
  - "Over the past 2 wk, how often have you been bothered by any of the following problems":
    - little interest or pleasure in doing things?
    - feeling down, depressed, or hopeless
- the PHQ-2 is scored out of 6, with a score of 3 or more considered positive
  - those who screen positive should be evaluated with the PHQ-9 to determine whether they meet criteria for depression
- PHQ-9 tool is useful to diagnose and monitor depression; use Geriatric Depression Scale (GDS) for the geriatric population
- Screen all patients presenting with depression for suicidal ideation and behaviour. A positive screen should prompt additional questioning

Assessment
- risk factors: see Psychiatry, PS12
- personal or family history of depression
- medications and potential substance misuse concerns
- high-risk for suicide/homicide
  - fill out Form 1 (in Ontario): application by physician to hospitalize a patient against his/her will for psychiatric assessment (up to 72 h)
- functional impairment (e.g. work, relationships)
- at least 5 out of 9 criteria including at least one of anhedonia or depressed mood ≥2 wk for actual diagnosis to be met (see Memory Aid)
- validated depression rating scales: Beck's Depression Inventory, Zung's self-rating depression scale, Children's Depression Inventory, Geriatric Depression Scale, Personal Health Questionnaire Depression Scale (PHQ-9)
- routine medical workup (physical exam, CBC, TSH, ferritin, folate, B_{12}, electrolytes, urinalysis, glucose, etc.)

Must Ask About/Rule Out
- Suicidal/homicidal ideation
- Psychosis
- Substance use/misuse/withdrawal
- Anxiety
- Bipolar/manic/hypomanic episodes
- Bereavement
- Intimate partner violence
- Post-partum depression
- Organic cause

Differential Diagnosis
- Other psychiatric disorders (e.g. anxiety, personality, bipolar, adjustment disorder, schizoaffective, seasonal affective disorder, substance misuse/withdrawal)
- Cancer (50% of patients with tumours, especially of brain, lung, and pancreas, develop symptoms of depression before the diagnosis of cancer is made)
- Chronic fatigue syndrome
- Early dementia
- Endocrine (e.g. hyper/hypothyroidism, DM, adrenal disorders)
- Infections (mononucleosis)
- Liver failure, renal failure
- Medication side effects (β-blockers, benzodiazepines, glucocorticoids, interferon)
- Menopause
- Neurological (Parkinson's, MS)
- Vitamin deficiency (pernicious anemia, pellagra)

Treatment
- goal: full remission of symptoms and return to baseline psychosocial function
- phases of treatment
  - acute phase (8-12 wk): relieve symptoms and improve quality of life, counsel patients on risks (e.g. sexual side effects, discontinuation syndrome)
  - maintenance phase (6-12 mo after symptom resolution): prevent relapse/recurrence, must stress importance of continuing medication treatment for full duration to patients
- treatment options are pharmacotherapy, psychotherapy, or a combination of both
  - combination therapy is synergistic and most effective (see EBM in sidebar)
- treatment of youth (ages 10-21)
  - for mild depression, a period of active support and monitoring before initiating treatment is recommended
  - fluoxetine is first line among SSRIs (most evidence)
    - monitor closely for adverse effects such as suicidal ideation and behaviour
  - psychotherapy
    - CBT or IPT alone can be used for mild depression
    - psychotherapy plus medication is recommended for moderate to severe depression
  - treatment should continue for at least 6 mo
    - ongoing management should include assessment in key domains (school, home, social setting)
    - reassessment and referral is recommended if there is no improvement after 6-8 wk of treatment
    - consider referral for adolescents with moderate/severe depression and coexisting psychosis and/or substance misuse

Table 11. Common Medications

Class	Examples	Action	Side Effects	Notes
SSRI	paroxetine (Paxil®) fluoxetine (Prozac®) sertraline (Zoloft®) citalopram (Celexa®) fluvoxamine (Luvox®) escitalopram (Cipralex®) vortioxetine (Trintellix®)	Block serotonin reuptake	Sexual dysfunction (impotence, decreased libido, delayed ejaculation, anorgasmia), headache, GI upset, weight loss, tremors, insomnia, fatigue, increase QT interval (baseline ECG is suggested)	First line therapy for youth is fluoxetine; paroxetine is not recommended for youth (controversial)
SNRI	venlafaxine (Effexor®) duloxetine (Cymbalta®) desvenlafazine (Pristiq®)	Block serotonin and norepinephrine reuptake	Insomnia, tremors, tachycardia, sweating	
SDRI	bupropion (Wellbutrin®)	Block dopamine and NE reuptake	Headache, insomnia, nightmares, seizures, less sexual dysfunction than SSRIs	Often chosen for lack of sexual side effects, can be used for augmentation of anti-depressant effects with other classes of medication
TCA	amitriptyline (Elavil®)	Block serotonin and NE reuptake	Sexual dysfunction, weight gain, tremors, tachycardia, sweating	Narrow therapeutic window, lethal in overdose

Prognosis
- up to 40% resolve spontaneously within 6-12 mo
- risks of recurrence: 50% after 1 episode; 70% after 2 episodes; 90% after 3 episodes

Criteria for Depression
(≥5/9 with at least one of anhedonia or depressed mood for ≥2 wk)

M-SIGECAPS
- **M** Depressed **M**ood
- **S** Increased/decreased **S**leep
- **I** Decreased **I**nterest
- **G** **G**uilt
- **E** Decreased **E**nergy
- **C** Decreased **C**oncentration
- **A** Increased/decreased **A**ppetite and weight
- **P** **P**sychomotor agitation/retardation
- **S** **S**uicidal ideation

Combined Pharmacotherapy and Psychological Treatment for Depression: A Systematic Review
Arch Gen Psychiatry 2004;61:714-719
Purpose: To examine the relationship between adherence and efficacy of antidepressant medications plus psychological treatment vs. medications alone in the management of depressive disorders.
Methods: Systematic review of RCTs comparing antidepressant medications alone vs. combination therapy with psychological intervention included. Efficacy and adherence to therapy were the main outcomes.
Results: 16 trials with 1842 patients were included. Patients receiving combination therapy showed significantly greater improvements than those receiving medications alone (OR) 1.86, 95% CI 1.38-2.52); dropout and non-responder proportions did not differ in distribution between the two groups (OR 0.86, 0.60-1.24). A significant advantage with combination therapy was noted in studies with follow-up longer than 12 wk (OR 2.21, 1.22-4.03), accompanied by significant reduction in dropout and non-responder proportions.
Conclusion: Combination therapy with psychological treatment and medication is associated with greater improvement rates than medication alone, and may decrease dropout rates with longer therapies.

Diabetes Mellitus

- see Endocrinology, E8
- see 2018 Clinical Practice Guidelines from Diabetes Canada, available from: http://guidelines.diabetes.ca/cpg
- see Diabetes Mellitus Patient Care Flow Sheet from Canadian Diabetes Association, available from: https://guidelines.diabetes.ca/docs/cpg/Appendix-3.pdf

Definition
- metabolic disorder characterized by the presence of hyperglycemia due to defective insulin secretion, defective insulin action, or both

Classification and Diagnosis
- see Endocrinology, E9

Epidemiology
- major health concern, affecting up to 10% of Canadians
- incidence of T2DM is rising due to increasing obesity, sedentary lifestyle, and age of the population
- leading cause of new-onset blindness and renal dysfunction
- Canadian adults with DM are twice as likely to die prematurely compared to persons without DM
- 1 in 5 Indigenous people in Canada has diabetes

DM Related Symptoms
- **Hyperglycemia**: polyphagia, polydipsia, polyuria, weight change, blurry vision, yeast infections
- **Diabetic Ketoacidosis (DKA):** fruity breath, anorexia, N/V, fatigue, abdominal pain, Kussmaul breathing, dehydration
- **Hypoglycemia**: hunger, anxiety, tremors, palpitations, sweating, headache, fatigue, confusion, seizures, coma

Long-Term Complications of DM
- **Microvascular**: nephropathy, retinopathy, neuropathy
- **Macrovascular**: CAD, CVD, PVD

Risk Factors
- T1DM
  - personal or family history of autoimmune disease
- T2DM
  - first degree relative with DM
  - ages ≥40 yr
  - obesity (especially abdominal), HTN, hyperlipidemia, CAD, vascular disease
  - prior gestational diabetes mellitus, macrosomic baby (>4 kg)
  - PCOS
  - history of IGT or IFG
  - presence of complications associated with DM
  - presence of associated diseases: PCOS, acanthosis nigricans, psychiatric disorders, HIV
  - medications: glucocorticoids, atypical antipsychotics, HAART
- both
  - member of a high-risk population (e.g. Indigenous peoples, Hispanic, Asian, or African descent)

Screening
- T2DM
  - FBG or HbA1c in everyone ≥40 q3 yr, or at high-risk using the CANRISK calculator
  - more frequent and/or earlier testing if presence of ≥1 risk factor (see above)
- gestational diabetes mellitus (see Obstetrics, OB29)
  - all pregnant women between 24-28 wk gestation

A1C Interpretation
- advantages:
  - convenient (measure any time of day)
  - single sample
  - predicts microvascular complications
  - better predictor of CVD than FPG or 2hPG in a 75 g OGTT
  - slow day-to-day variability
  - reflects long-term glucose concentration
- disadvantages:
  - cost
  - misleading in various medical conditions (e.g. hemoglobinopathies, iron deficiency, hemolytic anemia, severe hepatic or renal disease)
  - altered by ethnicity and aging
  - standardized, validated assay required
  - not for diagnostic use in children and adolescents (as the sole diagnostic test), pregnant women as part of routine screening for gestational diabetes, those with cystic fibrosis, or those with suspected T1DM

Goals of Therapy
- see Endocrinology, E10 and Clinical Pearl (SMART Goals)

SMART
Diabetes Quick Reference Guide

A A1C: Optimal Glycemic Control (Usually <7%)
B BP: Optimal Blood Pressure Control (≤130/80)
C Cholesterol: LDL-C <2 if treating
D Drugs: Consider ACEI/ARB, Statin, and ASA
E Exercise/Eating
S Smoking Cessation

Assessment and Monitoring

Table 12. Assessment and Monitoring

	Initial Assessment	q2-4mo	Annually
History	Symptoms of hyperglycemia, ketoacidosis, hypoglycemia Past medical history Functional inquiry Family history Risk factors Medications Sexual function Lifestyle	DM-directed history Screen for awareness and frequency of hypoglycemia and DKA Glucose monitoring Use of insulin and oral agents Smoking cessation	DM-directed history Screen for awareness and frequency of hypoglycemia and DKA Glucose monitoring Use of insulin and oral agents Sexual function Lifestyle counselling Screen for depression
Physical Exam	General: height, weight, BMI, BP, WC Head and neck: fundoscopy, thyroid exam Cardiovascular exam: signs of PVD, pulses, bruits Abdominal exam (e.g. for organomegaly) Hand/foot/skin exam Neurological exam	Wt, BP, BMI, WC	Foot exam for sensation (using a 10 g monofilament), ulcers or infection Remainder of exam as per PHE
Investigations	FBG, HbA1c, fasting lipids, Cr, urine albumin:creatinine ratio Baseline ECG; repeat testing q2 yr for those at high-risk	HbA1c q3 mo FBG as needed	Fasting lipid profile Annual random urine ACR and Cr
Management	Nutritional and physical education Consider referral to DM education program if available Monitoring blood glucose: explain methods and frequency Medication counselling: oral hypoglycemic agents and/or insulin, method of administration, dosage adjustments Pneumococcal vaccination Ophthalmology consult T1DM within 5 yr T2DM at diagnosis	Assess progress towards long-term complications Adjust treatment plan if necessary	Calibrate home glucose monitor Arrange annual retinopathy screening Influenza vaccination annually

Calculate Total Insulin Required
T1DM: 0.5-0.7 units/kg/d
T2DM: 0.3 units/kg/d
More information on insulin prescription, available at:
1) https://guidelines.diabetes.ca/CDACPG/media/documents/hcp-resources/Insulin_Prescription_Fillable_EN_02_21.pdf
2) https://guidelines.diabetes.ca/docs/resources/in-hospital-management-clinical-order-set-fillable.pdf

Dietary Advice for Treatment of T2DM in Adults
Cochrane DB Syst Rev 2007;3:CD004097
Purpose: To assess the effects of type and frequency of different dietary advice strategies for adults with T2DM.
Methods: Systematic review of RCTs with follow-up of 6 mo or longer, where dietary advice was the main intervention.
Results: 36 RCTs with 1467 participants were included, all measuring weight and glycemic control measures, and some reporting mortality, blood pressure, serum cholesterol and triglycerides, maximal exercise capacity and compliance. No data was available for efficacy of dietary advice in terms of dietary changes. Adoption of regular exercise was found to promote HbA1c glycemic control in type 2 diabetic patients.
Conclusion: No high-quality data is available for the efficacy of dietary treatment of T2DM, though exercise has been shown to improve HbA1C at 6 and 12 mo follow-up in patients.

Nonpharmacologic Management

- diet
  - can reduce HbA1c by 1-2%
  - moderate weight loss (5%) improves glycemic control and CVD risk factors
  - all diabetics should see a registered dietician for nutrition counselling
  - decrease combined saturated fats and trans-fatty acids to <10% of calories
  - avoid simple sugars, choose low glycemic-index foods, ensure regularity in timing and spacing of meals
- physical activity and exercise
  - at least 150 min of aerobic exercise plus 2 sessions of resistance training per wk is recommended
  - encourage 30-45 min of moderate exercise 4-7 d/wk
  - promote cardiovascular fitness: increases insulin sensitivity, lowers BP, and improves lipid profile
  - if using insulin, may require alterations of diet, insulin regimen, injection sites, and self-monitoring

Self-Monitoring of Blood Glucose

- T1DM: 3 or more self-tests/d is associated with a 1% reduction in HbA1c
- T2DM: recommendations vary based on treatment regimen (e.g. insulin dependent requires more frequent monitoring – refer to 2020 Diabetes Canada Clinical Practice Guidelines)
- if FBG >14 mmol/L, perform ketone testing to rule out DKA
- if bedtime level is <7 mmol/L, have bedtime snack to reduce risk of nocturnal hypoglycemia

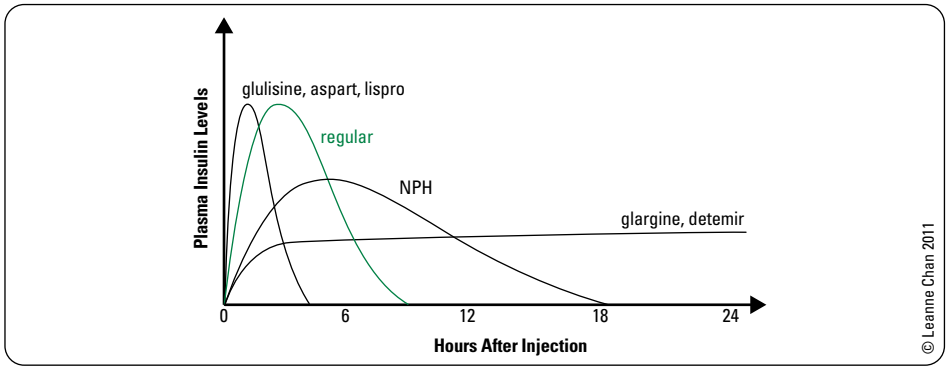

Figure 9. Types of insulin preparation

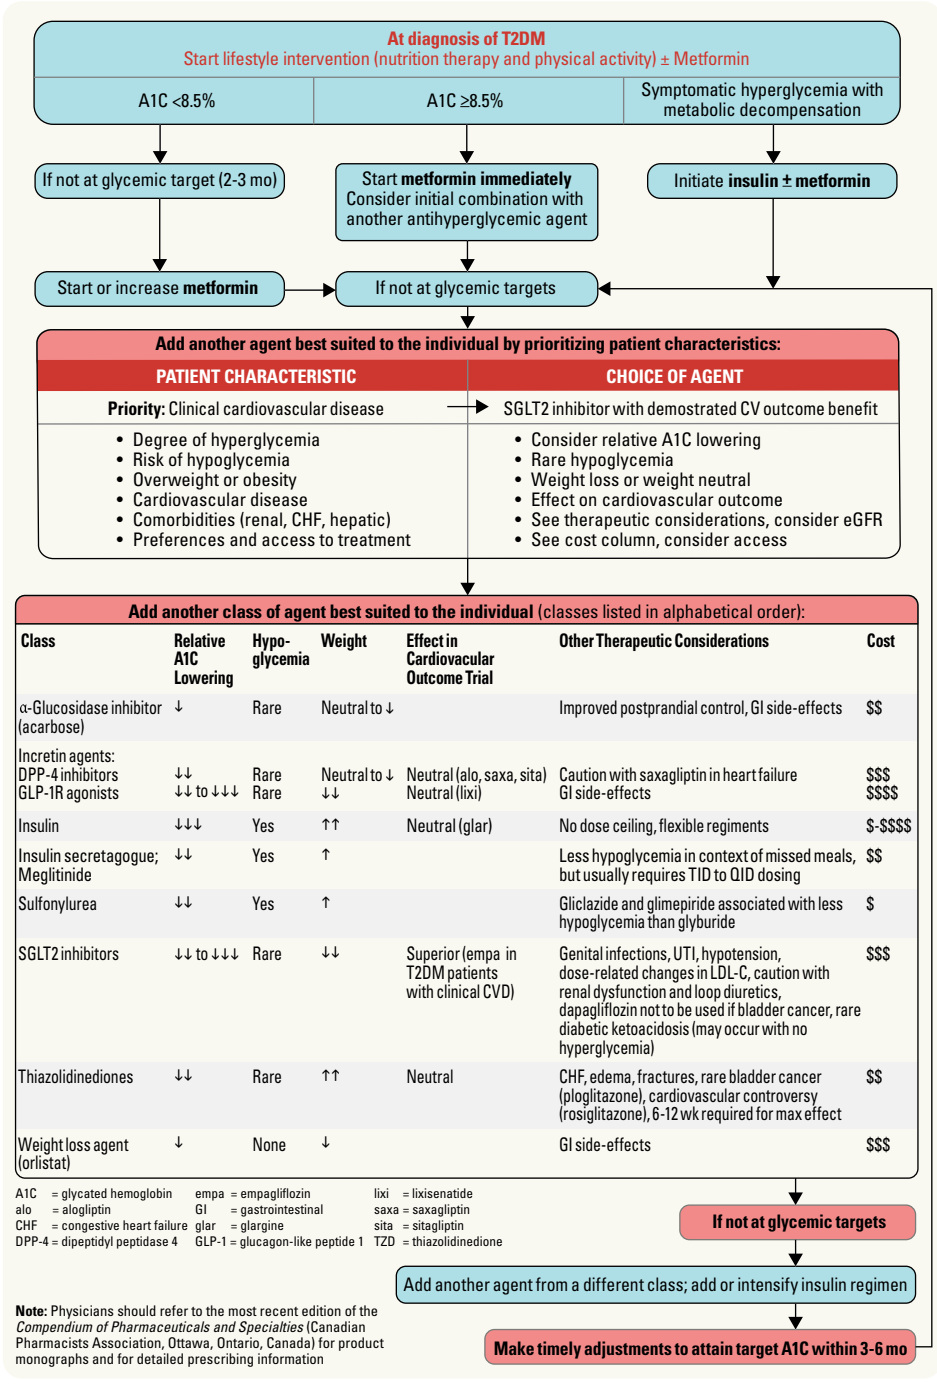

Figure 10. Management of hyperglycemia in T2DM
With permission of: Diabetes Canada Clinical Practice Guidelines Expert Committee. Diabetes Canada 2018 Clinical Practice Guidelines for the Prevention and Management of Diabetes in Canada. Can J Diabetes. 2018;42(Suppl 1):S1-S325.

Pharmacologic Agents (T2DM)

- oral
  - biguanide: metformin (Glucophage®)
  - thiazolidinedione: troglitazone (Rezulin®), rosiglitazone (Avandia®)
  - α-glucosidase inhibitor: acarbose (Precose®)
  - nonsulfonylureas: nateglinide (Starlix®), repaglinide (Gluconorm®)
  - sulfonylureas: glyburide (DiaBeta®), glimepiride (Amaryl®), gliclazide (Diamicron®)
  - DPP-4 inhibitor: sitagliptin (Januvia®), linagliptin (Trajenta)
  - SGLT2 inhibitors: canagliflozin (Invokana®), dapagliflozin (Farxiga®), empagliflozin (Jardiance®)
- injectable
  - GLP-1 analogue: liraglutide (Victoza®), semaglutide (Ozempic)

Other Medications Used in DM

- ACEI or ARB in those with any of:
  - clinical macrovascular disease
  - ages ≥55
  - ages <55 and microvascular complications
- statin in those with any of:
  - clinical macrovascular disease
  - ages ≥40
  - ages <40 and any of the following:
    - diabetes duration >15 yr and ages >30 yr
    - microvascular complications
    - other cardiovascular risk factors
- low dose ASA (81-325 mg)
  - for secondary prevention in people with established CVD (NOT to be used routinely for primary prevention)

Rosiglitazone Revisited: An Updated VertiMeta-Analysis of Risk for Myocardial Infarction and Cardiovascular Mortality
Arch Intern Med 2010;170:1191-1201
Purpose: To evaluate the effectiveness of rosiglitazone on myocardial infarctions (MIs) and mortality.
Methods: Systematic review of RCTs of rosiglitazone, lasting at least 24 wk in duration, and reporting cardiovascular (CV) adverse events. Main outcomes were MIs, CV-related mortality and all-cause mortality.
Results: Rosiglitazone significantly increased MI risk (odds ratio (OR) 1.28, 95% CI 1.02-1.63, P=0.04) but not CV mortality (OR 1.03, 0.78-1.36, P=0.86).
Conclusion: Rosiglitazone continues to demonstrate increased risk of MIs, though it is not associated with increased risk of CV or all-cause mortality.

Dizziness

- see Otolaryngology, OT6

Epidemiology

- 70% of affected patients see general practitioners initially; 4% are referred to specialists
- frequency is proportional to age; commonest complaint of ambulatory patients ages >75

Differential Diagnosis

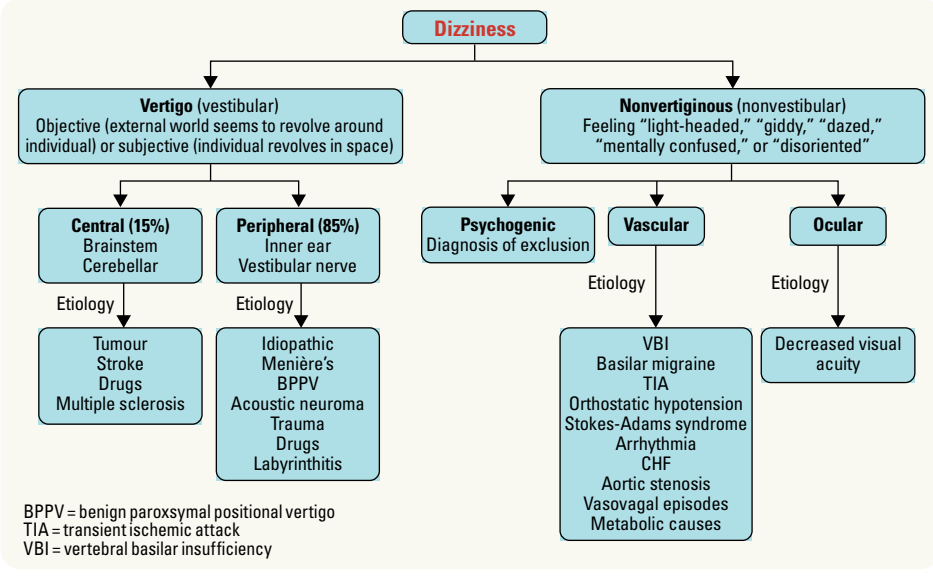

Figure 11. Differential diagnosis of dizziness

Differential Diagnosis of Vertigo

	BPPV	Labyrinthitis	Menière's	Acoustic Neuroma
Onset	Sudden	Sudden	Gradual	Insidious
Duration	Seconds	Days	Min-h	Chronic
Hearing Loss	–	+	+	+
Tinnitus	–	+	+	+
Neuro Sx	–	–	–	+

History

- clarify type of dizziness: vertigo, pre-syncope, disequilibrium, light-headedness
- duration
- exacerbations
  - worse with head movement or eye closure (vestibular)
  - no change with head movement and eye closure (nonvestibular)
  - worse with exercise (cardiac/pulmonary causes)
- associated symptoms
  - neurologic (central)
    - transient diplopia, dysphagia, dysarthria, ataxia (TIA, VBI, migraine)
    - persistent headache, alterations in level of consciousness, sensory and/or motor deficits (CNS)
  - audiologic (peripheral)
    - hearing loss, tinnitus, otalgia, aural fullness
  - others
    - N/V (peripheral vestibular disorders)
    - SOB, palpitations (hyperventilation, cardiac problem)

- general medical history
  - HTN, DM, heart disease, fainting spells, seizures, cerebrovascular disease, migraines
  - ototoxic drugs: aminoglycosides (gentamicin, streptomycin, tobramycin), erythromycin, ASA, antimalarials
  - hypotension (secondary to diuresis): furosemide, caffeine, alcohol
  - depression/anxiety: can present with light-headedness

Physical Exam/Investigations
- syncopal
  - cardiac (orthostatic changes in vitals), peripheral vascular, and neurologic exams
  - blood work, ECG, 24 h Holter, treadmill stress test, loop ECG, tilt table testing, carotid, vertebral doppler, and EEG
- vertiginous
  - ENT and neurologic exams (HINTS exam)
  - Dix-Hallpike, consider audiometry, and MRI if indicated
- non-syncopal, non-vertiginous
  - assess gait, vision, and test for neuropathy
  - cardiac and neurologic exams (cerebellar and cranial nerve function)
  - 3 min hyperventilation trial (patient is coached to hyperventilate until patient becomes dizzy to identify if symptoms are reproducible and confirm that hyperventilation is the etiology of the symptoms), ECG, EEG
  - Romberg test: test for disequilibrium (patient sways towards the side of vestibular dysfunction)

Dix-Hallpike Test
- Have the patient seated with legs extended and head at 45° rotation
- Rapidly shift patient to supine position with head fully supported in slight extension (for 45 s)
- Observe for rotatory nystagmus and ask about sensation of vertigo

Treatment
- guided by history, physical exam, and investigations
- include education, lifestyle modification, physical maneuvers (e.g. Epley or Carol Foster's technique for BPPV), symptomatic management (e.g. antiemetics), pharmacotherapy, and surgery
- refer when significant central disease is suspected, when vertigo of peripheral origin is persistent (lasting >2-4 wk), or if atypical presentation

Domestic Violence/Elder Abuse

INTIMATE PARTNER VIOLENCE

Definition
- includes physical, sexual, emotional, psychological, and financial abuse

Epidemiology
- lifetime prevalence of intimate partner violence against women is between 25-30%
- similar prevalence of intimate partner violence against men, who may be less likely to report due to social stigma
- women who experience abuse have increased rates of injury, death, and health consequences including 50-70% increase in gynaecological, central nervous system, and stress-related problems
- remember that men can also be victims of abuse
- occurs in all socioeconomic, educational, and cultural groups with increased incidence in pregnancy, disabled women, bisexuality, and 18-24 age group
- 25-50% chance of child abuse or neglect in families where partner abuse occurs; children exposed to violence in the home are more likely to experience or perpetrate violence later in life (Cycle of Violence)
- physician recognition rates as low as 5%

Presentation
- multiple visits with vague, ill-defined complaints such as: headaches, gastrointestinal symptoms, insomnia, chronic pain, hyperventilation
- may also present with injuries inconsistent with history

Management
- maintain a high index of suspicion
  - asking about abuse is the strongest predictor of disclosure
  - consider asking if patient feels safe at home or in their relationships; several screening tools (see sidebar) exist to identify victims of partner violence
  - make sure to determine the victim's level of immediate and long-term danger and ask if there are weapons in the house
- ensure patient safety
  - victim most at risk for homicide when attempting to leave home or following separation
  - safety planning includes ensuring that there is access to an exit in the home, establishing a safe place to go, and having emergency items prepared should the patient need to leave quickly (including money, clothes, keys, medications, and important documents)
- provide community resources
  - shelter or helpline number with legal advocacy and counselling services
  - involve social workers or domestic violence advocates

Screening Instruments for Domestic Violence

A) Woman Abuse Screening Tool (WAST)-SHORT

1. In general how would you describe your relationship?
   a. A lot of tension
   b. Some tension
   c. No tension
2. Do you and your partner work out arguments with . . .?
   a. Great difficulty
   b. Some difficulty
   c. No difficulty

Endorsing either question 1 ("a lot of tension") or question 2 ("great difficulty") makes intimate partner violence exposure likely

B) HITS

How often does your partner:
1. Physically hurt you?
2. Insult you?
3. Threaten you with harm?
4. Scream or curse at you?

Each question on HITS to be answered on a 5 point scale ranging from 1 (= never) to 5 (= frequently)
A total score of 10 or greater is significant

- appointment for follow-up to assess whether condition is better or worse
- reassure patient that she/he is not to blame and that the assault is a crime
- goal is to convey support
  - reporting suspected or known child abuse is mandatory
  - spousal abuse is a criminal act, but not reportable without the person's permission
- DOCUMENT all evidence of abuse-related visits for medico-legal purposes

ELDER ABUSE
- see Geriatric Medicine, GM5

Dyspepsia

- see Gastroenterology, G10

Definition and Clinical Features
- defined as epigastric pain or discomfort
- can be associated with fullness, belching, bloating, heartburn, food intolerance, N/V

Epidemiology
- annual incidence 1-2%, prevalence 20-40%

Etiology
- common: functional, PUD, GERD, gastritis
- others: cholelithiasis, irritable bowel syndrome, esophageal or gastric cancer, pancreatitis, pancreatic cancer, Zollinger-Ellison syndrome, and abdominal angina

History
- symptoms may not be useful in finding cause
- associated with eating, anorexia, N/V, alcohol, NSAID use
- red flags: vomiting, bleeding/anemia, abdominal mass, dysphagia (VBAD)

Investigations
- for new onset dyspepsia:
  - <60 yr without high-risk features, test for *H. pylori* using the urea breath test or serology
  - ≥60 yr should undergo upper endoscopy to rule out organic pathology

Management
- lifestyle modifications: decrease caffeine and alcohol intake, avoid citrus food, smaller and more frequent meals, avoid supine position right after meals, smoking cessation
- pharmacologic treatment
  - gastric acid suppression: H2 blockers, PPIs; both are effective for PUD and GERD
  - TCAs or prokinetics: e.g. metoclopramide; effective for functional dyspepsia
- *H. pylori* eradication
  - do not keep patients on PPI without at least 1 trial off the medication per year
  - (https://choosingwiselycanada.org/perspective/ppi-toolkit/)
- for non-responders, upper endoscopy should be considered. If endoscopy is negative, defined as functional dyspepsia

Dyspepsia Red Flags
- Weight loss
- Dysphagia
- Persistent vomiting
- GI bleeding (hematemesis, hematochezia, melena)
- Onset ages >50

***H. pylori* Eradication**
Bismuth Quadruple Therapy (PBMT) or Concomitant NonBismuth Quadruple Therapy (PAMC) for 14 days

PBMT:
1) PPI standard dose BID
2) Bismuth subsalicylate 524mg QID
3) Metronidazole 500mg QID
4) Tetracycline 500mg QID

PAMC:
1) PPI standard dose BID
2) Clarithromycin 500mg BID
3) Amoxicillin 1000mg BID
4) Metronidazole 500mg BID

Dyspnea

- see Respirology, R3 and Emergency Medicine, ER26

Definition
- uncomfortable, abnormal awareness of breathing, a subjective sensation of shortness of breath, or difficulty breathing
- when discussing dyspnea with patients, consider using language that is easy for patients to understand such as speaking about "feeling breathless" or "having trouble catching your breath"

History and Physical Exam
- history
  - associated symptoms (cough, sputum, hemoptysis, wheezing, chest pain, palpitations, dizziness, edema)
  - constitutional symptoms (night sweats, fever, weight loss)
  - history of asthma, allergies, eczema, ASA/NSAID sensitivity, nasal polyps
  - smoking, recreational drugs, medications
  - occupational exposure, environmental exposure (e.g. pets, allergens, smoke)
  - travel and birth place (considering areas with increased prevalence of tuberculosis)
  - family history of atopy
  - previous CXR or PFTs
- physical exam: vitals, respiratory, precordial, HEENT, signs of anemia/liver failure/heart failure

Differential Diagnosis of Dyspnea
Pulmonary
- COPD
- Asthma
- Restrictive lung disease
- Pneumothorax
- Congenital lung disease
- PE
- Malignancy

Cardiac
- HF
- CAD
- MI (recent or past) cardiomyopathy
- Valvular dysfunction
- Pericarditis
- Arrhythmia
- Hypertrophy

Mixed/Other
- Deconditioning
- Trauma
- Pain
- Neuromuscular
- Metabolic condition
- Anemia
- Functional: anxiety, panic attack, hyperventilation

Investigations
- CXR, ECG
- PFTs, ABG acutely if indicated

Management
- dependent on cause
- send to ED if in severe respiratory distress

Dysuria

- see Urology, U10

Definition
- the sensation of pain, burning, or discomfort when urinating

Epidemiology
- more common in women than men
- approximately 25% of women report one episode of acute dysuria per yr
- most common in women ages 25-54 and in those who are sexually active
- in men, prevalence of dysuria increases with age

Etiology
- infectious
  - most common cause
  - presents as cystitis, urethritis, pyelonephritis, vaginitis, cervicitis, epididymo-orchitis, or prostatitis
- non-infectious
  - hormonal conditions (hypoestrogenism), obstruction (BPH, urethral strictures), allergic reactions, radiation, drugs/chemicals, foreign bodies, trauma, neoplasm, kidney stones, inflammatory diseases, endometriosis, psychogenic

Table 13. Etiology, Signs, and Symptoms of Common Causes of Dysuria

Infection	Etiology	Signs and Symptoms
UTI/Cystitis	KEEPS bacteria (*Klebsiella, E. coli, Enterobacter, Proteus mirabilis, Pseudomonas, S. saprophyticus*)	Internal dysuria throughout micturition, frequency, urgency, incontinence, hematuria, nocturia, back pain, suprapubic discomfort, low grade fever (rare)
Urethritis	*C. trachomatis, N. gonorrhoeae, Trichomonas, Candida*, herpes	Initial dysuria, urethral/vaginal discharge, history of STI
Vaginitis	*Candida, Gardnerella, Trichomonas, C. trachomatis,* atrophic, herpes, lichen sclerosis	External dysuria/pain, vaginal discharge, irritation, dyspareunia, abnormal vaginal bleeding
Prostatitis	*E. coli, C. trachomatis, S. saprophyticus, Proteus mirabilis, Enterobacter, Klebsiella, Pseudomonas*	Dysuria, fever, chills, urgency, frequency, tender prostate, rectal pain
Pyelonephritis	*E. coli, S. saprophyticus, Proteus mirabilis, Enterobacter, Klebsiella, Pseudomonas*	Internal dysuria, fever, chills, flank pain radiating to groin, CVA tenderness, N/V

Investigations
- if history and physical are consistent with an uncomplicated UTI, treat empirically with no further investigations
- urinalysis/dipstick: positive for nitrites and leukocytes
- urine R&M: pyuria, bacteriuria, hematuria
- urine C&S
- CBC and differential if suspecting pyelonephritis
- if vaginal/urethral discharge present: wet mount, Gram stain, KOH test, vaginal pH, culture for yeast and trichomonas, endocervical/urethral swab or urine PCR for *N. gonorrhoeae* and *C. trachomatis*
- radiologic studies and other diagnostic tests if atypical presentation
- see Paediatrics, P69 for UTI

Management
- hospitalize if septic or critically ill, and consider hospitalization if persistently high fever, persistent pain, severe weakness, or inability to maintain hydration or tolerate oral feeds
- first-line treatment of uncomplicated UTI is TMP/SMX (cotrimoxazole) 160/800mg BID x 3 d or nitrofurantoin 100 mg BID x 5 d
- UTI/cystitis
  - pregnant women with bacteriuria (2-7%) must be treated (first line: amoxicillin, nitrofurantoin, cephalexin) even if asymptomatic due to increased risk of pyelonephritis, preterm labour, low birth weight, and perinatal mortality. Need to follow with monthly urine cultures and repeat if still infected
  - patients with recurrent UTIs (>3/yr) should be considered for prophylactic antibiotics
  - if complicated UTI, patients require longer courses of broader spectrum antibiotics

UTI Clinical Decision Aid
Arch Intern Med 2007;67:2201-2206
- Dysuria
- +Leukocytes (on urine dipstick)
- +Nitrites (on urine dipstick)

If 2 or more criteria met, then treat without culture, otherwise culture required prior to treatment.

Risk Factors for Complicated UTI
- Male
- Pregnancy
- Recent urinary tract instrumentation
- Functional or anatomic abnormality of the urinary tract
- Chronic renal disease
- DM
- Immunosuppression
- Indwelling catheter

Cranberries for Preventing Urinary Tract Infections
Cochrane DB Syst Rev 2012;10:CD001321
Purpose: To assess the effectiveness of cranberry products in preventing UTIs in susceptible populations.
Methods: All randomised controlled trials (RCTs) or quasi-RCTs of cranberry products for the prevention of UTIs were assessed and a meta-analysis of 24 RCTs (n=4473) conducted.
Results: Cranberry products did not significantly reduce the incidence of symptomatic UTIs at 12 mo (RR 0.86, 95% CI 0.71-1.04) compared with placebo/control.
Conclusion: Cranberry products do not have a significant benefit in the prevention of symptomatic UTIs over a 12 mo period.

Prevention of UTIs
- Maintain good hydration
- Avoid feminine hygiene sprays and scented douches
- Empty bladder immediately before and after intercourse
- Vaginal estrogen therapy for peri- and post-menopausal women with recurrent UTIs

- urethritis
  - positive swab or PCR for chlamydia or gonorrhea must be reported to Public Health
  - all patients should return 4-7 d after completion of therapy for clinical evaluation

Epistaxis

- see Otolaryngology, OT27

Erectile Dysfunction

- see Urology, U33

Definition

- >3 mo of consistent or recurrent inability to attain and/or maintain sufficient penile erection for sexual performance

Epidemiology

- ~20% of men age 40; ~50% of men age 70

Etiology

- organic: vascular (90%) (arterial insufficiency, atherosclerosis), endocrine (low testosterone, DM), anatomic (structural abnormality, e.g. Peyronie's), neurologic (postoperative, DM), medications (clonidine, antihypertensives, psychotropics)
- psychogenic (10%)

Table 14. Differentiation Between Organic and Psychogenic ED

Characteristic	Organic	Psychogenic
Onset	Gradual	Acute
Circumstances	Global	Situational
Course	Constant	Varying
Non-Coital Erection	Poor	Rigid
Morning Erection	Absent	Present
Psychosexual Problem	Secondary	Long history
Partner Problem	Secondary	At onset
Anxiety and Fear	Secondary	Primary

Walsh PC, Campbell MF, Retik AB. Campbell's Urology, 8th ed. W.B. Saunders, 2002.Table 46-4

History

- comprehensive sexual, medical, and psychosocial history
  - review medication and substance use
- time course
  - last satisfactory erection
  - gradual or sudden onset
  - attempts at sexual activity
- quantify
  - presence of morning or night time erections
  - stiffness (scale of 1-10)
  - ability to initiate and maintain an erection with sexual stimulation
  - erection stiffness during sex (scale of 1-10)
- qualify
  - partner or situation specific
  - loss of erection before penetration or climax
  - degree of concentration required to maintain an erection
  - percentage of sexual attempts satisfactory to patient and/or their partner
  - significant bends in penis or pain with erection
  - difficulty with specific positions
  - impact on quality of life and relationship

Investigations

- hypothalamic-pituitary-gonadal axis evaluation: testosterone (free + total), prolactin, LH
- risk factor evaluation: fasting glucose, HbA1c, lipid profile
- others: TSH, CBC, urinalysis
- specialized testing
  - psychological and/or psychiatric consultation
  - in-depth psychosexual and relationship evaluation
  - nocturnal penile tumescence and rigidity (NPTR) assessment
  - vascular diagnostics (e.g. doppler studies, angiography)

Differential Diagnosis of Erectile Dysfunction

PENIS
Psychogenic
Endocrine (T2DM, testosterone)
Neurogenic (T2DM, postoperative)
Insufficiency of blood (atherosclerosis)
Substances

The Effect of Lifestyle Modification and Cardiovascular Risk Factor Reduction on Erectile Dysfunction
Arch Intern Med 2011;171:1797-1803
Purpose: To evaluate the effectiveness of lifestyle interventions and pharmacotherapy for cardiovascular (CV) risk factors on severity of erectile dysfunction (ED).
Methods: Meta-analysis of RCTs with a follow-up of a minimum of 6 wk, evaluating lifestyle intervention vs. pharmacotherapy for CV risk factor reduction. Main outcome measure was weighted mean differences in the International Index of Erectile Dysfunction (IIEF-5) score.
Results: 6 RCTs with a total of 740 participants were included. Lifestyle modifications and pharmacotherapy for CV risk factor reduction were both associated with significant improvements in sexual function based on IIEF-5 scores (weighted mean difference (WMD) 2.66, 95% CI 1.86-3.47). Excluding statin trials, lifestyle modification interventions were associated with a statistically significant improvement in sexual function (WMD 2.40, 1.19-3.61).
Conclusion: Lifestyle modifications and pharmacotherapy for CV risk reduction are effective in improving male sexual function.

Reasons for Referral to Urology
- Significant penile anatomic disease
- Younger patient with a history of pelvic or perineal trauma
- Cases requiring vascular or neuro-surgical intervention
- Complicated endocrinopathies
- Complicated psychiatric or psychosocial problems
- Patient or physician desire for further evaluation

Management

Table 15. Management of Erectile Dysfunction

Nonpharmacologic	Pharmacologic	Surgical
Lifestyle changes (alcohol, smoking, exercise) Relationship/sexual counselling Vacuum devices	Oral agents Suppository Male urethral suppository for erection (MUSE) Injections	Implants Vascular repair Realignment

- pharmacologic treatment
  - phosphodiesterase type 5 inhibitors
  - serotonin antagonist and reuptake inhibitor (e.g. trazodone)
  - testosterone (currently only indicated in patients presenting with hypogonadism and testosterone deficiency (note: breast/prostate cancer are absolute contraindications))
  - α-adrenergic blockers (e.g. yohimbine); currently limited data for use in erectile dysfunction

Table 16. Phosphodiesterase Type 5 Inhibitors

Examples	Dosing (1 dose/d)	Specifics	Side Effects	Contraindications
sildenafil (Viagra®)	25-100 mg/dose	Take 0.5-4 h prior to intercourse May last 24 h	Flushing, headache, indigestion	Not to be used in patients taking nitrates
tadalafil (Cialis®)	5-20 mg/dose	Effects may last 36 h	As above	As above
vardenafil (Levitra®)	2.5-20 mg/dose	Take 1 h prior to intercourse	As above	As above

Fatigue

Definition

- can describe difficulty or inability to initiate activity, maintain activity, or difficulty with concentration/memory
- presentation may vary and the patient's specific complaint should be clarified, e.g. excessive sleepiness, muscle weakness, decreased exercise tolerance, mood concerns

Epidemiology

- 25% of office visits to family physicians
  - peaks in ages 20-40
  - F:M=3-4:1
- 50% have associated psychological complaints/problems, especially if <6 mo duration

Differential Diagnosis

Table 17. Differential Diagnosis of Fatigue: PS VINDICATE

P	**Psychogenic**	**Depression, life stresses**, anxiety disorder, chronic fatigue syndrome, fibromyalgia
	Physiologic	Pregnancy, caregiving demands (young children, elderly)
S	Sleep disturbance	**Obstructive sleep apnea**, **sleep disorder**, poor sleep hygiene, BPH, shift work, pain
	Sedentary	Unhealthy/sedentary lifestyle
V	**Vascular**	Stroke
I	**Infectious**	Viral (e.g. mononucleosis, hepatitis, HIV), bacterial (e.g. TB), fungal, parasitic
N	Neoplastic	Any malignancy
	Nutrition	**Anemia** (Fe^{2+} deficiency, B12 deficiency)
	Neurogenic	Myasthenia gravis, multiple sclerosis, Parkinson's disease
D	**Drugs**	β-blockers, antihistamines, anticholinergics, benzodiazepines, antiepileptics, antidepressants
I	Idiopathic	
C	Chronic illnesses	HF, lung diseases (e.g. COPD, sarcoidosis), renal failure, chronic liver disease
A	Autoimmune	SLE, RA, mixed connective tissue disease, polymyalgia rheumatica
T	Toxin	**Substance misuse** (e.g. alcohol), heavy metal
E	Endocrine	**Hypothyroidism, DM**, Cushing's syndrome, adrenal insufficiency, pregnancy

Common causes are in **bold**

Investigations
- psychosocial causes are common, so usually minimal investigation is warranted
- physical causes of fatigue usually have associated symptoms/signs that can be elicited from a focused history and physical exam
- investigations are guided by history and physical exam and may include:
  - CBC and differential, electrolytes, BUN, Cr, ESR, glucose, TSH, ferritin, vitamin B_{12}, serum protein electrophoresis, Bence-Jones protein, albumin, AST, ALT, ALP, bilirubin, calcium, phosphate, ANA, β-hCG
  - urinalysis, CXR, ECG
  - additional tests: serologies (Lyme disease, hepatitis B and C screen, HIV, ANA) and Mantoux skin tests

Treatment
- treat underlying cause
- if etiology cannot be identified (1/3 of patients)
  - reassurance and follow-up, especially with fatigue of psychogenic etiology
  - supportive counselling, behavioural, or group therapy
  - encourage patient to stay physically active to maximize function, and consider using motivational interviewing techniques to create person-centred approaches
  - review all medications, OTC, and herbal remedies for drug-drug interactions and side effects
  - prognosis: after 1 yr, 40% are no longer fatigued

CHRONIC FATIGUE SYNDROME

Diagnosis (IOM, 2015)
- diagnosis requires the following three symptoms:
  1. a substantial reduction or impairment in the ability to engage in pre-illness levels of activity that is:
     - lasting >6 mo
     - accompanied by fatigue of new onset, not alleviated by rest, and not caused by excessive exertion
  2. post-exertional malaise*
     - worsening of symptoms after physical, mental or emotional exertion that would not have caused a problem before the illness
  3. unrefreshing sleep*
     - even after a full night of sleep despite the absence of specific objective sleep alterations
  - at least one of the two following manifestations is also required:
     - cognitive impairment*
     - orthostatic intolerance

*The frequency and severity of these symptoms need to be evaluated

Epidemiology
- F>M, more common in white individuals than other groups, majority in their 30s
- found in <5% of patients presenting with fatigue

Etiology
- unknown, likely multifactorial
- may include infectious agents, immunological factors, neurohormonal factors, and/or nutritional deficiency

Investigations
- no specific diagnostic laboratory tests

Treatment
- promote sleep hygiene
- provide support and reassurance that most patients improve over time
- non-pharmacological
  - regular physical activity, optimal diet, psychotherapy, family therapy, support groups
  - consider using motivational interviewing techniques to create person-centred approaches
- pharmacological
  - to relieve symptoms: e.g. antidepressants, anxiolytics, NSAIDs, antimicrobials (if indicated based on investigations), anti-allergy therapy, antihypotensive therapy

Exercise Therapy for Chronic Fatigue
Cochrane DB Syst Rev 2019;10:CD003200
Purpose: To determine the effects of exercise therapy for adults with chronic fatigue syndrome (CFS) compared with any other intervention or control.
Methods: Meta-analysis of RCTs involving adults with CFS as a primary diagnosis who were able to participate in exercise therapy. Studies compared exercise therapy to passive control, psychological therapies, adaptive pacing therapy, or pharmacological therapy.
Results: Eight RCTs with 1518 participants were included. Exercise therapy lasted 12 to 26 wks. Moderate-quality evidence showed exercise therapy was more effective in reducing fatigue vs. passive or no treatment, and was also associated with a positive effect on daily physical functioning and sleep. It also slightly improved physical functioning, depression, and sleep compared to adaptive pacing.
Conclusion: Exercise therapy may have a positive effect on fatigue in adults with CFS compared to usual care or passive therapies.

Fever

- see Paediatrics, P58

Definition
- oral temperature >37.2°C (AM), 37.7°C (PM)
- fever in children <2 yr must be a rectal temperature for accuracy
- TM not accurate for measurement until child is >5 yr

Table 18. Differential Diagnosis of Fever

Infection	Cancer	Medications		Other
Bacterial	Leukemia	Allopurinol	Nifedipine	Inflammatory Bowel
Viral	Lymphoma	Captopril	Phenytoin	Disease
TB	Other Malignancies	Cimetidine	Diuretics	Collagen Vascular Disease
		Heparin	Barbiturates	DVT
		INH	Antihistamines	
		Meperidine		

History
- fever
  - peak temperature, type of thermometer, site of temperature measurement, duration
  - time of day
  - response to antipyretics
- systemic symptoms
  - weight loss, fatigue, rash, arthralgia, night sweats
- symptoms of possible source
  - URTI: cough, coryza, ear pain (consider influenza, COVID-19)
  - UTI/pyelonephritis: dysuria, foul-smelling urine, incontinence, frequency, hematuria, flank pain
  - pneumonia: cough, pleuritic chest pain
  - meningitis: headache, confusion, stiff neck, rash
  - osteomyelitis: bone pain
  - skin: purulent discharge
  - PID: discharge, dyspareunia, lower abdominal pain
  - gastroenteritis: abdominal pain, diarrhea, blood per rectum, vomit
  - medications
  - PE/DVT: swollen legs, pain in calf, SOB, pleuritic chest pain
  - history of cancer/family history of cancer
- infectious contacts
  - travel history, camping, daycare, contact with TB, foodborne, animals

Possible Investigations
- CBC and differential, blood culture, urine culture, urinalysis
  - viral swab including influenza, COVID-19
- stool O&P, Gram stain, culture
- CXR, Mantoux skin test, sputum culture
- lumbar puncture

Management
- increase fluid intake
- general: sponge bath, light clothing
- acetaminophen/ibuprofen as needed
- treat underlying cause

Headache

Definitions
- **primary headaches**
  - see Neurology, N46
    - primary headaches are the most common headaches seen in family medicine including tension headaches, migraines, and cluster headaches
    - secondary causes should be ruled out prior to diagnosing a patient with a primary headache
- **secondary headaches**
  - caused by underlying organic disease
  - account for <10% of all headaches, may be life-threatening

Etiology of Secondary Headaches
- drug: drug withdrawal, medication overuse, drug side effect, and carbon monoxide
- infectious: meningitis, encephalitis, abscess
- vascular: aneurysm, stroke, subarachnoid hemorrhage, HTN, and temporal arteritis
- endocrine: thyroid disease, pheochromocytoma
- neoplastic: tumour
- trauma: TMJ injury, c-spine injury, head injury, subdural hematoma, and subarachnoid hemorrhage
- other: serious ophthalmological and otolaryngological causes

Investigations
- indicated only when red flags are present and may include:
  - CBC for suspected systemic or intracranial infection
  - ESR or CRP for suspected temporal arteritis
  - neuroimaging (CT or MRI) to rule out intracranial pathology
  - CSF analysis for suspected intracranial hemorrhage, infection

Acupuncture for Migraine Prophylaxis
Cochrane DB Syst Rev 2016:6:CD001218
Purpose: To investigate whether acupuncture is more effective than no prophylactic treatment, routine care only or sham acupuncture, and whether it is as effective as prophylactic pharmacological treatment, in terms of reducing headache frequency in adults with episodic migraine.
Methods: Meta-analysis of RCTs with a minimum of an 8 wk duration, comparing acupuncture intervention with a no-acupuncture control (no prophylaxis, routine care, sham, or pharmacological prophylaxis).
Results: 22 trials with 4985 participants were included. Acupuncture was associated with moderate headache frequency reduction compared to no acupuncture (standardized mean difference (SMD) -0.56, 95% CI -0.65 to -0.48), and a reduction of >50% in headache frequency for 41% and 17% of participants receiving acupuncture and no acupuncture, respectively (pooled risk ratio (RR) 2.40, 2.08 to 2.76; NNT 4, 3 to 6). Acupuncture showed a small but statistically significant reduction over sham both post-treatment (SMD -0.18, -0.28 to -0.08) and post-follow-up (SMD -0.19, -0.30 to -0.09), with 50%+ headache frequency reduction being achieved in 50% vs. 41% of those receiving acupuncture and sham, respectively (pooled RR 1.23, 1.11 to 1.36; NNT 11, 7 to 20); these numbers were 53% and 42%, respectively, post-follow-up (pooled RR 1.25, 1.13 to 1.39; NNT 10, 6 to 18). Number of participants dropping out and reporting adverse effects did not differ significantly between acupuncture and sham groups. Compared to pharmacological prophylaxis, a significant reduction in migraine frequency was noted with drugs (SMD -0.25, -0.39 to -0.10), but the significance was not maintained at follow-up. After 6 mo, headache frequency was halved in 59% of patients receiving acupuncture and 54% receiving prophylactic drugs (pooled RR 1.11, 0.97 to 1.26). Those receiving acupuncture were less likely to drop out due to adverse effects or to report adverse events than those receiving drugs.
Conclusion: Adding acupuncture to symptomatic treatment of attacks reduces frequency of headaches. Acupuncture is more effective than sham, and is similarly effective to pharmacological interventions for migraine prophylaxis.

Migraine Screen

POUND
Pulsatile quality
Over 4-72 h
Unilateral
Nausea and vomiting
Disabling intensity
If ≥4 present then a diagnosis is likely (+LR = 24)

Management
- based on underlying disorder
- analgesics may provide symptomatic relief
  - see Neurology, N46

Hearing Impairment

- see Otolaryngology, OT7

Definition
- hearing impairment: a raised hearing threshold measured as decibels of hearing loss relative to the normal population at specific frequencies
- hearing disability: hearing impairment that interferes with performing daily tasks

Epidemiology
- prevalence increases with age (6% of 35-44 yr, 43% of 65-84 yr)
- 90% of age-related hearing loss (presbycusis) is sensorineural
- hearing loss detectable by audiology is present in greater than 1/3 of people >65 yr

Classification
- conductive (external sound does not reach the middle ear)
- sensorineural involving the inner ear, cochlea, or auditory nerve
- mixed

Assessment
- infants: universal newborn hearing screening program
- elderly
- screening tests
  - whispered-voice test
    - examiner stands 0.6 metres (arm's length) behind the patient, whispers a combination of 6 letters/numbers, and asks the patient to repeat the sequence. Test 1 ear at a time while masking the non-test ear simultaneously
  - tuning fork test (to distinguish conductive from sensorineural hearing loss)
- diagnostic tests (formal audiologic assessment)
  - pure tone, air, and bone conduction testing
  - speech audiometry
  - impedance audiometry

Management
- counsel about noise control and hearing protection programs (grade A evidence)
  - treat patients with unexplained unilateral sensorineural hearing loss urgently with steroids
  - consider blood sugar, CBC and differential, TSH, syphilis testing for unexplained sensorineural hearing loss
  - consider a CT/MRI for patients with progressive asymmetric sensorineural hearing loss to exclude vestibular schwannoma (acoustic neuroma)
- refer patients who
  - have an unknown etiology to an ENT specialist
  - experience sudden sensorineural hearing loss to an ENT specialist for ongoing care
- treatment: hearing amplification (e.g. hearing aids), assistive listening devices, and cochlear implants can dramatically improve quality of life

Hypertension

Hypertension guidelines are reviewed and updated annually, for up-to-date recommendations, please see http://guidelines.hypertension.ca/

Definitions
- HTN
  - BP ≥140/90 mmHg (office Blood Pressure Measurement (OBPM)); ≥135/85 mmHg (ambulatory blood pressure monitoring (ABPM)/automated office blood pressure (AOBP)
- isolated systolic HTN
  - sBP ≥140 mmHg and dBP <90 mmHg
  - associated with progressive reduction in vascular compliance
  - usually begins in 5th decade
- hypertensive urgency
  - sBP >210 mmHg or dBP >120 mmHg with minimal or no target-organ damage

Headache Red Flags

SNOOP
Systemic symptoms of illness
- Fever
- Anticoagulation
- Pregnancy
- Cancer

Neurologic signs/symptoms
- Impaired mental status
- Neck stiffness
- Seizures
- Focal neurological deficits

Onset
- Sudden and severe
- New headache after age 50

Other associated conditions
- Following head trauma
- Awakens patient from sleep
- Jaw claudication
- Scalp tenderness
- Worse with exercise, sexual activity, or Valsalva

Prior headache history
- Different pattern
- Rapidly progressing in severity/ frequency

Does This Patient Have Hearing Impairment?
JAMA 2006;295:416-428
Purpose: To evaluate bedside clinical maneuvers used to evaluate the presence of hearing impairment.
Methods: Systematic review of original studies examining the accuracy or precision of screening questions and tests.
Results: 24 studies were included.
Conclusions: Elderly patients acknowledging a hearing impairment require audiometry, while those who indicate they do not have hearing impairment should be screened with a whispered-voice test. A normal whispered-voice test requires no further workup, and those unable to perceive the whisper require audiometry. Weber and Rinne tests are not suitable for general hearing impairment screening.

- Symptoms of HTN are usually not present (this is why it is called the "silent killer")
- Patients may have an occipital headache upon awakening or organ-specific complaints if advanced disease

Renovascular HTN Suspected if Patient Presenting with 2 or more of:
- Sudden onset or worsening of HTN and ages >55 or <30 yr
- Presence of abdominal bruit
- HTN resistant to 3 or more drugs
- Rise in Cr of 30% or more associated with use of an ACEI or ARB
- Other atherosclerotic vascular disease, particularly in patients who smoke or have dyslipidemia
- Recurrent pulmonary edema associated with hypertensive surges

- hypertensive emergency
  - severe HTN (dBP >120 mmHg) + acute target-organ damage
  - accelerated HTN
    - significant recent increase in BP over previous hypertensive levels associated with evidence of vascular damage on fundoscopy, but without papilledema
  - malignant HTN
    - sufficient elevation in BP to cause papilledema and other manifestations of vascular damage (retinal hemorrhages, bulging discs, mental status changes, increasing creatinine)
- white coat HTN
  - high clinic BP with normal home BP and 24 h ambulatory BP, caused by anxiety in clinic
- masked HTN
  - normal clinic BP with high BP in home and/or ambulatory setting, often provoked by anxiety, job stress, exercise

Epidemiology

- 22% of Canadian adults suffer from HTN (prevalence is 52% in the 60-70 age group)
- lifetime risk of developing HTN is approximately 90%
- 64% of Canadians who have HTN are treated and controlled, while 17% are unaware that they have HTN
- 3rd leading risk factor associated with death
  - risk factor for CAD, HF, cerebrovascular disease, renal failure, peripheral vascular disease

Suspect Hyperaldosteronism when

- HTN refractory to treatment with ≥3 drugs
- Spontaneous hypokalemia
- Profound diuretic-induced hypokalemia (<3.0 mmol/L)
- Incidental adrenal adenomas

Etiology

- essential HTN (90%, undetermined cause)
- secondary HTN (10%, known cause)

Hypertensive Emergencies

- **Malignant HTN**
- **Cerebrovascular**
  - Hypertensive encephalopathy
  - Stroke
  - Intracerebral hemorrhage
  - SAH
- **Cardiac**
  - Acute aortic dissection
  - Acute refractory LV failure
  - Myocardial infarction/ischemia
  - Acute pulmonary edema
- **Renal failure**

Predisposing Factors

- family history
- obesity (especially abdominal)
- alcohol consumption
- stress
- sedentary lifestyle
- smoking
- male
- ages >30
- excessive salt intake/fatty diet
- African American ancestry
- dyslipidemia

Table 19. Causes of Secondary HTN

	Common Cause		
Renal	Renovascular HTN Renal parenchymal disease, glomerulonephritis, pyelonephritis, polycystic kidney		
Endocrine	1º hyperaldosteronism Pheochromocytoma Cushing's syndrome Hyperthyroidism/hyperparathyroidism Hypercalcemia of any cause		
Vascular	Coarctation of the aorta Renal artery stenosis		
Other	Obstructive sleep apnea		
Drug-Induced	Estrogens/OCP MAOIs Cocaine	Steroids Lithium Amphetamines	NSAIDs Decongestants Alcohol

Investigations

- for all patients with HTN:
  - electrolytes, Cr, fasting glucose and/or HbA1c, lipid profile, 12-lead ECG, urinalysis
  - self-measurement of BP at home is encouraged (recommended devices listed at www.hypertension.ca)
- for specific patient etiology:
  - DM or chronic kidney disease: urinary protein excretion
  - if suspected renovascular HTN: renal ultrasound, captopril renal scan (if GFR >60 mL/min), MRA/CTA (if normal renal function)
  - if suspected endocrine cause: plasma aldosterone, plasma renin (aldosterone-to-renin ratio)
    - measured from morning samples taken from patients in sitting position after resting 15 min
    - discontinue aldosterone antagonists, ARBs, β-blockers, and clonidine prior to testing
  - if suspected pheochromocytoma: 24 h urine for metanephrines and creatinine
  - if suspected LV dysfunction: echocardiogram
  - if clinically indicated or with refractory hypertension: sleep study

Diagnosis

- all Canadian adults should have BP assessed at all appropriate clinical visits, oscillometric preferred to manual

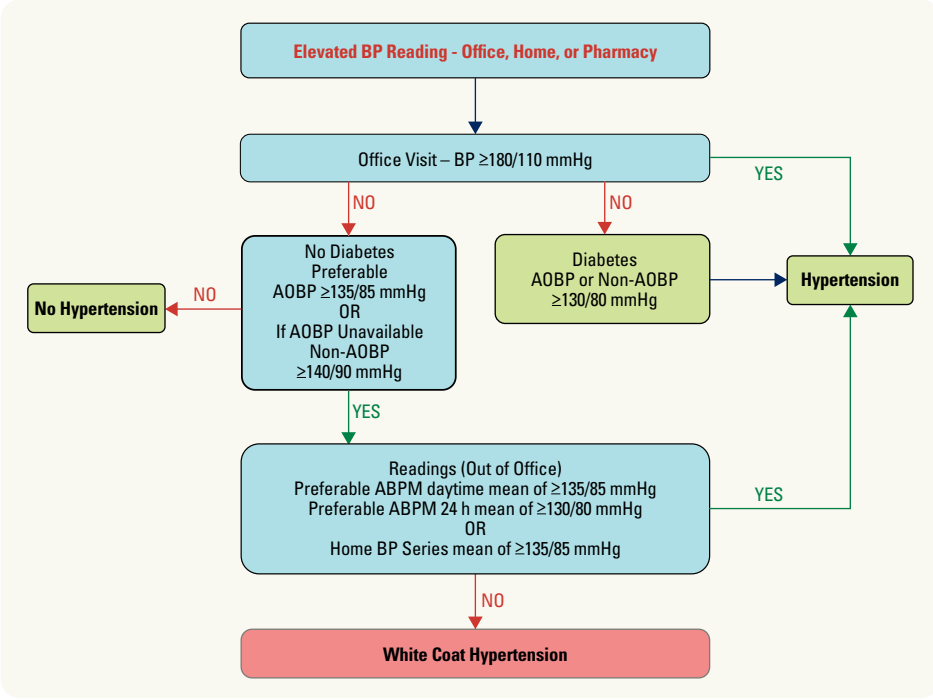

Figure 12. Diagnostic algorithm for hypertension in adults

Treatment

- treat to target BP: <140/90 mmHg, <130/80 mmHg if DM
- optimum management of HTN requires assessment of overall cardiac risk
- adherence to lifestyle modification and pharmacotherapy should be assessed at each visit
- single pill combinations should be used as first line treatment (regardless of the extent of BP elevation)
- lifestyle modification (in all HTN patients – may be sufficient treatment in patients with stage 1 HTN (140-159/90-99 mmHg))
  - diet
    - follow Canada's Guide to Healthy Eating (see *Nutrition*, FM7) and Dietary Approaches to Stop Hypertension (DASH)
    - limit daily salt intake to 5g (2000 mg of sodium)
    - potassium/magnesium/calcium supplementations are NOT recommended for HTN but an increase in dietary potassium may help
  - moderate intensity dynamic exercise: 30-60 min, 4-7x/wk; higher intensity exercise is not more effective
  - smoking cessation
  - low-risk alcohol consumption (see *Alcohol Use*, FM15)
  - work towards a healthy BMI (18.5-24.9 kg/m^2) and waist circumference (<102 cm for men, <88 cm for women)
  - individualized cognitive behavioural interventions for stress management
- pharmacological
  - indications for therapy (caution with elderly patients):
    - dBP ≥90 mmHg with target organ damage or independent cardiovascular risk factors
    - dBP ≥100 mmHg or sBP ≥160 mmHg without target organ damage or cardiovascular risk factors
    - sBP ≥140 with target organ damage
    - sBP >130 for high-risk populations (Framingham Risk >20%, ages >50)
  - first line antihypertensives (consider a single pill combination therapy)
  - combination therapy principles:
    - if there is an inadequate response to therapy, consider adding another first line antihypertensive
    - avoid combining a non-DHP CCB with a β-blocker or an ACEI with an ARB
    - monitor potassium and creatinine when administering an ACEI/ARB with a potassium sparing diuretic

Impact of Health Behaviour on Blood Pressure

Intervention	sBP (mmHg)	dBP (mmHg)
Diet and weight control	-6.0	-4.8
Reduced salt/ sodium intake	- 5.4	- 2.8
Reduced alcohol intake (heavy drinkers)	-3.4	-3.4
DASH diet	-11.4	-5.5
Physical activity	-3.1	-1.8
Relaxation therapies	-3.7	-3.5

CHEP (Canadian Hypertension Education Program) Guidelines 2014. Available from: http://www.hypertension.ca/en/chep

β-blocker
Not recommended as first line for patients of ages ≥60

ACEI
Not recommended as monotherapy in people of African descent

Table 20. Considerations in the Individualization of Pharmacological Therapy in Adults

Condition or Risk Factor	Recommended Drugs	Alternative Drugs	Not Recommended/Notes
Isolated Diastolic HTN with or without Systolic HTN	Monotherapy or single pill combination (SPC) Recommended monotherapy choices include thiazide/thiazide-like diuretics (with longer-acting diuretics preferred), β-blockers, ACEI, ARBs, or long-acting CCBs. Recommended SPC choices include combinations of an ACEI with CCB, ARB with CCB, or ACEI/ARB with a diuretic. (Consider ASA and statins in selected patients)	Combinations of first-line drugs	Not recommended for monotherapy: α-blockers, β-blocker in those ≥60 yr, ACEI in Black people Hypokalemia should be avoided in those prescribed diuretics. ACEI, ARBs and direct renin inhibitors are potential teratogens, and caution is required if prescribing to women with childbearing potential. Combination of an ACEI with an ARB is not recommended
Isolated Systolic HTN without other compelling indications	Thiazide diuretic, ARB, or long acting dihydropyridine CCB	Combinations of first-line drugs	Same as above
CAD	ACEI or ARB; β-blockers or CCB for patients with stable angina	When combination therapy for high-risk patients, ACEI/DHP CCB is preferred	Avoid short-acting nifedipine. Combination of an ACEI with an ARB is specifically not recommended. Exercise caution when lowering sBP to target if dBP is ≤60 mmHg, especially in patients with LVH
Recent MI	β-blocker and ACEI (ARB if cannot tolerate ACEI)	Long-acting CCB if β-blocker contraindicated or not effective	Non-dihydropyridine CCBs should not be used with concomitant heart failure
Left Ventricular Hypertrophy	ACEI, ARB, thiazide/thiazide-like diuretics, or long-acting CCB	Combination of additional agents	Hydralazine and minoxidil can increase LVH, thus not recommended
Cerebrovascular Disease (stroke/TIA)	ACEI and thiazide/thiazide-like diuretic combination	Combination of additional agents	Treatment of HTN should not be routinely undertaken in acute stroke unless extreme BP elevation. ACEI and ARB combination after a stroke is not recommended
Heart Failure	ACEI (ARB if ACEI intolerant) and β-blockers Aldosterone antagonists (mineralocorticoid receptor antagonists) may be added for patients with a recent cardiovascular hospitalization, acute myocardial infarction, elevated BNP or NT-proBNP level, or NYHA Class II to IV symptoms	ARB in addition to ACEI Hydralazine/isosorbide dinitrate combination if ARB or ACEI not tolerated/contraindicated Thiazide/thiazide-like or loop diuretics are recommended as additive therapy. DHP CCB can also be used A combined ARB/neprilysin inhibitor is recommended (in place of an ACEI or ARB) in symptomatic patients with HTN and HFrEF on standard guideline-based therapies	Titrate doses of ACEI and ARBs to those used in clinical trials Carefully monitor potassium and renal function if combining any of ACEI, ARB and/or aldosterone antagonist
Dyslipidemias	Does not affect initial treatment recommendations	Combination of additional agents	
DM with Albuminuria (ACR >2.0 mg/mmol renal disease, CVD or additional CV risk factors)	ACEI or ARB	Addition of a dihydropyridine CCB is preferred over a thiazide/thiazide-like diuretic	A loop diuretic could be considered in hypertensive chronic kidney disease patients with extracellular fluid volume overload
DM without Albuminuria (criteria listed above)	ACEI, ARB, DHP CCB, or thiazide/thiazide-like diuretics	Combination of first-line drugs If combination with ACEI is being considered, a dihydropyridine CCB is preferable to a thiazide/thiazide like diuretic	Normal urine microalbumin to creatinine ratio <2.0 mg/mmol
Non-Diabetic Chronic Kidney Disease with Proteinuria (urinary protein >500 mg/24 h or ACR >30 mg/mmol)	ACEI (ARB if ACEI intolerant), if there is proteinuria Diuretics as additive therapy	Combinations of additional agents	Patients on an ACEI or ARB should have careful monitoring of renal function and potassium. ACEI and ARB combinations are not recommended in patients without proteinuria
Renovascular Disease	Does not affect initial treatment recommendations Atherosclerotic renal artery stenosis should be primarily managed medically, while revascularization should be considered for renal fibromuscular dysplasia	Combinations of additional agents	Caution in using ACEI or ARB if bilateral renal artery stenosis or unilateral disease with solitary kidney Renal artery angioplasty and stenting could be considered for patients with renal artery stenosis and complicated, uncontrolled HTN

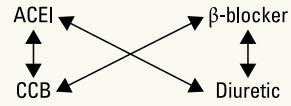
2020 Hypertension Highlights, Hypertension Canada. https://hypertension.ca/wp-content/uploads/2018/07/Hypertension-Guidelines-English-2018-Web.pdf

Calcium Channel Blockers

Dihydropyridine CCBs
- Amlodipine
- Nifedipine
- Felodipine

Non-dihydropyridine CCBs
- Diltiazem
- Verapamil

How to Combine Antihypertensive Medications (in general)



Systematic Review for 2017 ACC/AHA Guidelines for Prevention, Detection, Evaluation, and Management of High Blood Pressure in Adults
Hypertension 2018;71:e116-135

Purpose: Determine evidence for self-measured BP without other augmentation for clinical outcomes and BP control. Determine optimal target for BP lowering during antihypertensive therapy in adults. Determine benefits and harms of different classes of antihypertensive drugs.

Methods: Systematic review and meta-analysis using PubMed and EMBASE.

Results: There is a modest but significant improvement in sBP in RCTs of self-measured BP vs. usual care at 6 but not 12 mo; may be a helpful adjunct to routine office care. sBP lowering to a target of <130 mmHg may reduce risk of several important outcomes including MI, stroke, heart failure, and major CV events. No class of medications (ie, ACEI, ARBs, CCBs, or β-blockers) was significantly better than thiazides and thiazide-like diuretics as a first-line therapy for any outcome.

Conclusion: Self-measured BP is a useful adjunct in BP control. Target sBP <130.
Thiazides, CCBs, β-blockers, ARBs, ACEI are to be used as first-line therapy with patient factors guiding choice.

Table 21. Common Antihypertensive Medications in Pregnancy and Lactation

Pregnancy			Lactation
First line oral drugs	**Second line oral drugs**	**Medications to avoid**	**Oral drugs**
Labetalol Methyldopa Long-acting oral nifedipine Other β-blockers (acebutolol, metoprolol, pindolol, and propranolol)	Clonidine Hydralazine Thiazide diuretics	ACEIs* ARBs*	Labetalol Methyldopa Long-acting oral nifedipine Enalapril Captopril

* Fetotoxicity of renal system

Follow-Up
- assess and encourage adherence to pharmacological and non-pharmacological therapy at every visit
- lifestyle modification q3-6 mo
- pharmacological
  - follow-up q1-2 mo until BP under target for 2 consecutive visits, q3-6 mo once at target BP
  - follow-up frequently for patients with symptomatic/severe HTN, antihypertensive drug intolerance, target organ damage
- referral is indicated for cases of refractory HTN, suspected secondary causes, or worsening renal failure
- hospitalization is indicated for malignant HTN

Joint Pain

- see Rheumatology, RH3

Signs and Symptoms of Inflammatory Arthritis

WARM(S) Joints
Worse with rest, better with activity
Awakening in the latter half of the night
Redness around joint
Morning stiffness (>30 min)
Soft tissue swelling, erythema

History
- number of joints involved: monoarticular, oligoarticular, polyarticular
- inflammatory vs. non inflammatory
- pattern of joints involved: symmetrical vs. asymmetrical, large vs. small joints, axial skeleton
- onset: acute vs. chronic (>6 wk)
- morning stiffness (duration) vs. worse at end of day with activity
- PMHx
  - trauma, infection, medications (steroids, diuretics)
  - comorbidities: DM, renal insufficiency (gout), psoriatic arthritis, myeloma, osteoporosis, and OA
  - FHx of arthritis, autoimmune disease
- ROS: constitutional symptoms (neoplasm, septic arthropathy), myalgia, skin/eye/nail/hand changes, and GI/GU changes

Physical Exam
- vitals
- specific joint exams to affected areas
- systemic features (skin, nails, eyes, hands)

Investigations (Guided by the History and Physical Exam)
- general: CBC and differential, electrolytes, creatinine
- acute phase reactants: ESR, CRP
- complement (C3, C4)
- urinalysis to detect disease complications (proteinuria, active sediment)
- serology
  - antinuclear antibody (ANA)
  - anti-double stranded DNA (anti-dsDNA)
  - human leukocyte antigen B27 (HLA-B27)
  - anti-histidyl tRNA synthetase autoantibodies (anti-Jo1)
  - anti-smith (anti-Sm)
  - anti-La antibodies (anti-La)
  - anti-Sjögren's-syndrome-related antigen A (anti-SSA/Ro)
  - rheumatoid factor (RhF)
  - anti-cyclic citrullinated peptide (anti-CCP)
- synovial fluid analysis (cell count and differential, culture, Gram stain, microscopy)
- radiology (plain film, CT, MRI, U/S, bone densitometry, bone scan)

Systemic Features
- Fever (SLE, infection)
- Rash (SLE, psoriatic arthritis)
- Nail abnormalities (psoriatic, reactive arthritis)
- Uveitis (psoriatic, reactive arthritis, ankylosing spondylitis)
- Myalgias (fibromyalgia, myopathy)
- Weakness (polymyositis, neuropathy)
- GI symptoms (scleroderma, IBD)
- GU symptoms (reactive arthritis, gonococcemia)

Treatment
- tailor therapy depending on the specific cause
- non-pharmacological: patient education, lifestyle modification, assisted devices, physiotherapy, occupational therapy
- pharmacological: analgesia (acetaminophen, NSAIDs), anti-inflammatory (disease-modifying anti-rheumatic drugs (DMARDs), steroids), antibiotics
  - if osteoarthritis, consider steroid injections, hyaluronic acid injections

Low Back Pain

- see Orthopaedic Surgery, OR28
- https://cep.health/clinical-products/low-back-pain/

Definition
- acute: <6 wk
- subacute: 6-12 wk
- chronic: >12 wk

Epidemiology
- 5th most common reason for visiting a physician
- lifetime prevalence: 90%, peak prevalence: ages 45-60
- largest WSIB category and most common cause of chronic disability for individuals <45 y/o
- 90% resolve in 6 wk, <5% become chronic

Etiology
- source of pain can be local, radicular, referred, or related to a psychiatric illness
- 98% are mechanical causes (worse with movement, better with rest)
  - soft tissue: sprain (ligament), strain (muscle)
  - spine: facet joint/disc degeneration, disc herniation, spinal stenosis (e.g. spondylosis), spondylolisthesis, compression fracture
  - other: pregnancy
- 2% are non-mechanical causes
  - surgical emergencies
    - cauda equina syndrome (areflexia, lower extremity weakness, saddle anesthesia, fecal incontinence, urinary retention)
- abdominal aortic aneurysm (pulsatile abdominal mass)
  - medical conditions
- neoplastic: primary, metastatic, multiple myeloma
- infectious: osteomyelitis, TB
- metabolic: osteoporosis, osteomalacia, Paget's disease
- rheumatologic: ankylosing spondylitis, polymyalgia rheumatica
- referred pain: perforated ulcer, pancreatitis, pyelonephritis, ectopic pregnancy, herpes zoster

Physical Exam
- inspection: curvature, posture, gait
- palpation: bony deformities/tenderness, paraspinal muscle bulk/tenderness, trigger points
  - percussion of spine to elicit pain due to fracture or infection
- range of motion and peripheral pulses
- neurologic exam for L4/L5/S1 helps determine level of spinal involvement (power, reflexes, sensation)
- special tests
  - straight leg raise (positive if pain at <70° and aggravated by ankle dorsiflexion), positive test is indicative of sciatica
  - crossed straight leg raise (raising of uninvolved leg elicits pain in leg with sciatica), more specific than straight leg raise
  - femoral stretch test (patient prone, knee flexed, examiner extends hip) to diagnose L4 radiculopathy

Investigations
- plain films not recommended in initial evaluation
- if infection/cancer suspected: CBC, ESR
- if neurologic deficits worsening or infection/cancer suspected: consider CT or MRI

Red Flags
Bowel or bladder dysfunction
Anesthesia (saddle)
Constitutional symptoms/malignancy
Chronic disease
Paresthesias
Ages >50 and mild trauma
IV drug use/Infection
Neuromotor deficits

Indications for Lumbar Spine X-Ray
- No improvement after 6 wk
- Fever >38°C
- Unexplained weight loss
- Prolonged corticosteroid use
- Significant trauma
- Progressive neurological deficit
- Suspicion of ankylosing spondylitis
- History of cancer (rule out metastases)
- Alcohol/drug misuse (increased risk of osteomyelitis, trauma, fracture)

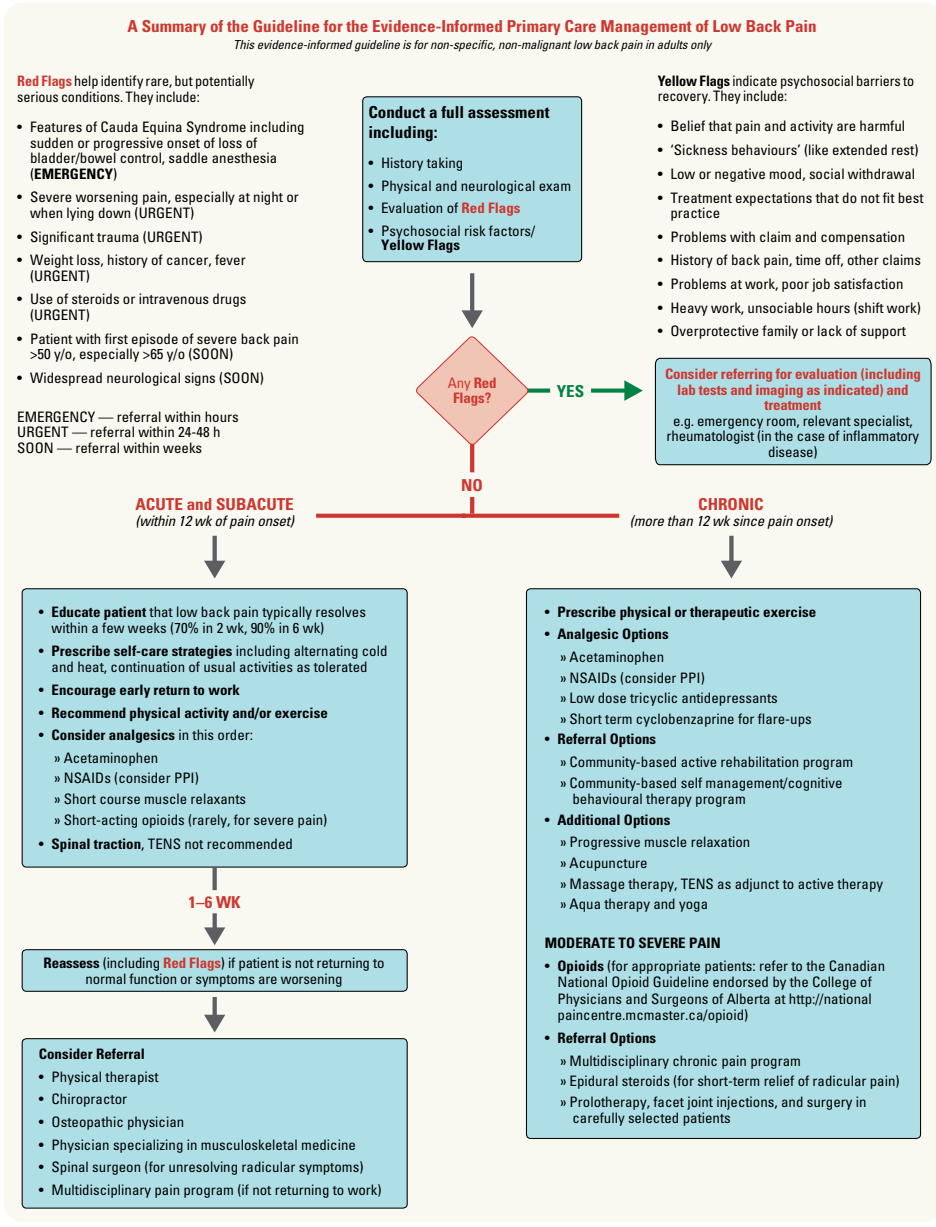


Figure 13. Low back pain treatment

Adapted with permission from Toward Optimized Practice (TOP) Low Back Pain Working Group. 2015 December. Evidence-informed primary care management of low back pain: Clinical practice guideline. Edmonton, AB: Toward Optimized Practice. Appendix I – Summary, p. 43-44. Available from: https://actt.albertadoctors.org/CPGs/Pages/Low-Back-Pain.aspx. Copyright 2015, Toward Optimized Practice.

Massage for Low Back Pain
Cochrane DB Syst Rev 2015;4
Purpose: To evaluate the effect of massage therapy for non-specific low back pain.
Methods: Meta-analysis of randomized or quasi-randomized trials evaluating use of any massage modality (hands or mechanical device) as a treatment for non-specific low back pain.
Results: 13 RCTs were identified, comparing massage therapy to other active or sham treatments. Massage was superior for pain and function on both short and long-term follow-ups relative to sham treatment. It was similar to exercises, and superior to join mobilization, relaxation therapy, physical therapy, acupuncture and self-care education. Benefits lasted at least 1 yr post-treatment. Acupuncture massage was associated with better results than classic (Swedish) massage, and Thai massage produced similar results to the classic massage.
Conclusions: Massage may be beneficial for subacute and chronic non-specific low back pain, especially in combination with exercise and education.

Association of Spinal Manipulative Therapy with Clinical Benefit and Harm for Acute Low Back Pain
JAMA 2017;317:1451-1460
Purpose: To systematically review studies about the effectiveness and harms of Spinal Manipulative Therapy (SMT) for acute (≤6 wk) low back pain.
Methods: Systematic review and meta-analysis including RCTs and observational studies. Evidence assessed using GRADE criteria. Outcomes such as pain, function, or any harms were measured during 6 wk of SMT.
Results: 15 RCTs provided moderate-quality evidence that SMT has a statistically significant association with improvements in pain (pooled mean improvement in the 100 mm visual analog pain scale, −9.95 (95% CI, −15.6 to −4.3)). 12 RCTs (1381 patients) produced moderate-quality evidence that SMT has a statistically significant association with improvements in function (pooled mean effect size, −0.39 (95% CI, −0.71 to −0.07)). No RCT reported any serious adverse event. Minor transient adverse events such as increased pain, muscle stiffness, and headache were reported 50-67% of the time in large case series of patients treated with SMT.
Conclusion: SMT in acute low back pain was associated with modest improvements in pain and function at up to 6 wk, with transient minor musculoskeletal harms. However, heterogeneity in study results was large.

Table 22. Approach to Non-Traumatic Low Back Pain

	Back Dominant (Pain greatest above gluteal fold)		**Leg Dominant** (Pain greatest below gluteal fold)	
History	**Pattern 1** Worse with flexion Constant/intermittent	**Pattern 2** Worse with extension Never worse with flexion Always intermittent	**Pattern 3** Pain changes with back movement/position Currently/previously constant	**Pattern 4** Worse with activity Improves with rest and posture change Intermittent/short duration
Physical Exam	Normal neurological exam Fast responder Improves with extension Slow responder No change or worsens with extension	Normal neurological exam ± improves with flexion Worse with extension	Leg pain can improve but not disappear Positive straight leg raise ± conduction loss Fast responder Improves with specific back position Slow responder Not better with position changes	No irritative findings ± conduction loss
Likely Pathology	Disc pain	Facet joint pain	Compressed nerve pain: sciatica	Symptomatic spinal stenosis: neurogenic claudication
Initial Management	Scheduled extension Lumbar roll Night lumbar roll Medication as required: acetaminophen + NSAIDs	Scheduled flexion Limited extension Night lumbar roll Medication as required: acetaminophen + NSAIDs	Prone extension Supine "Z" lie Lumbar roll Night lumbar roll Medication as required: acetaminophen + NSAIDs, may consider if 1st line not sufficient	Abdominal exercises Night lumbar roll Sustained flexion Pelvic tilt Medication as required: acetaminophen + NSAIDs

Adapted from: American Academy of Orthopaedic Surgeons. Acute care: nontraumatic low back pain. Orthopaedic Knowledge Update: Spine 2 2001;153-166
Adapted from: Centre for Effective Practice. Clinically Organized Relevant Exam (CORE) Back Tool. 2016

Menopause/Hormone Therapy

- see Gynaecology, GY36

Definition
- 12 mo of amenorrhea following the final menstrual period

Epidemiology
- mean age of menopause is 51.4 yr

Clinical Features
- associated with estrogen deprivation
- urogenital tract: atrophy, vaginal dryness/itching, urinary frequency/urgency/incontinence, bleeding
- vascular: vasomotor instability (e.g. hot flashes), increased risk of heart disease
- bones: bone loss, joint/muscle/back pain, fractures, loss of height
- brain: depression, irritability, mood swings, memory loss

Management
- person-specific support and offering of health education about menopause (if desired)
- https://www.menopauseandu.ca
- non-pharmacological management: encourage physical exercise, smoking cessation, and a balanced diet with adequate intake/supplementation of calcium (1200 mg/d) and vitamin D (1000 IU/d)
- pharmacological management:
  - hormone therapy (HT)
    - initiation of HT requires a thorough discussion of short- and long-term benefits and risks
    - prescribe for moderate to severe symptoms for no longer than 5 yr; routine use is not recommended
    - regimens: cyclic or continuous estrogen-progestin, estrogen only (if no uterus, patch/gel/cream/ring/vaginal tablet)
    - advantages: decreases risk of osteoporotic fractures, colorectal cancer
    - disadvantages: increases risk of breast cancer, coronary heart disease, stroke, DVT, and PE
  - venlafaxine, SSRIs, or gabapentin to ease vasomotor instability

Osteoarthritis

- see Rheumatology, RH5

Definition
- progressive deterioration of articular cartilage and surrounding joint structures caused by genetic, metabolic, biochemical, and biomechanical factors with secondary components of inflammation

Epidemiology
- most common form of arthritis seen in primary care
- prevalence is 10-12% and increases with age
- results in long-term disability in 2-3% of patients with OA
- almost everyone >65 shows signs of OA on x-ray, but only 33% of these individuals will be symptomatic

Clinical Features
- joint pain with activity, improved with rest, morning stiffness or gelling <30 min
- deformity, bony enlargement, crepitus, limitation of movement, periarticular muscle atrophy
- usually affects distal joints of hands, spine, hips, and knees

Investigations
- no laboratory tests for the diagnosis of OA
- hallmark radiographic features: joint space narrowing, subchondral sclerosis, subchondral cysts, osteophytes

Management
- goals: relieve pain, preserve joint motion and function, prevent further injury
- conservative
  - patient education, weight loss, low-impact exercise (through occupational therapy/physiotherapy), assistive devices (e.g. canes, orthotics)
- pharmacological
  - consider comorbidities such as PUD, HTN, IHD, hepatic disease, and renal disease
  - medications do not alter natural course of OA
  - 1st line: acetaminophen up to 4 g/d (OA is not an inflammatory disorder)
  - 2nd line: NSAIDs (cyclooxygenase-2 (COX2) selective) in low doses for short durations
  - 3rd line: duloxetine, combination analgesics (e.g. acetaminophen and codeine)

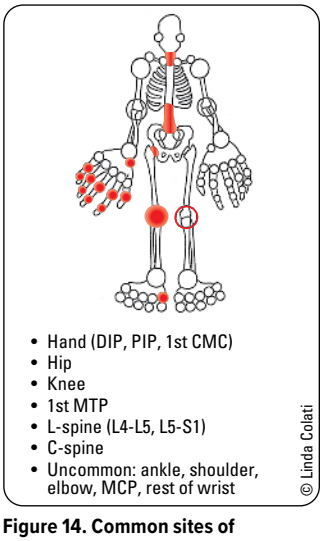

Figure 14. Common sites of involvement in OA
CMC = carpometacarpal joint
DIP = distal interphalangeal joint
MCP = metacarpophalangeal joint
MTP = metatarsophalangeal joint
PIP = proximal interphalangeal joint

- other pharmacological adjuncts:
  - intra-articular corticosteroid or hyaluronic acid injections
  - topical NSAIDS (diclofenac)
  - capsaicin cream
  - oral glucosamine (evidence remains inconclusive)
- surgery
  - consider if persistent significant pain and functional impairment despite optimal pharmacotherapy (e.g. debridement, osteotomy, total joint arthroplasty)

Osteoporosis

- see Endocrinology, E47

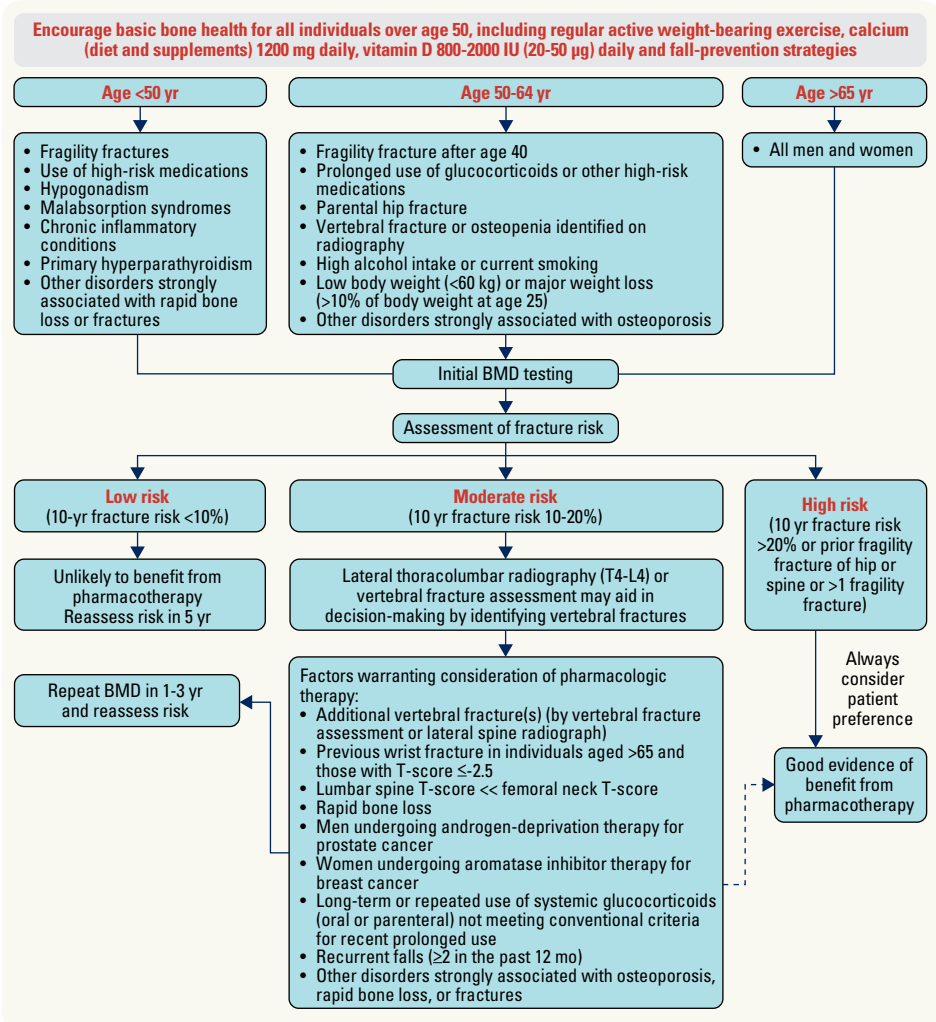

Figure 15. 2010 Clinical practice guidelines for the diagnosis and management of osteoporosis in Canada (integrated management model) Adapted from: CMAJ 2010;182:1864-1873

Definition

- age-related disease characterized by decreased bone mass and increased susceptibility to fractures

Epidemiology

- for current guidelines and tools see www.osteoporosis.ca
- in Canada, affects 1 in 4 women and 1 in 8 men

Clinical Presentation

- asymptomatic for many years
- fragility or osteoporotic fractures

Disorders Strongly Associated with Osteoporosis Include:
Primary hyperparathyroidism, T1DM, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause (<45 yr), Cushing's disease, chronic malnutrition or malabsorption, chronic liver disease, COPD, and chronic inflammatory conditions (e.g. IBD)

10 Yr Fracture Risk Assessment
FRAX (WHO Fracture Risk Assessment Tool) and CAROC (Canadian Association of Radiologists and Osteoporosis Canada) have been validated in the Canadian Population
FRAX and CAROC are available online from: https://www.osteoporosis.ca/health-care-professionals/clinical-tools-and-resources/

How Much Calcium Do We Need?

Age	Amount /day
4-8	1000 mg
9-18	1300 mg
19-50	1000 mg
>50	1200 mg

Calcium Content of Common Foods
1 cup milk = 300 mg
¾ cup yogurt = 332 mg
½ can salmon with bones = 240 mg
½ cup cooked broccoli = 33 mg
1 medium orange = 50 mg

Vitamin D Content in Food
- Milk fortified with vitamin D_3 contains 100 IU per 250 mL glass
- Foods such as margarine, eggs, chicken livers, salmon, sardines, herring, mackerel, swordfish, and fish oils (halibut and cod liver oils) all contain small amounts; supplementation is necessary to obtain adequate levels as dietary intake has minimal impact
- Most multivitamins provide 400 IU of vitamin D_3

Approach to Clinical Assessment
- identify risk factors on history and physical examination
- history
  - prior falls, fragility fractures, parental hip fractures, and gait or balance issues
  - glucocorticoid use
  - smoking and alcohol intake (≥3 units/d)
  - rheumatoid arthritis
- physical examination
  - height annually (prospective loss >2 cm or historical loss >6 cm) and weight (weight loss >10% since age 25)
  - rib-to-pelvis distance ≤2 fingers' breadth
  - occiput-to-wall distance >5 cm
  - assess fall risk by ability to get up from chair without support with arms, and walking several steps and return

Investigations
- CBC, Cr, corrected Ca^{2+}, ALP, TSH, 25-hydroxyvitamin D (after 3-4 mo of adequate supplementation), and serum protein electrophoresis if there are vertebral fractures

Indications for Bone Mineral Density Testing and Management
- see Endocrinology, E48

Rash
- see Dermatology, D16

Sexually Transmitted Infections
- see Gynaecology, GY28

Definition
- diverse group of infections caused by multiple microbial pathogens
- transmitted by either secretions or fluids from mucosal surfaces

Epidemiology
- high incidence rates worldwide
- Canadian prevalence in clinical practice
  - common: chlamydia (most common), gonorrhea (2nd most common), HPV, genital herpes
  - less common: hepatitis B, HIV, syphilis, trichomoniasis
  - rare: chancroid, granuloma inguinale, lymphogranuloma venereum
- non-sexually transmitted genital tract infections: vulvovaginal candidiasis (VVC), bacterial vaginosis (BV)
- three most common infections associated with vaginal discharge in adult women are BV, VVC, and trichomoniasis

History
- sexual history
  - age of first intercourse, gender of sexual partners (past and present), sexual activity (oral, anal, vaginal intercourse, use of sex toys), contraception use, sexual activity during travel
  - total number of partners in the past year/month/week and duration of involvement with each
- STI history
  - STI awareness, previous STIs and testing (including Pap tests), partner communication/history regarding STIs
  - local symptoms such as burning, itching, discharge, sores, vesicles, testicular pain, dysuria, abdominal pain
  - systemic symptoms such as fever, lymphadenopathy, arthralgia

Investigations/Screening
- individuals at increased risk should be screened for hepatitis B, HIV, and syphilis
- Pap test q3 yr for anyone with a cervix aged 25 to 69 who has ever been sexually active
- annual screening for all sexually active people under 30 for gonorrhea and chlamydia

Management
- primary prevention is vastly more effective than treating STIs and their sequelae
- offer hepatitis B vaccine if not immune
- offer Gardasil® to females and males aged 9-14 yr
- discuss STI risk factors (e.g. decreasing the number of sexual partners)
- direct advice to ALWAYS use barrier contraception or to abstain from intercourse

When an STI is detected in a child, evaluation for sexual abuse is mandatory

STI Risk Factors
- Sexually active males and females <25 yr old
- Unprotected sex, sexual contact with a known case of STI, previous STI
- New sexual partner or >2 sexual partners in the past 12 mo
- Street involved, homeless, and/or substance misuse

Sexual History
5 P's
Partners (numbers, gender)
Practices (vaginal, oral, anal insertive/receptive)
Protection
Past history of STIs
Pregnancy prevention

Efficacy of Human Papillomavirus Vaccines – A Systematic Quantitative Review
Int J Gynecol Cancer 2009;19:1166-1176
Purpose: To evaluate two vaccines for human papillomavirus (HPV) in terms of efficacy, safety and immunogenicity.
Methods: Systematic review of RCTs involving women between the ages of 9 and 26 yr, randomly assigned to receive vaccination with HPV L1 virus-like particle in either quadrivalent (HPV 6, 11, 16, 18), bivalent (HPV 16, 18), or univalent (HPV 16) form or placebo. Main outcomes were prevention of cytologically and/or histologically proven lesions (including LSIL, HSIL, VIN, VAIN, AIN, adenocarcinoma *in situ* of the cervix, or cancer of the cervix associated with HPV infection).
Results: Six studies involving 47236 women were included. Bivalent and quadrivalent vaccines reduced the rate of lesions in the cervix, vulva, vagina, and anogenital region with efficacy of 93% (95% CI 87-96%) and 62% (95% CI 27-70), respectively. More symptoms were found in the bivalent vaccine group (35%, 5-73%) compared to control groups.
Conclusion: Prophylactic vaccination can prevent HPV infection in women ages 9-26 not previously infected with HPV subtypes covered by the vaccines.

- condoms are not 100% effective against HPV or HSV
- a person with an STI is not considered treated until the management of his/her partner(s) is ensured (contact tracing by Public Health)
- patients diagnosed with bacterial STI or trichomonas infection should abstain from sexual activity until treatment completion and for 7 d after treatment for both partners, or until test of cure completed
- mandatory reporting: chlamydia, gonorrhea, hepatitis B, HIV, syphilis, chancroid

Table 23. Diagnosis and Treatment of Common STIs

	Signs and Symptoms	Investigations	Treatment	Complications
Gonococcal Urethritis/ Cervicitis (*Neisseria gonorrhoeae*)	M: urethral discharge, unexplained pyuria, dysuria, irritation, testicular swelling, symptoms of epididymitis F: mucopurulent endocervical discharge, vaginal bleeding, dysuria, pelvic pain, dyspareunia M and F: often asymptomatic, can involve rectal symptoms in cases of unprotected anal sex	M: first-void urine NAAT, urethral swab for Gram stain and culture F: vaginal swab or urine NAAT, endocervical swab for Gram stain and culture, vaginal swab for wet mount (to rule out trichomonas) M and F: urine NAAT, rectal/pharyngeal swabs if indicated	Ceftriaxone 250 mg IM single dose* Test of cure: cultures 3-7 d post-treatment for pharyngeal infections, ongoing signs or symptoms, treatment failure, or pregnancy Repeat screening in all patients 6 mo post-treatment	M: urethral strictures, epididymitis, infertility F: PID, infertility, ectopic pregnancy, perinatal infection, chronic pelvic pain M and F: arthritis, increased risk of acquiring and transmitting HIV
Non-Gonococcal Urethritis/Cervicitis (Usually *Chlamydia trachomatis*)**	~70% asymptomatic If symptoms appear (usually 2-6 wk after infection) then similar to gonococcal symptoms (see above)	Same as above	Azithromycin 1 g PO single dose + gonococcal urethritis/cervicitis prescription* Same follow-up as above	Same as above
Human Papillomavirus (genital warts, cervical dysplasia)	Most are asymptomatic M: cauliflower lesions (condylomata acuminata) on skin/mucosa of penile or anal area F: cauliflower lesions and/or pre-neoplastic/neoplastic lesions on cervix/vagina/vulva	None needed if simple condylomata Potential biopsy of suspicious lesions F: screening for cervical dysplasia through regular Pap smears	For condylomata: cryotherapy, electrocautery, laser excision, topical therapy (patient-applied or office-based) For cervical dysplasia: colposcopy and possible excision, dependent on grade of lesion	M and F: anal cancer MSM and F who have receptive anal sex: rectal cancer F: cervical/vaginal/vulvar cancer
Genital Herpes (HSV-1 and -2)	1° episode: painful vesiculoulcerative genital lesions ± fever, tender lymphadenopathy, protracted course Recurrent episodes: less extensive lesions, shorter course may have "trigger factors"	Swab of vesicular content for culture or NAAT	1° Episode Acyclovir 200 mg PO 5x/d x 5-10 d or Famciclovir 250 mg PO TID x5 d or Valacyclovir 1000 mg PO BID x 10 d Recurrent Episode Acyclovir 200 mg PO 5x/d x5 d or 800 mg PO TID x2 d or Famciclovir 125 mg PO BID x5 d or Valacyclovir 500 mg PO BID x3 d or 1000 mg PO once daily x3 d	Genital pain, urethritis, cervicitis, aseptic meningitis, increased risk of acquiring and transmitting HIV
Infectious Syphilis (*Treponema pallidum*)	1°: chancre (painless sore), regional lymphadenopathy 2°: rash and flu-like symptoms, meningitis, headache, uveitis, retinitis, condyloma lata, mucus lesions, alopecia Latent Phase: asymptomatic 3°: neurologic, cardiovascular, and tissue complications	Specimen collection from 1° and 2° lesions, screen high-risk individuals with serologic syphilis testing (VDRL), universal screening of pregnant women	Benzathine penicillin G 2.4 million units IM single dose Notify partners (last 3-12 mo) Continuous follow-up and testing until patients are seronegative	Chronic neurologic and cardiovascular sequelae, increased risk of acquiring and transmitting HIV

F = females; M = males
*N.B. if urethritis/cervicitis is suspected, always treat for both gonococcal and non-gonococcal types (i.e. ceftriaxone AND azithromycin)
**Most common reportable STI in Canada

Sinusitis

- see Otolaryngology, OT25

Definition
- acute or chronic inflammation of the sinuses, often also involving the nasal cavities

Etiology
- viral etiology is more common
- viral: rhinovirus, influenza, parainfluenza
- bacterial: *S. pneumoniae, H. influenzae, M. catarrhalis*

Clinical Presentation
- often presents with PODS symptoms (see Figure 16, FM48)

Management of Acute Sinusitis
- for symptom relief: oral analgesics (acetaminophen, NSAIDs), nasal saline rinse, short-term use of topical/ or oral decongestants
- antihistamines are ineffective
- mild to moderate acute bacterial sinusitis: intranasal corticosteroids

Red Flags for Urgent Referral
- Altered mental status
- Headache
- Systemic toxicity
- Swelling of the orbit or change in visual acuity or extraocular muscles
- Hard neurological findings
- Signs of meningeal irritation
- Suspected intracranial complications (meningitis, intracranial abscess, cavernous sinus thrombosis)
- Involvement of associated structures (periorbital cellulitis, Pott's puffy tumour)

- severe acute bacterial sinusitis: antibiotics and intranasal corticosteroids
  - first-line antibiotic is amoxicillin, and second line is amoxicillin-clavulanic acid or a fluoroquinolone
  - ENT referral if: anatomic defect (e.g. deviated septum, polyp, adenoid hypertrophy), failure of second-line therapy, or ≥4 episodes/yr, refer urgently for the red flags listed in the side box

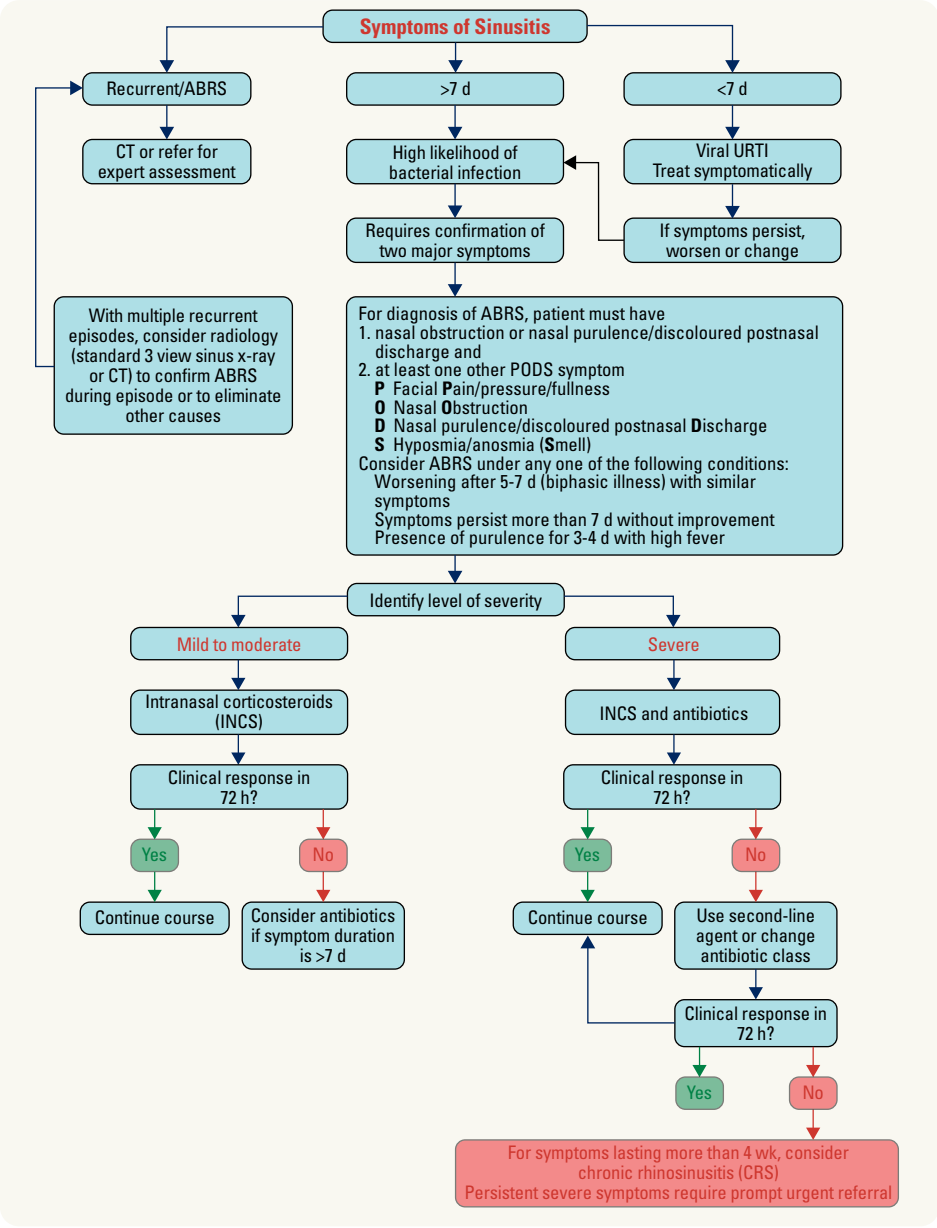

Figure 16. Diagnosis and management of sinusitis
ABRS = acute bacterial rhinosinusitis.
Adapted from: Desrosiers M, et al. Allergy Asthma Clin Immunol 2011;7:doi:10.1186/1710-1492-7-2

Sleep Disorders

- see Respirology, R29 and Neurology, N48

Definition and Clinical Presentation

- most often characterized by one of three complaints: insomnia, parasomnias, excessive daytime sleepiness
- insomnia: difficulty falling asleep, difficulty maintaining sleep, early morning wakening, non-refreshing sleep
- parasomnias: night terrors, nightmares, restless leg syndrome, somnambulism (performing complex behaviour during sleep with eyes open but without memory of event)
- excessive daytime sleepiness: abnormal fatigue or tiredness extending into waking hours

Epidemiology
- 1/3 of patients in primary care setting have occasional sleep problems, 10% have chronic sleep problems

Etiology
- primary sleep disorders
  - primary insomnia, narcolepsy, obstructive sleep apnea, restless leg syndrome, periodic limb movements of sleep
- secondary causes
  - medical: COPD, asthma, CHF, hyperthyroidism, chronic pain, BPH, menopause, GERD, PUD, pregnancy, neurological disorders
  - drugs: alcohol, caffeine, nicotine, nicotine replacement therapy, β-agonists, antidepressants, steroids
  - psychiatric: mood and anxiety disorders
  - lifestyle factors: shift work, jet lag

Investigations
- complete sleep diary every morning for 1-2 wk, see https://app.consensussleepdiary.com/#/
  - record bedtime, sleep latency, total sleep time, awakenings, quality of sleep
- rule out specific medical problems (e.g. CBC and differential, TSH)
- refer for sleep study, nocturnal polysomnogram, or daytime multiple sleep latency test if suspicion of sleep apnea or periodic leg movements of sleep

Management of Specific Problems
- **primary insomnia**
  - person reacts to insomnia with fear or anxiety around bedtime or with a change in sleep hygiene, which can progress to a chronic disorder (psychophysiological insomnia)
  - consider asking the patient if they have questions or fears about sleep that you might be able to address
  - treat any suspected medical or psychiatric cause
  - exercise regularly, avoid heavy exercise within 3 h of bedtime
  - first-line treatment (CBT)
    - sleep hygiene: avoid alcohol, caffeine, nicotine; comfortable sleep environment; regular sleep schedule; no napping
    - relaxation therapy: deep breathing, meditation, biofeedback
    - stimulus control therapy: re-association of bed/bedroom with sleep, re-establishment of a consistent sleep-wake schedule, reduce activities that cue staying awake
    - sleep restriction therapy: total time in bed should closely match the total sleep time of the patient
    - address inappropriate beliefs and attitudes that perpetuate dysfunctional sleep
  - pharmacologic treatment (used to supplement CBT; short-term prescription of <14 d with appropriate follow-up in 7-14 d):
    - short-acting benzodiazepines (e.g. lorazepam) are used to:
      - break the cycle of chronic insomnia
      - manage an exacerbation of previously controlled insomnia
    - non-benzodiazepines: zopiclone, zolpidem, melatonin, sedating antidepressants (e.g. amitriptyline, trazodone)
    - if no progress or limited improvement on pharmacotherapy, consider referral to sleep medicine program
- **snoring**
  - results from soft tissue vibration at the back of the nose and throat due to turbulent airflow through narrowed air passages
  - physical exam: obesity, nasal polyps, septal deviation, hypertrophy of the nasal turbinates, enlarged uvula and tonsils
  - investigations (only if severely symptomatic): nocturnal polysomnography and airway assessment (CT/MRI)
  - treatment
    - sleep on side (position therapy), weight loss
    - nasal dilators, tongue-retaining devices, mandibular advancement devices
  - at risk of developing obstructive sleep apnea
- **obstructive sleep apnea (OSA)**
  - apnea (no breathing for ≥10 s) resulting from partial or complete upper airway obstruction due to collapse of the base of the tongue, soft palate with uvula, and epiglottis; respiratory effort is present
  - leads to a distinctive snorting, choking, awakening type pattern as the body rouses itself to open the airway
  - apneic episodes can last from 20 s-3 min and occur 100-600 episodes/night
  - diagnosis is based on nocturnal polysomnography: >15 apneic/hypopneic episodes per hour of sleep

Risk Factors for Obstructive Sleep Apnea
- 2% of women, 4% of men between ages 30-60
- Obesity (due to upper airway narrowing). BMI >28 kg/m² present in 60-90% of cases
- Children (commonly due to large tonsils and adenoids)
- Aging (due to decreased muscle tone)
- Persistent URTIs, allergies, nasal tumours, hypothyroidism (due to macroglossia), neuromuscular disease
- Family history

- consequences
  - daytime somnolence, non-restorative sleep
  - poor social and work performance
  - mood changes: anxiety, irritability, depression
  - sexual dysfunction: poor libido, impotence
  - morning headache (due to hypercapnia)
  - HTN (2x increased risk), CAD (3x increased risk), stroke (4x increased risk), arrhythmias
  - OSA is an independent risk factor for CAD
  - pulmonary HTN, right ventricular dysfunction, cor pulmonale (due to chronic hypoxemia)
  - memory loss, decreased concentration, confusion
- investigations
  - evaluate BP, inspect nose, and oropharynx (enlarged adenoids or tonsils)
  - blood gas not helpful, TSH if clinically indicated
  - nocturnal polysomnography
- treatment
  - modifiable factors: avoid sleeping supine; weight loss; avoid alcohol, sedatives, opioids; inhaled steroids if nasal swelling present; dental appliances to modify mandibular position
  - primary treatment of OSA is CPAP: maintains patent airway in 95% of OSA cases
  - surgery: somnoplasty, uvulopalatopharyngoplasty (UPPP), tonsillectomy, and adenoidectomy (in children)
  - report patient to Ministry of Transportation if OSA is not controlled by CPAP

Sore Throat (Pharyngitis)

Definition
- inflammation of the oropharynx
- may be caused by a wide range of infectious organisms, most of which produce a self-limited infection with no significant sequelae

Red Flags in Patients with "Sore Throat"
- Persistence of symptoms longer than 1 wk without improvement
- Respiratory difficulty (particularly stridor, croup, etc.)
- Difficulty in handling secretions (peritonsillar abscess)
- Difficulty in swallowing (Ludwig's angina)
- Severe pain in the absence of erythema (supraglottitis/epiglottitis)
- Palpable mass (neoplasm)
- Blood in the pharynx or ear (trauma)

Etiology
- viral: adenovirus, rhinovirus, influenza virus, RSV, EBV, coxsackie virus, herpes simplex virus, CMV, HIV
- bacterial: β-Hemolytic *Streptococcus, Neisseria gonorrhoeae, Chlamydia pneumoniae, Mycoplasma pneumoniae, Corynebacterium diphtheriae, Fusobacterium necrophorum*

Epidemiology
- viral
  - most common cause (90% in adults is viral), occurs year round
- bacterial
  - Group A β-Hemolytic *Streptococcus* (GABHS)
    - most common bacterial cause
    - occurs most often in winter months
    - 5-15% of adult cases and up to 50% of all paediatric cases of acute pharyngitis
    - most prevalent between 5-17 y/o

Clinical Presentation
- viral
  - pharyngitis, conjunctivitis, rhinorrhea, hoarseness, cough
  - nonspecific flu-like symptoms such as fever, malaise, and myalgia
  - often mimics bacterial infection
  - common viral infections
    - EBV (infectious mononucleosis)
      - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
    - coxsackie virus (hand, foot, and mouth disease)
      - primarily late summer, early fall
      - sudden onset of fever, pharyngitis, headache, abdominal pain, and vomiting
      - appearance of small vesicles that rupture and ulcerate on soft palate, tonsils, pharynx
      - ulcers are pale grey and several mm in diameter, have surrounding erythema, and may appear on hands and feet
    - herpes simplex virus
      - like coxsackie virus but ulcers are fewer and larger
      - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
- bacterial
  - symptoms: pharyngitis, fever, malaise, headache, abdominal pain, absence of cough
  - signs: fever, tonsillar or pharyngeal erythema/exudate, swollen/tender anterior cervical nodes, halitosis
  - complications:
    - suppurative: abscess, sinusitis, otitis media, cervical adenitis, pneumonia
    - non-suppurative: acute rheumatic fever, acute glomerulonephritis

Table 24. Modified Centor Score: Approach to Diagnosis and Management of GABHS

CRITERIA		POINTS
Cough absent?		1
History of fever >38°C?		1
Tonsillar exudate?		1
Swollen, tender anterior nodes?		1
Ages 5-14		1
Ages 15-44		0
Ages >45		–1
In communities with moderate levels of strep infection (10-20% of sore throats):		
SCORE	**0-2**	**3 or more**
Risk of GABHS	1-17%	28-53%
Suggested action	No further testing or antibiotics	Perform RADT and treat with antibiotics if positive; for negative RADT, perform throat culture in patients under 20 and treat with antibiotics if cultures are positive. Patients 20 and over with negative RADT should not receive antibiotics

Note: Patients who score 2 points should undergo RADT if they are under 18, immunocompromised, frail, or otherwise clinically unwell
Limitations:
*This score is not applicable to patients <5 yr
*If an outbreak or epidemic of illness caused by GABHS is occurring in any community, the score is invalid and should not be used
Adapted from: Centor RM, et al. Med Decis Making 1981;1:239-46; Sykes EA, et al. Can Fam Physician. 2020 Apr; 66(4): 251-257.

Investigations

- suspected GABHS
  - see Table 24 for approach to diagnosis and management of GABHS
  - gold standard for diagnosis is throat culture
  - rapid antigen detection testing: high specificity (95-99%) but moderate sensitivity (85%)
  - nucleic acid detection: high sensitivity (92%)
  - populations at increased risk of GABHS complications, such as Indigenous peoples in Canada, are more likely to benefit from testing
- suspected EBV (infectious mononucleosis)
  - peripheral blood smear, heterophile antibody test (i.e. the latex agglutination assay or "monospot")

Management

- viral pharyngitis
  - antibiotics not indicated
  - symptomatic therapy: acetaminophen/NSAIDs for fever and muscle aches, decongestants
- GABHS
  - antibiotic treatment decreases severity and duration of symptoms, risk of transmission (after 24 h of treatment), and risk of rheumatic fever and suppurative complications
  - 10 d of treatment required
  - incidence of glomerulonephritis is not decreased with antibiotic treatment
  - no increased incidence of rheumatic fever with 48 h delay in antibiotic treatment; if possible, delay antibiotic treatment until culture confirms diagnosis
  - routine F/U and/or post-treatment throat cultures are not required for most patients
  - F/U throat culture only recommended for: patients with history of rheumatic fever, patients of family member(s) with history of acute rheumatic fever, suspected streptococcal carrier
- infectious mononucleosis (EBV)
  - self-limiting course; antibiotics are not indicated
  - symptomatic treatment: acetaminophen/NSAIDs for fever, pharyngitis, malaise
  - avoid heavy physical activity and contact sports for at least 1 mo or until splenomegaly resolves because of risk of splenic rupture
  - if acute airway obstruction, give corticosteroids and consult ENT

Palliative Care

Principles and Quality of Life

- early identification of patients who could benefit from a palliative approach to care
- support, educate, and treat both patient and family
- address physical, psychological, social and spiritual needs
- establish a multidisciplinary team
- focus on symptom management and comfort measures
- offer therapeutic environment and bereavement support
- ensure maintenance of human dignity

End-of-Life Care Discussions

- see Palliative Medicine, PM6

Power of Attorney

- see Ethical, Legal, and Organizational Medicine, ELOM14

Instructional Advance Directives

- see Ethical, Legal, and Organizational Medicine, ELOM14

Symptom Management

- see Palliative Medicine, PM9

Complementary and Integrative Medicine

Prevalence and Use

- 50-75% of Canadians report some use of CAM over their lifetime, but only half will disclose this use to their physician
- use is highest in Western provinces and lowest in Atlantic provinces
- more likely to be used by younger patients and those with higher education and income
- examples: chiropractic, acupuncture, massage, naturopathy, homeopathy, traditional Chinese medicine, craniosacral therapy, osteopathy, natural health products
- Indigenous Peoples may receive support from a Traditional Healer in addition to receiving allopathic/colonial medical care
- try to be curious about your own feelings about and experiences with different types of medicine; avoid dismissing or shaming

Natural Health Products

- over 50% of Canadians use NHPs
- most commonly used NHPs include: echinacea, ginseng, ginkgo, garlic, St. John's wort, and soy
- relatively few herbal products have been shown to be effective in clinical trials (though many have been used for millennia)
- many patients believe herbal products are inherently safe and are unaware of potential side effects and interactions with conventional medicines
- all NHPs must be regulated under The Natural Health Products Regulations as of January 1, 2004, including herbal remedies, homeopathic medicines, vitamins, minerals, traditional medicines, probiotics, amino acids, and essential fatty acids (e.g. omega-3)
- always ask patients whether they are taking any herbal product, herbal supplement, or other natural remedy. Further questions may include:
  - are you taking any prescription or non-prescription medications for the same purpose as the herbal product?
  - are you allergic to any plant products?
  - are you pregnant or breastfeeding?
- information resources: National Centre for CAM (https://www.nccih.nih.gov/), Health Canada website (https://www.canada.ca/en/health-canada/services/drugs-health-products/natural-non-prescription/regulation.html)

Serum Creatinine Does Not Reflect Creatinine Clearance in the Elderly

Instead, use:
CrCl = $\frac{(\text{weight in kg})(140 - \text{age})(1.23)}{(\text{serum creatinine in } \mu\text{mol/L})}$ (mL/min)

Multiply by 0.85 for females

Limitations:
- Underestimates CrCl in patients without significant age-related decline in renal function
- Overestimates CrCl in patients with muscle mass reduced beyond normal aging

Approach to Medication Review in the Elderly

Ask patient to bring all their current medications:
- Review Beers Criteria (2019) to identify potentially inappropriate medications
- Consider consulting https://deprescribing.org
- Screen for adverse drug effects and drug interactions
- Eliminate unnecessary medications (duplicate therapies or pharmacologic effects)
- Simplify dosing regimen where possible
- Discuss patient's goals of care to guide pharmacologic management of symptoms/disease
- Establish patient's understanding of medications and directions for use
- For tapering off sedatives, consider this tool: http://www.criugm.qc.ca/images/stories/les_chercheurs/risk_ct.pdf

Most Common Uses of CAM
- Back/neck problems
- Gynaecological problems
- Anxiety
- Headaches
- Digestive problems
- Chronic fatigue syndromes

Table 25. Common Herbal Products

Common Name	Reported Uses	Possible Adverse Effects	Possible Drug Interactions
Black Cohosh	Menopausal symptoms, PMS, labour induction	Hepatitis, liver failure, GI discomfort, rashes	None reported
Chamomile	Mild sedative, anxiolytic, GI complaints, skin conditions (topical)	Allergic/contact dermatitis, anaphylaxis	Anxiolytics, sedatives, cyclosporine, warfarin
Echinacea	Common cold, flu, wound treatment, URTI, cancer	Hypersensitivity, GI discomfort, avoid use if immunosuppressed	None reported
Evening Primrose	PMS, breast pain, menopausal symptoms, eczema, RA	Headache, nausea, diarrhea, stomach upset, may increase risk of some pregnancy complications	Anticoagulants, antiplatelets
Feverfew	Migraine prevention, headache, RA, anti-inflammatory, fever, menstruation problems, psoriasis, allergies, asthma, tinnitus, dizziness, nausea, vomiting, intestinal parasites	Nausea, GI discomfort,irritation of mouth/skin, miscarriage (may affect uterine contractions), "post-feverfew syndrome" (headaches, sleep disturbances, myalgias, arthralgias experienced after discontinuing feverfew)	Anticoagulants
Flaxseed Oil	Laxative, menopausal symptoms, source of omega-3 fatty acids, dietary supplement for DM, cholesterol, cancer	Diarrhea, raw/unripe flaxseeds may contain potentially toxic compounds, can worsen constipation if not taken with plenty of water	Do not take with other medications as fibre content can bind drugs
Garlic	Elevated lipids/cholesterol, atherosclerosis prevention, HTN, common cold, cancer prevention	Breath/body odour, GI irritation, contact dermatitis (raw garlic) May increase postoperative bleeding	Anticoagulants, saquinavir (HIV drug)
Ginger	Nausea, motion sickness, chemotherapy or pregnancy-induced nausea, RA, osteoarthritis	Heartburn, abdominal discomfort, diarrhea, gas, increased flow of bile (use with caution in gallstone disease), not to be used for morning sickness	Anticoagulants
Ginkgo Biloba	Increases peripheral circulation (Alzheimer's disease, dementia, intermittent claudication), eye problems, tinnitus, premenstrual syndrome, vertigo	Headache, stomach upset, bleeding, severe allergic reactions (whole plant/seeds/pulp), poisonous if ingested raw/roasted	Anticoagulants, ASA
Ginseng	Energy enhancer, decreases stress, adjunct support for chemotherapy/radiation	HTN, nervousness, insomnia, breakthrough bleeding, palpitations	Stimulant medications, antihypertensives, hormonal therapies
Glucosamine (Chondroitin)	Osteoarthritis	May cause kidney damage with long-term use, impaired glucose tolerance	Anticoagulants, caution if shellfish allergy
Saw Palmetto	BPH (adjunct to finasteride), chronic pelvic pain, decreased libido, migraine, hair loss	Mild GI distress, headache	None known
St. John's Wort	Mild to moderate depression, dietary supplement for menopausal symptoms, attention-deficit hyperactivity disorder, obsessive-compulsive disorder, bladder problems, anxiety, sleep disorders, wound healing, dermatologic conditions (topical)	Photosensitivity, anxiety, dry mouth, GI symptoms, fatigue, sexual dysfunction, drowsiness, dizziness, headache, confusion	Antidepressants (SSRIs), OCPs, cyclosporine, digoxin, irinotecan (cancer medication), anticoagulants, contraindicated with indinavir
Valerian Root	Sedative, anxiolytic, depression, menopausal symptoms	Drowsiness, dizziness, headache, itching, digestive problems	CNS depressants, antihistamines, other sedatives

Zink T, Chaffin J. Herbal "health"products: What family physicians need to know. American Family Physician 1998;58:1133-1140; NIH National Centre for Complementary and Alternative Medicine website (http://nccam.nih.gov/)

Antimicrobial Quick Reference

Condition	Microorganisms	Antimicrobial
RESPIRATORY/ENT		
Acute Rhinitis (common cold)	Rhinovirus, coronavirus, influenza, RSV, parainfluenza, adenovirus	None
Pharyngitis (sore throat)	Rhinovirus, adenovirus, influenza, parainfluenza, coxsackie virus, coronavirus	None
Streptococcal Pharyngitis	Group A β-Hemolytic *Streptococcus*	**Children**: 1st line: penicillin V 40 mg/kg/d PO div BID-TID (max 750 mg/d) x 10 d (use adult dose if >27 kg) amoxicillin 40 mg/kg/d PO div BID-TID (max 1 g/d) x 10 d penicillin allergy (rash): erythromycin estolate 40 mg/kg/d PO div BID-TID (max 2 g/d) x 10 d penicillin allergy (anaphylaxis): cephalexin 25-50 mg/kg/d PO div QID (max 1 g/d) x 10 d **Adults**: 1st line: penicillin V 300 mg PO tid or 600 mg BID x 10 d penicillin allergy (rash): erythromycin 250 mg PO QID x 10 d penicillin allergy (anaphylaxis): cephalexin 250 mg PO QID x 10 d
Sinusitis	*S. pneumoniae* *H. influenzae* *M. catarrhalis* *S. aureus*	**Children**: 1st line: amoxicillin 40-90 mg/kg/d PO div BID-TID (max 3 g/d) x 10 d 2nd line: amoxicillin/clavulanate 45 mg/kg/d div BID (max 3 g/d) x 10 d **Adults**: 1st line: amoxicillin 500-1000 mg PO TID x 5-10 d 2nd line: amoxicillin/clavulanate 500 mg PO TID or 875 mg PO BID (7:1 formulation) x 5-10 d
Acute Otitis Media	*S. pneumoniae* *H. influenzae* *M. catarrhalis* *Group A Strep* *S. aureus*	**Children**: Treat with antibiotics if under age 6 mo If ages 6-24 mo, watchful waiting appropriate if parents can observe child for 24-48 h with appropriate medical follow-up, treat with antibiotics if no better or worse at follow-up If ages >24 mo, treat with antibiotics if worsens after 24-48 h 10 d course if ages <24 mo, 5 d course if ages ≥24 mo 1st line: amoxicillin 75-90 mg/kg/d PO div BID (max 3 g/d) 2nd line: amoxicillin/clavulanate 45-60 mg/kg/d PO div TID (7:1 formulation) x 10 d if under 35 kg amoxicillin/clavulanate 500 mg PO TID (7:1 formulation) x 10 d if over 35 kg Chronic TM perforation or ventilation tubes: Ciprodex® otic suspension 4 drops BID x 5 d **Adults**: 1st line: amoxicillin 500 mg PO TID x 7-10 d 2nd line: amoxicillin/clavulanate 500 mg PO tid or 875 mg PO BID x 7-10 d Chronic TM perforation or ventilation tubes: Ciprodex® otic suspension 4 drops BID x 5 d
Otitis Externa	*P. aeruginosa* *Coliforms* *S. aureus*	Cortisporin® otic solution 4 drops TID or QID (3 drops TID or QID for children) TM defect: Ciprodex® otic suspension 4 drops BID x 5 d Necrotizing (i.e. bone involvement): ciprofloxacin 750 mg PO BID x 4-8 wk
Bronchitis	*H. influenzae*, parainfluenza, coronavirus, rhinovirus, RSV	None
Community Acquired Pneumonia: Outpatient without Comorbidity	*S. pneumoniae* *M. pneumoniae* *C. pneumoniae*	1st line: amoxicillin 1000 mg PO TID x 5-7 d (for patients over age 50 where mycoplasma infection is less likely) if atypical organisms present, add either of the following: clarithromycin 500 mg PO BID or 1000 mg (ER) PO once daily x 5-7 d azithromycin 500 mg PO on 1st d then 250 mg PO once daily x 4 d or 500 mg PO once daily x 3 d 2nd line: doxycycline 200 mg PO on 1st d then 100 mg PO BID x 5-7 d amoxicillin/clavulanate 875 mg PO BID x 5-7 d
Community Acquired Pneumonia: Outpatient with Comorbidity	*S. pneumoniae* *M. pneumoniae* *C. pneumoniae* *H. influenzae*	**PLUS** clarithromycin, azithromycin, or doxycycline as above if treatment failure: levofloxacin 500-750 mg PO once daily x 5 d OR moxifloxacin 400 mg PO once daily x 5 d
Dental Infections/Periapical and Periodontal Abscesses	Oral Flora	penicillin V potassium 500 mg PO QID x 7-10 d clindamycin 300 mg PO QID or 600 mg BID x 7-10 d
GASTROENTEROLOGY		
Diarrhea – Enteritis	*Enterotoxigenic E. coli* *Campylobacter* *Salmonella* *Shigella* Viruses Protozoa	azithromycin is the preferred agent given growing resistance to quinolones, particularly in Southeast Asia azithromycin 1000 mg PO single dose or 500 mg PO once daily x 1-3 d (children: 10 mg/kg/d x 3 d) ciprofloxacin 750 mg PO single dose or 500 mg PO BID x 1-3 d (prevention: 500 mg PO once daily) levofloxacin 500 mg PO once daily x 1-3 d (prevention: 500 mg PO once daily)
Diarrhea – Post Antibiotics (common with clindamycin)	*C. difficile*	Mild to moderate (WBC <15 x 109/L and Cr <1.5 x baseline): vancomycin 125 mg PO QID x 10-14 d (children: metronidazole 30 mg/kg/d PO div QID x 10-14 d max 2 g/d) Severe (WBC ≥15 x 109/L and Cr ≥1.5 x baseline): vancomycin 125 mg PO QID x 10-14 d (children: vancomycin 40 mg/kg/d PO div TID-QID x 10-14 d max 500 mg/d)
Peptic Ulcer Disease (non-NSAID related)	*H. pylori*	PPI PO BID + amoxicillin 1000 mg PO BID + clarithromycin 500 mg PO BID + metronidazole 500 mg PO BID x 7 d OR PPI PO BID + bismuth subsalicylate 524 mg PO QID + metronidazole 375 mg PO QID + tetracycline 500 mg PO QID x 7-14 d PPI: lansoprazole 30 mg or omeprazole 20 mg or pantoprazole 40 mg or rabeprazole 20 mg

Condition	Microorganisms	Antimicrobial
DERMATOLOGIC		
Head and Pubic Lice (crabs)	*Pediculosis humanus capitis* *Phthirus pubis*	permethrin cream 1%: apply as liquid onto washed hair for 10 min, then rinse; repeat in 1 wk
Vulvovaginal Candidiasis	*Candida*	Treat only if patient is symptomatic fluconazole 150 mg PO x 1 dose miconazole 2% cream (Monistat 7®): one applicator (5 g) intravaginally QHS x 7 d Multiple other OTC azole treatments
Bacterial Vaginosis	Overgrowth of: *G. vaginalis* *M. hominis* Anaerobes	If patient is asymptomatic, treatment is unnecessary unless high-risk pregnancy, prior IUD insertion, gynaecologic surgery, induced abortion, or upper tract instrumentation 1st line: metronidazole 500 mg PO BID x 7 d metronidazole 0.75% gel: one applicator (5 g) intravaginally QHS x 5 d clindamycin 2% cream: one applicator (5 g) intravaginally QHS x 7 d 2nd line: metronidazole 2 g PO x 1 dose clindamycin 300 mg PO BID x 7 d
Herpes	Herpes simplex virus	1° episode: acyclovir 200 mg PO five times daily x 5-10 d OR famciclovir 250 mg PO TID x 5 d OR valacyclovir 1000 mg PO BID x 10 d Recurrent Episode: acyclovir 200 mg PO five times daily x 5-10 d famciclovir 125 mg PO BID x 5 d valacyclovir 500 mg PO BID x 3 d or 1000 mg PO once daily x 3 d Pregnancy: 1° episode: acyclovir 200 mg PO 5x/d x 5-10 d Prior infection within previous yr: acyclovir 200 mg PO QID at 36 wk valacyclovir 500 mg PO BID at 36 wk
Gonorrhea/Chlamydia	*N. gonorrhoeae* *C. trachomatis*	ceftriaxone 250 mg IM x 1 dose + azithromycin 1 g PO x 1 dose OR doxycycline 100 mg PO BID x 7 d No intercourse for one week after treatment
Mastitis	*S. aureus* *S. pyogenes*	cloxacillin 500 mg PO QID x 7 d cephalexin 500 mg PO QID x 7 d
Tinea Cruris/Pedis (jock itch/athlete's foot)	*Trichophyton*	clotrimazole 1% cream BID ketoconazole 2% cream BID
Uncomplicated Cellulitis	*S. aureus* Group A *Streptococcus*	**Children:** 1st line: cephalexin 50-100 mg/kg/d div QID x 10-14 d 2nd line: cloxacillin 50 mg/kg/d div QID x 10-14 d clindamycin 25 mg/kg/d x 10-14 d **Adults:** 1st line: cephalexin 500 mg PO QID x 10-14 d 2nd line: cloxacillin 500 mg PO QID x 10-14 d clindamycin 300 mg PO x 10-14 d

Landmark Family Medicine Trials

Trial Name	Reference	Clinical Trial Details
HYPERTENSION		
DASH	NEJM 1997; 336:1117-1124	Diet rich in fruits, vegetables, and low-fat dairy foods, with reduced saturated and total fat can substantially lower BP
MENOPAUSE/HORMONE REPLACEMENT THERAPY		
Women's Health Initiative Trial	JAMA 2002;288:321-333	Overall health risks exceeded benefits from use of combined estrogen plus progestin for an average 5.2-year follow-up among healthy postmenopausal US women

Anatomy Review

Overview of Gastrointestinal Tract

- the GI tract runs from mouth to anus ("gum to bum")

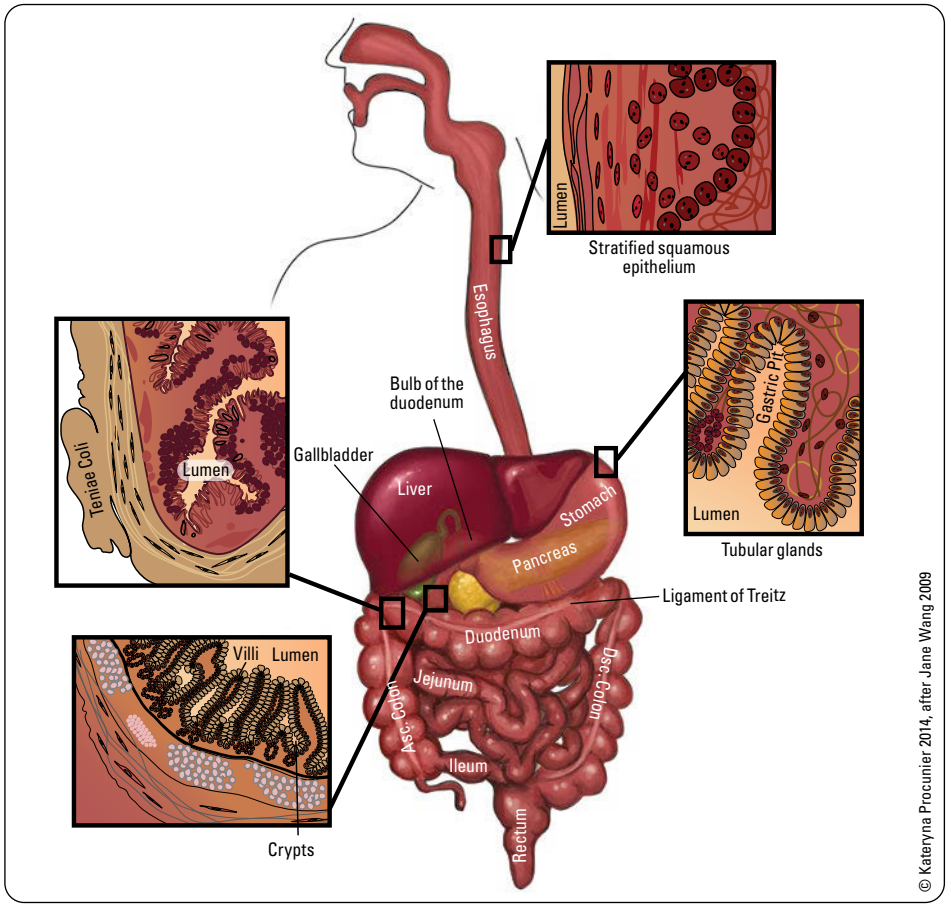

Figure 1. Overview of GI tract

Table 1. Summary of GI Tract Structure and Function

Organ	Function	Blood Supply	Innervation	Histology and Structural Features
Esophagus	Muscular tube approximately 40 cm long with a diameter of 2 cm Extends from the pharynx to the stomach	Arterial: left gastric artery and left inferior phrenic artery Venous: Left gastric vein → portal venous system Esophageal veins → azygos vein → inferior vena cava (systemic)	Parasympathetic innervation via anterior and posterior gastric nerves (vagal trunks) Sympathetic innervation via thoracic trunks of the greater splanchnic nerves	Mucosa: stratified squamous epithelium Submucosa: connective tissue, lymphocytes, plasma cells, nerve cells Muscularis propria (muscularis externa): inner circular, outer longitudinal muscle Upper 1/3: striated muscle Middle 1/3: transition zone Lower 1/3: smooth muscle
Stomach	Delivers food to intestine for digestion and absorption Secretes acid, probably to reduce enteric infections/pneumonia; facilitates digestion of protein and absorption of iron/B_{12} Secretes intrinsic factor (IF) to facilitate B_{12} absorption Minor contribution to initial protein digestion via pepsin	Lesser curvature Right and left gastric arteries (from celiac trunk) Greater curvature Right and left gastro-omental (gastroepiploic) arteries (from gastroduodenal and splenic arteries respectively) Fundus: short and posterior gastric arteries (from the splenic artery)	Parasympathetic innervation via vagus nerve Sympathetic innervation via celiac plexus (from T6-T9)	5 parts Cardia Fundus Body Antrum Pylorus
Duodenum	Modulates enteral pH via secretin → decreased gastric acid secretion, increased bicarbonate secretion Secretes CCK to stimulate gallbladder contraction Site of iron absorption	Branches of celiac artery and superior mesenteric artery	Parasympathetic innervation via vagus nerve Sympathetic innervation via greater and lesser splanchnic nerves	4 parts Superior (5 cm) Descending (7-10 cm) Horizontal (6-8 cm) Ascending (5 cm) 1st part is intraperitoneal; rest is retroperitoneal
Jejunum	Absorption of sodium, water, and nutrients (protein, carbohydrates, fat, folic acid, and vitamin A, B, C, D, E, K)	Superior mesenteric artery	Parasympathetic innervation via fibres of the posterior vagal trunk Sympathetic innervation via fibres of T8-T10	Deep red colour 2-4 cm in thickness Thick and heavy wall Plicae circulares are large, tall, and closely packed Has long vasa recta Scant fat in mesentery Scant Peyer's patches
Ileum	Absorption of sodium, water, nutrients, soluble vitamins (only site of vitamin B_{12} absorption), and bile salts (entero-hepatic circulation)	Superior mesenteric artery	Same as jejunum	When compared to jejunum: Paler pink colour 2-3 cm in thickness Thin and light walls Plicae circulares are small and sparse Contains more mesenteric fat Many Peyer's patches
Large Bowel	Absorption of water (5-10% of total water) Bacteria: further digestion of chyme and metabolism of undigested carbohydrate to short chain fatty acids Formation and storage of feces	Branches of superior and inferior mesenteric arteries Rectal blood supply: sigmoid, right pudendal, and rectal arteries	Parasympathetic innervation via vagus nerve Sympathetic innervation via greater and lesser splanchnic nerves	Consists of cecum, colon (ascending, transverse, descending, and sigmoid), rectum and anal canal Features include teniae coli, haustra, and omental appendices
Liver	Glucose homeostasis Plasma protein synthesis Lipid and lipoprotein synthesis Bile acid synthesis and secretion Vitamin A, D, E, K, B_{12} storage Biotransformation, detoxification Excretion of compounds	2 sources Portal vein (75-80%) Hepatic artery (20-25%)	Parasympathetic innervation via fibres of the anterior and posterior vagal trunks Sympathetic innervation via fibres of the celiac plexus	Largest internal organ Composed of 4 lobes (left, right, caudate, quadrate), and divided into 8 segments
Biliary Tract	Gallbladder stores and releases bile that is produced in the liver Bile emulsifies fat and is composed of cholesterol, lecithin, bile acids, and bilirubin CCK stimulates gallbladder emptying while trypsin and chymotrypsin inhibit bile release	Cystic artery	Parasympathetic innervation via vagus nerve Sympathetic and visceral innervation via celiac nerve plexus Somatic afferent fibres via right phrenic nerve	Consists of the hepatic ducts (intrahepatic, left, right and common), gallbladder, cystic duct, common bile duct, and ampulla of Vater
Pancreas	Endocrine function: islets of Langerhans produce glucagon, insulin, and somatostatin (from the α, β, and δ cells, respectively) Exocrine function: digestive enzymes, including amylase, lipase, trypsin, chymotrypsin, and carboxypeptidase, are produced	Anterior superior pancreaticoduodenal artery (from the celiac trunk) Anterior inferior pancreaticoduodenal artery (from the superior mesenteric artery) Dorsal pancreatic artery (from the splenic artery) Pancreatic veins drain into the portal, splenic, and superior mesenteric veins	Parasympathetic innervation via vagus nerve Sympathetic innervation via abdominopelvic splanchnic nerves	4 parts of pancreas: head (includes uncinate process), neck, body, and tail (Major) pancreatic duct connecting to common bile duct prior to ampulla of Vater Accessory pancreatic duct connected directly to duodenum

Visualizing the Gastrointestinal Tract

- see Medical Imaging, MI16

Esophagus, Stomach, Duodenum

- OGD: best visualization of mucosa; also allows for therapeutic intervention (e.g. banding varices, thermal therapy/clipping/injecting bleeding ulcers, and dilatation for the treatment of esophageal strictures)
  - consider barium swallow first if dysphagia, decreased level of consciousness (increases risk of aspiration), inability to cooperate (increases risk of pharyngeal trauma during intubation), possibility of fistulae
  - endotracheal intubation first if massive UGIB, acidemia, or inability to protect airway

Small Bowel

- most difficult to visualize, especially if mucosal detail is needed
- CT enterography more accurate than small bowel follow-through, but both have low sensitivity
- MRI small bowel imaging increasingly available, especially useful if radiation exposure is an issue (e.g. young patient, multiple radiological images already done)
  - note: MRI enteroclysis, luminal contrast is administered by nasojejunal (NJ) tube to dilate the small bowel – disliked by both radiologist and patient, but may improve sensitivity
- "double balloon" enteroscopy (enteroscope with proximal and distal balloons to propel endoscope into jejunum from mouth or into jejunum/ileum from anus) may be most sensitive but currently available only in selected centres; technically demanding
- wireless endoscopy capsule (26 x 11 mm capsule is swallowed, transmits images to a computer; contraindicated in bowel obstruction) is also accurate in diagnosis but unable to provide any therapeutic intervention

Colon and Terminal Ileum

- colonoscopy, with biopsy if required; contraindicated in perforation, acute diverticulitis, and severe colitis (increased risk of perforation)
- CT colonography ("virtual colonoscopy") more accurate in diagnosing diverticulosis, extrinsic pressure on colon (e.g. ovarian cancer compressing sigmoid colon), and fistulae; increasing evidence for use in colorectal cancer screening, especially for assessment of right side of colon in cases where colonoscopy is less sensitive
  - most often used when optical endoscopic colonoscopy is risky (e.g. frail elderly) or unsuccessful (e.g. stricture)

Pancreatic/Biliary Duct

- MRCP almost as sensitive as ERCP in determining if bile duct obstruction present, but less accurate in determining cause of obstruction (tumour, stone, stricture)
- ERCP if therapeutic intervention likely to be required (strong suspicion of stone, obstruction requiring stenting, or if tissue sampling required)
- EUS can provide detailed anatomy of biliary tree and pancreas with potential for sampling/intervention (e.g. cyst drainage)

Acute Upper Abdominal Pain
Remember to rule out thoracic sources (e.g. MI, pneumonia, dissecting aneurysm)

Differential Diagnosis of Common Complaints

- see General and Thoracic Surgery, GS4

Obscure but Treatable Causes of Abdominal Pain
- Acute Intermittent Porphyria
- Hereditary Angioedema
- Familial Mediterranean Fever
- Vasculitis (e.g. polyarteritis nodosa)

Table 2. Differential Diagnosis of Common Presenting Complaints

CHRONIC/RECURRENT ABDOMINAL PAIN	Inflammatory	Neoplastic/ Vascular	Toxin	Other
	PUD Biliary colic IBD Chronic pancreatitis	Gastric cancer Recurrent bowel obstruction Mesenteric ischemia Sickle cell anemia	Lead poisoning	Mittelschmerz Endometriosis Porphyria IBS Radiculopathy Diverticular disease Anterior cutaneous nerve entrapment syndrome
ACUTE DIARRHEA	**Inflammatory**		**Non-Inflammatory**	
*Causes of bloody diarrhea	**Bacterial** *Shigella** *Salmonella** *Campylobacter** *Yersinia** *E. coli* (EHEC 0157:H7)*	**Protozoal** *E. histolytica** (amoebiasis) *Strongyloides* **Others** NSAIDs IBD* Ischemia*	**Bacterial** *S. aureus* *C. perfringens* *B. cereus* *E. coli* (enterotoxigenic, enteropathogenic) *Salmonella enteritidis* *Vibrio cholera* **Protozoal** *Giardia lamblia*	**Viral** Rotavirus Norwalk CMV **Drugs** ABx Colchicine Laxatives Antacids (magnesium)

Inflammatory Diarrhea: Occurs when there is damage to the mucosal lining or brush border, which leads to a passive loss of protein-rich fluids and a decreased ability to absorb these lost fluids. Diarrhea may be profuse or very small in volume. Often associated with abdominal pain ± fever and chills

Non-Inflammatory Diarrhea: No damage to the mucosal lining. Nausea/vomiting may be present. Fever, chills, blood in the stool, severe abdominal pain, or tenderness are not present

Table 2. Differential Diagnosis of Common Presenting Complaints

CHRONIC DIARRHEA	**Organic**				**Functional**
*Causes of bloody diarrhea	**Inflammatory**	**Secretory**	**Steatorrhea**	**Osmotic**	
	IBD* Infectious (TB, CMV, HSV) Ischemic bowel* Radiation colitis Neoplasia *C. difficile* rarely causes bleeding	Stimulant laxatives Post-ileal resection/ cholecystectomy (bile salts) Bacterial toxins Vasculitis Neoplasia* (colon cancer, carcinoid, vasoactive intestinal peptide tumour (i.e. VIPoma)) Addison's disease Congenital syndromes	*Giardia lamblia* Celiac sprue Chronic pancreatitis Chronic cholestasis	Osmotic laxatives Lactose intolerance Chewing gum (sorbitol, mannitol)	IBS Constipation (overflow diarrhea) Anal sphincter dysfunction
CONSTIPATION: if no associated rectal bleeding/weight loss, etc., usually no cause found (and dysmotility assumed)					
	Colorectal cancer Stricture Extrinsic compression Anal disease Rectocele	Medications (narcotics, antidepressants, calcium channel blockers) Metabolic (DM, thyroid, hypercalcemia)	Neurologic (Parkinson's, MS, stroke) Collagen vascular disease (scleroderma, dermatomyositis)		
NAUSEA/VOMITING	**With Abdominal Pain**		**Without Abdominal Pain**		
	Relieved by Vomiting	**Not Relieved by Vomiting**	**Headache/Dizziness**	**No Other Symptoms**	
	Gastric outlet obstruction Small bowel obstruction GERD (regurgitation more common)	Gallbladder disease Pancreatitis MI Hepatitis Infectious Gastroenteritis	Cerebral tumour Migraine Vestibular disease Increased ICP	Drugs Uremia Pregnancy Metabolic (e.g. hypercalcemia) Gastroparesis (e.g. DM) Ketoacidosis	
DYSPEPSIA	**Common**		**Uncommon**	**Rare**	
	Functional dyspepsia Drug side effect Peptic ulcer GERD (esophagitis)		Angina CD Cancer (stomach, pancreas, liver) Gallstones Aerophagia	*Giardia lamblia* Malabsorption (celiac sprue) Pancreatitis	
UPPER GI BLEED	**Common**		**Uncommon**	**Rare**	
	Ulcers (*H. pylori*, ASA, NSAIDs) Esophageal varices Mallory-Weiss tears Erosive esophagitis Erosive gastritis		Tumours Arteriovenous malformation Dieulafoy's lesion (arterial) Gastric antral vascular ectasia (GAVE) Portal hypertensive gastropathy	Aorto-enteric fistulae Hemobilia	
LOWER GI BLEED	**Common**		**Uncommon**	**Rare**	
	Diverticulosis Ischemia Angiodysplasia (elderly) Infectious Anorectal (hemorrhoids, fissure, ulcer)		UGIB (brisk) Post-polypectomy Radiation colitis IBD	Intussusception Vasculitides Stercoral ulcer Coagulopathies	
DYSPHAGIA	**Mechanical (Solids)**		**Motility (Solids and Liquids)**	**Other**	
	Peptic stricture/cancer Eosinophilic esophagitis Extrinsic compression Schatzki ring/esophageal web Zenker's diverticulum		Achalasia DES Scleroderma	Foreign body Eosinophilic esophagitis	
ODYNOPHAGIA	**Infection**	**Inflammation/Ulceration**	**Drugs**	**Other**	
	Candida HSV CMV (common in those who are immunosuppressed)	Caustic damage Eosinophilic esophagitis	Quinidine Iron Vitamin C ABx (e.g. tetracycline) Bisphosphonates	Radiation	
ABDOMINAL DISTENSION	**Fluid (Ascites)**	**Flatulence**	**Feces**	**Other**	
	Portal HTN / **Normal Portal Pressure**				
	Cirrhosis Cardiac failure Hepatic vein thrombosis / Cancer (especially ovarian) Pancreatitis TB	Functional bowel disease (e.g. IBS) Fibre Lactose intolerance Chewing gum (e.g. sorbitol, mannitol)	Constipation Colonic obstruction Dysmotility	Pregnancy (fetus) Obesity (fat) Blood Large tumours (fatal growth)	

IBD is a common cause of bloody diarrhea but can be diagnosed only if mimickers are excluded. Chiefly, infection, ischemia, and medication side effects

Commonly Forgotten Causes of Vomiting

- Drugs
- Uremia
- CNS disease
- Pregnancy
- Cannabis (cannabinoid hyperemesis)

Difference Between Dysphagia and Odynophagia

- **Dysphagia:** Difficulty swallowing due to mechanical obstruction or dysmotility of the esophagus or pharynx
- **Odynophagia:** Pain when swallowing due to ulceration or inflammation (e.g. eosinophilic esophagitis) in the esophagus or pharynx

Differential Diagnosis of Abdominal Distension

6 Fs
Fat
Feces
Fetus
Flatus
Fluid
Fatal growth

Table 2. Differential Diagnosis of Common Presenting Complaints

JAUNDICE (UNCONJUGATED BILIRUBIN)	**Overproduction**	**Decreased Hepatic Intake**	**Decreased Conjugation**
	Hemolysis Ineffective erythropoiesis (e.g. megaloblastic anemias)	Gilbert's syndrome Drugs (e.g. rifampin)	Drug inhibition (e.g. chloramphenicol) Crigler-Najjar syndromes type I and II Gilbert's syndrome Neonatal jaundice
JAUNDICE (CONJUGATED BILIRUBIN)	**Common**		**Uncommon**
	Hepatocellular disease Drugs Cirrhosis (any cause) Inflammation (hepatitis, any cause) Infiltrative (e.g. hemochromatosis) Familial disorders (e.g. Rotor syndrome, Dubin-Johnson syndrome, cholestasis of pregnancy) PBC PSC Sepsis Postoperative/TPN		Intraductal obstruction Gallstones Biliary stricture Parasites Malignancy (cholangiocarcinoma) Sclerosing cholangitis Extraductal obstruction Malignancy (e.g. pancreatic cancer, lymphoma) Metastases in periportal nodes Inflammation (e.g. pancreatitis)

Esophagus

Gastroesophageal Reflux Disease

Definition

- a condition which develops when the reflux of gastric content causes troublesome symptoms or complications

Etiology

- inappropriate transient relaxations of LES – most common cause
- low basal LES tone (especially in scleroderma)
- contributing factors include: delayed esophageal clearance, delayed gastric emptying, obesity, pregnancy, acid hypersecretion (rare) from Zollinger-Ellison syndrome (gastrin-secreting tumour)
- hiatus hernia worsens reflux, does not cause it (see General and Thoracic Surgery, GS15)

Clinical Features

- "heartburn" (pyrosis) and regurgitation (together are 80% sensitive and specific for reflux); less sensitive and less specific: water brash, sensation of a lump in the throat (globus sensation), and frequent belching
- non-esophageal symptoms are increasingly recognized as being poor predictors of reflux

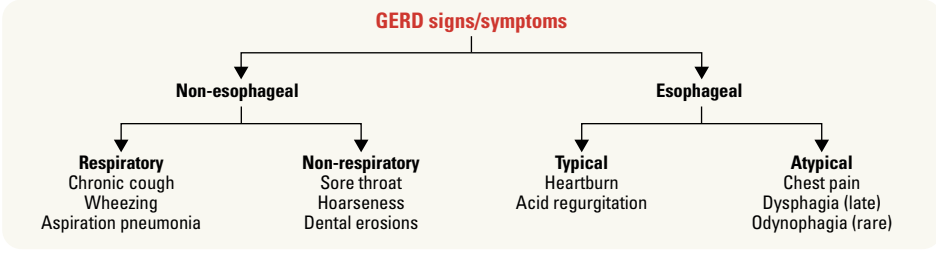

Figure 3. Signs and symptoms of GERD

Investigations

- usually, a clinical diagnosis is sufficient based on symptom history and relief following a trial of pharmacotherapy (PPI: symptom relief 80% sensitive for reflux)
- however, response to anti-secretory agents such as PPI is not a requirement for GERD diagnosis
- gastroscopy indications
  - absolute indications
    - heartburn accompanied by red-flags (bleeding, weight loss, dysphagia, persistent vomiting, family history of GI cancer, etc.)
    - persistent reflux symptoms or prior severe erosive esophagitis after therapeutic trial of 4-8 wk of PPI BID
    - history suggests esophageal stricture especially dysphagia
    - high-risk for BE (male, ages >50, obese, white, tobacco use, long history of symptoms)
- repeat endoscopy after 6-8 wk of PPI therapy indicated if severe esophagitis because it can mask BE or symptoms

Ischemic Colitis
The splenic flexure and rectosigmoid junction are watershed areas and are susceptible to ischemia. History and symptoms include acute onset crampy left abdominal pain, possible abdominal tenderness on exam, and rectal bleeding. Risk factors include atherosclerotic risk factors, vasoconstricting medications, and history of low flow state

Dyspepsia = postprandial fullness, early satiety, epigastric pain or burning

Foods/Substances that May Aggravate GERD Symptoms (but diet does not change the underlying disease)

- EtOH
- Caffeine
- Tobacco
- Fatty/fried foods
- Chocolate
- Peppermint
- Spicy foods
- Citrus fruit juices

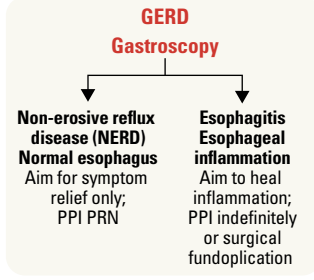

Figure 2. Classification and gastroscopic findings of GERD

Side Effects of Long-Term Use of PPIs

- Only some (*C. difficile* diarrhea, hypomagnesemia, vitamin B_{12} deficiency, small bowel bacterial overgrowth) seem to be related to suppressing gastric acid whereas others (pneumonia, fractures, chronic kidney disease, dementia) have no apparent pathophysiological relationship
- Stopping PPIs can increase gastric acid above baseline by a "rebound effect" causing heartburn even in healthy volunteers
- These associations do not preclude long term use of PPIs in patients with esophagitis or peptic ulcer, or those needing gastric protection when taking NSAIDs or anti-platelet drugs, but do emphasize the importance of being as definitive as possible when making these diagnoses and accurately assessing risk-benefit ratios (as is true for all drugs)

- esophageal manometry (study of esophageal motility): indicated in patients who have a normal gastroscopy but with chest pain and/or dysphagia
  - done to diagnose abnormal peristalsis and/or decreased LES tone, but cannot detect presence of reflux; indicated before surgical fundoplication to ensure intact esophageal function; exclude alternative diagnoses like scleroderma and achalasia
  - surgical fundoplication (wrapping of gastric fundus around the lower end of the esophagus) more likely to alleviate symptoms if lower esophageal pressure is diminished; less likely to be successful if abnormal peristalsis
- 24 h pH monitoring: most accurate test for reflux, but not required or performed in most cases most useful if PPIs do not improve symptoms

Up to 25% of patients with BE do not report symptoms of GERD

Treatment
- PPIs are the most effective therapy and usually need to be continued as maintenance therapy
- on-demand: antacids ($Mg(OH)_2$, $Al(OH)_3$), alginate, H2-blockers, or PPIs can be used for NERD
- diet helps symptoms, not the disease; avoid EtOH, coffee, spices, tomatoes, and citrus juices
- only beneficial lifestyle changes are weight loss (if obese) and elevating the head of bed (if nocturnal symptoms)
- symptoms may recur if therapy is discontinued

Complications
- esophageal stricture disease – scarring can lead to dysphagia (solids)
- esophagitis
- ulcer
- bleeding
- BE and esophageal adenocarcinoma – gastroscopy is recommended for patients with chronic GERD or symptoms suggestive of complicated disease (e.g. anorexia, weight loss, bleeding, dysphagia)

Should Patients with Barrett's Esophagus Undergo Periodic Upper GI Endoscopy for Esophageal Cancer Screening?
Impact of Endoscopic Surveillance on Mortality From Barrett's Esophagus - Associated Esophageal Adenocarcinomas
Gastroenterology 2013;145:273-276
There is no question that Barrett's esophagus increases the incidence of esophageal adenocarcinoma, which can be recognized early on with a safe procedure, endoscopy. Indeed, because early cancer is often asymptomatic and curable, most clinicians recommend periodic upper endoscopy. Yet Corley et al. found no difference in endoscopy rates in BE patients who died of esophageal adenocarcinoma compared to BE patients who died of other diseases. Perhaps this result is due to statistics, but as the accompanying editorial (Gastroenterology 2013;145:273-276) emphasizes, at the very least this finding should question the value of a screening program. In fact, there are multiple other lines of evidence indicating that endoscopic surveillance is of marginal benefit at most. Possible explanations for this disappointing finding include: most esophageal adenocarcinomas may not arise from BE, esophageal carcinoma is too rare a cause of death in BE, morbidity from esophageal cancer treatments, or that endoscopic screening is just not that effective in the real world. The situation is analogous to the disappointing value of serum prostate-specific antigen (PSA) screening for prostate cancer. Therefore, adoption of screening programs requires more than theoretical calculations.

Barrett's Esophagus

Definition
- metaplasia of normal squamous esophageal epithelium to intestinal columnar epithelium

Etiology
- thought to be acquired via long-standing GERD and consequent damage to squamous epithelium

Epidemiology
- in North America and Western Europe, 0.5-20% of adults are thought to have BE
- up to 10% of GERD patients will have already developed BE by the time they seek medical attention
- more common in males, ages >50, White individuals, smokers, overweight, hiatus hernia, and long history of reflux symptoms

Pathophysiology
- endoscopy shows erythematous epithelium in distal esophagus; diagnosis of BE relies on biopsy demonstrating the presence of specialized intestinal epithelium of any length within the esophagus
- BE predisposes first to premalignant changes characterized as low or high-grade dysplasia, which then progresses to adenocarcinoma

Significance
- rate of malignant transformation is approximately 0.12% per yr for all BE patients prior to dysplasia
- risk of malignant transformation in high-grade dysplasia is significantly higher; studies have reported a 32-59% transformation rate over 5-8 yr of surveillance
- increased gastric acid secretion is more frequently associated with BE as opposed to reflux alone

Treatment
- acid suppressive therapy with high-dose PPI indefinitely (or surgical fundoplication)
- surveillance gastroscopy every 3 yr if no dysplasia
- high grade dysplasia: regular and frequent surveillance with intensive biopsy, endoscopic ablation/resection, or esophagectomy produce similar outcomes
  - however, evidence increasingly favouring endoscopic ablation with mucosal resection or radiofrequency ablation
- if low grade dysplasia, both surveillance (every 6 mo for 1 yr then annually) and endoscopic ablation/resection are satisfactory options

Clinical Guidelines Update on the Diagnosis and Management of Barrett's Esophagus
For a report reviewing the US and international guidelines on the diagnosis and management of BE, please refer to: Dig Dis Sci 2018;63:2122-2128

Randomized Trial of Medical vs. Surgical Treatment for Refractory Heartburn
NEJM 2019;381:1513-1523
Patients with PPI-refractory and reflux-related heartburn (n=78) were randomly assigned to surgical treatment (laparoscopic Nissen fundoplication), active medical treatment (omeprazole plus baclofen, and desipramine prn), or control medical treatment (omeprazole plus placebo). The incidence of treatment success in the surgical treatment group (67%) was significantly greater than that in the active medical treatment group (28%; P=0.007) or control medical treatment group (12%; P<0.001).

Dysphagia

Definition
- difficulty swallowing

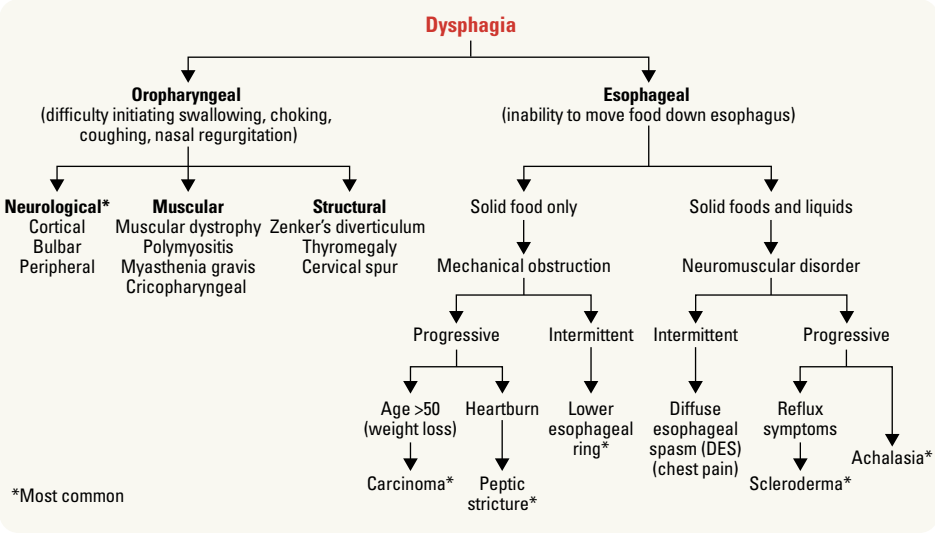

Figure 4. Approach to dysphagia (eosinophilic esophagitis omitted)

Remember:
Dysphagia = Difficulty in swallowing
Odynophagia = Pain on swallowing

Key Questions in Dysphagia
- Difficulty in starting swallowing?
- Associated symptoms? (regurgitation, change in voice pitch, weight loss)
- Solids, liquids, or both?
- Intermittent or progressive?
- History of heartburn?
- Change in eating habits/diet?

Esophageal Motor Disorders

Clinical Features
- dysphagia with solids and liquids
- chest pain (in some disorders)

Diagnosis
- motility study (esophageal manometry)
- barium swallow sometimes helpful

Causes
- idiopathic
- achalasia
- scleroderma
- DM
- DES: rare and can be difficult to diagnose due to intermittent presentation

Table 3. Esophageal Motor Disorders

Disorder	Achalasia	Scleroderma	Diffuse Esophageal Spasm
Definition	Failure of smooth muscle relaxation at LES Increased LES pressure Progressive loss of peristaltic function	See Rheumatology, RH15 Systemic disease characterized by vasculopathy and tissue fibrosis (especially skin thickening)	Normal peristalsis interspersed with frequent, repetitive, spontaneous, high pressure, non-peristaltic waves (tertiary peristalsis)
Etiology	Usually idiopathic 2° or pseudo-achalasia e.g. malignancy, Chagas disease (*Trypanosoma cruzi*))	Involves autoimmune, genetic, hormonal, and environmental factors Dysphagia: caused by reflux, dysmotility, or both	Idiopathic
Pathophysiology	Inflammatory degeneration of Auerbach's plexus → increase in LES pressure, incomplete relaxation of LES with swallowing, aperistalsis	Blood vessel damage → intramural neuronal dysfunction → distal esophageal muscle weakening → aperistalsis and loss of LES tone → reflux → stricture → dysphagia	Potential mechanisms include impaired inhibitory innervation to esophageal body, malfunction in endogenous nitric oxide synthesis
Diagnosis	CXR: no air in stomach, dilated esophagus Barium studies: esophagus terminates in narrowing at LES ("bird's beak") Endoscopy: normal mucosa Manometry: definitive diagnosis (signs listed above)	Clinical features of scleroderma Manometry: decreased pressure in LES, decreased peristalsis in body of esophagus	Barium x-ray: "Corkscrew pattern" Manometry: >30% (but <100%) of esophageal contractions are aperistaltic Endoscopy: normal mucosa
Treatment	Dilatation of LES with balloon, ± GERD prophylaxis, 50% good response, can repeat, 5% risk of perforation Injection of botulinum toxin into LES (temporary) POEM (peroral endoscopic myotomy)	Medical: aggressive GERD therapy (PPIs BID) Surgery: anti-reflux surgery (gastroplasty, last resort)	Reassurance that symptoms are not due to cardiac pain Medical: nitrates, calcium channel blockers, anticholinergics have variable benefit Surgical: long esophageal myotomy if unresponsive to above treatment (rarely helpful), balloon dilatation

Endoscopic or Surgical Myotomy in Patients with Idiopathic Achalasia
NEJM 2019;381:2219-2229
Purpose: To compare peroral endoscopic myotomy (POEM) to laparoscopic Heller's myotomy (LMH) in the treatment of achalasia.
Methods: Patients with symptomatic achalasia (n=221) were randomly assigned to either POEM or LMH. The primary endpoint was clinical success, while secondary endpoints included adverse events, esophageal function, Gastrointestinal Quality of Life (G QoL) score, and gastroesophageal reflux (GER).
Results: 83.0% of patients in the POEM group and 81.7% of patients in the LHM group achieved clinical success at 2 yr (P=0.007 for noninferiority). There was no difference in improvement of esophageal function or G QoL score between groups. Serious adverse events were observed in 2.7% and 7.3% of patients in the POEM and LHM groups, respectively. At 12 mo, 44% of patients in the POEM group and 29% of patients in the LHM group had reflux esophagitis.
Conclusions: POEM was noninferior to LHM in the treatment of symptomatic achalasia. GER was more common among patients who were treated with POEM than those treated with LHM.

Esophageal Diverticula

Definition
- outpouchings of one or more layers of the esophageal tract

Clinical Features
- commonly associated with motility disorders
- dysphagia, regurgitation, retrosternal pain, intermittent vomiting, may be asymptomatic

Classification
- pharyngoesophageal (Zenker's) diverticulum
  - most common form of esophageal diverticulum
  - posterior pharyngeal outpouching most often on the left side, above cricopharyngeal muscle and below the inferior pharyngeal constrictor muscle
  - symptoms: dysphagia, regurgitation of undigested food, halitosis (bad breath)
  - treatment: small and asymptomatic: no treatment required, large and symptomatic: endoscopic or surgical myotomy of cricopharyngeal muscle ± surgical excision of sac

Peptic Stricture (from Esophagitis)

Definition
- a smooth, concentric narrowing most commonly seen in the lower esophagus

Clinical Features
- presents as dysphagia alongside a long history of reflux symptoms, but reflux symptoms may disappear as stricture develops

Diagnosis
- diagnosed with endoscopy or barium study if endoscopy contraindicated or unavailable

Treatment
- endoscopic dilatation and indefinite PPI

Esophageal Carcinoma

- see General and Thoracic Surgery, GS17

Webs and Rings

Definition
- web = partial occlusion (upper esophagus)
- ring = circumferential narrowing (lower esophagus)

Clinical Features
- asymptomatic with lumen diameter >12 mm, provided peristalsis is normal
- dysphagia with large food boluses
- Schatzki ring
  - mucosal ring at squamo-columnar junction
  - causes intermittent dysphagia with solids
  - treatment involves disrupting ring with endoscopic dilation

Plummer-Vinson Syndrome Triad
- Iron deficiency anemia
- Dysphagia
- Esophageal webs
- Rare (prevalence <1 in 1000000) but good prognosis when treated with iron and esophageal dilatation

Infectious Esophagitis

Definition
- severe mucosal inflammation and ulceration as a result of a viral or fungal infection

Risk Factors
- DM
- chemotherapeutic agents
- immunocompromised states

Clinical Features
- characteristically odynophagia, less often dysphagia

Appearance
- *Candida* (most common): whitish-yellow plaques without visible ulceration or inflammation
- HSV (second most common), CMV: focal ulcers

Investigations
- diagnosis via endoscopic visualization and biopsy

Eosinophilic Esophagitis
- Eosinophils infiltrate the epithelium of the esophagus
- Causes odynophagia, dysphagia, common cause of bolus food impaction
- Usually primary, but can be part of the spectrum of eosinophilic gastroenteritis, secondary to drugs, parasites etc.
- Often associated with allergies
- Most characteristically occurs in young men
- Diagnosis established by endoscopic biopsy, suggested by mucosal rings seen in the esophageal mucosa at endoscopy
- Treatment: (a) diet (milk, soy, eggs, wheat, peanuts/tree nuts, and seafood), (b) swallowed topical corticosteroid (fluticasone or budesonide), (c) prednisone

Treatment
- *Candida*: nystatin swish and swallow (for simple *Candida* infection), ketoconazole, fluconazole
- HSV: often self-limiting; acyclovir, valacyclovir, famciclovir
- CMV: IV ganciclovir, famciclovir, or oral valganciclovir

Stomach and Duodenum

Dyspepsia

Definition
- predominant epigastric pain/burning lasting at least 1 mo (predominant associated symptoms are vomiting, weight loss, etc. DDx revolves around these more ominous symptoms)
- other symptoms under umbrella of dyspepsia: post-prandial fullness, early satiety
- although the most common cause is functional (investigations show no organic disease but pain persists), sinister disease can present similarly (e.g. pancreatic cancer)

History and Physical Exam
- history: most important risk factors are age, associated symptoms (such as weight loss and vomiting), and drugs (especially NSAIDs)
- physical exam: adenopathy, abdominal mass/organomegaly, Carnett's sign (if pain is due to abdominal wall muscle problem then the pain will increase during muscle contraction, such as during a sit-up)

Investigations
- consider blood tests including CBC, liver enzymes, calcium, *H. pylori* serology, and U/S
- gastroscopy to investigate dyspepsia: most causes of dyspepsia are either functional or diagnosable by either blood tests or PPI trial (for peptic disease); however, gastric cancer should not be missed. Gastroscopy recommended if ages ≥60 (and if ages <60 and under special circumstances such as risk factors for gastric cancer)

The most common cause of dyspepsia is functional (idiopathic) dyspepsia

Red Flags of Dyspepsia
(raise suspicion of gastric malignancy):
- Unintended weight loss
- Persistent vomiting
- Progressive dysphagia
- Odynophagia
- Unexplained anemia or iron deficiency
- Hematemesis
- Jaundice
- Palpable abdominal mass or lymphadenopathy
- Family history of upper GI cancer
- Previous gastric surgery

Stomach

Table 4. Cells of the Gastric Mucosa

Cell Type	Secretory Product	Important Notes
Parietal Cells	Gastric acid (HCl) and IF	Stimulated by histamine, acetylcholine (ACh), gastrin
Chief Cells	Pepsinogen	Stimulated by vagal input and local acid
D-Cells	Somatostatin	Inhibits release of hormones including gastrin
G-Cells	Gastrin	Stimulates H^+ production from parietal cells
Superficial Epithelial Cells	Mucus, HCO_3^-	Protect gastric mucosa

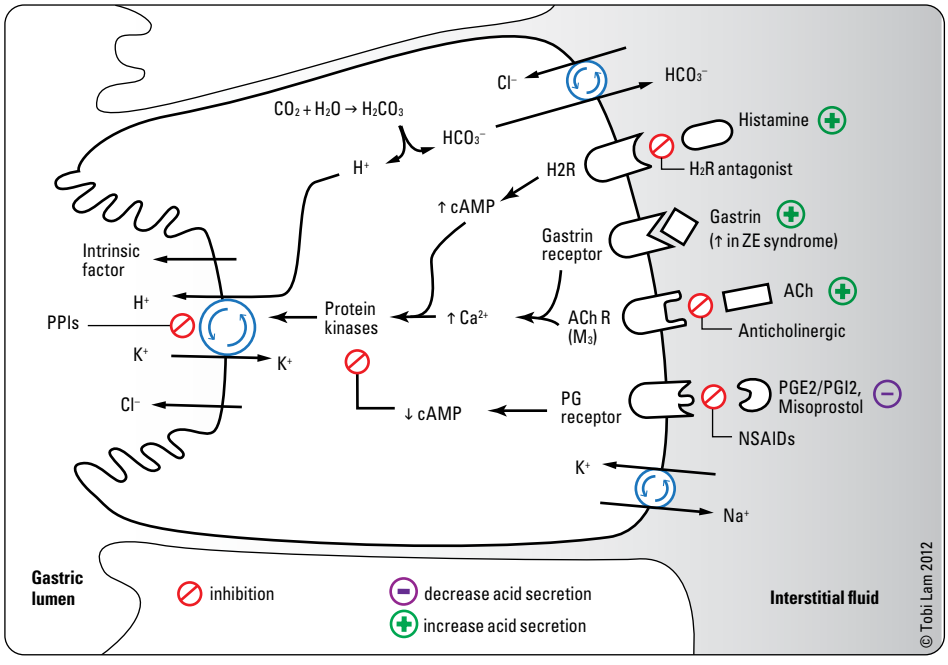

Figure 5. Stimulation of H+ secretion from the parietal cell

Gastritis

Definition
- defined histologically: inflammation of the stomach mucosa

Etiology
- some causative agents may play a role in more than one type of gastritis and an individual patient may have histopathological evidence of more than one type of gastritis

Table 5. Updated Sydney Classification of Gastritis

Type	Common Etiology
Acute Gastritis	
Hemorrhagic/erosive gastritis	EtOH, Aspirin®/NSAID, shock/physiological stress (seen in ICU patients)
Helicobacter gastritis	*H. pylori*
Chronic Gastritis	
Non-atrophic	*H. pylori*
Atrophic	*H. pylori*, dietary, environmental factors (multi-focal), autoimmunity
Chemical	NSAID, bile
Radiation	Radiation injury
Lymphocytic	Celiac disease, drug
Eosinophilic	Food allergies
Non-infectious granulomatous	CD, sarcoidosis
Other infectious gastritides	Bacteria, viruses, fungi, parasite, TB, syphilis

Clinical Features
- non-erosive gastritis is asymptomatic (except with certain rare causes like CD), does not cause pain; difficult to diagnose clinically or endoscopically – requires biopsy for diagnosis
- erosive gastritis can cause bleeding (pain only if progresses to ulcers – rare); can be seen endoscopically

Treatment
- determined by etiology (see *H. pylori*, G13, *NSAID*, G13 and *Stress-Induced Ulceration*, G14)
- non-pharmacological: avoidance of mucosal irritants such as EtOH, NSAIDs, and foods that trigger symptoms

Peptic Ulcer Disease

Definition
- focal defects in the mucosa that penetrate the muscularis mucosa layer; results in scarring (defects superficial to the muscularis mucosa are erosions and do not cause scarring)
- PUD includes defects located in the stomach (gastric ulcers) and duodenum (duodenal ulcers)

Etiology

Table 6. Etiology of PUD

	Duodenal	Gastric
***H. pylori* Infection**	90%	60%
NSAIDs	7%	35%
Physiologic Stress-Induced	<3%	<5%
Zollinger-Ellison Syndrome	<1%	<1%
Idiopathic	15%	10%

- NSAID negative, *H. pylori* negative ulcers becoming more commonly recognized as *H. pylori* prevalence decreases
- others: CMV (especially immunocompromised patients), ischemic, idiopathic
- EtOH: damages gastric mucosa but rarely causes ulcers
- peptic ulcer associated with cigarette smoking, cirrhosis of liver, COPD, and chronic renal failure

Cigarette Smoking and PUD
- Increased risk of ulcer
- Increased risk of complications
- Increased chance of death from ulcer
- Impaired healing

Clinical Features
- dyspepsia: most common presenting symptom
  - only 5% of patients with dyspepsia have ulcers, while most have functional disease
  - however, 70% of peptic ulcers are asymptomatic
- may present with complications
  - bleeding 10% (severe if from gastroduodenal artery), perforation 2% (usually anterior ulcers), gastric outlet obstruction 2%
  - posterior inflammation (penetration) 2%; may also cause pancreatitis

- duodenal ulcers: 6 classical features, but history alone cannot distinguish from functional dyspepsia
  - epigastric pain; may localize to tip of xiphoid
  - burning
  - develops 1-3 h after meals
  - relieved by eating and antacids
  - interrupts sleep
  - periodicity (tends to occur in clusters of weeks with subsequent periods of remission)
- gastric ulcers: more atypical symptoms; a biopsy is necessary to exclude malignancy

Investigations

- endoscopy (most accurate)
- upper GI series
- *H. pylori* tests (see Table 7, G13)
- fasting serum gastrin measurement if Zollinger-Ellison syndrome suspected (but most common cause of elevated serum gastrin level is atrophic gastritis)

Gastric vs. Duodenal Ulcers
Most gastric ulcers are biopsied to rule out malignancies; duodenal ulcers are rarely malignant

Treatment

- specific management depends on etiology; (see *H. pylori*, G13, *NSAID-Induced Ulceration*, G13, and *Stress-Induced Ulceration*, G14)
- treat *H. pylori* infection if present; eradication of infection prevents recurrence of PUD
- stop NSAIDs if possible
- start PPI: inhibits parietal cell H^+/K^+-ATPase pump which secretes acid
  - heals most ulcers, even if NSAIDs are continued
- other medications (e.g. histamine H2-antagonists) less effective
- discontinue cigarette smoking
- no diet modifications required but some people have fewer symptoms if they avoid caffeine, EtOH, and spices

Approach to PUD
- Stop NSAIDs
- Acid neutralization
- *H. pylori* eradication
- Quit smoking

Management of Bleeding Peptic Ulcers

- Gastroscopy (OGD) to explore upper GI tract
- IV pantoprazole continuous drip
- establish risk of rebleeding/continuous bleed (since most ulcers stop bleeding spontaneously)
  - clinical risk factors: increased ages >60, bleeding diathesis, history of PUD, comorbid disease, hemodynamically unstable
  - endoscopic signs of recurrent bleeding (active bleeding, visible vessel, clot, red spot) more predictive than clinical risk factors
    - if ulcer possesses high-risk stigmata, then endoscopic therapy (e.g. clip) should be performed, consider ICU admission

Bleeding Peptic Ulcers
- Risk Factors for Increased Mortality
- Co-existent illness
- Hemodynamic instability
- Ages >60 yr
- Transfusion required

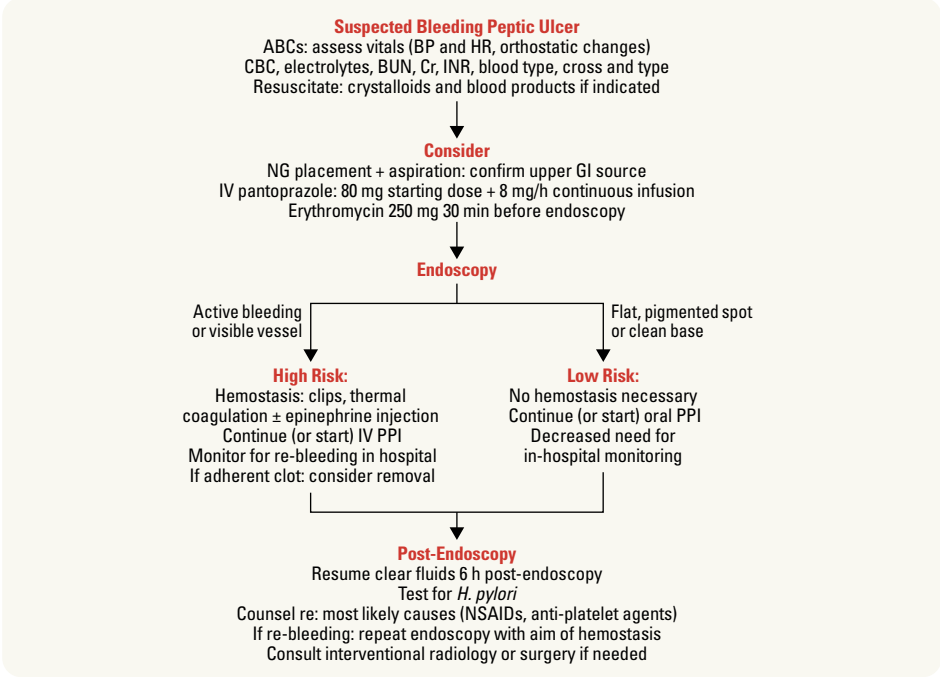

Figure 6. Approach to management of suspected bleeding peptic ulcer
Adapted from: Gralnek I, Barkun A, Bardou M. Management of acute bleeding from a peptic ulcer. NEJM 2008;359:928-937

H. pylori-Induced Peptic Ulceration

Pathophysiology

- *H. pylori*: Gram-negative flagellated rod that resides within the gastric mucosa, causing persistent infection and inflammation
- acid secreted by parietal cells (stimulated by vagal ACh, gastrin, histamine) necessary for most ulcers
- etiology of PUD secondary to *H. pylori* is not well understood; however, the pattern of colonization correlates with outcome
- gastritis only in antrum (15% of patients), high gastric acid, associated with duodenal ulcer, may progress to gastric metaplasia of duodenum where ulcer forms
- gastritis throughout stomach ("pangastritis" – 85% of patients), low gastric acid, associated with stomach ulcer and cancer

Epidemiology

- *H. pylori* is found in about 20% of all Canadians, with increased prevalence in Indigenous populations and immigrants from high prevalence countries
- highest prevalence in those raised during 1930s
- infection most commonly acquired in childhood, presumably by fecal-oral route
- high prevalence in developing countries, low socioeconomic status (poor sanitation and overcrowding)

Outcome

- gastritis (non-erosive) occurs in 100% of patients but is asymptomatic
- peptic ulcer in 15% of patients
- gastric carcinoma and mucosal associated lymphomatous tissue (MALT) lymphoma in 0.5% of patients
- most are asymptomatic but still worthwhile eradicating to lower future risk of peptic ulcer/gastric malignancy and prevent spread to others (mostly children ages <5)

Diagnosis

Table 7. Diagnosis of *H. pylori* Infection

Test	Sensitivity	Specificity	Comments
Non-invasive Tests			
Urea breath test	90-100%	89-100%	Affected by PPI therapy (false negatives)
Serology	88-99%	89-95%	Does not distinguish active vs. past infection Can remain positive after treatment
Fecal antigen			Only rarely used in clinical practice
Invasive Tests (require endoscopy)			
Histology	93-99%	95-99%	Gold standard; affected by PPI therapy (false negatives)
Rapid urease test (on biopsy)	89-98%	93-100%	Rapid
Microbiology culture	98%	95-100%	Not widely available but can be used to determine ABx susceptibility. Research only

Treatment: *H. pylori* Eradication

- bismuth quadruple therapy recommended for 14 d: PPI (e.g. lansoprazole 30 mg BID) + bismuth 525 mg QID + metronidazole 500 mg QID + tetracycline 500 mg QID
- alternatively, concomitant nonbismuth quadruple therapy for 10-14 d: PPI + amoxicillin + metronidazole + clarithromycin

***Helicobacter pylori* Therapy for the Prevention of Metachronous Gastric Cancer**
NEJM 2018;378:1085-1095
Purpose: To evaluate the role of *H. pylori* eradication in the prevention of metachronous gastric cancer.
Study: Double-blinded RCT.
Population: 470 patients with a subtotal gastrectomy for gastric cancer and *H. pylori* infection with or without ABx treatment.
Outcome: Incidence of metachronous gastric cancer.
Results: After almost 6 yr, 7.2% of the ABx-treated group developed another cancer in the gastric remnant vs. 13.4% in the placebo control group.
Conclusions: This provides definitive evidence that *H. pylori* is worthwhile treating no matter how advanced the gastric carcinogenic process.

Serology for *H. pylori* should not be used to check for eradication

NSAID-Induced Ulceration

Pathophysiology

- NSAID use causes gastric mucosal petechiae in virtually all, erosions in most, ulcers in some (25%)
- direct: erosions/petechiae – are due to local (direct) effect of drug on gastric mucosa
- indirect: systemic NSAID effect (IV NSAID causes ulcers, but not erosions)
  - NSAIDs also inhibit mucosal cyclooxygenase, leading to decreased prostaglandin synthesis
  - this results in ulcers from reduced secretion of protective bicarbonate and mucous, and decreased mucosal blood flow

Risk Factors for NSAID-induced Peptic Ulcer

- previous peptic ulcers/UGIB
- age (≥65 yr)
- high dose of NSAID/multiple NSAIDs being taken
- concomitant corticosteroid use
- concomitant cardiovascular disease/other significant diseases

Clinical Features
- erosions bleed, but usually only ulcers cause significant clinical problems
- most NSAID-induced ulcers are clinically asymptomatic: dyspepsia is as common in patients with ulcers as in patients without ulcers; NSAID-induced ulcers characteristically present with complications (bleeding, perforation, obstruction)
- NSAIDs more commonly cause gastric ulcers than duodenal ulcers
- may exacerbate underlying duodenal ulcer disease

Treatment
- prophylactic cytoprotective therapy with a PPI is recommended if any of the above risk factors exist concomitantly with ASA/NSAID use
- lower NSAID dose or stop all together and replace with acetaminophen
- combine NSAID with PPI or misoprostol (less effective) in one tablet
- enteric coating of Aspirin® (ECASA) provides minor benefit since this decreases incidence of erosion, not incidence of ulceration

If at high-risk for development of ulcers, prophylaxis with PPI indicated

Stress-Induced Ulceration

Definition
- ulceration or erosion in the upper GI tract of ill patients, usually in ICU (stress is physiological, not psychiatric)
- lesions most commonly in fundus of stomach

Pathophysiology
- unclear: likely involves ischemia; may be caused by CNS disease, acid hypersecretion, Cushing's ulcers
- mechanical ventilation is the most important risk factor

Risk Factors
- mechanical ventilation
- anti-coagulation
- multi-organ failure
- septicemia
- severe surgery/trauma
- CNS injury ("Cushing's ulcers")
- burns involving more than 35% of body surface

Curling's and Cushing's Ulcers
- **Curling's Ulcer:** acute peptic ulcer of the duodenum resulting as a complication from severe burns when reduced plasma volume leads to ischemia and cell necrosis (sloughing) of the gastric mucosa (think BURN from a CURLing iron)
- **Cushing's Ulcer:** peptic ulcer produced by elevated ICP (may be due to stimulation of vagal nuclei secondary to elevated ICP which leads to increased secretion of gastric acid)

Clinical Features
- UGIB (see *Upper Gastrointestinal Bleeding*, G28)
- painless

Treatment
- prophylaxis with gastric acid suppressants decreases risk of UGIB; PPI most potent but may increase risk of pneumonia; H2 blockers less potent but less likely to cause pneumonia
- treatment same as for bleeding peptic ulcer but often less successful

Gastric Carcinoma

- see General and Thoracic Surgery, GS25

Small and Large Bowel

Classification of Diarrhea

Definition
- clinically: diarrhea defined as stools that are looser and/or more frequent than normal (i.e. ≥3x/d); physiologically: 24 h stool weight >200 g (less useful clinically)

Classification
- acute vs. chronic
- small volume (tablespoons of stool; typical of colonic diseases) vs. large volume (>1/2 cup stool; typical of small bowel diseases)
- watery: secretory (diarrhea persists with fasting) vs. osmotic (diarrhea stops with fasting)
- steatorrhea
- inflammatory
- transit or functional

Acute Diarrhea

- see Paediatrics, P43

Definition
- passage of ≥3 loose or liquid stools/d OR >200 g stool/d for >2 d but ≤14 d

Epidemiology
- one of the leading causes of death worldwide (about 88% of diarrhea associated deaths are caused by unsafe water, inadequate sanitation, and insufficient hygiene)
- significant morbidity in developed countries (over 900000 hospitalizations in the United States each year)

Etiology
- most commonly due to infections
- most infections are self-limiting and resolve within 7 d

Risk Factors
- food (raw or undercooked meat and seafood, unpasteurized dairy products)
- medications: ABx, laxatives
- others: high-risk sexual activity, infectious outbreaks, occupational exposures (daycare workers), family history (IBD)

Approach to Acute Diarrhea
- the most common cause of acute diarrhea is infectious
- in most cases, acute diarrheal illness is viral and/or self-limited, and lasts <3 d
- investigations are costly and are necessary only in certain circumstances
  - therefore, evaluation of acute diarrhea involves identifying characteristics of the patient or illness that warrant further investigation and assessing volume status to determine the most appropriate method of rehydration

Physical Exam
- volume status: appearance, level of alertness, pulse, BP, orthostatic vitals, JVP, mucous membranes, skin turgor, capillary refill
- abdominal exam: pain, guarding, peritoneal signs

Table 8. Classification of Acute Diarrhea

	Inflammatory	Non-Inflammatory
Definition	Disruption of intestinal mucosa	Intestinal mucosa intact
Site	Usually colon	Usually small intestine
Mechanism	Organisms and cytotoxins invade mucosa, resulting in the destruction of mucosal cells, and perpetuation of the diarrhea	Stimulation of intestinal water secretion and inhibition of water absorption (i.e. net secretion)
Sigmoidoscopy	Usually abnormal mucosa seen	Usually normal mucosa seen
Symptoms	Bloody (not always) Small volume, high frequency Often lower abdominal cramping with urgency ± tenesmus May have fever ± shock	Watery, little or no blood Large volume, low frequency Upper/periumbilical pain/cramping ± shock
Investigations	Fecal WBC and RBC positive	Fecal WBC negative
Etiology	See *Differential Diagnosis of Common Complaints*, G4	See *Differential Diagnosis of Common Complaints*, G4
Differential Diagnosis	Acute presentation of idiopathic IBD	Acute presentation of non-inflammatory chronic diarrhea (e.g. celiac disease)
Significance	Higher yield with stool C&S Can progress to life-threatening megacolon, perforation, hemorrhage ABx may be helpful	Lower yield with stool C&S Chief life-threatening problem is electrolyte disturbances/ fluid depletion ABx unlikely to be helpful

Investigations
- stool cultures/microscopy (C&S/O&P) are required only if diarrhea is inflammatory, severe, or for epidemiological purposes (daycare worker, nursing home resident, community outbreaks, e.g. Walkerton, etc.)
  - O&P takes up to three weeks to obtain the results
  - C&S only tests *Campylobacter, Salmonella, Shigella, E. coli, Yersinia*
    - other organisms must be ordered separately
- flexible sigmoidoscopy (without bowel preparation): useful if inflammatory diarrhea suspected
  - histology (i.e. biopsies of mucosa) helps to distinguish idiopathic IBD (CD and UC) from infectious colitis or acute self-limited colitis
- *C. difficile* toxin: indicated in cases with recent/remote antibiotic use, hospitalization, nursing home living, or recent chemotherapy

Useful Questions in Acute Diarrhea

Those **F**ads **W**ilt
Travel
High-risk sexual activity (increased risk of fecal-oral exposure)
Outbreaks
Seafood
Extra intestinal signs of IBD
Family history
ABx
Diet
Steatorrhea
Weight loss
Immunosuppression
Laxatives
Tumour history

Infectious Causes of Inflammatory Diarrhea

Your **S**tool **S**mells **E**xtremely **C**rappy
***Y**ersinia*
***S**higella*
***S**almonella*
***E**. coli* (EHEC 0157:H7), ***E**. histolytica*
***C**ampylobacter*, ***C**. difficile*

Finally: A Role for Bacteriotherapy
Duodenal Infusion of Donor Feces for Recurrent *Clostridium difficile*
NEJM 2013;368:407-415
For centuries, out-of-the-box thinkers have speculated that colonic bacteria, which differ among individuals, play a role in disease. More recently, the colonic microbiome has become the hottest area of research in gastroenterology. The best documented medical indication for manipulating the colonic bacteria is recurrent *C. difficile* infection. In this randomized study of this disease, infusion of donor feces via a nasoduodenal tube resolved diarrhea in 81% of patients, without side effects, compared to 31% given the standard treatment of oral vancomycin, and 23% of patients given oral vancomycin plus bowel lavage.

Treatment

- fluid and electrolyte replacement orally in most cases, intravenously if severe extremes of age/coma
- antidiarrheals
  - antimotility agents: diphenoxylate, loperamide (Imodium®) should be used with caution; contraindicated in patients with mucosal inflammation, bloody diarrhea
  - side effects: abdominal cramps, toxic megacolon
  - modifiers of fluid transport: bismuth subsalicylate (Pepto-Bismol®) may be helpful (but should not be used in the presence of bloody diarrhea or fever)
- ABx: rarely indicated
  - risks
    - prolonged excretion of enteric pathogen (especially *Salmonella*)
    - drug side effects (including *C. difficile* infection)
    - development of resistant strains
    - renal failure/hemolysis (enterohemorrhagic *E. coli* O157:H7)
  - indications for antimicrobial agents in acute diarrhea
    - septicemia
    - prolonged fever with fecal blood (bloody diarrhea) or WBCs seen on O&P
    - clearly indicated: *Shigella, V. cholerae, C. difficile*, traveller's diarrhea (*E. coli* (ETEC)), *Giardia, Entamoeba histolytica, Cyclospora*
    - situational: *Salmonella, Campylobacter, Yersinia*, non-enterotoxigenic *E. coli*
    - *Salmonella*: always treat *Salmonella typhi* (typhoid or enteric fever); treat other *Salmonella* only if there is underlying immunodeficiency, hemolytic anemia, extremes of age, aneurysms, prosthetic valve grafts/joints, sickle cell disease
- report diarrheal illness to public health if appropriate

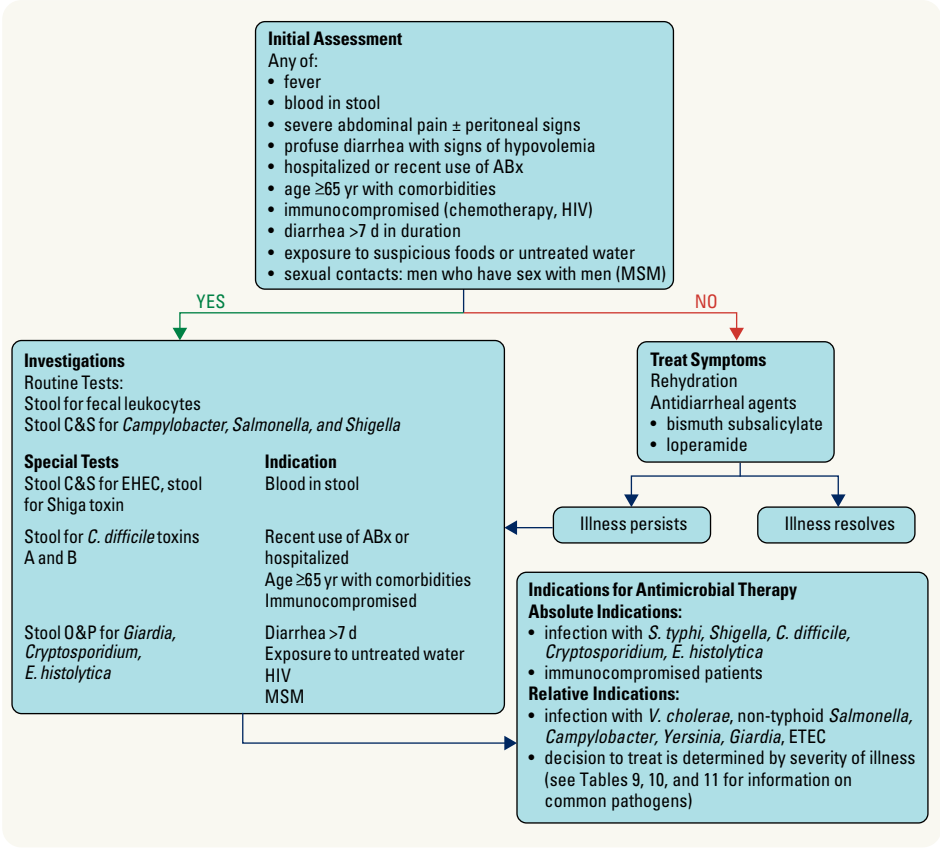

Figure 7. Approach to acute diarrhea
Note: *S. typhi* has a rose spot rash (transient maculopapular rash on anterior thorax, upper abdomen), and a prodrome of high fever, bradycardia, headache, and abdominal pain. Diarrhea is not the initial presentation

Causes of Acute Bloody Diarrhea

CHESS
C*ampylobacter*
Hemorrhagic *E. coli* (e.g. O157:H7)
E*ntamoeba histolytica*
S*almonella*
S*higella*

Table 9. Bacteria in Infectious Diarrhea

Pathogen	Source or Mode of Transmission	Incubation	Clinical Features				Duration	Antimicrobial Therapy	Notes
			Fever	Bloody Stool	Abdo Pain	Nausea/ Vomiting			
***B. cereus* – Type A (emetic)**	Rice dishes	1-6 h	–	–	–	+	<12 h	None	Preformed exotoxin
***B. cereus* – Type B (diarrheal)**	Meats, vegetables, dried beans, cereals	8-16 h	–	–	–	–	<24 h	None	Secondary endotoxin
Campylobacter jejuni	Uncooked meat, especially poultry	2-10 d	+	±	+	±	<1 wk	Macrolide or fluoroquinolone if diarrhea >1 wk, bloody diarrhea, or immunocompromised	Most common bacterial cause of diarrhea in Canada Associated with Guillain-Barré syndrome
Clostridium difficile	Can be normally present in colon in small numbers (primary risk factor for disease is exposure to antimicrobials)	Unclear	±	±	±	–	Variable	Stop culprit antibiotic therapy if possible Supportive therapy (IV fluids) Empiric treatment with either vancomycin or fidaxomicin If access to empiric treatment is limited, then metronidazole may be used For fulminant *C. difficile* infection (previously called severe), oral vancomycin is used. IV metronidazole added to regimen if ileus present	Usually follows antibiotic treatment (especially clindamycin, fluoroquinolones, penicillins, cephalosporins) Can develop pseudomembranous colitis
Clostridium perfringens	Contaminated food, especially meat and poultry	8-12 h	±	–	+	–	<24 h	None	*Clostridium* spores are heat resistant Secondary enterotoxin Enteroinvasive
***E. coli* (EIEC)**	Contaminated food/ water	1-3 d	+	±	+	–	7-10 d	None	Relatively uncommon Enterotoxigenic
***E. coli* (ETEC)**	Contaminated food/ water	1-3 d	–	–	+	–	3 d	Fluoroquinolone or azithromycin for moderate to severe symptoms	Most common cause of traveller's diarrhea Heat-labile and heat-stable toxins
Enterohemorrhagic *E. coli* (EHEC/STEC) i.e. O157:H7	Contamination of hamburger, raw milk, drinking, and recreational water	3-8 d	–	+	+	±	5-10 d	None: ABx increase risk of HUS	Shiga toxin production Monitor renal function:10% develop HUS Antidiarrheals increase risk of HUS
***Salmonella Typhi S. Paratyphi* (i.e. Enteric Fever, Typhoid)**	Fecal-oral Contaminated food/ water Travel to endemic area	10-14 d	+	±	+	±	<5-7 d	Empiric treatment with ceftriaxone, ciprofloxacin, or azithromycin Fluoroquinolone resistance is increasing	*Salmonella typhi*: "Rose spot" rash (on anterior thorax, upper abdomen), fever, and abdominal pain precedes diarrhea
Non-typhoidal Salmonellosis *S. Typhimurium, S. Enteritidis*	Contaminated animal food products, especially eggs, poultry, meat, milk	12-72 h	+	±	+	+	3-7 d	Ciprofloxacin only in severe illness, extremes of age, joint prostheses, valvular heart disease, severe atherosclerosis, cancer, uremia	
Shigella dysenteriae	Fecal-oral Contaminated food/ water	1-4 d	+	±	+	+	<1 wk	Fluoroquinolone	Very small inoculum needed for infection Complications include toxic megacolon, HUS Antidiarrheals may increase risk of toxic megacolon
Staphylococcus aureus	Unrefrigerated meat and dairy products (custard, pudding, potato salad, mayo)	2-4 h	–	–	+	+	1-2 d	None	Heat-stable preformed exotoxin
Vibrio cholerae	Contaminated food/ water, especially shellfish	1-3 d	–	–	–	+	3-7 d	Tetracycline or fluoroquinolones (ciprofloxacin)	Massive watery diarrhea (1-3 L/d) Mortality <1% with treatment
Yersinia	Contaminated food Unpasteurized milk	5 d	+	±	+	±	Up to 3 wk	Fluoroquinolone only for severe illness	Majority of cases in children 1-4 yr Mesenteric adenitis and terminal ileitis can occur without diarrhea, mimicking appendicitis Can also mimic CD of terminal ileum

Table 10. Parasites in Infectious Diarrhea

Pathogen	Source or Mode of Transmission	Incubation	Clinical Features				Duration	Antimicrobial Therapy	Notes
			Fever	Bloody Stool	Abdo Pain	Nausea/ Vomiting			
Cryptosporidium	Fecal-oral	7 d	±	–	–	+	1-20 d	Paromomycin + nitazoxanide	Immune reconstitution if immunosuppressed
Entamoeba histolytica	Worldwide endemic areas Fecal-oral	2-4 wk	±	+	–	+	Variable	Metronidazole + iodoquinol or paromomycin if symptomatic infection Only iodoquinol or paromomycin for asymptomatic cyst passage	If untreated, potential for liver abscess Sigmoidoscopy may show flat ulcers with yellow exudates
Giardia lamblia	Fecal-oral Contaminated food/ water	1-4 wk	–	–	+	+	Variable	Metronidazole or nitazoxanide Treatment of asymptomatic carriers NOT recommended	Higher risk in: daycare children, intake of untreated water ("beaver fever"), MSM, immunodeficiency (decreased IgA) May need duodenal biopsy

Table 11. Viruses in Infectious Diarrhea

Pathogen	Source or Mode of Transmission	Incubation	Clinical Features				Duration	Antimicrobial Therapy	Notes
			Fever	Bloody Stool	Abdo Pain	Nausea/ Vomiting			
Norovirus	Fecal-oral	24 h	–	–	+	+	24 h	None	Noroviruses include Norwalk virus
Rotavirus	Fecal-oral	2-4 d	±	–	–	±	3-8 d	None	Can cause severe dehydration Virtually all children are infected by 3 yr Oral vaccine given at 2 and 4 mo

Traveller's Diarrhea

Epidemiology

- most common illness to affect travellers
- up to 50% of travellers to developing countries affected in first 2 wk and 10-20% after returning home

Etiology

- bacterial (80-90%): *E. coli* most common (ETEC), *Campylobacter, Shigella, Salmonella, Vibrio* (non-cholera); wide regional variation (e.g. *Campylobacter* more common in Southeast Asia)
- viral: norovirus, rotavirus, and astrovirus account for 5-8%
- protozoal (rarely): *Giardia, Entamoeba histolytica, Cryptosporidium*, and *Cyclospora* for ~10% in long-term travellers
- pathogen-negative traveller's diarrhea common despite exhaustive microbiological workup

Treatment

- rehydration is the mainstay of therapy
  - rehydrate with sealed beverages
  - in severe fluid loss, use oral rehydration solutions (1 package in 1 L boiled or treated water)
- treat symptoms: antidiarrheal agents (e.g. rifamycin ABx, bismuth subsalicylate, loperamide)
- empiric ABx in moderate or severe illness: ciprofloxacin, azithromycin, or rifaximin

note: there is increasing fluoroquinolone resistance in causative agents, especially in South and Southeast Asia

Prevention

- proper hygiene practices
  - avoid consumption of: foods or beverages from establishments with unhygienic conditions (e.g. street vendors), raw fruits or vegetables without a peel, raw or undercooked meat and seafood
  - avoid untreated water
- bismuth subsalicylate (Pepto-Bismol®): 60% effective (2 tablets QID)
- antibiotic prophylaxis not recommended
  - increased risk of infection with resistant organisms
  - high-risk groups (e.g. immunocompromised individuals) likely to be infected with pathogen not covered by standard antimicrobial agents

- Dukoral®: oral vaccine that offers protection against *V. cholerae* (efficacy ~80%) and ETEC (efficacy ~50-67%)
  - two doses should be taken two weeks prior to traveling and the effect may last up to three months
  - Public Health Agency of Canada recommends that it may be considered for the following situations (not recommended for routine use in travellers):
    - increased risk of acquiring traveller's diarrhea (gastric hypochlorhydria or young children >2 yr)
    - short-term travellers who are high-risk (e.g. chronic illness) and have an increased risk of serious consequences of traveller's diarrhea (e.g. chronic renal failure, CHF, T1DM, IBD)
    - immunosuppression
    - history of repeat traveller's diarrhea
    - travellers to cholera endemic countries at increased risk of exposure
- two vaccines against *Salmonella typhi* are available and their effectiveness is estimated to be 50-70%

Chronic Diarrhea

Definition
- passage of frequent unformed stool for >4 wk (compared to persistent diarrhea lasting 14-30 d)

Etiology/Classification
- majority of cases are non-infectious
- see *Differential Diagnosis of Common Complaints*, G5

Investigations
- guided by history
- stool analysis for: *C. difficile* toxin, C&S, O&P ± fecal fat, WBC
- blood for: CBC, electrolytes, C-reactive protein (CRP) , TSH, celiac serology (IgA anti-tTG; ask for serum protein electrophoresis or immunoglobulin quantitation to rule out IgA deficiency, which has an increased frequency in celiac disease)
- colonoscopy and ileoscopy with biopsy
- upper GI endoscopy with duodenal biopsy
- wireless small bowel endoscopy capsule (low yield)
- trial of lactose free diet
  - caveat: may delay diagnosis of IBD and celiac disease

Treatment
- approach is similar to that of acute diarrhea

Maldigestion and Malabsorption

Definition
- maldigestion: inability to break down large molecules in the lumen of the intestine into their component small molecules
- malabsorption: inability to transport molecules across the intestinal mucosa into circulation

Etiology
- maldigestion
  - inadequate mixing of food with enzymes (e.g. post-gastrectomy)
  - pancreatic exocrine deficiency
  - primary diseases of the pancreas (e.g. cystic fibrosis (CF) (remember CF can result in pancreatic exocrine insufficiency as well), pancreatitis, cancer)
  - bile salt deficiency
    - terminal ileal disease (impaired enterohepatic recycling in view of loss greater than synthesis), bacterial overgrowth (deconjugation of bile salts), rarely liver disease (cholestatic, e.g. PBC)
  - specific enzyme deficiencies (e.g. lactase)
- malabsorption
  - inadequate absorptive surface
    - infections/infestations (e.g. Whipple's disease, *Giardia*)
    - immunologic (e.g. celiac disease)
    - infiltration (e.g. lymphoma, amyloidosis)
    - fibrosis (e.g. systemic sclerosis, radiation enteritis): can lead to loss of surface area but also areas of stricture formation resulting in stasis with small bowel overgrowth
    - small bowel resection (length, site, location, presence/absence of ileocecal valve, and integrity of colon are important)
    - congenital (e.g. short bowel syndrome)
    - inflammatory: extensive ileal CD (pivotal number is 100 cm as <100 cm = bile salt or choleretic diarrhea, >100 cm = fatty diarrhea or steatorrhea)

- drug-induced
  - cholestyramine, ethanol, neomycin, tetracycline, and other ABx
- endocrine
  - DM (complex pathogenesis)

Fat Soluble Vitamins: ADEK
vitamin **A**, vitamin **D**, vitamin **E**, vitamin **K**

Clinical Features
- symptoms usually vague unless disease is severe
- weight loss, diarrhea, steatorrhea, weakness, fatigue
- manifestations of malabsorption/deficiency

Table 12. Absorption of Nutrients and Fat Soluble Vitamins

Deficiency	Absorption	Clinical Disease and/or Features	Investigations
Iron	Duodenum, upper jejunum	Hypochromic, microcytic anemia, glossitis, koilonychia (spoon nails), pica	↓ Hb, ↓ serum Fe, ↓ serum ferritin
Calcium	Duodenum, upper jejunum (binds to Ca^{2+} binding-protein in cells; levels increased by vitamin D)	Metabolic bone disease, may get tetany and paresthesias if serum calcium falls* (see Endocrinology, E43)	↓ Serum Ca^{2+}, ↓ serum Mg^{2+}, and ↑ ALP Evaluate for ↓ bone mineralization radiographically (dual energy x-ray absorptiometry, DEXA)
Folic Acid	Jejunum	Megaloblastic anemia, glossitis, ↓ red cell folate (may see ↑ folic acid with bacterial overgrowth)	↓ Serum folic acid
Vitamin B_{12}	B_{12} ingested and bound to R proteins mainly from salivary glands; stomach secretes IF in acidic medium; in basic medium, proteases from the pancreas cleave R protein and B_{12}-IF complex forms, protecting B_{12} from further protease attack; B_{12} absorbed in ileum and binds to transcobalamin (TC)	Subacute combined degeneration of the spinal cord, peripheral/optic neuropathy, dementia, megaloblastic anemia, glossitis	Differentiate causes by nuclear Schilling test (when available) Positive anti-intrinsic factor antibodies and atrophic gastritis point toward pernicious anemia (see Hematology, H25)
Carbohydrate	Complex polysaccharides hydrolyzed to oligosaccharides and disaccharides by salivary and pancreatic enzymes Monosaccharides absorbed in duodenum/jejunum	Generalized malnutrition, weight loss, flatus, and diarrhea	Hydrogen breath test Trial of carbohydrate-restricted diet D-xylose test
Protein	Digestion at stomach, brush border, and inside cell Absorption occurs primarily in the jejunum	General malnutrition and weight loss, amenorrhea, and ↓ libido if severe	↓ Serum albumin (low sensitivity)
Fat	Lipase, colipase, phospholipase A (pancreatic enzymes), and bile salts needed for digestion Products of lipolysis form micelles which solubilize fat and aid in absorption Absorption occurs primarily in the jejunum Fatty acids diffuse into cell cytoplasm	Generalized malnutrition, weight loss, and diarrhea Foul-smelling feces + gas Steatorrhea	Small bowel biopsy MRCP, ERCP, pancreatic function tests (not routinely available) Quantitative stool fat test (72 h) May start with qualitative stool fat test (Sudan stain of stool) C-triolein breath test (not routinely available)
Vitamin A	Dietary sources (e.g. milk, eggs, liver, carrots, sweet potatoes)	Night blindness Dry skin Keratomalacia	
Vitamin D	Skin (via UV light) or diet (e.g. eggs, fish oil, fortified milk)	Osteomalacia in adults Rickets in children	
Vitamin E	Dietary sources (e.g. vegetable oils, nuts, leafy green vegetables)	Retinopathy, neurological problems	
Vitamin K	Synthesized by intestinal flora ↑ risk of deficiency after prolonged use of broad spectrum ABx and/or starvation	Prolonged INR may cause bleeding	

* Calcium malabsorption more commonly causes decreased bone density rather than hypocalcemia because serum calcium levels are protected by leaching calcium from the bone

Investigations
- tTG-IgA antibody serology/immunoglobulin A quantitation and abdominal imaging are most useful because celiac disease and chronic pancreatitis are the two most common causes of steatorrhea
- 72 h stool collection (weight, fat content) documents steatorrhea (gold standard)
- fecal elastase to screen for pancreatic insufficiency and/or consider empiric trial of pancreatic enzymes based on clinical context
- serum carotene (precursor to vitamin A), folate, Ca^{2+}, Mg^{2+}, vitamin B_{12}, albumin, ferritin, serum iron solution, international normalized ratio/partial thromboplastin time (INR/PTT)
- stool fat globules on fecal smear stained with Sudan (used as an initial qualitative screening tool)
- other tests specific for etiology (e.g. CT scan/MRI to visualize pancreas)

Treatment
- dependent on underlying etiology

Celiac Disease (Gluten Enteropathy/Sprue)

Definition
- abnormal small intestine mucosa due to intestinal reaction to gluten, a protein found in wheat, barley, rye, and possibly oats (certified gluten-free oats may be acceptable in a subgroup of patients)

Etiology
- unique autoimmune disease because the genetics (HLA-DQ2/8), the auto-antigen (tTG), and the environmental trigger (gluten) are all known
- associated with other autoimmune diseases, especially Sjögren's, T1DM, thyroid disease
- gluten is broken down to gliadin, which is the toxic protein
- HLA-DQ2 (chromosome 6) found in 80-90% of patients compared to 20% of the general population; celiac also associated with HLA-DQ8
- HLA-DQ2/Q8 are necessary permissive genes, but their presence does not confer a diagnosis of celiac disease (note: up to 40% of White individuals carry the HLA alleles, but will never develop celiac disease)

Early Gluten Introduction and Celiac Disease in the EAT Study: A Prespecified Analysis of the EAT Randomized Clinical Trial
JAMA Pediatr 2020;174:1-7
Purpose: Determine whether introduction of high-dose gluten lowers celiac disease prevalence at 3 yr of age
Methods: Infants were randomized to consume 6 allergenic foods in addition to breast milk from age 4 mo (early introduction), or to avoid allergenic foods and follow exclusive breastfeeding guidelines (standard introduction). Evaluation of celiac disease was an a priori secondary outcome of the EAT trial, tested at age 3 with anti transglutaminase 2 antibodies.
Results: 1.4% of infants in the standard introduction group had a celiac disease diagnosis confirmed, versus 0% of infants in the early introduction group.
Conclusion: Introduction of gluten from age 4 mo was associated with a reduction in the prevalence of celiac disease.

Epidemiology
- more common in women
- prevalence: 1 first degree relative: 10%; 2 first degree relatives: 20%
- may present any time in life, with peak presentation in infancy (when cereals introduced)

Clinical Features
- classic presentation: diarrhea, weight loss, anemia, symptoms of vitamin/mineral deficiency, failure to thrive; more common current presentation: bloating, gas, iron deficiency, or asymptomatic (patient at risk)
- improves with gluten-free diet, deteriorates when gluten reintroduced
- disease is usually most severe in proximal bowel
  - iron, calcium, and folic acid deficiency (absorbed in proximal small bowel) more common than vitamin B_{12} deficiency (absorbed in distal small bowel or ileum)
- gluten enteropathy may be associated with dermatitis herpetiformis skin eruption, epilepsy, myopathy, depression, paranoia, infertility, bone fractures/metabolic bone disease

Investigations
- serological tests
  - serum anti-tTG antibody, IgA, is 90-98% sensitive, 94-97% specific
  - patients with selective IgA deficiency have false-negative anti-tTG
    - therefore, measure serum IgA concomitantly (via serum immunoglobulin quantitation)
- incorporate serum testing tTG and/or DGP IgG in IgA deficiencies
- small bowel mucosal biopsy (usually duodenum) is diagnostic:
  - increased intraepithelial lymphocytes (earliest pathologic finding)
  - crypt hyperplasia (next stage of pathophysiology)
  - villous atrophy (last stage of pathophysiology)
  - note: there is a wide differential diagnosis for villous atrophy, including, but not limited to, small bowel overgrowth, CD, lymphoma, *Giardia*, HIV
- improvement with a gluten-free diet, but should not be started in adults before serological tests and biopsy
- consider CT enterography to visualize small bowel to rule out lymphoma
- evidence of malabsorption (localized or generalized)
  - steatorrhea
  - low levels of ferritin/iron saturation, Ca^{2+}, Fe, albumin, cholesterol, carotene, B_{12} absorption
- quantitative fecal fat >7%

Treatment
- dietary counselling
  - gluten free diet; avoid barley, rye, wheat (as these grains are related and have toxic proteins, similar to gliadin)
  - oats allowed if not contaminated by other grains (grown in soil without cross-contamination)
  - rice and corn flour are acceptable
  - iron, folate supplementation (with supplementation of other vitamins as needed)
- if poor response to diet change, consider
  - alternate diagnosis
  - non-adherence to gluten-free diet (advertent or inadvertent)
  - concurrent disease (e.g. microscopic colitis, pancreatic insufficiency)
  - development of intestinal (enteropathy-associated T-cell) lymphoma (abdominal pain, weight loss, palpable mass)
  - development of diffuse intestinal ulceration, characterized by aberrant intraepithelial T-cell population (precursor to lymphoma)

Gluten Found in BROW

Barley
Rye
Oats (controversial)
Wheat

Prognosis
- associated with increased risk of lymphoma, carcinoma (e.g. small bowel and colon; slight increase compared with general population), autoimmune diseases
- risk of lymphoma may be lowered by dietary gluten restriction

Inflammatory Bowel Disease

Definition
- group of disorders characterized by inflammation, and potentially ulceration, of the gastrointestinal tract; two main forms include CD and UC

Etiology
- complex, multifactorial etiology
- most likely a sustained response of the immune system, perhaps to enteric flora
- lack of appropriate down-regulation of immune responsiveness after an infection in a genetically predisposed individual

Genetics
- increased risk of both UC and CD in relatives of patients with either disease, especially siblings; early onset disease
  - familial risk greater if proband has CD rather than UC
- likely polygenomic pattern: 200+ associated gene loci
- *CARD15/NOD2* gene mutation associated with CD (relative risk in heterozygote is 3, in homozygote is 40), especially in Ashkenazi Jews, early onset disease, ileal involvement, and fistulizing, fibrostenotic, or stricturing disease
  - *CARD15* gene product modulates NFκβ, which is required for the innate immune response to microbial pathogens, best expressed in monocytes-macrophages

Clinical Features

Table 13. Clinical Differentiation of Ulcerative Colitis from Crohn's Disease

	Crohn's Disease	Ulcerative Colitis
Location	Any part of GI tract ("gum to bum") Small bowel + colon: 50% Small bowel only: 30% Colon only: 20%	Isolated to large bowel Always involves rectum, may progress proximally
Rectal Bleeding	Uncommon; possible if colonic disease	Very common (90%)
Diarrhea	Usually non-bloody (may be bloody, particularly if distal colon is involved)	Frequent, mucous, bloody, small volume stools
Abdominal Pain	Post-prandial/colicky	Predefecation/colicky
Fever	Common	Uncommon
Urgency/Tenesmus	Uncommon (unless rectum involved)	Common
Palpable Mass	Frequent (25%), RLQ	Rare (if present, often related to cecum full of stool)
Recurrence After Surgery	Common	None post-colectomy (with permanent ileostomy)
Endoscopic Features	Segmental inflammation, ulcers (aphthous, stellate, linear), patchy lesions, pseudopolyps, cobblestoning	Continuous diffuse inflammation, erythema, friability, loss of normal vascular pattern, pseudopolyps
Histologic Features	Transmural distribution with skip lesions Focal inflammation ± Noncaseating granulomas, deep fissuring + aphthous ulcerations, strictures Glands intact	Mucosal distribution, continuous disease (no skip lesions) Architectural distortion, gland disruption, crypt abscess Granulomas absent
Radiologic Features	Cobblestone mucosa Frequent strictures and fistulae Abdominal x-ray: bowel wall thickening, "string sign"	Lack of haustra Strictures rare; if present, need to rule out complicating cancer
Complications	Strictures, fistulae, perianal disease	Toxic megacolon
Colon Cancer Risk	Increased if >30% of colon involved	Increased except in proctitis

Table 14. Extraintestinal Manifestations of IBD

System	Crohn's Disease	Ulcerative Colitis
Dermatologic		
Erythema nodosum	15%	10%
Pyoderma gangrenosum	10%	Less common
Perianal skin tags	75-80%	Rare
Oral mucosal lesions, stomatitis	Common	Rare
Psoriasis	Present in 5-10% of those with IBD but not an EIM	
Rheumatologic		
Peripheral arthritis	15-20% of those with IBD (CD>UC)	
Ankylosing spondylitis	10% of those with IBD (CD>UC)	
Sacroiliitis	Occurs equally in CD and UC	
Ocular (~10% of IBD)		
Uveitis (vision threatening)		
Episcleritis (benign)	3-4% of IBD patients (CD>UC)	
Hepatobiliary		
Cholelithiasis	15-35% of patients with ileal CD	
PSC	1-5% of IBD cases with colonic involvement	
Fatty liver		
Gallstones	Pigment stones in CD	
Urologic		
Calculi	Most common in CD, especially following ileal resection or extensive terminal ileal disease (oxalate stones), usually in context of an intact colon	
Ureteric obstruction		
Fistulae	Characteristic of CD	
Others		
Thromboembolism		
Vasculitis		
Osteoporosis	Increased in CD with/without prior steroids, in UC only after steroids usage	
Vitamin deficiencies (B_{12}, ADEK)		
Cardiopulmonary disorders		
Pancreatitis (rare)		
Phlebitis		

Crohn's Disease

Definition

- chronic transmural inflammatory disorder potentially affecting the entire gut from mouth to perianal region ("gum to bum")

Epidemiology

- worldwide incidence 3-15 to 10-20/100000; 135000 Canadians living with CD
- bimodal: onset before age 30, second smaller peak at age 60; M=F
- incidence of CD increasing (relative to UC) especially in young females
- more common in White people, Ashkenazi Jews
  - risk in Asians increases with move to Western countries
- smoking incidence in CD patients is higher than general population

Pathology

- most common location: ileum + right colon
- linear ulcers leading to mucosal islands and "cobblestone" appearance
- granulomas are found in 50% of surgical specimens, 15% of mucosal biopsies

Clinical Features

- natural history unpredictable; young age, perianal disease, and need for corticosteroids have been associated with poor prognosis, but associations are not strong enough to guide clinical decisions
- most often presents as recurrent episodes of abdominal cramps, non-bloody diarrhea, and weight loss
- ileitis may present with post-prandial pain, vomiting, RLQ mass; mimics acute appendicitis
- EIMs are more common with colonic involvement
- fistulae, fissures, abscesses are common
- deep fissures with risk of perforation into contiguous viscera (leads to fistulae and abscesses)
- enteric fistulae may communicate with skin, bladder, vagina, and other parts of bowel

Effect of Tight Control Management on Crohn's Disease (CALM): A Multi-Centre, Randomized Controlled Phase 3 Trial
Lancet 2017; 390:2779-2789
Purpose: To define the role of incorporating laboratory biomarkers in the management algorithm of active CD.
Study: RCT
Population: 224 adult patients (22 countries at 74 hospitals) with active CD were randomized to intensify treatment based on either laboratory biomarkers (serum CRP, fecal calprotectin) plus clinical evaluation (CD activity index and prednisone use) or treatment based on clinical evaluation alone.
Outcomes: Mucosal healing via the absence of deep ulcers.
Results: At 2 yr, more patients receiving treatment criteria that included laboratory tests had complete mucosal healing (i.e. no ulcers) than the group treated on basis of symptoms alone (46% vs. 30%). Admittedly, the endpoint of mucosal healing is not a strong clinically relevant result, but other studies have shown that the greater the mucosal ulceration, the higher the rate of complications (i.e. strictures, fistulae, abscesses, hospitalizations, and surgery).
Conclusions: This is not definitive data but adds to other evidence showing that the traditional management paradigm needs revising, so in most patients it is worthwhile aiming for endoscopic healing of CD irrespective of symptoms.

Investigations

- colonoscopy with biopsy to visualize (less often gastroscopy)
- CT/MR enterography to visualize small bowel
- CRP elevated in most new cases, useful to monitor treatment response (especially acutely in UC)
- bacterial cultures, O&P, *C. difficile* toxin to exclude other causes of inflammatory diarrhea

Management (see Figure 8)

Table 15. Management of Crohn's Disease

Management	Notes
Lifestyle/Diet	Smoking cessation Fluids only during acute exacerbation Enteral diets may aid in remission only for Crohn's ileitis, not colitis No evidence for any non-enteral diet changing the natural history of CD, but may affect symptoms Those with extensive small bowel involvement or extensive resection require electrolyte, mineral, and vitamin supplements (vitamin D, Ca^{2+}, Mg^{2+}, Zn, Fe, B_{12})
Antidiarrheal Agents*	Loperamide (Imodium®) > diphenoxylate (Lomotil®) > codeine (cheap but addictive) All work by decreasing small bowel motility, used only for symptom relief CAUTION if colitis is severe (risk of precipitating toxic megacolon), therefore avoid during flare-ups
5-ASA**	Sulfasalazine (Salazopyrin®): 5-ASA bound to sulfapyridine Hydrolysis by intestinal bacteria releases 5-ASA (active component) Dose-dependent efficacy Mesalamine (Pentasa®, Salofalk®, Mezavant®, Olsalazine®): used for the treatment of mild ileitis (CD) and mild UC, when inflammation is mild
Antibiotics	E.g. metronidazole (20 mg/kg/d, BID or TID dosing) or ciprofloxacin Best described for perianal CD, although characteristically relapse when discontinued
Corticosteroids	Prednisone: starting dose 40 mg once daily for acute exacerbations; IV methylprednisolone if severe No proven role for steroids in maintaining remissions; masks intra-abdominal sepsis
Immunosuppressives	6-mercaptopurine (6-MP), azathioprine (Imuran®); MTX (used less often) More often used to maintain remission than to treat active inflammation Most commonly used as steroid-sparing agents i.e. to lower risk of relapse as corticosteroids are withdrawn May require >3 mo to have beneficial effect; usually continued for several years May help to heal fistulae, decrease disease activity Increases efficacy of biologics plus lowers chances of biologic dosing efficacy (tolerance) so often given in combination with biologics Side effects: vomiting, pancreatitis, bone marrow suppression, increased risk of malignancy (i.e. lymphoma)
Biologics	Infliximab IV (Remicade®) or adalimumab SC (Humira®): both = antibody to TNF-α Proven effective for treatment of fistulae and medically refractory CD First-line immunosuppressive therapy with infliximab + azathioprine (dual therapy) more effective than using either alone (monotherapy) Ustekinumab, monoclonal antibody against P40 subunit of interleukin 12 and 23 Vedolizumab, monoclonal antibody directed against integrin α4β7 thereby reducing lymphocyte traffic to gut – now indicated for UC and CD
Immunotherapy (Small molecules)	JAK (Janus Kinase) inhibitors (e.g. tofacitinib). Efficacy demonstrated in UC
Surgical/ Experimental	Surgical treatment (see General and Thoracic Surgery, GS36) Surgery generally reserved for complications such as fistulae, obstruction, abscess, perforation, bleeding, and for medically refractory disease If <50% or <200 cm of functional small intestine, risk of short bowel syndrome At least 50% clinical recurrence within 5 yr; 85% within 15 yr; endoscopic recurrence rate even higher 40% likelihood of second bowel resection, 30% likelihood of third bowel resection Complications of ileal resection <100 cm resected → watery diarrhea or cholorrhea (impaired bile salt absorption) Treatment: cholestyramine or antidiarrheals, e.g. loperamide >100 cm resected → steatorrhea (reduced mucosal surface area, bile salt deficiency) Treatment: fat restriction, medium chain triglycerides

*Cholestyramine: a bile-salt binding resin; for watery diarrhea with <100 cm of terminal ileum diseased or resected; however, non-specific antidiarrheals are more convenient and often more potent
**5-ASA use in CD is controversial; however, initial trial for mild ileitis only is warranted (induction and maintenance if clinical response)

Prognosis

- highly variable course
- 10% disabled by the disease eventually, spontaneous remission also described
- increased mortality, especially with more proximal disease, greatest in the first 4-5 yr
- complications include
  - intestinal obstruction/perforation
  - fistula formation
  - malignancy (lower risk compared to UC)
- surveillance colonoscopy same as UC (see *Ulcerative Colitis*, G25) if more than 1/3 of colon involved

Traditional Medical Management of Crohn's Disease

	Induction of Remission	Maintenance
5-ASA*	?	?
Steroids	+	
Immuno-modulators (e.g. azathioprine, methotrexate (MTX))	-	+
Antibiotics	+	
Biologics	+	+

*5-aminosalicylic acid (5-ASA) use in CD is controversial. However, initial trial for mild ileitis only is warranted (induction and maintenance if clinical response)

Note: Starting with biologics plus immunomodulators ("top-down approach") increasingly being used (Lancet 2008;371:660-667). Combination of azathioprine and infliximab has the highest remission rate yet described with medical treatment (NEJM 2010;362;1383-95).
Characteristically more than 1 yr between onset of symptoms and diagnosis of CD.

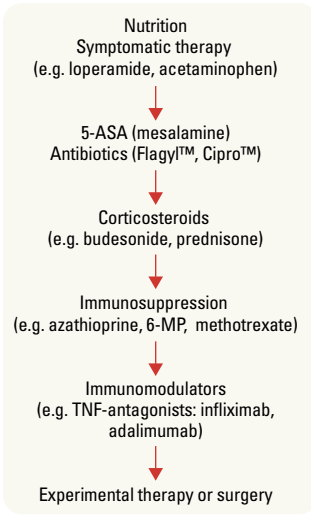

Figure 8. Traditional graded approach to induction therapy in Crohn's disease
Note: immunosuppressants and immunomodulators are increasingly used initially ("top-down management strategy")

Ulcerative Colitis

Definition
- inflammatory disease affecting colonic mucosa anywhere from rectum (always involved) to cecum

Epidemiology
- worldwide incidence 3-15 to 10-20/100000; 120000 Canadians living with UC (less common than CD)
- 2/3 onset by age 30 (with second peak after 50 yr); M=F
- small hereditary contribution (15% of cases have 1st degree relative with disease)
- reduced risk in smokers
- inflammation limited to rectum or left colon is more common than pancolitis

Pathology
- disease can involve any portion of lower bowel ranging from rectum only (proctitis) to entire colon (pancolitis)
- inflammation is diffuse, continuous, and confined to mucosa

Clinical Features
- rectal bleeding is the hallmark feature; diarrhea present if more than the rectum is involved
  - can also have abdominal cramps/pain, especially with defecation
- severity of colonic inflammation correlates with symptoms (stool volume, amount of blood in stool)
- tenesmus, urgency, incontinence
- systemic symptoms: fever, anorexia, weight loss, fatigue in severe cases
- EIMs (see Table 14, G23)
- characteristic exacerbations and remissions; 5% of cases are fulminant

Investigations
- sigmoidoscopy with mucosal biopsy (to exclude self-limited colitis) without bowel prep often sufficient for diagnosis
- colonoscopy helpful to determine extent of disease; contraindicated in severe exacerbation
- CT colonography (formerly barium enema) if colonoscopy cannot be done; contraindicated in severe disease
- stool culture, microscopy, *C. difficile* toxin assay necessary to exclude infection
- no single confirmatory test

Treatment
- mainstays of treatment: 5-ASA derivatives (only in mild to moderate disease) and corticosteroids, with azathioprine used in steroid-dependent or resistant cases
- diet of little value in decreasing inflammation but may alleviate symptoms
- antidiarrheal medications generally not indicated in UC
- 5-ASA
  - topical (suppository or enema): effective for distal disease (rectum to splenic flexure) if inflammation is mild, preferable to corticosteroids
  - oral: effective for mild to moderate, but not severe colitis (e.g. sulfasalazine 3-4 g/d, mesalamine 4 g/d)
  - commonly used in maintaining remission (decreases yearly relapse rate from 60% to 15%)
  - may decrease rate of colorectal cancer
- corticosteroids
  - to remit acute disease, especially if severe or first attack; may need maximum dose IV steroids initially (e.g. methylprednisolone 30 mg IV q12 h)
  - limited role as maintenance therapy for mild to moderate disease
  - use suppositories (predominantly available in compound pharmacies) for proctitis
  - use enemas and topical steroids (e.g. hydrocortisone foam, budesonide enemas) for inflammation distal to splenic flexure
- immunosuppressants (steroid-sparing)
  - in hospitalized patients with severe UC – add IV infliximab if no response to IV methylprednisolone within 3 d; then consider colectomy if inadequate response
  - biologics (infliximab, adalimumab, golimumab, vedolizumab, tofacitinib) can also be used for outpatients with moderate-severe disease, particularly those that are steroid-unresponsive or steroid-dependent, some evidence that they are best used early in course of disease
  - azathioprine and 6-MP: too slow to rapidly resolve acute relapse
    - most commonly used to maintain remission as corticosteroids withdrawn
    - given with biologics: increase efficacy of infliximab and decrease likelihood of developing tolerance to infliximab (~10% chance/yr)
- surgical treatment (restorative)
  - aim for cure with colectomy; bowel continuity can be restored with ileal pouch-anal anastomosis (IPAA)
  - indications: failure of adequate medical therapy, toxic megacolon, uncontrollable bleeding, pre-cancerous changes detected either by endoscopy or endoscopic biopsies (dysplasia), inability to taper corticosteroids, overt malignancy

In UC, non-bloody diarrhea is frequently the initial presentation; eventually progressing to bloody diarrhea

Medical Management of Ulcerative Colitis

	Induction of Remission	Maintenance
5-ASA	+	+
Steroids	+	
Immuno-suppressive	±	+

Complications
- similar to CD, except:
  - more liver problems (especially PSC in men)
  - greater risk of colorectal cancer
    - risk increases with duration and extent of disease (5% at 10 yr, 15% at 20 yr for pancolitis; overall relative risk is 8%)
    - risk also increases with active mucosal inflammation and sclerosing cholangitis
    - thus, regular colonoscopy and biopsy in pancolitis of ≥8 yr is indicated
  - toxic megacolon (transverse colon diameter >6 cm on abdominal x-ray) with immediate danger of perforation (see General and Thoracic Surgery, GS45)

When Considering Complications of IBD, Think:

ULCERATIVE COLITIS
Urinary calculi
Liver problems
Cholelithiasis
Epithelial problems
Retardation of growth/sexual maturation
Arthralgias
Thrombophlebitis
Iatrogenic complications
Vitamin deficiencies
Eyes
Colorectal cancer
Obstruction
Leakage (perforation)
Iron deficiency
Toxic megacolon
Inanition (wasting)
Strictures

Prognosis
- chronic relapsing pattern in most patients
- 10-15% chronic continuous pattern
- >1 attack in almost all patients
- more colonic involvement in the 1st yr correlates with increased severity of attacks and increased colectomy rate
  - colectomy rate = 1% for all patients after the 1st yr; 20-25% eventually undergo colectomy
- normal life expectancy
- if proctitis only, usually benign course, lifetime risk of extension is 15%
- fecal calprotectin increasingly recognized as a marker of bowel mucosal inflammation, reported to be especially useful in monitoring the activity of IBD, but accuracy is still controversial

Irritable Bowel Syndrome

Definition
- a form of functional bowel disease; more than just a label for GI symptoms unexplained after normal investigations

Epidemiology
- 11% worldwide prevalence
- onset of symptoms usually in young adulthood
- F>M

Clinical Features
- Rome IV Criteria are used for diagnosis
- diagnosis is based chiefly on history; no specific diagnostic test available

Pathophysiology
- associated with either abnormal perception of intestinal activity or abnormal intestinal motility
- abnormal motility: multiple abnormalities described; unclear if associated or causative
- psychological: stress may increase IBS symptoms but probably does not cause IBS
- 4 main types of IBS
  - IBS-D: IBS with predominant diarrhea
  - IBS-C: IBS with predominant constipation
  - IBS-M: IBS-mixed with both diarrhea and constipation (each >25% of all abnormal bowel movements)
  - IBS untyped: insufficient abnormality in stool consistency to meet other types

Emerging Biologic Treatments for Ulcerative Colitis

Generic Name	Brand Name	Major Study
Ustekinumab	Stelara™	NEJM 2019; 381:1201-1214
Vedolizumab	Entyvio™	NEJM 2019; 381:1215-1226
Adalimumab	Humira™	NEJM 2019; 381:1215-1226

Diagnosis

Table 16. Rome IV Criteria for Diagnosing Irritable Bowel Syndrome

IBS Rome IV Criteria	
Recurrent abdominal pain for more than 6 mo, at least 1 d/wk in the last 3 mo, associated with 2 or more of the following: 1. Related to defecation 2. Associated with a change in frequency of stool 3. Associated with a change in form (appearance) of stool	
Symptom onset at least 6 mo before diagnosis and criteria present during the last 3 mo	
The following are supportive, but not essential to the diagnosis: Abnormal stool frequency (>3/d or <3/wk) Abnormal stool form (lumpy/hard/loose/watery) >1/4 of defecations Abnormal stool passage (straining, urgency, feeling of incomplete evacuation) >1/4 of defecations Passage of mucus >1/4 of defecations Bloating	
Diagnosis of IBS Less Likely in Presence of "Red Flag" Features	
Weight loss	Anemia
Fever	Blood or pus in stool
Nocturnal defecation	Abnormal gross findings on flexible sigmoidoscopy
Normal Physical Exam	

Investigations
- if history consistent with Rome IV criteria, no alarm symptoms, and no family history of IBD or colorectal cancer, limited investigations required
- aim is to rule out diseases which mimic IBS, particularly celiac disease and IBD
- investigations can be limited to CBC and celiac serology
- if available, fecal calprotectin is likely more reliable test to rule out IBD
- consider TSH, stool cultures depending on clinical circumstances
- consider colonoscopy (e.g. if alarm features present, family history of IBD, or ages >50)

Treatment
- education: reassurance, explanation, support, aim for realistic goals
- relaxation therapy, biofeedback, hypnosis, stress reduction, cognitive behavioural therapy, probably exercise
- dietary: low FODMAP (Fermentable Oligo-, Di-, Monosaccharides And Polyols) diet for pain, bloating, gas, irregular bowel movements (BMs)
- no therapeutic agent consistently effective, pain most difficult to control, no drug changes natural history so the drug should be "wanted, since it is not needed"
- symptom-guided treatment
  - pain predominant
    - antispasmodic medication before meals (e.g. hyoscine, pinaverium, trimebutine - low level of evidence)
    - tricyclic antidepressants (TCA), selective serotonin reuptake inhibitors (SSRI) - moderate level of evidence
  - IBS-D
    - increase fibre (bran or psyllium) to increase stool consistency but may worsen abdominal gas (controversial)
    - loperamide (Imodium®) (continuous use advised against)
    - diphenoxylate (Lomotil®)
    - eluxadoline
    - rifaximin
  - IBS-C
    - increase fibre in diet
    - linaclotide
    - osmotic or other laxatives (help more with the constipation than the pain)

Prognosis
- 80% improve over time
- most have intermittent episodes
- normal life expectancy

IBS Mimickers
- Enteric infections e.g. *Giardia*
- Lactose intolerance/other disaccharidase deficiency
- CD
- Celiac sprue
- Drug-induced diarrhea
- Diet-induced (excess tea, coffee, colas)

Rifaximin Therapy for Patients with Irritable Bowel Syndrome without Constipation
NEJM 2011;364:22-32
Purpose: Previous evidence suggests that gut flora may play an important role in the pathophysiology of IBS. This study evaluated rifaximin, a minimally absorbed antibiotic, in treating IBS without constipation.
Methods: Two phase 3, double-blind, placebo-controlled trials (TARGET 1 and TARGET 2). 1260 patients who had IBS without constipation were randomly assigned to rifaximin (550 mg dose) or placebo, TID for 2 wk, with a follow-up of 10 wk. The primary endpoint was adequate self-reported relief of global IBS symptoms.
Results: Significantly more patients in the rifaximin group had adequate self-reported relief of global IBS symptoms compared to the placebo group during the first 4 wk after treatment (40.8% vs. 31.2%, respectively). Also, more patients in the rifaximin group had adequate relief of bloating compared to the placebo group (39.5% vs. 28.7%, respectively).
Conclusions: Rifaximin therapy for 2 wk provided significant relief of symptoms, bloating, abdominal pain, and stool consistency associated with IBS without constipation.

Constipation

Definition
- passage of infrequent/hard stools and/or difficult stool evacuation (e.g. straining, sensation of anorectal blockage)

Epidemiology
- increasing prevalence with age; F>M
- rare in Africa and India where stool weight is 3-4x greater than in Western countries

Etiology
- most common: functional, idiopathic attributed to colon dysmotility but this is difficult to measure
- organic causes: likely only if there are symptoms other than constipation
  - medication side effects (e.g. narcotics, antidepressants) are the most common
  - intestinal obstruction, left sided colon cancer (consider in older patients), and fecal impaction
  - metabolic
    - DM
    - hypothyroidism
    - hypercalcemia, hypokalemia, uremia
  - neurologic
    - intestinal pseudo-obstruction
    - Parkinson's disease
    - MS
  - collagen vascular disease (e.g. scleroderma)
  - painful anal conditions (e.g. fissures)

Causes of Constipation

DOPED
Drugs
Obstruction
Pain
Endocrine dysfunction
Depression

Clinical Features
- overlaps with IBS
- stool firm, difficult to expel, passed with straining, abdominal pain relieved by defecation, flatulence, overflow diarrhea, tenesmus, abdominal distension, infrequent BMs (<3/wk)

Investigations
- underlying disease rarely found if constipation is the only presenting symptom
  - only test indicated in this situation is a CBC (2013 recommendation of American Gastroenterology Association), but also consider TSH, calcium, glucose, and abdominal x-ray
- colon visualization (colonoscopy, CT colonography) if concomitant symptoms such as rectal bleeding, weight loss, anemia or ages >50
- if refractory to treatment, consider classification based on colon transit time; can measure colonic transit time with radio-opaque (Sitz) markers that are ingested and followed with a series of plain film abdominal x-rays (normal: elimination of markers within 70 h)
  1. normal = misperception of normal defecation (IBS)
  2. prolonged throughout = "colonic inertia" (infrequent bowel movements with gas/bloating, tends to occur in youth)
  3. outlet obstruction = inability to coordinate pelvic floor muscles to empty rectum, straining, stool in rectum on digital exam, tends to occur in old age
- combination of 1 and 3 common

Treatment (in order of increasing potency)
- dietary fibre
  - useful if mild or moderate constipation, but not if severe
  - aim for 30 g daily, increase dose slowly
- surface-acting (soften and lubricate)
  - docusate salts (likely limited efficacy based on evidence), mineral oils
- osmotic agents (effective in 2-3 d)
  - polyethylene glycol 3350, lactulose, sorbitol, magnesium salts (e.g. magnesium hydroxide, i.e. milk of magnesia), lactitol (β-galactosido-sorbitol)
- cathartics/stimulants (effective in 24 h)
  - senna, bisacodyl
- enemas and suppositories (e.g. saline enema, phosphate enema, glycerin suppository, bisacodyl suppository)
- prokinetic agents (e.g. prucalopride)
- linaclotide (secretagogue, increases water secretion into the intestinal lumen)

Upper Gastrointestinal Bleeding

Definition
- bleeding proximal to the ligament of Treitz, see *Overview of Gastrointestinal Tract*, G2 (75% of GI bleeds)
  - ligament of Treitz: suspensory ligament where fourth portion of the duodenum transitions to jejunum

Etiology
- above the GE junction
  - epistaxis
  - esophageal varices (10-30%)
  - esophagitis
  - esophageal cancer
  - Mallory-Weiss tear (10%)
- stomach
  - gastric ulcer (20%) (see *Peptic Ulcer Disease*, G11)
  - erosive gastritis (e.g. from EtOH or post-surgery) (20%)
  - gastric cancer
  - gastric antral vascular ectasia (rare, associated with cirrhosis and connective tissue disease)
  - Dieulafoy's lesion (very rare)
- duodenum
  - ulcer in bulb (25%)
  - aortoenteric fistula: usually only if previous aortic graft (see sidebar)
- coagulopathy (drugs, renal disease, liver disease)
- vascular malformation (Dieulafoy's lesion, arteriovenous malformation)

Clinical Features
- in order of decreasing severity of the bleed: hematochezia (brisk UGIB) > hematemesis > coffee ground emesis > melena > occult blood in stool

Always ask about NSAID/Aspirin® or anticoagulant therapy in GI bleed

Aortoenteric Fistula is a rare and lethal cause of GI bleed, most common in patients with a history of aortic graft surgery. Therefore, perform emergency endoscopy if suspected, emergency surgery if diagnosed
Note: The window of opportunity is narrow. Suspect if history of aortic graft, abdominal pain associated with bleeding

Transfusion Strategies for Acute Upper Gastrointestinal Bleeding
NEJM 2013;368:11-21
Study: Prospective, unblinded, RCT, follow-up up to 45 d.
Population: 921 patients with hematemesis, bloody nasogastric aspirate, melena, or both. Exclusion criteria included massive bleed, acute coronary syndrome, stroke/ transient ischemic attack or transfusion within previous 90 d; recent trauma/ surgery; lower GI bleed.
Intervention: Patients randomized to restrictive (<70 g/L) or liberal (<90 g/L) transfusion.
Outcome: Mortality, further bleeding, adverse events.
Results: Fewer patients in the restrictive group required transfusion (51% vs. 15%; P <0.001). The hazard ratio for death for restrictive compared to liberal transfusion was 0.55; 95% CI 0.33-0.92; P=0.02. Further bleeding occurred in 10% vs. 16% (P=0.01) of patients, while adverse effects occurred in 40% vs. 48% (P=0.02) of patients in the restrictive and liberal strategies, respectively. The restrictive strategy had a better survival rate in patients with bleeding associated with cirrhosis Child-Pugh class A or B (HR: 0.30; 95% CI 0.11-0.85), but not in cirrhosis Child-Pugh class C (HR: 1.04; 95% CI 0.45-2.37) or a peptic ulcer (HR: 0.70; 95% CI 0.26-1.25).
Conclusions: Transfusing patients with an acute UGIB at Hb of <70 g/L rather than 90 g/L is associated with fewer transfusions, better survival, and fewer adverse events.

Treatment
- stabilize patient (1-2 large bore IVs, IV fluids, monitor)
- send blood for CBC, cross and type, platelets, PT, PTT, electrolytes, BUN, Cr, LFTs
- keep NPO
- consider nasogastric (NG) tube to determine upper vs. lower GI bleeding in some cases
- IV PPI: decrease risk of rebleed if endoscopic predictors of rebleeding seen (see prognosis section)
  - given to stabilize clot, not to accelerate ulcer healing
  - if given before endoscopy, decreases need for endoscopic therapeutic intervention
- for variceal bleeds, octreotide 50 µg loading dose followed by constant infusion of 50 µg/h and ABx for those with cirrhosis (reduces risk of infections)
- consider IV erythromycin (or metoclopramide) to accelerate gastric emptying prior to gastroscopy to remove clots from stomach
- H2-antagonists should not be used since they have minimal impact on rebleeding rates and need for surgery
- endoscopy (OGD): establish bleeding site + treat lesion
  - if bleeding peptic ulcer: most commonly used method of controlling bleeding is injection of epinephrine around bleeding point + thermal hemostasis (bipolar electrocoagulation or heater probe); less often thermal hemostasis may be used alone, but injection alone not recommended
  - endoclips
  - Hemospray™
  - dual therapy (more than one therapeutic intervention method) is standard of care and has greater efficacy than single therapy

Forrest Prognostic Classification of Bleeding Peptic Ulcers

Forrest Class	Type of Lesion	Risk of Rebleed (%)
I	Arterial bleeding (oozing/spurting)	55-100
IIa	Visible vessel	43
IIb	Sentinel clot	22
IIc	Hematin covered flat spot	10
III	No stigmata of hemorrhage	5

Lancet 1974;2:394-397

Prognosis
- 80% stop spontaneously
- peptic ulcer bleeding: low mortality (2%) unless rebleeding occurs (25% of patients, 10% mortality)
- endoscopic predictors of rebleeding (Forrest classification): spurt or ooze, visible vessel, fibrin clot
- can send home if clinically stable, bleed is minor, no comorbidities, endoscopy shows clean ulcer with no high-risk predictors of rebleeding
- esophageal varices have a high rebleeding rate (55%) and mortality (29%)

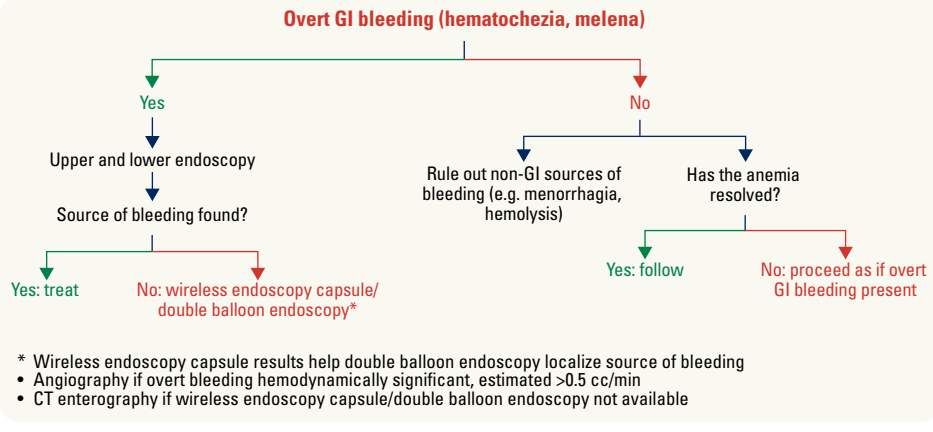

Figure 9. Approach to iron deficiency anemia

Management of Nonvariceal Upper Gastrointestinal Bleeding: Guideline Recommendations from the International Consensus Group
Ann Intern Med 2019;171:805-822
Pre-Endoscopic Management: In patients without cardiovascular disease, the suggested Hb threshold for blood transfusion is <80 g/L. The threshold is higher for patients with cardiovascular disease.
Endoscopic Management: Patients with acute UGIB should undergo endoscopy within 24 h of presentation. In patients with high-risk stigmata, thermocoagulation and sclerosant injection are recommended. TC-325, a hemostatic powder, can be used as a temporizing agent for actively bleeding ulcers.
Pharmacologic Management: High-dose PPI should be given for 3 d to patients with bleeding ulcers with high-risk stigmata who have undergone successful endoscopic therapy. Continued oral PPI therapy is recommended twice daily for 14 d, then once daily for a duration that depends on the nature of the bleeding lesion.

Esophageal Varices

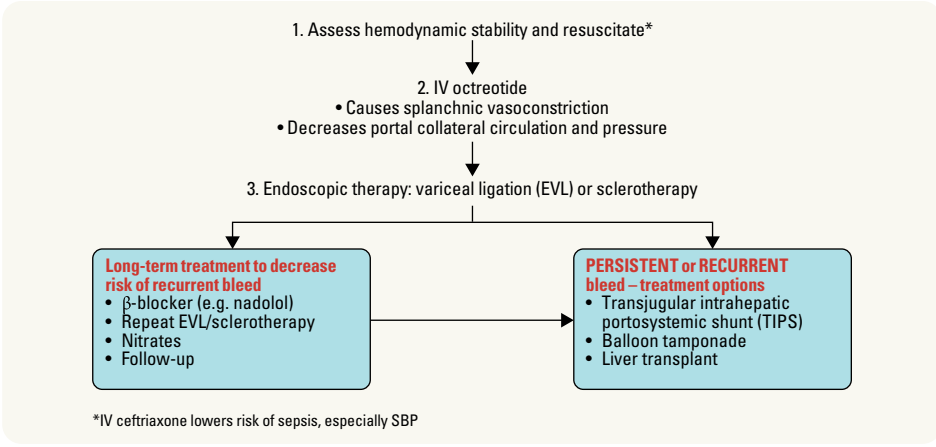
Etiology
- almost always due to portal hypertension

Clinical Features
- characteristically massive upper GI bleeding

Prognosis
- risk of bleeding: 30% in 1st yr
- risk of rebleeding: 50-70% (20% mortality at 6 wk)

Investigations
- endoscopy

Management



If varices isolated to stomach, think of splenic vein thrombosis

Gastric varices best treated by endoscopic injection of cyanoacetate ("crazy glue")

Figure 10. Management of bleeding esophageal varices

Mallory-Weiss Tear

Definition
- longitudinal laceration in gastric mucosa on lesser curvature near GE junction (20% straddle junction, 5% in distal esophagus)

Etiology
- due to rapid increases in gastric pressure from retching/vomiting against a closed glottis
- hiatus hernia often present

Clinical Features
- hematemesis ± melena, classically following an episode of retching without blood
- can lead to fatal hematemesis

Management
- 90% stop spontaneously
- if persistent: endoscopy with epinephrine injection ± clips or surgical repair

Lower Gastrointestinal Bleeding

Definition
- bleeding distal to ligament of Treitz

Etiology
- diverticular
- vascular
  - angiodysplasia (small vascular malformations of the gut)
  - anorectal (hemorrhoids, fissures)
- neoplasm
  - cancer
  - polyps
- inflammation
  - colitis (ulcerative, infectious, radiation, ischemic) (see *Ulcerative Colitis*, G25)
- post-polypectomy

Lower GI Bleed

CHAND
Colitis (radiation, infectious, ischemic, IBD (UC > CD))
Hemorrhoids/fissure
Angiodysplasia
Neoplasm
Diverticular disease

Clinical Features
- hematochezia
- anemia
- occult blood in stool
- occasionally melena due to slow small bowel or right-colonic course

Treatment
- if blood per rectum with hemodynamic instability, stabilize patient (1-2 large bore IVs, IV fluids, monitor) and rule out upper GI source with endoscopy (OGD)
- send blood for CBC, cross and type, INR/PTT, electrolytes, BUN, Cr, LFTs
- initial examination of choice is colonoscopy to determine source of the bleeding
- if bleeding is severe or ongoing, consider radionuclide imaging or angiography (see Medical Imaging, MI16)
- treat underlying cause
  - majority of cases will stop bleeding spontaneously

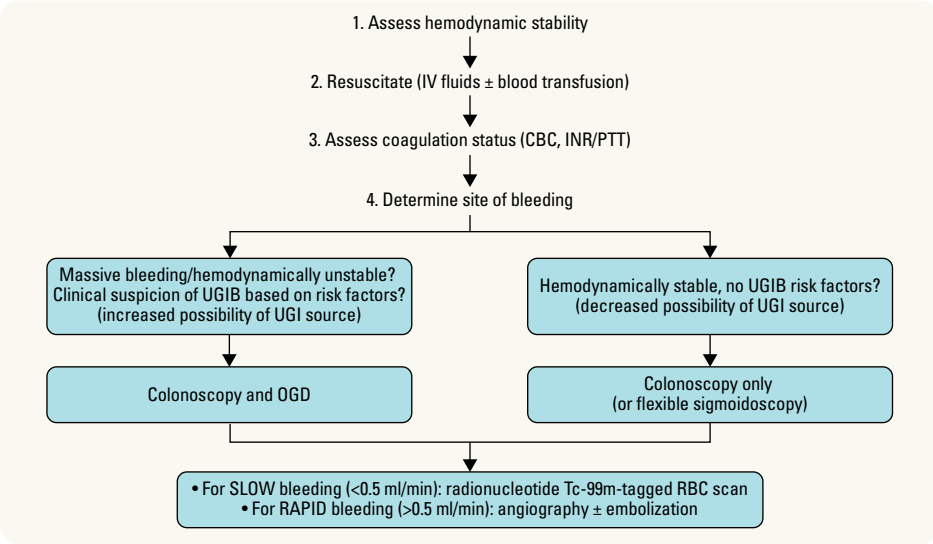


Figure 11. Approach to hematochezia

Always exclude upper GI lesion before localizing the site of the bleeding to the lower GI tract

Diverticular Bleeding

Etiology
- herniation of diverticula exposes vasa recta, increasing susceptibility to disruption
- bleeding most common from the right colon (thinner walled), although diverticula often develop throughout colon

Clinical Features
- painless hematochezia, acute onset
- stool can range from bright red to dark maroon; gelatinous clots often mixed in

Management
- often resolves spontaneously
- if colonoscopy identifies source, epinephrine injection or electrocautery therapy
- if ongoing, can consider embolization or surgery

Infectious Colitis

Etiology
- variety of pathogens; often due to *Campylobacter, Entamoeba histolytica, Salmonella, E. coli, Shigella*
- consider travel history, food exposures

Clinical Features
- bloody diarrhea, fever, abdominal pain

Management
- stool cultures to determine pathogen and guide management
- see *Acute Diarrhea*, G15

Colorectal Carcinoma

- see General and Thoracic Surgery, GS43

Colorectal Polyps

- see General and Thoracic Surgery, GS41

Familial Colon Cancer Syndromes

- see General and Thoracic Surgery, GS42

Benign Anorectal Disease

- see General and Thoracic Surgery, GS47

Liver

Investigations of Hepatobiliary Disease

A. Tests of Liver Function

Table 17. Liver Function Tests

Test	What Do Levels Correlate With?	Increased by	How to Interpret
Prothrombin Time (PT or INR)	Hepatic protein synthesis All coagulation factors except VIII	Hepatocellular dysfunction Vitamin K deficiency (due to malnutrition, malabsorption, etc.)	PT/INR will promptly correct if vitamin K is administered, so increased PT/INR in absence of vitamin K deficiency is a reliable marker of hepatocellular dysfunction
Serum Albumin	Hepatic protein synthesis (and other causes listed in next column)	Hepatocellular dysfunction Malnutrition Renal or GI losses Significant inflammation Malignancy	Rule out potential causes other than hepatocellular dysfunction
Serum Direct Bilirubin*	Hepatic excretion from hepatocyte to biliary system	Liver dysfunction	Conjugation is preserved even in end stage liver failure, thus increased direct bilirubin indicates liver dysfunction

*Serum Bilirubin
- canaliculus breakdown product of hemoglobin; metabolized in the reticuloendothelial system of liver, transported through biliary system, excreted via gut
- direct bilirubin = conjugated; indirect bilirubin = unconjugated

B. Tests of Liver Injury

Table 18. Liver Enzyme Profile

Profile	Liver Enzyme Change	Notes
Hepatocellular	↑ AST ↑ ALT	ALT more specific to liver AST from multiple sources (especially muscle) Elevation of both highly suggestive of liver injury Most common cause of elevated ALT is fatty liver
Cholestatic	↑ ALP ↑ GGT	Cholestasis = stasis of bile flow If ALP is elevated alone, rule out bone disease by fractionating ALP and/or checking GGT If ALP elevation out of proportion to ALT/AST elevation, consider: Obstruction of common bile duct (e.g. extraluminal = pancreatic cancer, lymphoma; intraluminal = stones, cholangiocarcinoma, sclerosing cholangitis, helminths) Predominant rise in hepatocellular enzyme possible in acute biliary obstruction secondary to a stone due to the sudden impairment in bile flow and because ALP is an inducible enzyme which takes time to rise Destruction of microscopic ducts (e.g. PBC) Bile acid transporter defects (e.g. drugs, intrahepatic cholestasis of pregnancy) Infiltration of the liver (e.g. liver metastases, lymphoma, granulomas, amyloid)

Acute Viral Hepatitis (General)

Definition
- viral hepatitis lasting <6 mo

Clinical Features
- most are subclinical
- flu-like prodrome may precede jaundice by 1-2 wk
  - N/V, anorexia, headaches, fatigue, myalgia, low-grade fever, arthralgia, and urticaria (especially HBV)
- only some progress to icteric (clinical jaundice) phase, lasting days to weeks
  - pale stools and dark urine 1-5 d prior to icteric phase
  - hepatomegaly and RUQ pain
  - splenomegaly and cervical lymphadenopathy (10-20% of cases)

Quick Reference Diagnostic Tests for Common Liver Conditions

Disease	Diagnostic Tests
Viral Hepatitis	Anti-HAV IgM, HBsAg, anti-HCV
Autoimmune Hepatitis	ANA, SMA, LKM, Ig levels
Wilson's Disease	Ceruloplasmin, liver biopsy
Hereditary Hemochromatosis	Iron saturation, ferritin, HFE genetic testing
α1-Antitrypsin Deficiency	α1-antitrypsin levels, liver biopsy
Drug-induced Liver Injury	Careful medication history, liver biopsy
NAFLD/Nonalcoholic Steatohepatitis (NASH)	U/S, metabolic testing, liver biopsy

ANA = anti-nuclear antibody; SMA = smooth muscle antibody; LKM = liver-kidney microsomal-1 antibody; HFE = hemochromatosis gene

DDx for Hepatomegaly
- Congestive (right heart failure, Budd-Chiari syndrome)
- Infiltrative
  - Malignant (primary, secondary, lymphoproliferative, leukemia)
  - Benign (fatty liver, cysts, hemochromatosis, extramedullary hematopoiesis, amyloid)
- Proliferative
  - Infectious (viral, tuberculosis, abscess, echinococcus)
  - Inflammatory (granulomas (sarcoid), histiocytosis X)

All clotting factors except factor VIII and von Willebrand factor are exclusively synthesized in the liver. Factor VIII is also produced in the endothelium. In cirrhosis, risk of bleeding does not correlate closely with elevations in INR/PTT since so many of the proteins in the coagulation cascade are affected

ALT > AST = most causes of hepatitis
AST > ALT = alcoholic liver disease or other causes of hepatitis (i.e. non-alcoholic liver disease) that have progressed to advanced cirrhosis

Serum Transaminases >1000 due to
- Viral hepatitis
- Drugs/toxins
- Autoimmune hepatitis
- Hepatic ischemia
- Less often, common bile duct stone

Investigations
- AST and ALT (>10-20x normal in hepatocellular necrosis)
- ALP minimally elevated
- viral serology, particularly IgM antibody directed to the virus

Treatment
- supportive (hydration, diet)
- usually resolves spontaneously, but if severe HBV infection, treatment with antiviral agent such as tenofovir or entecavir can be considered; in acute hepatitis C, antiviral treatment should be considered (see *Hepatitis C Virus*, G34)
- indications for hospitalization: encephalopathy, coagulopathy, severe vomiting, hypoglycemia

Prognosis
- poor prognostic indicators: comorbidities, persistently high bilirubin (>340 mmol; 20 mg/dL), increased INR, decreased albumin, hypoglycemia

Complications
- cholestasis (most commonly associated with HAV infection)
- hepatocellular necrosis: AST, ALT >10-20x normal, ALP and bilirubin minimally increased, increased cholestasis

Hepatitis A Virus

- RNA virus
- fecal-oral transmission; incubation period 4-6 wk
- diagnosed by elevated transaminases, positive anti-HAV IgM
- in children: characteristically asymptomatic
- in adults: fatigue, nausea, arthralgia, fever, jaundice, hepatomegaly
- can cause ALF and subsequent death (<1-5%)
- can relapse (rarely), but never becomes chronic
- treatment is supportive (no specific treatments available, disease is often self-limiting)

Hepatitis B Virus

Table 19. Hepatitis B Serology

	HBsAg	Anti-HBs	HBeAg	Anti-HBe	Anti-HBc	Liver Enzymes
Acute HBV	+	–	+	–	IgM	
Chronic (HBe-Ag positive) HBV (generally high HBV- DNA)	+	–	+	–	IgG	ALT, AST may or may not be elevated
Chronic (HBe-Ag negative) HBV (generally low HBV- DNA)	+	–	–	+	IgG	ALT, AST may or may not be normal
Resolved Infection	–	±	–	±	IgG	
Immunization	–	+	–	–	–	

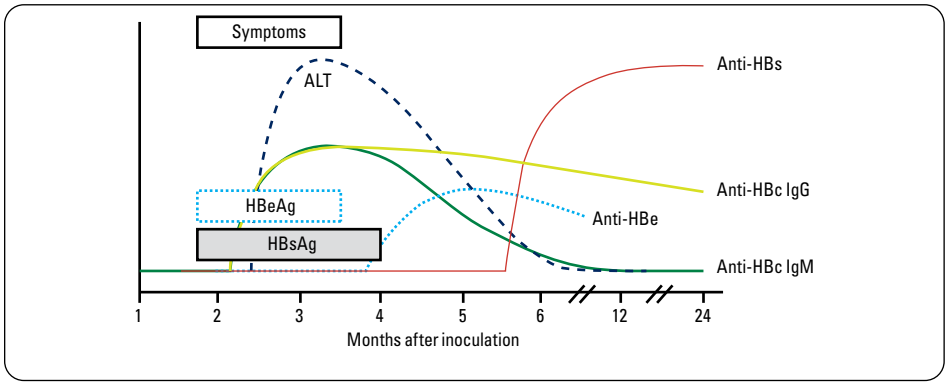

Figure 12. Time course of acute hepatitis B infection

Alcoholic Hepatitis: history of chronic EtOH use (possibly with recent increased consumption, although often patient may have stopped drinking in the days-weeks prior to presentation due to symptoms), RUQ abdominal pain, AST/ALT >2, AST usually <300, low grade fever, mildly elevated WBC

Major Sources of ALP
- Hepatobiliary tree
- Bone
- Placenta
- Intestine

DDx for Hepatitis
- Viral infection
- Alcohol
- Drugs
- Immune-mediated
- Toxins

Without treatment, 8-20% of those with ongoing immunoactive chronic hepatitis can develop cirrhosis within 5 yr. In contrast, those in the immune tolerant phase (with extremely high HBV-DNA levels) are at minimal risk for liver fibrosis as they do not have immune-mediated liver injury

Risk of HCC in HBV increases with increasing age, which is likely a surrogate for increasing liver fibrosis/cirrhosis, and serum HBV-DNA
Risk of HCC in HCV increases only after cirrhosis develops

HCV (and HBV) treatment lowers the risk of HCC

Risk Factors for Progression
- EtOH
- HIV coinfection
- Old age at diagnosis

Epidemiology

- 4 phases of chronic hepatitis B: not all carriers will go through all 4 phases, but all carriers will have positive HBsAg
  1. **immune tolerance:** extremely high HBV-DNA (>20000 IU/mL), HBeAg positive, but normal ALT/AST; due to little immune control and minimal immune-mediated liver damage; characteristic of perinatal infection (or 'incubation period' in adult with newly-acquired HBV)
  2. **immune clearance (or immunoactive):** HBV-DNA levels (>20000 IU/mL), HBeAg positive; due to immune attack on the virus and immune-mediated liver damage; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or HCC); likely to benefit from treatment
  3. **inactive carrier (immune control):** lower HBV-DNA (<2000 IU/mL), HBeAg negative, anti-HBe positive, ALT/AST normal; due to immune control without immune-mediated liver damage; risk of reactivation to phase 2 (clinically resembles acute hepatitis B), especially with immunosuppression e.g. corticosteroids or chemotherapy
  4. **HBeAg-negative chronic hepatitis (immune escape) ("core or precore mutant"):** elevated HBV-DNA (>2000 IU/mL), HBeAg negative because of pre-core or core promoter gene mutation, anti-HBe positive, ALT/AST high; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or HCC); likely to benefit from treatment

Treatment

- counselling: 40% of men and 10% of women with perinatal infection without treatment will die from HBV-related complications
- prolonged immune-mediated damage leads to higher risk of liver fibrosis
- HCC screening with U/S q6 mo, especially if high serum HBV-DNA levels, cirrhosis, men, (ages >40 in Asian men, >50 in Asian women, and >20 in African descent)
- consider pharmacological therapy if:
  1. HBeAg positive + HBV-DNA >20000 IU/mL + elevated ALT; or
  2. HBeAg negative + HBV-DNA >2000 IU/mL + elevated ALT ± stage ≥2 fibrosis on liver biopsy
  3. treat to prevent flare when placed on immunosuppressive therapy such as prednisone, chemotherapy, biologics, etc.
- treatment goal: reduce serum HBV-DNA to undetectable level
- treatment options: tenofovir, entecavir, lamivudine (not preferred due to high rate of developing resistance)
- vaccinate against HAV if serology negative (to prevent further liver damage)
- follow blood and sexual precautions
- vaccinate household contacts

Hepatitis D Virus

- defective RNA virus requiring HBsAg for entry into hepatocyte, therefore infects only patients with HBV; causes more aggressive disease than HBV alone
- coinfection: acquire HDV and HBV at the same time
- HDV can present as ALF and/or accelerate progression to cirrhosis
- treatment: low-dose interferon (20% response) and liver transplant for end-stage disease

Hepatitis C Virus

- RNA virus (7 genotypes; genotype 1 is most common in North America)
- blood-borne transmission; sexual transmission is "inefficient"
- major risk factor: injection drug use
- other risk factors: blood transfusion received before 1992 (or received in developing world), tattoos, intranasal cocaine use
- acute hepatitis C occurs 2-6 mo after transmission
  - symptoms mild and vague (fatigue, malaise, nausea) therefore not commonly diagnosed in acute stage
  - almost 30% of cases of acute hepatitis C are cleared spontaneously without therapy

Diagnosis

- suspected on basis of elevated ALT/AST and positive serum anti-HCV
- diagnosis established by detectable HCV-RNA in serum
- normal hepatocellular enzymes does not rule out active disease or presence of advanced fibrosis
- abdominal U/S and transient elastography (FibroScan®) to assess the staging of the disease and the degree of fibrosis

In acute hepatitis B, HDV coinfection increases severity of hepatitis but does not increase risk of progression to chronic hepatitis. However in the context of chronic hepatitis B, superinfection with HDV increases progression to cirrhosis

Causes of Elevated Serum Transaminases in Chronic Hepatitis B

- Active hepatitis (either immune clearance phase in HBeAg-positive individuals or HBeAg-negative active hepatitis)
- Reactivation (e.g. due to immunosuppression)
- Hepatitis D
- Other liver insult (fatty liver, EtOH, drugs, hepatitis A)

Risk Factors for Contracting Hepatitis B

- Infants born to a hepatitis B-infected parent (maternal or paternal)
- Unprotected sexual intercourse (especially if multiple partners)
- Needle sharing (e.g. injection drug users)
- Travel to endemic regions
- Exposure to human blood, semen, and other bodily fluids

Clinical Features of Hepatitis B

- Many patients are asymptomatic, both in the acute and chronic phases
- Acute hepatitis can manifest as jaundice, nausea, arthritis, or constitutional symptoms
- Patients with chronic hepatitis can be asymptomatic, experience exacerbations, develop extrahepatic complications (e.g. glomerular disease), or develop cirrhosis

Treatment

- blood-borne precautions; vaccinate for hepatitis A and B if serology negative; avoid EtOH
- clearest indication for treatment is in subgroups likely to develop clinically significant liver disease, i.e. persistently elevated transaminases, liver biopsy showing moderate-advanced fibrosis/cirrhosis, and at least moderately severe necrosis/inflammation
  - now that a safe, effective cure is available, the risk/benefit ratio favours treating everyone with chronic hepatitis C
- choice and duration of treatment depends mostly on whether patient is cirrhotic (and if so, whether decompensated or not), prior treatment history, and possibly genotype (but less so with availability of pan-genotypic therapies)
- direct acting antiviral (DAA) tablets (Mavyret®, a combination of glecaprevir and pibrentasvir, and Epclusa®, a combination of velpatasvir and sofosbuvir) are the most commonly used
- other oral interferon-free regimens (for all genotypes) (e.g. sofosbuvir/ledipasvir, ombitasvir/paritaprevir/ritonavir+dasabuvir, or elbasvir/grazoprevir, and sofosbuvir/velpatasvir) are also available but used less frequently
- it is important to check for hepatitis B prior to therapy as direct acting antivirals may lead to reactivation of hepatitis B

Prognosis

- 80% of acute hepatitis C cases become chronic (of these, 20% evolve to cirrhosis within 20 years of exposure)
- risk of HCC increases if cirrhotic
- can cause cryoglobulinemia; associated with membranoproliferative glomerulonephritis, lymph

Table 20. Characteristics of the Viral Hepatitides

	HAV	HBV	HCV	HDV	HEV	CMV	EBV	Yellow Fever
Virus Family	*Picornaviridae*	*Hepadnaviridae*	*Flaviviridae*	*Deltaviridae*	*Caliciviridae*	*Herpesviridae*	*Herpesviridae*	*Flavivirus*
Genome	RNA	DNA	RNA	RNA	RNA	DNA	RNA	RNA
Envelope	No	Yes	Yes	Yes	No	Yes	Yes	Yes
Transmission	Fecal-oral	Parenteral/sexual or equivalent Vertical	Parenteral/sexual (transfusion, IV drug user, sexual (<HBV)) 40% have no known risk factors	Non-parenteral (close contact in endemic areas) Parenteral (blood products, IV drug user)-sexual transmission is inefficient	Fecal-oral (endemic: Africa, Asia, central America, India, Pakistan)	Close contacts, most body fluids	Saliva-oral	Vector (mosquito)
Incubation	4-6 wk	6 wk-6 mo	2-26 wk	3-13 wk	2-8 wk	20-60 d	30-50 d	3-6 d
Onset	Usually abrupt	Usually insidious	Insidious	Usually abrupt	Usually abrupt	Variable	Variable	Usually abrupt
Communicability	2-3 wk in late incubation to early clinical phase Acute hepatitis in most adults, 10% of children	HBsAg+ state highly communicable Increased during third trimester or early post-partum	Communicable prior to overt symptoms and throughout chronic illness	Infectious only in presence of HBV (HBsAg required for replication)	Unknown	Variable – dormant or persistent	Highly communicable during year after primary infection but never zero	Variable, vector-dependent
Chronicity	None, although can relapse	5% adults, 90% infants	80%, 20% of which develop cirrhosis	5%	None	Common; latent	Common; latent	Infection confers lifelong immunity
Serology	Anti-HAV (IgM)	See Table 19, G33	HCV-RNA Anti-HCV (IgG/IgM)	HBsAg Anti-HDV (IgG/IgM)	Anti-HEV (IgG/IgM)	Anti- CMV (IgM/IgG)	Monospot; anti-EBV IgM/IgG, EBV-DNA quantitation	Anti-YF (IgM/IgG)
Vaccine	Havrix, 2 doses q6 mo, combined with Twinrix at 0, 7, and 21 d	Recombivax HBTM, ages 11-15, 2 doses q6 mo	No	No	No	No	No	YF-VAX, 1 dose booster q10 yr
Management	General hygiene Treat close contacts (anti-HAV Ig) Prophylaxis for high-risk groups (HAV vaccine ± HAV Ig) unless immune	Prevention: HBV vaccine and/or hepatitis B Ig (HBIg) for needlestick, sexual contact, infants of infected mothers (unless already immune) Rx: oral antivirals vs. interferon if indications met	Prevention: no vaccine Rx: interferon + ribavirin ± protease inhibitor; although all oral antiviral (IFN-free) therapies now available are highly efficacious	Prevention: HBV vaccine	Prevention: general hygiene, no vaccine	In high-risk transplant patients: CMV Ig and antivirals (ganciclovir, valganciclovir)	Supportive treatment post-infection	Prevention Supportive treatment post infection
Acute Mortality	0.1-0.3%	0.5-2%	1%	2-20% coinfection with HBV, 30% superinfection Predisposes HBV carriers to more severe hepatitis and faster progression to cirrhosis	1-2% overall, 10-20% in pregnancy	Rare in immuno-competent adults	Rare	20-60% in developing countries
Oncogenicity	No	Yes	Yes	Yes	No	No	Yes	No
Complications	Can cause ALF and subsequent death (<1-5%)	HCC secondary to cirrhosis, serum sickness-like syndrome, glomerulonephritis, cryoglobulinemia, polyarteritis nodosa, porphyria cutanea tarda	HCC in 2-5% of cirrhosis per yr, cryoglobulinemia, B-cell non-Hodgkin lymphoma	Leukocytoclastic vasculitis, membranous glomerulonephropathy	Mild, except in third trimester (10-20% ALF)	5% of newborns with multiple handicaps Immuno-compromised patients at risk of CMV-induced hepatitis, retinitis, colitis, esophagitis, pneumonitis	Associated with Burkitt's lymphoma and nasopharyngeal carcinoma (rare in Western world)	Can cause a recurrent toxic phase with liver damage, GI bleeding, and high mortality rates

Autoimmune Liver Disease

- diagnosis of exclusion: rule out viruses, drugs/EtOH, metabolic, or genetic causes
- can be severe: 40% mortality at 6 mo without treatment
- extrahepatic manifestations
  - sicca, Raynaud's, thyroiditis, Sjögren's, arthralgias
  - hypergammaglobulinemia (particularly elevated IgG)
  - typical auto-antibodies: ANA and/or anti-smooth muscle antibody
  - infrequently may see anti-LKM elevation (liver kidney microsome), especially in children
  - can have false positive viral serology (especially anti-HCV)
  - biopsy – periportal (zone 1) and interface inflammation and necrosis
- treatment: corticosteroids (80% respond) ± azathioprine (without this, most will relapse as corticosteroids are withdrawn)

Drug-Induced Liver Disease

Table 21. Classification of Hepatotoxins

	Predictable	Idiosyncratic
Example	Acetaminophen, CCl_4	Phenytoin, INH
Dose-Dependence	Usual	Unusual
Latent Period	Hours-days	Weeks-months
Host Factors	Not important	Very important

Hy's Law: drug-induced hepatocellular jaundice indicates a mortality of at least 10%

- many different patterns of liver injury (i.e. hepatocellular, cholestatic, mixed, granulomatous, ALF) can be seen in drug-induced liver injury and thus this requires a high index of suspicion
- see: LiverTox for Information regarding drug-specific risks and patterns of hepatotoxicity (http://livertox.nih.gov)

Specific Drugs

- acetaminophen
  - metabolized by hepatic cytochrome P450 system
  - can cause ALF (transaminases >1000 U/L followed by jaundice and encephalopathy)
  - requires 10-15 g in healthy, 4-6 g in alcoholics/anticonvulsant users
  - mechanism: high acetaminophen dose saturates glucuronidation and sulfation elimination pathways ➔ reactive metabolite (NAPQI (n-acetyl-p-benzoquinone imine)) is formed ➔ covalently binds to hepatocyte membrane
  - presentation
    - first 24 h: nausea and vomiting (usually within 4-12 h of overdose)
    - 24-48 h: asymptomatic, but ongoing hepatic necrosis resulting in increased transaminases
    - >48 h: continued hepatic necrosis possibly complicated with ALF or resolution
    - note: potential delay in presentation in sustained-release products
  - blood levels of acetaminophen correlate with the severity of hepatic injury, particularly if time of ingestion known
  - therapy
    - gastric lavage/emesis (if <2 h after ingestion)
    - oral activated charcoal
    - NAC (Mucomyst®) can be given PO or IV (most effective within 8-10 h of ingestion, but should be given regardless of time of ingestion)
      - promotes hepatic glutathione regeneration
    - no recorded fatal outcomes if NAC given before increase in transaminases
    - NAC use should be determined by the Rumack-Matthew nomogram or if unclear, time of ingestion
- chlorpromazine: cholestasis in 1% after 4 wk; often with fever, rash, jaundice, pruritus, and eosinophilia
- INH
  - 20% develop elevated transaminases but <1% develop clinically significant disease
  - susceptibility to injury increases with age
- MTX
  - causes fibrosis/cirrhosis; increased risk in the presence of obesity, DM, alcoholism (i.e. with underlying risk for pre-existing fatty liver)
  - scarring develops without symptoms or changes in liver enzymes, therefore biopsy may be needed in long-term treatment
- amiodarone: can cause same histology and clinical outcome as alcoholic hepatitis
- others: azoles, statins, methyldopa, phenytoin, propylthiouracil (PTU), rifampin, sulfonamides, tetracyclines
- herbs: chaparral, Chinese herbs (e.g. germander, comfrey, bush tea)

Wilson's Disease

Definition
- autosomal recessive defect in copper elimination (gene *ATP7B*)

Etiology
- decreased biliary excretion of copper plus decreased incorporation of copper into ceruloplasmin
- worldwide incidence 1 in 40000

Clinical Features
- liver: acute hepatitis, ALF, chronic active hepatitis, cirrhosis, low-risk of HCC
- eyes: Kayser-Fleischer rings (copper deposits in Descemet's membrane); more common in patients with CNS involvement, present in only 50% of isolated liver involvement
- CNS: basal ganglia (wing flapping tremor, Parkinsonism), cerebellum (dysarthria, dysphagia, incoordination, ataxia), cerebrum (psychosis, affective disorder)
- kidneys: Fanconi's syndrome (proximal tubule transport defects) and stones
- blood: intravascular hemolysis; may be initial presentation in fulminant hepatitis
- joints: arthritis, bone demineralization, calcifications

Clinical Manifestations of Wilson's Disease

ABCD
Asterixis
Basal ganglia degeneration: suspect if parkinsonian features in the young
Ceruloplasmin decreases
Cirrhosis
Corneal deposits (Kayser-Fleischer ring)
Copper
Dementia

Investigations
- suspect if increased liver enzymes with clinical manifestations at young age (<40); especially combination of liver disease with dystonia, psychiatric symptoms
- screening tests
  1. reduced serum ceruloplasmin (<50% of normal)
  2. Kayser-Fleischer rings (usually require slit-lamp examination)
  3. increased urinary copper excretion (measure 24-hour urine copper)
- gold standard
  1. increased copper on liver biopsy by quantitative assay
  2. genetic analysis imperfect as many mutations in *ATP7B* are possible
- first degree relatives should also be considered for screening

Treatment
- 4 drugs available
  1. penicillamine: chelates copper, but poorly tolerated
  2. trientine: chelates copper
  3. zinc: impairs copper excretion in stool and decreases copper absorption from gut. Often used as maintenance therapy or in neurologic presentations
  4. tetrathiomolybdate: preferred if neurological involvement
- hepatic presentations are best treated with a trientine + zinc combination
- liver transplant in severe cases of liver failure

Hemochromatosis

Definition
- excessive iron storage causing multiorgan system dysfunction (liver, in particular) with total body iron stores increased to 20-40 g (normal 1 g)

Etiology
- primary (hereditary) hemochromatosis
  - usually related to HFE mutation (see *Epidemiology* below)
  - decreased hepcidin production results in increased GI absorption and tissue iron deposition despite adequate iron stores
- secondary hemochromatosis
  - parenteral iron overload (e.g. transfusions, hemodialysis, parenteral iron injections)
  - excessive oral iron intake (e.g. dietary iron overload)
  - other liver diseases (e.g. EtOH, NAFLD, viral hepatitis)
  - iron-loading anemias (hemolytic, sideroblastic, aplastic, thalassemia major)
  - ineffective erythropoiesis

Hemochromatosis Clinical Features

ABCD
Arthralgia
Bronze skin
Cardiomyopathy, cirrhosis of liver
Diabetes (pancreatic damage)
Hypogonadism (anterior pituitary damage)

Epidemiology
- classic hereditary hemochromatosis most common in Northern European descent
- primarily due to the recessive gene, *HFE*, which has a homozygous genetic prevalence of 1/400
- mainly caused by mutations in the *HFE* gene (e.g. C282Y/C282Y, C282Y/H63D)
  - C282Y/H63D only potentially causative as compound heterozygote
- rare non-*HFE* mutations also exist (e.g. ferroportin, hemojuvelin, hepcidin, aceruloplasminemia)

Clinical Features
- usually presents with trivial elevation in serum transaminases although often picked up incidentally when iron studies noted to be elevated
- liver: cirrhosis (less common nowadays due to earlier detection), HCC (200x increased risk)
- pancreas: DM, chronic pancreatitis
- skin: bronze or grey (due to melanin, not iron)
- heart: diastolic dysfunction and arrhythmias in early stages with dilated cardiomyopathy in later stages
- pituitary: hypogonadotropic hypogonadism (impotence, decreased libido, amenorrhea)
- joints: arthralgia (any joint, but especially MCP joints), chondrocalcinosis

Ferritin may never normalize if other causes of high ferritin present (e.g. fatty liver from metabolic syndrome or EtOH)

Gene mutation not 100% penetrant, so not all with homozygous gene defect have clinically significant iron overload

Investigations
- screening for individuals with clinical features and/or family history (25% chance of sibling having the disease)
  - transferrin saturation (free Fe^{2+}/total iron binding capacity (TIBC)) >45%
  - serum ferritin >400 ng/mL
  - *HFE* gene analysis: 90% of primary hemochromatosis involves C282Y allele, while H63D and S65C alleles also commonly involved and screened
- MRI (often used instead of a liver biopsy)
  - noninvasive approach to assess iron overload
  - most sensitive and specific modality in the diagnosis of hemochromatosis
  - serum ferritin >1000 ng/mL or symptoms of organ injury (e.g. elevated LFTs, symptoms of heart failure)
  - can be used to follow treatment by phlebotomies
- liver biopsy (generally used to detect cirrhosis or if potential for other causes of liver disease)
  - markers of advanced fibrosis: if any of the following are present at the time of diagnosis ➔ ages >40, elevated liver enzymes, or ferritin >1000 ng/mL
  - considered if compound heterozygote and potential other cause of liver injury (e.g. NAFLD, excess EtOH, hepatitis)
  - if C282Y/C282Y and no markers of advanced fibrosis, then biopsy generally not needed
- HCC screening if cirrhosis

Treatment
- phlebotomy: weekly or q2 wk then lifelong maintenance phlebotomies q2-6 mo, generally aiming for ferritin of 50-100 ng/mL
- deferoxamine if phlebotomy contraindicated (e.g. cardiomyopathy, anemia)
- primary hemochromatosis responds well to phlebotomy
- secondary hemochromatosis usually requires chelation therapy (administration of agents that bind and sequester iron, and then excreted)

Prognosis
- normal life expectancy if treated before the development of cirrhosis or DM

Alcoholic Liver Disease

Definition
- spectrum of diseases, ranging from:
  - fatty liver (common amongst individuals with EtOH use disorder): reversible if EtOH stopped
  - alcoholic hepatitis (35% of individuals with EtOH use disorder): usually reversible if EtOH stopped
  - cirrhosis (10-15% of individuals with EtOH use disorder): potentially irreversible

Standard Drink Equivalent
1 standard drink = 14 g EtOH
= 12 oz beer (5% alcohol)
= 5 oz wine (12-17%)
= 3 oz fortified wine (17-22%)
= 1.5 oz liquor (40%)
Tip: percentage EtOH multiplied by oz in 1 standard drink roughly equals 60

Pathophysiology
- several mechanisms, poorly understood
- ethanol oxidation to acetaldehyde
  - reduces NAD+ to NADH; increased NADH decreases ATP supply to liver, impairing lipolysis so fatty acids and triglycerides accumulate in liver
  - binds to hepatocytes evoking an immune reaction
- EtOH increases gut permeability leading to increased bacterial translocation
- EtOH metabolism causes:
  - relative hypoxia in liver zone III (near central veins; poorly oxygenated) > zone I (around portal tracts, where oxygenated blood enters)
  - necrosis and hepatic vein sclerosis
- histology of alcoholic hepatitis
  - ballooned (swollen) hepatocytes often containing Mallory bodies, characteristically surrounded by neutrophils
  - large fat globules
  - fibrosis: space of Disse and perivenular

Biopsy + Histology of Alcoholic Hepatitis (triad)
- Hepatocyte necrosis with surrounding inflammation in zone III
- Mallory bodies (intracellular eosinophilic aggregates of cytokeratins)
- Chicken-wire fibrosis (network of intralobular connective tissue surrounding cells and venules)

Clinical Features
- >2-3 standard drinks/d in females and >3-6 standard drinks/d in men for >10 yr leads to cirrhosis, but only in about 10-20% of those who consume this amount daily on a continuous basis; cirrhosis risk increases with amount of EtOH consumed above threshold
- clinical findings do not accurately predict type of liver involvement
- fatty liver
  - mildly tender hepatomegaly; jaundice rare
  - mildly increased transaminases <5x normal
- alcoholic hepatitis
  - variable severity: mild to fatal liver failure
  - mild: stops drinking because feels unwell, resumes when feeling better (if assessed, findings of hepatitis, potentially mild jaundice, and mildly elevated INR)
  - severe: stops drinking but feels unwell, low grade fever, RUQ discomfort, increased WBC count – mimics right lower lobe pneumonia and cholecystitis

GI Complications of Alcohol Use
- Esophagus
  - Mallory-Weiss tear
  - Esophageal varices (secondary to portal hypertension)
- Stomach
  - Alcoholic gastritis
- Pancreas
  - Acute pancreatitis
  - Chronic pancreatitis
- Liver
  - Alcoholic hepatitis
  - Fatty liver
  - Cirrhosis
  - Hepatic encephalopathy
  - Portal hypertension
  - Ascites
  - HCC

Investigations
- blood tests are non-specific, but in general
  - AST:ALT >2:1 (both usually <300)
  - CBC: increased mean corpuscular volume (MCV), increased WBC often seen with alcoholic hepatitis but not necessarily in other alcohol-related liver injury
  - increased GGT

Treatment
- alcohol cessation (see Psychiatry, PS28)
  - Alcoholics Anonymous (or similar programs), disulfiram, naltrexone, acamprosate
- multivitamin supplements (especially thiamine)
- caution with drugs metabolized by the liver
- prednisolone if severe alcoholic hepatitis based on Maddrey's discriminant function or Model for End-Stage Liver Disease (MELD) score as described in Prognosis
  - pentoxifylline less used since most definitive trial did not demonstrate efficacy

Prognosis
- Maddrey's discriminant function (based on PT and bilirubin) and MELD predict mortality and guide treatment (consideration of corticosteroids for severe disease based on Maddrey ≥32 or MELD ≥21)
- bilirubin response at day 7 of corticosteroids (Lille model) also factors into prognosis and decision on whether to continue full course of corticosteroids if started
- fatty liver: complete resolution with cessation of EtOH intake
- alcoholic hepatitis mortality
  - immediate: 30%-60% in the first 6 mo if severe
  - with continued EtOH: 70% in 5 yr
  - with cessation: 30% in 5 yr

Non-Alcoholic Fatty Liver Disease

Definition
- spectrum of disorders characterized by macrovesicular hepatic steatosis, sometimes with inflammation and/or fibrosis
- most common cause of liver disease in North America

Etiology
- pathogenesis not well elucidated; insulin resistance implicated as key mechanism, leading to hepatic steatosis
- histological changes indistinguishable from those of alcoholic hepatitis despite negligible history of EtOH consumption

Risk Factors
- component of the metabolic syndrome along with obesity, T2DM, HTN, hypertriglyceridemia
- other less common causes such as medications (e.g. tamoxifen, corticosteroids, MTX), Wilson's, TPN, rapid weight loss, and others

Clinical Features
- often asymptomatic
- may present with fatigue, malaise, and vague RUQ discomfort

Investigations
- elevated serum AST, ALT ± ALP; AST/ALT <1
- presents as echogenic liver texture on U/S
- non-invasive testing of fibrosis: FIB4, NAFLD fibrosis score, Fibrotest, FibroScan®
- liver biopsy cannot distinguish fatty liver from alcoholic vs. non-alcoholic, but considered when investigating alternative etiologies or assessing for level of fibrosis

Treatment
- mainstay is gradual weight loss (0.5-1 kg/wk) as rapid weight loss can worsen liver disease
  - ideally, aim to lose at least 7-10% of body weight
- evidence for the use of pharmacologic agents such as pioglitazone and liraglutide, but potential benefits must be balanced with associated adverse effects (e.g. weight gain, CHF)
- some evidence for vitamin E (800 IU daily) if there is hepatic inflammation in non-diabetic, non-cirrhotic patients
- some evidence for benefits of coffee drinking (3 cups/d) and vitamin D
- consideration for bariatric surgery

Prognosis
- main causes of death, particularly in non-cirrhotic group, are cardiovascular disease and malignancy
- better prognosis than alcoholic hepatitis
  - <25% progress to cirrhosis over a 7-10 yr period
- risk of progression increases if inflammation or scarring occurs alongside fat infiltration (non-alcoholic steatohepatitis)
- other clinical indicators of unfavourable prognosis: obesity, T2DM, age, metabolic syndrome, higher levels of fibrosis

Acute Liver Failure (formerly Fulminant Hepatic Failure)

Definition
- severe decline in liver function characterized by coagulation abnormality (INR >1.5) and encephalopathy
- in setting of previously normal liver
- rapid (<26 wk duration)

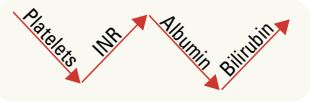

Figure 13. Progression of liver dysfunction based on liver function tests – the "W"

Etiology
- drugs (especially acetaminophen), hepatitis B (measure anti-HBc, IgM fraction because sometimes HBV-DNA and even HBsAg rapidly become negative), hepatitis A, hepatitis C (rare), ischemic, idiopathic

Treatment
- correct hypoglycemia, monitor level of consciousness, prevent GI bleed with PPI, monitor for infection and multiorgan failure (usually requires ICU)
- consider liver biopsy before INR becomes too high
- chief value of biopsy is to exclude chronic disease, less helpful for prognosis
- liver transplant (King's College criteria can be used as prognostic indicator): consider early, especially if time from jaundice to encephalopathy >7 d (e.g. not extremely rapid), ages <10 or >40, cause is drug or unknown, bilirubin >300 µmol/L, INR >3.5, creatinine >200 µmol/L

Cirrhosis

Definition
- liver damage characterized by diffuse distortion of the basic architecture with fibrosis and formation of regenerative nodules
- biopsy gold standard for diagnosis
- compensated cirrhosis = absence of complications, can last for 10-20 yr with almost normal life expectancy
- decompensated cirrhosis = development of complications such as ascites (most common), variceal bleeding, encephalopathy

Etiology
- fatty liver (alcoholic or NAFLD)
- chronic viral hepatitis (B, B+D, C; not A or E)
- autoimmune hepatitis
- drugs (e.g. chronic MTX or amiodarone use)
- hereditary hemochromatosis
- PBC
- chronic hepatic congestion
  - cardiac cirrhosis (chronic right heart failure, constrictive pericarditis)
  - hepatic vein thrombosis (Budd-Chiari)
- cryptogenic (i.e. no identifiable cause, although many of these patients may represent "burnt-out non-alcoholic steatohepatitis (NASH)")
- rare: Wilson's disease, Gaucher's disease, α1-antitrypsin deficiency

MELD-Na (Model for End-Stage Liver Disease)
- Predicts 3 mo survival and used to stratify patients on transplant list
- Based on creatinine, INR, total bilirubin, and serum sodium concentration

Investigations

- definitive diagnosis is histologic (liver biopsy)
- other tests may be suggestive
  - blood work
    - fall in platelet count <150 is the earliest finding
    - in late stages of cirrhosis, rise in INR, fall in albumin, rise in bilirubin
    - elevated bilirubin is usually seen in more advanced disease or in the setting of a concurrent insult
    - in very advanced cirrhosis (pre-terminal event), may also see hypoglycemia but this is more often a feature seen in severe ALF
  - FibroTest™: combination of various clinical and biochemical markers that can predict degree of fibrosis
  - imaging
    - U/S is the primary imaging modality but only finds advanced cirrhosis
    - CT to look for varices, nodular liver texture, splenomegaly, ascites
    - transient elastography (FibroScan®): non-invasive tool using elastography for measuring liver compliance (variable availability)
      - rapidly replacing liver biopsy to determine extent of liver fibrosis and make the diagnosis of cirrhosis
- gastroscopy: varices or portal hypertensive gastropathy

Cirrhosis Complications

VARICES
Varices
Ascites/Anemia
Renal failure (HRS)
Infection
Coagulopathy
Encephalopathy
Sepsis

Treatment

- treat underlying disorder
- decrease insults (e.g. EtOH cessation, hepatotoxic drugs, immunize for hepatitis A and B if non-immune)
- follow patient for complications (esophageal varices, ascites, HCC)
- prognosis: Child-Pugh Score and MELD score
- liver transplantation for end-stage disease; use MELD score (e.g. MELD ≥15)

Table 22. Child-Pugh Score and Interpretation

Classification	1	2	3
Serum bilirubin (μmol/L)	<34	34-51	>51
Serum albumin (g/L)	>35	28-35	<28
INR	<1.7	1.7-2.3	>2.3
Presence of ascites	Absent	Controllable	Refractory
Encephalopathy	Absent	Minimal	Severe
Interpretation			
Points	**Class**	**Life Expectancy**	**Perioperative Mortality**
5-6	A	15-50 yr	10%
7-9	B	Candidate for transplant	30%
10-15	C	1-3 mo	82%

Score: 5-6 (Child's A), 7-9 (Child's B), 10-15 (Child's C)
*Note: Child's classification is rarely used for shunting (TIPS or other surgical shunts), but is still useful to quantitate the severity of cirrhosis

Usual causes of death in cirrhosis: renal failure (hepatorenal syndrome), sepsis, GI bleed, or HCC

Complications

- hematologic changes in cirrhosis
  - pancytopenia from hypersplenism: platelets first, then WBC, then hemoglobin
  - decreased clotting factors resulting in elevated INR
  - relationship of INR to bleeding tendency is controversial; some patients may be hypocoagulable, others may be hypercoagulable
- variceal bleeds
  - half of patients with cirrhosis have gastroesophageal varices and one-third of these develop hemorrhage with an overall mortality of >30%
  - HVPG ≥10 mmHg is the strongest predictor of variceal development
  - treatment: resuscitation, antibiotic prophylaxis, vasoactive drugs (e.g. octreotide IV) combined with endoscopic band ligation or sclerotherapy, TIPS
- renal failure in cirrhosis
  - classifications
    - pre-renal (usually due to overdiuresis)
    - acute tubular necrosis
    - HRS
      - type I: sudden and acute renal failure (rapid doubling of creatinine over 2 wk)
      - type II: gradual increase in creatinine with worsening liver function (creatinine doubling over years)
    - HRS can occur at any time in severe liver disease, especially after:
      - overdiuresis or dehydration, such as diarrhea, vomiting, etc.
      - GI bleed
      - sepsis

Hepatorenal Syndrome vs. Pre-Renal Failure – Difficult to Differentiate
- Similar blood and urine findings
- Urine sodium: very low in hepatorenal; low in pre-renal
- IV fluid challenge: giving volume expanders improves pre-renal failure, but not hepatorenal syndrome

Hepatopulmonary Syndrome
- Clinical Triad
- Liver disease
- Increased alveolar-arterial gradient while breathing room air
- Evidence for intrapulmonary vascular abnormalities

Fibrosis may regress and disappear if cause of liver injury is treated or resolves

    - treatment for HRS (generally unsuccessful at improving long-term survival)
        - for type I HRS: octreotide + midodrine + albumin (increases renal blood flow by increasing systemic vascular resistance)
        - definitive treatment is liver transplant
- hepatopulmonary syndrome
    - majority of cases due to cirrhosis, though may be due to other chronic liver diseases, such as non-cirrhotic portal HTN
    - thought to arise from ventilation-perfusion mismatch, intrapulmonary shunting and limitation of oxygen diffusion, failure of damaged liver to clear circulating pulmonary vasodilators vs. production of a vasodilating substance by the liver
    - clinical features
        - hyperdynamic circulation with cardiac output >7 L/min at rest and decreased pulmonary + systemic resistance (intrapulmonary shunting)
        - dyspnea, platypnea (increase in dyspnea in upright position, improved by recumbency), and orthodeoxia (desaturation in the upright position, improved by recumbency)
        - diagnosis via contrast-enhanced echocardiography: inject air bubbles into peripheral vein; air bubbles appear in left ventricle after third heartbeat (normal = no air bubbles; in ventricular septal defect, air bubbles seen <3 heart beats)
        - only proven treatment is liver transplantation

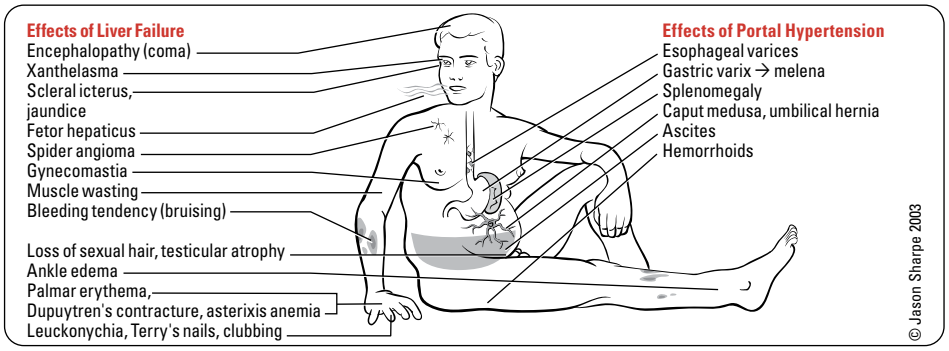

Figure 14. Clinical features of liver disease

Hepatocellular Carcinoma

- see General and Thoracic Surgery, GS53

Liver Transplantation

- see General and Thoracic Surgery, GS54

Portal Hypertension

Definition

- pressure gradient between hepatic vein pressure and wedged hepatic vein pressure (corrected sinusoidal pressure) >5 mmHg

Pathophysiology

- 3 sites of increased resistance (remember pressure = flow x resistance)
    - pre-sinusoidal (e.g. portal vein thrombosis, schistosomiasis, sarcoidosis)
    - sinusoidal (e.g. cirrhosis, alcoholic hepatitis)
    - post-sinusoidal (e.g. right-sided heart failure, hepatic vein thrombosis, veno-occlusive disease, constrictive pericarditis)

Complications

- GI bleeding from varices in esophagus, less commonly in stomach, even less frequently from portal hypertensive gastropathy
- ascites
- hepatic encephalopathy
- thrombocytopenia
- renal dysfunction
- sepsis
- arterial hypoxemia

Portal Hypertension

Signs
- Esophageal varices
- Melena
- Splenomegaly
- Ascites
- Hemorrhoids

Management
- β-blockers
- Nitrates
- Shunts (e.g. TIPS)

Treatment
- non-selective β-blockers (propranolol, nadolol, carvedilol) decrease risk of bleeding from varices
- TIPS: to decrease portal venous pressure
  - radiologically inserted stent between portal and hepatic vein via transjugular vein catheterization and percutaneous puncture of portal vein
  - can be used to stop acute bleeding or prevent rebleeding or treat ascites
  - complications: hepatic encephalopathy, deterioration of hepatic function
  - contraindicated with severe liver dysfunction, uncontrolled hepatic encephalopathy, and congestive heart failure
  - most commonly used as a "bridge" to liver transplant

Hepatic Encephalopathy

Definition
- spectrum of potentially reversible neuropsychiatric syndromes secondary to hepatic insufficiency and/or portosystemic shunting, diagnosed after ruling out other causes for symptoms (e.g. structural/metabolic)

Pathophysiology
- portosystemic shunt around hepatocytes and decreased hepatocellular function increase level of systemic toxins (believed to be ammonia from gut, mercaptans, fatty acids, amino acids) which go to the brain

Precipitating Factors
- nitrogen load (GI bleed, protein load from food intake, renal failure, constipation)
- drugs (narcotics, CNS depressants)
- electrolyte disturbance (hypokalemia, alkalosis, hypoxia, hypovolemia)
- infection (SBP)
- deterioration in hepatic function or superimposed liver disease
- spontaneous portosystemic shunts (e.g. splenorenal shunts) or intentional portosystemic shunts (e.g. TIPS)

Stages
A. minimal hepatic encephalopathy (diagnosed with specialized cognitive testing)
B. overt hepatic encephalopathy (stages I to IV)
  - I: apathy, restlessness, reversal of sleep-wake cycle, slowed intellect, impaired computational abilities, impaired handwriting
  - II: asterixis, lethargy, drowsiness, disorientation
  - III: stupor (rousable), hyperactive reflexes, extensor plantar response (upgoing Babinski)
  - IV: coma (response to painful stimuli only)

Investigations
- clinical diagnosis: supported by laboratory findings and exclusion of other neuropsychiatric diseases
- rule out
  - non-liver-related neuropsychiatric disease in a patient with liver problems (e.g. EtOH withdrawal or intoxication, sedatives, subdural hematoma, metabolic encephalopathy)
  - causes of metabolic encephalopathy (e.g. renal failure, respiratory failure, severe hyponatremia, hypoglycemia)
- characteristic EEG findings: diffuse (non-focal), slow, high amplitude waves
- serum ammonia levels increased, but not often necessary to measure in routine clinical use

Treatment
- treat underlying precipitating factors
- decrease generation of nitrogenous compounds
  - routine protein restriction is no longer recommended given patients generally have concurrent malnutrition and muscle wasting; however, vegetable protein (as opposed to animal protein) may help reduce risk of encephalopathy
  - lactulose: titrated to achieve 2-3 soft stools/d
    - prevents diffusion of NH_3 (ammonia) from the colon into blood by lowering pH and forming non-diffusible NH_4^+ (ammonium)
    - serves as a substrate for incorporation of ammonia by bacteria, promotes growth in bowel lumen of bacteria which produce minimal ammonia
    - also acts as a laxative to eliminate nitrogen-producing bacteria from colon
- oral rifaximin for both acute treatment and maintenance therapy has high level evidence for efficacy
- best acute treatment in comatose patient is lactulose enemas

Precipitating Factors for Hepatic Encephalopathy

HEPATICS
Hemorrhage in GI tract/Hypokalemia
Excess dietary protein
Paracentesis
Alkalosis/Anemia
Trauma
Infection
Colon surgery
Sedatives

A Randomized, Double-Blind, Controlled Trial Comparing Rifaximin plus Lactulose with Lactulose Alone in Treatment of Overt Hepatic Encephalopathy
American J Gastroenterol 2013;108:1458-1463
Study: Prospective double-blinded RCT.
Purpose: Efficacy and safety of rifaximin plus lactulose vs. lactulose alone for treatment of overt HE.
Results: Of the patients, 48 (76%) in group A (lactulose plus rifaximin 1200 mg/d, n=63) compared with 29 (50.8%) in group B (lactulose plus placebo, n=57) had complete reversal of HE (P<0.004). There was a significant decrease in mortality after treatment with lactulose plus rifaximin vs. lactulose plus placebo (23.8% vs. 49.1%, P<0.05). There were significantly more deaths in group B because of sepsis (group A vs. group B: 7:17, P=0.01), whereas there were no differences because of GI bleed (group A vs. group B: 4:4, P=nonsignificant (NS)) and HRS (group A vs. group B: 4:7, P=NS). Patients in the lactulose plus rifaximin group had shorter hospital stay (5.8±3.4 vs. 8.2±4.6 d, P=0.001).
Conclusion: Combination of lactulose plus rifaximin is more effective than lactulose alone in the treatment of overt HE.

Ascites

Definition
- accumulation of excess fluid in the peritoneal cavity

Etiology

Table 23. Serum-Ascites Albumin Gradient in the Evaluation of Ascites

Serum [Alb] – Ascitic [Alb] >11 g/L (1.1 g/dL) Portal Hypertension Related	Serum [Alb] – Ascitic [Alb] <11 g/L (1.1 g/dL) Non-Portal Hypertension Related
Cirrhosis/severe hepatitis	Peritoneal carcinomatosis
Chronic hepatic congestion (right heart failure, Budd-Chiari)	Peritoneal TB
Massive liver metastases	Pancreatic disease
Portal vein thrombosis	Serositis
Idiopathic portal fibrosis	Nephrotic syndrome*

* In nephrotic syndrome: decreased serum [Alb] to begin with, therefore gradient not helpful

Pathophysiology
- key factor in pathogenesis is increased sodium (and water) retention by the kidney for reasons not fully understood. Theories include:
  - underfill hypothesis
  - overfill hypothesis
  - peripheral arterial vasodilation theory (most popular): as portal hypertension develops in cirrhosis, production of local mediators such as nitric oxide leads to splanchnic arterial vasodilation, ultimately pulling blood away from the systemic circulation and resulting in reduced effective arterial volume, which causes compensatory sodium and fluid retention by the kidneys (i.e. circulatory volume is increased, as per the overfill hypothesis, but effective volume is decreased as per the underfill hypothesis)

Underfill Hypothesis
First step in ascites formation is increased portal pressure and low oncotic pressure (e.g. low serum albumin) driving water out of the splanchnic portal circulation into abdominal cavity; the resulting decreased circulating volume causes secondary sodium retention by the kidney

Overfill Hypothesis
Cirrhosis directly causes increased sodium retention by the kidney in the absence of hypovolemia and ascites arises secondarily

Diagnosis
- abdominal U/S
- physical exam (clinically detectable when >500 mL)
  - bulging flanks, shifting dullness, fluid-wave test positive
  - most sensitive symptom: ankle swelling

Investigations
- diagnostic paracentesis
  - 1st aliquot: cell count and differential
  - 2nd aliquot: chemistry (especially albumin, but also total protein; amylase if pancreatitis; TG and chylomicrons if turbid and suspect chylous ascites)
  - 3rd aliquot: C&S, Gram stain
  - 4th aliquot: cytology (usually positive in peritoneal carcinomatosis)

Serum Ascites Albumin Gradient (SAAG) = serum albumin – ascites albumin
- >11 g/L portal HTN
- ascitic fluid total protein >25 g/L, suggests cardiac portal hypertension
- ascitic fluid total protein <25 g/L, suggests cirrhosis portal hypertension
- <11 g/L unrelated to portal HTN

Treatment
- diuretic-sensitive ascites
  - Na^+ restriction (daily sodium intake <2 g)
  - no need for fluid restriction unless significant hyponatremia (e.g. Na^+ <120-125 mmol/L)
  - diuretics: spironolactone, furosemide
  - aim for weight loss 0.5-1 kg/d, more if concomitant peripheral edema (which is mobilized quicker than ascitic fluid); overly rapid weight loss increases risk of renal failure
  - if target weight loss is not achieved and there are no complications, increase dose to achieve target while monitoring for complications
- refractory ascites (diuretics are inadequate or not tolerated)
  - therapeutic paracentesis with IV albumin
  - TIPS in an appropriate patient (no contraindications) with potential transplant-free survival advantage
  - liver transplantation should be considered in every case, since development of ascites in patients with cirrhosis is associated with a high 2 yr mortality

Complication: Primary/Spontaneous Bacterial Peritonitis
- primary/SBP
  - complicates ascites, but does not cause it (occurs in 10% of cirrhotic ascites); higher risk in patients with GI bleed
  - 1/3 of patients are asymptomatic, thus do not hesitate to do a diagnostic paracentesis in ascites even if no clinical indication of infection
  - fever, chills, abdominal pain, ileus, hypotension, worsening encephalopathy, acute kidney injury
  - Gram-negatives compose 70% of pathogens: *E. coli* (most common), *Streptococcus, Klebsiella*

- diagnosis
  - absolute neutrophil count in peritoneal fluid >0.25x10^9 cells/L (250 cells/mm^3)
  - Gram stain positive in only 10-50% of patients
  - culture positive in <80% of patients (not needed for diagnosis)
- prophylaxis: consider in patients with:
  - cirrhotic with GI bleed: ceftriaxone IV daily or norfloxacin BID x 7 d
  - previous episode of SBP: long-term prophylaxis with daily norfloxacin or TMP-SMX
- treatment
  - IV ABx (cefotaxime 2 g IV q8h or ceftriaxone 1 g IV daily is the treatment of choice for 5 d; modify if response inadequate or culture shows resistant organisms)
  - IV albumin (1.5 g/kg at time of diagnosis and 1 g/kg on day 3) decreases mortality by lowering risk of acute renal failure

Biliary Tract

Jaundice

- see Table 2, G4 and Figures 15 and 16

Signs and Symptoms

- dark urine, pale stools: suggests that bilirubin elevation is from direct fraction
- pruritus: suggests chronic disease, cholestasis
- abdominal pain: suggests biliary tract obstruction from stone or pancreatic/biliary tumour (obstructive jaundice)
- painless jaundice in the elderly: think of pancreatic cancer
- kernicterus: rarely seen in adults due to maturation of blood brain barrier

Investigations

- blood work: CBC, bilirubin (direct and total), liver enzymes (AST, ALT, ALP, GGT), liver function tests (INR/PT, PTT, albumin), ± amylase/lipase
- U/S or CT for evidence of bile duct obstruction (e.g. bile duct dilation)
- more detailed evaluation of bile duct ± surrounding structures like pancreas:
  - MRCP: non-invasive
  - EUS: sensitive for stones and pancreatic tumours
  - ERCP: invasive, most accurate, allows for therapeutic intervention
  - PTC: if ERCP fails (endoscopic access not possible)

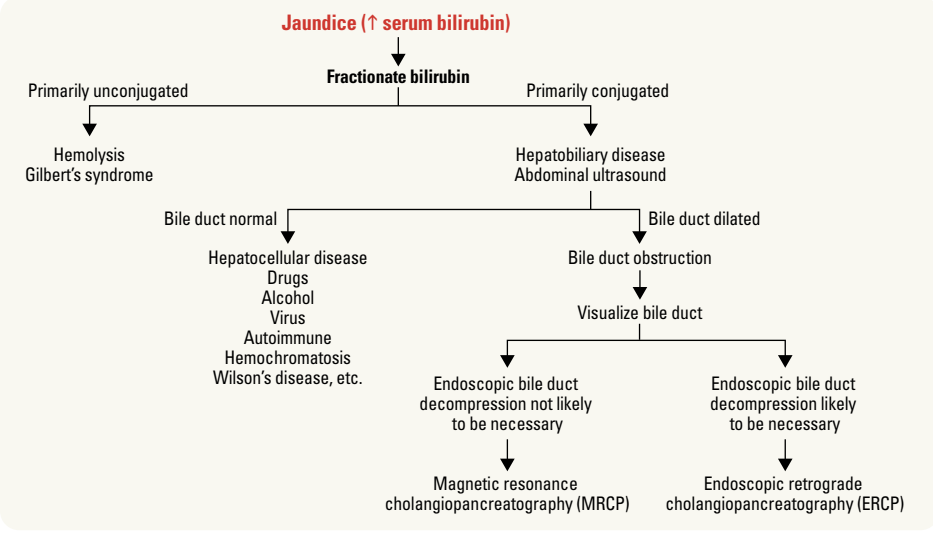

Figure 15. Approach to jaundice

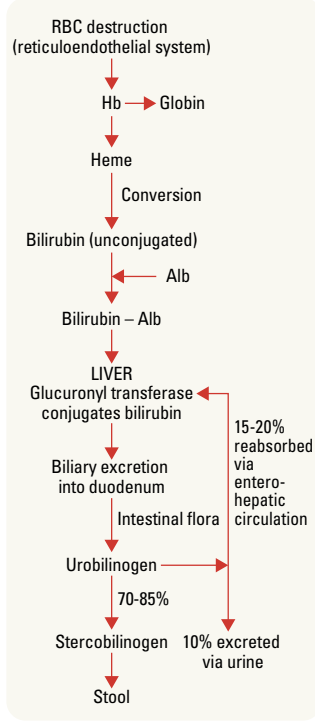

Figure 16. Production and excretion of bilirubin

Gilbert's Syndrome

Etiology/Epidemiology
- some patients have decreased hepatobiliary uptake
- affects 7% of population, especially males
- autosomal dominant, 70% due to a mutation in the UGT gene

Gilbert's Syndrome vs. Crigler-Najjar Syndrome
Gilbert's Syndrome: mild decrease in glucuronyltransferase activity
Crigler-Najjar Syndrome: complete deficiency of glucuronyltransferase

Clinical Features
- presents in teens-20s, often an incidental finding
- only manifestation is intermittent jaundice with increased serum unconjugated bilirubin developing most characteristically while fasting, or at times of acute illness; no other clinical implications

Treatment
- none indicated (entirely benign)

Primary Sclerosing Cholangitis

Definition
- inflammation, fibrosis, and stricturing of biliary tree (intra and/or extrahepatic bile ducts) from scarring

Etiology
- primary/idiopathic (most common)
  - associated with IBD, more commonly UC, in up to 70-80% of patients (usually male) with PSC
- secondary (less common)
  - long-term choledocholithiasis
  - cholangiocarcinoma
  - surgical/traumatic injury (iatrogenic)
  - contiguous inflammatory process
  - post-ERCP
  - associated with HIV/AIDS ("HIV cholangiopathy")
  - IgG4-related disease
  - critical illness

Signs and Symptoms
- often insidious, may present with fatigue and pruritus
- may present with signs of episodic bacterial cholangitis secondary to biliary obstruction

Investigations
- increased ALP (hallmark), less often increased bilirubin
- mildly increased AST, usually <300 U/L
- p-ANCA (30-80%), elevated IgM (40-50%)
- MRCP and ERCP shows narrowing and dilatations of bile ducts that may result in "beading," both intrahepatic and extrahepatic bile ducts
  - if intrahepatic narrowing only, do anti-mitochondrial antibody to rule out PBC

Complications
- repeated bouts of cholangitis may lead to complete biliary obstruction with resultant secondary biliary cirrhosis and hepatic failure
- increased incidence of cholangiocarcinoma (10-15%): difficult to diagnose and treat

Treatment
- image bile duct (MRCP) at least annually for early detection of cholangiocarcinoma (controversial)
- endoscopic sphincterotomy, biliary stent in selected cases of dominant common bile duct stricture
- ABx for cholangitis
- suppurative cholangitis requires emergency drainage of pus in common bile duct
- liver transplantation appears to be the best treatment for advanced sclerosing cholangitis (nearly 90% 1 yr survival; mean follow-up time from diagnosis to need for transplant is 10 yr)
- ursodiol: previously recommended, but studies suggest that it increases mortality if taken in high doses

Prognosis
- unfavourable regardless of treatment
- mean survival after diagnosis remains 4-10 yr

Primary Biliary Cholangitis (formerly Primary Biliary Cirrhosis)

Definition
- chronic inflammation and fibrous obliteration of intrahepatic bile ductules

Etiology/Epidemiology
- likely autoimmune (associated with Sjögren's syndrome, scleroderma, CREST syndrome (calcinosis, Raynaud's phenomenon, esophageal dysfunction, sclerodactyly, telangiectasia), RA, thyroiditis)
- affects mainly middle-aged women (M:F=1:9)

Signs and Symptoms
- often asymptomatic
- initial symptoms: pruritus, fatigue
- chronic: jaundice and melanosis (darkening skin) and other signs of cholestasis
- end-stage: hepatocellular failure, portal HTN, ascites
- high incidence of osteoporosis

Investigations
- increased ALP, GGT; bilirubin rises in later stage
- positive anti-mitochondrial antibodies (AMA; 95% specificity and sensitivity)
- elevated IgM
- increased serum cholesterol (mild increase in LDL, larger increase in HDL)
  - may have: xanthelasmas, xanthomas
- liver biopsy confirms diagnosis and stages severity
- normal bile duct on MRCP rules out bile duct obstruction which can mimic PBC
- "overlap" syndromes with autoimmune cholangitis, autoimmune hepatitis, sclerosing cholangitis are possible

Treatment
- drugs that treat the underlying disease:
  - ursodiol (usual first line treatment)
  - obeticholic acid (particularly if inadequate response to ursodiol)
- cholestyramine (for pruritus and hypercholesterolemia)
- calcium and vitamin D for low bone density; bisphosphonates if osteoporosis severe
- monitor for thyroid disease
- liver transplant if disease severe, progressive

Prognosis
- can be fatal, although not all asymptomatic patients show progression

Table 24. Primary Sclerosing Cholangitis vs. Primary Biliary Cholangitis

	Primary Sclerosing Cholangitis	Primary Biliary Cholangitis
Predominant Gender	Male	Female
Associated Comorbidities	IBD, especially UC	Other autoimmune disorders (Sjögren's, CREST, RA)
Affected Ducts	Both intra- and extrahepatic	Intrahepatic only
Investigations	ERCP/MRCP (narrowing and dilatations of ducts visualized)	Anti-mitochondrial antibodies, IgM, increased lipids, liver biopsy (absence of duct narrowing on ERCP)

MRCP/ERCP
- Absence of narrowing in PBC
- Narrowing of intra- and extrahepatic ducts in PSC

Endoscopic or Surgical Step-Up Approach for Infected Necrotising Pancreatitis: A Multicentre Randomised Trial
Lancet 2018;391:51-58
Purpose: To compare the outcomes of endoscopic vs. the standard surgical removal of infected necrotising pancreatitis.
Study: RCT.
Population: 98 patients with pancreatic or extrapancreatic necrosis were randomized to either endoscopic removal or surgical removal of the infected necrosis.
Outcomes: Major complications and death at 6 mo follow-up.
Results: The primary endpoints of mortality and major complications were the same in the two groups, but the endoscopic group had shortened hospital stays and less pancreatic fistulae.
Conclusions: Three points are worth emphasizing: (1) necrotising pancreatitis is a severe disease: about 15% in each group died; (2) it is best to wait at least 4 wk after the necrosis has developed to allow it to be encapsulated; (3) the management of severe acute pancreatitis should include experts skilled in therapeutic endoscopy.

Biliary Colic, Cholecystitis

- see General and Thoracic Surgery, GS56

Ascending Cholangitis

- see General and Thoracic Surgery, *Acute Cholangitis*, GS58

Definition
- infection of the biliary tree

Etiology
- stasis in the biliary tract due to obstruction or stricture
- bacteria
  - *E. coli, Klebsiella, Enterobacter, Enterococcus*
  - coinfection with *Bacteroides* and *Clostridia* can occur

Signs and Symptoms
- Charcot's triad: fever, RUQ pain, jaundice (50-70%)
- Reynolds' pentad in patients with suppurative cholangitis: fever, RUQ pain, jaundice, hypotension, altered mental status

Charcot's Triad
- RUQ pain
- Fever
- Jaundice

Reynolds' Pentad
- Charcot's triad
- Hypotension
- Altered mental status

Investigations
- increased WBC
- usually increased ALP and bilirubin, ALT variably elevated (can be markedly increased if acute obstruction from common bile duct (CBD) stone)
- blood culture
- abdominal U/S: CBD dilation, stones

Treatment
- most important is drainage, ideally via ERCP; perform by percutaneous biliary or by surgical routes (least often) if ERCP not possible
- antibiotic therapy: broad spectrum to cover Gram-negatives, *Enterococcus*, and anaerobes (especially if CBD manipulation); no clear consensus on antibiotic choice but consider:
  - ampicillin + sulbactam or piperacillin/tazobactam
  - metronidazole + 3rd generation cephalosporin (e.g. ceftriaxone) or fluoroquinolone (e.g. ciprofloxacin or levofloxacin)
  - carbapenem monotherapy (e.g. imipenem or meropenem)

Prognosis
- good with effective drainage and ABx in mild to moderate cases
- high mortality (~50%) in patients with Reynolds pentad

Pancreas

Pancreatic Enzyme Abnormalities

Causes of Increased Serum Amylase
- pancreatic disease
  - pancreatitis, pancreatic duct obstruction (e.g. ampullary cancer), pseudocyst, abscess, ascites, trauma, cancer
- non-pancreatic abdominal disease
  - biliary tract disease, bowel obstruction/ischemia, perforated or penetrating ulcer, ruptured ectopic pregnancy, aneurysm, chronic liver disease, peritonitis
- non-abdominal disease
  - cancer (lung, ovary, esophagus, etc.), salivary gland lesions, bulimia, renal transplant/insufficiency, burns, ketoacidosis
  - macroamylasemia

Pancreatic Enzymes

TALC
Trypsin
Amylase
Lipase
Chymotrypsin

When serum amylase >5x normal, the cause is almost always pancreatitis or renal disease

Causes of Increased Serum Lipase
- pancreatic disease: same as above
- non-pancreatic abdominal disease (mild elevations only): same as above
- non-abdominal disease
  - macrolipasemia
  - renal failure

Acute Pancreatitis

Etiology (most common are alcohol and gallstones)
- **I**diopathic: thought to be hypertensive sphincter or microlithiasis
- **G**allstones (45%)
- **E**thanol (35%)
- **T**umours: pancreas, ampulla, choledochocele
- **S**corpion stings
- **M**icrobiological
  - bacterial: *Mycoplasma, Campylobacter*, TB, *M. avium intracellulare, Legionella, Leptospira*
  - viral: mumps, rubella, varicella, viral hepatitis, CMV, EBV, HIV, Coxsackie virus, echovirus, adenovirus
  - parasites: ascariasis, clonorchiasis, echinococcosis
- **A**utoimmune: SLE, *polyarteritis nodosa* (PAN), CD
- **S**urgery/trauma
  - manipulation of sphincter of Oddi (e.g. ERCP), post-cardiac surgery, blunt trauma to abdomen, penetrating peptic ulcer
- **H**yperlipidemia (TG >11.3 mmol/L; >1000 mg/dL), hypercalcemia, hypothermia
- **E**mboli or ischemia
- **D**rugs/toxins
  - azathioprine, mercaptopurine, furosemide, estrogens, methyldopa, H2-blockers, valproic acid, ABx, acetaminophen, salicylates, methanol, organophosphates, steroids (controversial)

When thinking about the causes of acute pancreatitis remember: **I GET SMASHED**, but vast majority due to gallstones or ethanol

Pathophysiology
- activation of proteolytic enzymes within pancreatic cells, starting with trypsin, leading to local and systemic inflammatory response
- in gallstone pancreatitis, this is due to mechanical obstruction of the pancreatic duct by stones
- in ethanol-related pancreatitis, pathogenesis is unknown
- in rare genetic diseases, mutations prevent the physiological breakdown of trypsin required normally to stop proteolysis (e.g. mutant trypsin in hereditary pancreatitis or mutation in *SPINK1* gene, which normally inhibits activated trypsin); may be model for ethanol-related pancreatitis

Pathology
- mild (interstitial)
  - peri-pancreatic fat necrosis
  - interstitial edema
- severe (necrotic)
  - extensive peri-pancreatic and intra-pancreatic fat necrosis
  - parenchymal necrosis and hemorrhage ➔ infection in 60%
  - release of toxic factors into systemic circulation and peritoneal space (causes multi-organ failure)
- severity of clinical features may not always correlate with pathology
- 3 phases
  - local inflammation + necrosis ➔ hypovolemia
  - systemic inflammation in multiple organs, especially in lungs, usually after IV fluids given ➔ pulmonary edema
  - local complications >2 wk after presentation ➔ fluid collection (pseudocyst) or tissue collection (necrosis), sterile or infected

Cullen's Sign
- Sensitive, not specific for acute pancreatitis

Grey-Turner's Sign
- Flank ecchymosis

Signs and Symptoms
- pain: epigastric, noncolicky, constant
- can radiate to back
- may improve when leaning forward (Inglefinger's sign)
- tender rigid abdomen; guarding
- N/V
- abdominal distention from paralytic ileus
- fever: chemical, not due to infection
- jaundice: compression or obstruction of bile duct
- Cullen's/Grey-Turner's signs
- tetany: transient hypocalcemia
- hypovolemic shock: can lead to renal failure
- acute respiratory distress syndrome
- coma

Increased Amylase
- Sensitive, not specific for acute pancreatitis

Increased Lipase
- Higher sensitivity and specificity
- Stays elevated longer

Investigations
- increased serum pancreatic enzymes: amylase, lipase (more specific)
- ALT >150 specific for biliary cause
- increased WBC, glucose, low calcium
- imaging: CT most useful for diagnosis and prognosis
  - x-ray: "sentinel loop" (dilated proximal jejunum), calcification, and "colon cut-off sign" (colonic spasm)
  - U/S: useful for evaluating biliary tree (67% sensitivity, 100% specificity)
  - CT scan with IV contrast: most useful when done >1 d after presentation, helpful for diagnosis and prognosis because contrast seen only in viable pancreatic tissue, non-viable areas can be biopsied percutaneously to differentiate sterile from infected necrosis
  - ERCP or MRCP if cause uncertain, assess for duct stone, pancreatic or ampullary tumour, pancreas divisum

Classification
- interstitial edematous vs. necrotizing
- mild, moderate, severe

Prognosis
- usually a benign, self-limiting course, single or recurrent
- occasionally severe leading to:
  - shock
  - pulmonary edema
  - multi-organ dysfunction syndrome
  - GI ulceration due to stress
  - death
    - numerous scales to describe severity: probably most useful is proportion of pancreas not taking up contrast on CT done 48 h after presentation (necrotic pancreas does not take up the contrast dye)
    - presence of organ failure, particularly organ failure that persists >48 h, is associated with worse outcomes

Table 25. Collections in Pancreatitis (Revised 2012 Atlanta Classification)

	Liquid	Solid
Acute	Acute peripancreatic fluid collection (APFC)	Acute necrotic collection (ANC)
Chronic	Pancreatic pseudocyst	Walled-off necrosis (WON)

All of these collections are classified as infected or not infected

Treatment
- goals (only supportive therapy available)
  1. hemodynamic stability
  2. analgesia
  3. oxygen
  4. stop progression of damage (difficult)
  5. treat local and systemic complications
- antibiotic use in infection (cephalosporins, imipenem), not indicated to prevent infection, although without aspiration/biopsy can be difficult to distinguish infection from non-infected inflammation
- aspirate necrotic areas of pancreas to diagnose infection; drain if infected
- IV fluids (crystalloid or colloid)
  - beware third spacing of fluid, monitor urine output carefully
- NG suction (lets pancreas rest) if vomiting, stomach very dilated
- endoscopic sphincterotomy if severe gallstone pancreatitis (i.e. cholangitis or ongoing obstruction)
- nutritional support: NJ feeding tube or TPN if cannot tolerate enteric feeds
  - recent evidence supports NG enteral (or oral if feasible) feeds
- no benefit: glucagon, atropine, aprotinin, H2-blockers, peritoneal lavage
- follow clinically and CT/U/S to exclude complications
- chief role of invasive intervention is to drain fluid collection, excise necrotic tissue (necrosectomy), especially indicated if pseudocyst or walled-off necrosis is infected,
  - try to delay for >2 wk to allow demarcation between viable and necrotic tissue, better done endoscopically or radiologically, rather than surgically if technically possible

Late Complications
- pseudocysts: follow if asymptomatic, drain if symptomatic or growing
  - drain preferably: endoscopic, percutaneous under radiological guidance, surgical if less invasive methods fail
- infected necrosis/abscesses: ABx + percutaneous drainage, endoscopic preferable to surgical
- bleeding: (1) gastric varices if splenic vein thrombosis, (2) pseudoaneurysm of vessels in areas of necrosis, especially splenic artery, (3) duodenal ulcer related to compression of duodenum by enlarged pancreas
- splenic and portal vein thrombosis: no effective therapy described, anticoagulation not proven, hazardous
- rare: DM, pancreatic duct damage

Chronic Pancreatitis

Definition
- irreversible damage to pancreas characterized by
  1. pancreatic cell loss (from necrosis)
  2. inflammation
  3. fibrosis

Etiology/Pathophysiology
- EtOH (most common)
  - causes a larger proportion (>90%) of chronic pancreatitis than acute pancreatitis
  - changes composition of pancreatic juice (e.g. increases viscosity)
  - decreases pancreatic secretion of pancreatic stone protein (lithostathine), which normally solubilizes calcium salts
    - precipitation of calcium within pancreatic duct results in duct and gland destruction
  - toxic effect on acinar and duct cells – directly or via increasing free radicals
  - acinar cell injury leads to cytokine release, which stimulates pancreatic stellate cells to form collagen (leading to fibrosis)
  - varying degrees of ductular dilatation, strictures, protein plugs, calcification
  - no satisfactory theory to explain why only a minority of individuals with EtOH use disorder develop pancreatitis
  - unusual causes
- cystic fibrosis
- severe protein-calorie malnutrition
- hereditary
- idiopathic

Signs and Symptoms
- early stages
  - recurrent attacks of severe abdominal pain (upper abdomen and back)
  - chronic painless pancreatitis: 10%
- late stages: occurs in 15% of patients
  - steatorrhea (maldigestion) when >90% of function is lost
  - diabetes, calcification, jaundice, weight loss, pseudocyst, ascites, GI bleed

Gallstones only cause acute pancreatitis (not chronic pancreatitis)

Symptoms of Chronic Pancreatitis
- Abdominal pain
- Diabetes
- Steatorrhea

Etiology = Almost Always Alcohol

Treatment
- EtOH abstinence
- Pancreatic enzyme replacement
- Analgesics
- Pancreatic resection if ductular blockage

When to Call the Surgeon in Acute Pancreatitis? Endoscopic Transgastric vs. Surgical Necrosectomy for Infected Necrotizing Pancreatitis: A Randomized Trial
JAMA 2012;307:1053-1061
Once it was recognized that severe acute (necrotizing) pancreatitis had a terrible prognosis because of an exuberant inflammatory response leading to multiorgan failure, pancreatectomy was attempted. However, contrary to the expected favourable results, clinical experience has shown that surgical pancreatectomy is usually not helpful, perhaps because once the inflammatory cascade starts, it persists as a self-perpetuating cycle. The problems caused by acute pancreatitis can be thought of as widespread burn initiated by inflammation in the pancreas, but having little do with ongoing problems within the pancreas itself. Studies suggest that the only compelling indication for surgery is infected necrotizing pancreatitis not responding to ABx.
As predicted, without removal of such infected pancreatic tissue, death is likely from sepsis.
In this recent randomized trial, transgastric necrosectomy, an endoscopic technique that also removes infected necrotic pancreatic tissue, reduced both a composite endpoint of major pancreatitis complications (especially new onset organ failure) and the pro-inflammatory response (as measured by serum IL-6 levels) to a greater extent than surgical necrosectomy. Of course, not all necrotic collections are in areas amenable to endoscopic intervention, and the advice of an experienced surgeon should always be welcomed in severe acute pancreatitis, but the role of surgery in this previously considered surgical disease is rapidly diminishing.

Investigations
- laboratory
  - increase in serum glucose
  - increase in serum ALP, less commonly bilirubin (jaundice)
  - serum amylase and lipase usually normal
  - stool elastase is low in steatorrhea
- abdominal x-ray: pancreatic calcifications
- U/S or CT: calcification, dilated pancreatic ducts, pseudocyst
- MRCP or ERCP: abnormalities of pancreatic ducts-narrowing and dilatation
- EUS: abnormalities of pancreatic parenchyma and pancreatic ducts, most sensitive test
- 72 h fecal fat test: measures exocrine function, fecal elastase preferable
- secretin test: gold standard, measures exocrine function but difficult to perform, unpleasant for patient, expensive

Treatment
- most common problem is pain, difficult to control
- general management
  - complete abstinence from EtOH
  - enzyme replacement may help pain by resting pancreas via negative feedback
  - analgesics
  - celiac ganglion blocks
  - time: pain decreases with time as pancreas "burns out"
- endoscopy: sphincterotomy, stent if duct dilated, remove stones from pancreatic duct
- surgery: drain pancreatic duct (pancreaticojejunostomy) if duct dilated (more effective than endoscopy); resect pancreas if duct contracted
- steatorrhea
  - pancreatic enzyme replacement
  - neither endoscopy nor surgery can improve pancreatic function

Autoimmune Pancreatitis

- most commonly presents as a mimicker of pancreatic cancer (pancreatic mass detected because of jaundice ± abdominal pain)

Investigations
- histology: lymphocyte and plasma cell infiltration of pancreas
- imaging: focal or diffuse enlargement of pancreas on CT or MRI, sausage shaped, low density rim around pancreas
- serology: increased serum IgG4
- other organ involvement: sialadenitis, retroperitoneal fibrosis, biliary duct narrowing, nephritis

Treatment
- responds to prednisone

Clinical Nutrition

Determination of Nutritional Status

Challenging to Differentiate Markers of Malnutrition from Markers of Disease
- most important feature in assessing the need for nutritional support is weight loss (expressed as change in body mass index (kg/m^2))
- Subjective Global Assessment divides nutritional status into A) adequately nourished, B) mild or moderate malnutrition and C) severe malnutrition in order to identify those who will benefit from nutritional support
- includes weight change in past 6 mo, weight change in past 2 wk, dietary intake change, current dietary intake, GI symptoms, functional capacity, effect of disease on nutritional requirements and physical examination, including loss of subcutaneous fat/muscles wasting/edema/ascites

Table 26. Small Bowel Nutrient Absorption

	Fe^{3+}	CHO	Proteins, Lipids Na^+, H_2O	Bile Acids	Vitamin B_{12}
Duodenum	+++	+++	+++	+	
Jejunum	+	+	++	+	+
Ileum	+	+	++	+++	+++

Determining Nutritional Requirements
- calories: total energy expenditure (TEE) = resting energy expenditure (REE) x stress factor (e.g. 1.7 for burns) usually works out to be 25-35 kcal/kg depending on how disease affects metabolism, with IV nutrition delivered as about 60% carbohydrate, 40% fat. Current trend is to provide fewer calories ("permissive underfeeding"), especially in ICU, to prevent hyperglycemia
- protein: 1-2 g/kg/d, depending on effect of disease on protein metabolism. In disease, a greater proportion of energy expenditure comes from protein than in health
- electrolytes, minerals, and vitamins also required

Indications for Aggressive Nutritional Support:
- inability to meet nutritional needs; logical, but convincing evidence from literature not available for ICU and other acute illnesses
- evidence that nutritional support improves outcome available for (1) short bowel syndrome (home TPN), (2) before major abdominal or thoracic surgery if there is substantial malnutrition, (3) before therapy for cancer of esophagus, head, and neck, (4) decompensated alcoholic liver disease, (5) pancreatitis (acute and chronic). May be helpful for other indications also, but insufficient data
- nutritional support at best prevents protein loss but usually no gain

Enteral Nutrition

Definition
- EN (tube feeding) is a way of providing food through a tube placed in the stomach or the small intestine
  - nasogastric (NG), or nasojejunal (NJ) if nutritional support required for brief time; percutaneous endoscopic gastrostomy ("G-tube" or "PEG tube")/percutaneous endoscopic jejunostomy (J-tube) if nutritional support required for more than 1 mo
- tubes can be placed endoscopically, radiologically or surgically

Most Common Indications for Artificial Nutrition Support
- Preexisting nutritional deprivation
- Anticipated or actual inadequate energy intake by mouth
- Significant multiorgan system disease

Indications
- oral feeding inadequate or contraindicated

Feeds
- polymeric feeds contain whole protein, carbohydrate, fat as a liquid, with or without fibre
- elemental feeds contain protein as amino acids, carbohydrate as simple sugars, fat content low (therefore high osmolarity)
- specific diets: low carbohydrate/high fat solution for ventilated patients (carbohydrate has a high respiratory quotient so minimizes carbon dioxide production), high energy, low electrolyte solutions for dialysis patients

Relative Contraindications
- non-functioning gut (e.g. intestinal obstruction, enteroenteral or enterocutaneous fistulae)
- uncontrolled diarrhea
- GI bleeding

Whenever possible, EN is ALWAYS preferable over PN

Complications
- aspiration
- diarrhea
- refeeding syndrome (rare): carbohydrate can stimulate excessive insulin release, leading to cellular uptake and low serum levels of phosphate, magnesium, potassium
- overfeeding syndrome (rare): hypertonic dehydration, hyperglycemia, hypercapnia, azotemia (from excess protein)

Parenteral Nutrition

Definition
- PN is the practice of feeding a person intravenously, bypassing the usual process of eating and digestion

Indications
- short-term (<1 mo)
  - use whenever GI tract not functioning
  - only situations where PN has been well shown to increase survival are after bone marrow transplant and in short bowel syndrome, some evidence for benefit in gastric cancer, but often used in ICU, perioperatively, and in difficult-to-control sepsis
  - preoperative: only useful in severely malnourished (e.g. loss of >15% of pre-morbid weight, serum albumin <28 g/L or <2.8 g/dL), and only if given for ≥2 wk
  - renal failure: PN shown to increase rate of recovery; no increase in survival
  - liver disease: branched chain amino acids may shorten duration of encephalopathy; no increase in survival

- IBD: PN closes fistulae and heals acute exacerbations of mucosal inflammation, but effect is transient (EN is equally effective)
- some evidence for efficacy, but convincing data not available for:
  - radiation/chemotherapy-induced enteritis
  - AIDS with wasting diarrhea
  - severe acute pancreatitis

- long-term (>1 mo): can be given at home
  - severe untreatable small bowel disease (e.g. radiation enteritis, extensive CD, high output fistulae)
  - following surgical resection of >70% of small bowel (e.g. small bowel infarction)
  - severe motility diseases (e.g. scleroderma affecting bowel)

Hypomagnesemia may be an initial sign of short bowel syndrome in patients who have undergone surgical bowel resection

Relative Contraindications

- functional GI tract available for EN
- active infection; at least until appropriate antibiotic coverage
- inadequate venous access; triple-lumen central venous lines usually prevent this problem

Enteral vs. Parenteral Nutrition for Acute Pancreatitis
Cochrane DB Syst Rev 2010;1:CD002837
Purpose: Compare EN vs. TPN on mortality, morbidity, and hospital stay in patients with pancreatitis.
Study Selection: RCTs of TPN vs. EN in pancreatitis.
Results: Eight trials (n=348) were included. EN decreases RR of death (0.50), multiple organ failure (0.55), infection (0.39), and other local complications (0.70). It also decreased hospital stay by 2.37 d.
Conclusion: EN reduces mortality, organ failure, infections, and length of hospital stay in patients with pancreatitis.

Complications of PN

- sepsis: most serious of the common complications
- mechanical pneumothorax from insertion of central line, catheter migration and thrombosis, air embolus
- metabolic: congestive heart failure, hyperglycemia, gallstones, cholestasis

Enteral Nutrition Preferable to Parenteral Nutrition

- fewer serious complications (especially sepsis)
- nutritional requirements better understood
- can supply gut-specific fuels such as glutamine and short chain fatty acids with EN
- nutrients in the intestinal lumen prevent atrophy of the gut and pancreas
- prevents gallstones by stimulating gallbladder motility
- much less expensive

Common Medications

Table 27. Common Drugs Prescribed in Gastroenterology

Class	Generic Drug Name	Trade Name	Dosing	Mechanism of Action	Indications	Contraindications	Side Effects
Proton Pump Inhibitors (H^+/K^+-ATPase inhibitors)	omeprazole	Losec®/ Prilosec®	20 mg PO once daily	Inhibits gastric enzymes H+/K+-ATPase (proton pump)	Duodenal ulcer, gastric ulcer, NSAID-associated gastric and duodenal ulcers, reflux esophagitis, symptomatic GERD, dyspepsia, Zollinger-Ellison syndrome, eradication of *H. pylori* (combined with ABx)	Hypersensitivity to drug	Dizziness, headache, flatulence, abdominal pain, nausea, rash, increased risk of osteoporotic fracture (secondary to impaired calcium absorption)
	lansoprazole or dexlansoprazole	Prevacid® Dexilant®	Oral therapy: lansoprazole 15-30 mg once daily (before breakfast), dexlansoprazole 30-60 mg once daily (does not need to be taken before breakfast)	Same as above	Same as above	Same as above	Same as above
	pantoprazole	Pantoloc® Protonix®	40 mg PO once daily for UGIB: 80 mg IV bolus then 8 mg/h infusion	Same as above	Same as above and UGIB	Same as above	Same as above
	rabeprazole	Pariet®/ Aciphex®	40 mg PO once daily	Same as above	Same as above	Same as above	Same as above
	esomeprazole	Nexium®	20-40 mg PO once daily	Same as above	Same as above	Same as above	Same as above
Histamine H2-Receptor Antagonists	ranitidine* *ranitidine drugs recalled in 2019 due to impurity concerns	Zantac®*	300 mg PO once daily or 150 mg BID IV therapy: 50 mg q8 h (but tachyphylaxis a problem)	Inhibits gastric histamine H2-receptors	Duodenal ulcer, gastric ulcer, NSAID-associated gastric and duodenal ulcers, ulcer prophylaxis, reflux esophagitis, symptomatic GERD; not useful for acute GI bleeds	Hypersensitivity to drug	Confusion, dizziness, headache, arrhythmias, constipation, nausea, agranulocytosis, pancytopenia, depression
	famotidine	Pepcid®	Oral therapy: duodenal/ gastric ulcers: 40 mg qhs GERD: 20 mg BID IV therapy: 20 mg BID	Same as above	Same as above	Same as above	Same as above
Stool Softener	docusate sodium	Colace®	100-400 mg PO once daily, divided in 1-4 doses	Promotes incorporation of water into stool	Relief of constipation	Presence of abdominal pain, fever, N/V	Throat irritation, abdominal cramps, rashes

Table 27. Common Drugs Prescribed in Gastroenterology

Class	Generic Drug Name	Trade Name	Dosing	Mechanism of Action	Indications	Contraindications	Side Effects
Osmotic Laxatives	lactulose	Lactulose Constulose®	Constipation: 15-30 mL PO once daily to BID Encephalopathy: 15-30 mL BID to QID	Poorly absorbed in GI tract and is broken down by colonic bacteria into lactic acid in the colon, increases osmotic colonic contents, increases stool volume	Chronic constipation, prevention, and treatment of portal-systemic encephalopathy	Patients who require a low galactose diet	Flatulence, intestinal cramps, nausea, diarrhea if excessive dosage
	PEG3350	Lax-a-day® RestoraLAX® Golytely®	Constipation: 17 g powder dissolved in 4-8 oz liquid PO once daily	Osmotic agent causes water retention in stool and promotes frequency of stool	Relief of constipation Colonoscopy prep	Hypersensitivity to drug	Abdominal distension, pain, anal pain, thirst, nausea, rigor, tonic-clonic seizures (rare)
	magnesium hydroxide	Milk of Magnesia/ Pedia-Lax®	Constipation (adult): 400 mg/5 mL: 30-60 mL PO qhs	Osmotic retention of fluid which distends the colon and increases peristaltic activity	Relief of constipation	Patients with myasthenia gravis or other neuromuscular disease	Renal impairment Abdominal pain, vomiting, diarrhea
Stimulant Laxatives	senna	Senokot®	Tablets: 1-4 PO qhs Syrup: 10-15 mL PO qhs	Induce peristalsis in lower colon	Constipation	Patients with acute abdomen	Abdominal cramps, discolouration of breast milk, urine, feces, melanosis coli and atonic colon from prolonged use (controversial)
	bisacodyl	Bisacodyl®	5-30 mg PO once daily (start at 10 mg for bowel preparation)	Enteric nerve stimulation and local contact-induced secretory effects Colonic movements	Constipation Preparation of bowel for procedure	GI obstruction Gastroenteritis	Abdominal colic, abdominal discomfort, proctitis (with suppository use), diarrhea
Bulk Laxatives	psyllium	Metamucil®	Start at one heaping tablespoon daily	Increases stool bulk → water retention in stool	Constipation	Hypersensitivity to drug GI obstruction	GI obstruction, diarrhea, constipation, abdominal cramps
Guanylate Cyclase C Agonist	linaclotide	Constella®	75-145 µg once daily	Opens water channels in bowel epithelial cells to add water to stool	Chronic constipation IBS-constipation	Children	Diarrhea
Antidiarrheal Agents	loperamide	Imodium®	Acute diarrhea: 4 mg PO initially, followed by 2 mg after each unformed stool	Acts as antidiarrheal via cholinergic, noncholingeric, opiate, and nonopiate receptor-medicated mechanisms; decreases activity of myenteric plexus	Adjunctive therapy for acute non-specific diarrhea, chronic diarrhea associated with IBD and for reducing the volume of discharge for ileostomies, colostomies, and other intestinal resections	Children <2 yr, known hypersensitivity to drug, acute dysentery characterized by blood in stools and fever, acute UC or pseudomembranous colitis associated with broad-spectrum ABx	Abdominal pain or discomfort, drowsiness or dizziness, tiredness, dry mouth, N/V, hypersensitivity reaction
	diphenoxylate/ atropine	Lomotil®	5 mg PO TID to QID	Inhibits GI propulsion via direct action on smooth muscle, resulting in a decrease in peristaltic action and increase in transit time	Adjunctive therapy for diarrhea, as above	Hypersensitivity to diphenoxylate or atropine, jaundice, pseudomembranous enterocolitis, diarrhea caused by enterotoxin producing bacteria	Dizziness, drowsiness, insomnia, headache, N/V, cramps, allergic reaction
	eluxadoline	Viberzil®	75-100 mg BID	Bowel opioid modulator	IBS Diarrhea	Pancreatic disease, excess EtOH, gallstones or other biliary disease	Pancreatocbiliary pain including sphincter of Oddi dysfunction
Anti-Emetics	dimenhydrinate	Gravol®	25-50 mg PO/IV/IM q4-6 h PRN	Competitive H1 receptor antagonist in GI tract, blood vessels, and respiratory tract. Blocks chemoreceptor trigger zone. Diminishes vestibular simulation and disrupts labyrinthine function through central anticholinergic action	Motion sickness, radiation sickness, postoperative vomiting, and drug-induced N/V	Hypersensitivity to drug	Xerostomia, sedation
	prochlorperazine	Stemetil®	5-10 mg PO/IV/IM BID-TID PRN	D1, D2 receptor antagonist in chemoreceptor trigger zone and α adrenergic and anti-cholinergic effects Depresses reticular activating system (RAS) affecting emesis	Postoperative N/V, antipsychotic, anxiety	Hypersensitivity to drug	Dystonia, extrapyramidal symptoms (EPS), seizure, NMS (rarely)
	metoclopramide	Maxeran®	10 mg IV/IM q2-3 h pm, 10-15 mg PO QID (30 min before meals and qhs)	Dopamine and 5-HT receptor antagonist in chemoreceptor trigger zone. Enhances response to ACh in upper GI tract, enhancing motility and gastric emptying. Increases LES tone	GERD, diabetic gastroparesis, postoperative and chemotherapy induced N/V, migraines, constipation	Hypersensitivity to drug, GI obstruction, perforation, hemorrhage, pheochromocytoma, seizures, and EPS	Restlessness, drowsiness, dizziness, fatigue, EPS, some rare serious side effects include NMS, agranulocytosis

Table 27. Common Drugs Prescribed in Gastroenterology

Class	Generic Drug Name	Trade Name	Dosing	Mechanism of Action	Indications	Contraindications	Side Effects
	ondansetron	Zofran®	Depends on procedure, generally 8-16 mg PO	Selective 5HT3 receptor antagonist in central chemoreceptor trigger zone and peripherally on vagus nerve	N/V caused by cancer chemotherapy and radiation therapy; multiple off label uses, including gastroenteritis N/V	Morphine, hypersensitivity to drug	Constipation, diarrhea, increased liver enzymes, headache, fatigue, malaise, cardiac dysrhythmia
	granisetron	Kytril®	1 mg PO BID (for nausea from chemotherapy/ radiation)	Same as above	N/V caused by cancer chemotherapy and radiation therapy	Same as above	Constipation, prolonged QT interval (rarely)
Aminosalicylates (5-ASAs)	mesalamine	Pentasa® Salofalk® Asacol® Mesasal®	CD: 1 g PO TID/QID Active UC: 1 g PO QID Maintenance UC: 1.6 g PO divided doses daily also as suppositories and enemas	5-ASA: Blocks arachidonic acid metabolism to prostaglandins and leukotrienes	Mild to moderate UC	Hypersensitivity to mesalamine salicylates; Asacol contains phthalate, potential urogenital teratogenicity for male fetus	Abdominal pain, constipation, arthralgia, headache
	sulfasalazine	Salazopyrin®	3-4 g/d PO in divided doses	Compound composed of 5-ASA bound to sulfapyridine, hydrolysis by intestinal bacteria releases 5-ASA, the active component	Mild to moderate UC	Hypersensitivity to sulfasalazine, sulfa drugs, salicylates; intestinal or urinary obstruction, porphyria	Rash, loss of appetite, N/V, headache, oligospermia (reversible)
Immuno-suppressive Agents	6-mercaptopurine (6-MP)	Purinethol®	CD: 1.5 mg/kg/d PO	Immunosuppressive	IBD: active inflammation and to maintain remission	Hypersensitivity to mercaptopurine, prior resistance to mercaptopurine or thioguanine, history of treatment with alkylating agents, hypersensitivity to azathioprine, pregnancy	Pancreatitis, bone marrow suppression, increased risk of cancer
	azathioprine	Azasan® Imuran®	IBD: 2-3 mg/kg/d PO	Same as above	Same as above	Same as above	Same as above
	prednisone		Induction of remission for acute exacerbations: 20-40 mg PO once daily; Taper 2.5-5 mg/wk until discontinued	Anti-inflammatory	Symptomatic moderate to severe CD and UC	Hypersensitivity to prednisone, systemic fungal infections	Hyperglycemia, insomnia, osteoporosis, weight gain, increased risk of infections
Biologics	infliximab	Remicade®	5-10 mg/kg IV over 2 h	Monoclonal antibody to TNFα	Medically refractory CD	Heart failure, moderate to severe, doses >5 mg/kg	Reported cases of reactivated TB, PCP, lymphoma, other infections Other TNFα share similar serious side effects
	adalimumab	Humira®	CD induction: four 40 mg SC on day 1, then 80 mg 2 wk later (day 15) CD maintenance: 40 mg every other wk beginning day 29	Monoclonal antibody to TNFα	Medically refractory CD or poor response to infliximab	Hypersensitivity to adalimumab Severe infection Moderate-to-severe heart failure	Headaches, skin rashes, upper respiratory tract infection
	golimumab	Simponi®	RA: 2 mg/kg at wk 0, 4 and then every 8 wk thereafter (use with methotrexate) UC induction: 200 mg SC at wk 0, then 100 mg at wk 2 UC maintenance: 50 mg every 4 wk	Monoclonal antibody to TNFα	Active ankylosing spondylitis Psoriatic arthritis Moderate-to-severe active RA (combined with methotrexate) UC: medically refractory UC	Hypersensitivity to golimumab or latex Severe infection Moderate-to-severe heart failure	
	vedolizumab	Entyvio®	CD/UC: 300 mg at 0, 2, 6 wk and then every 8 wk thereafter	Monoclonal antibody to α4β7 integrin	Medically refractory CD/UC, including other TNFα inhibitors and corticosteroids	Hypersensitivity to vedolizumab	Infections, liver injury, and progressive multifocal leukoencephalopathy
	tofactinib	Xeljanz®	5-10 mg BID	JAK inhibitor	UC	TB, hepatitis B	Infections
	ustekinumab	Stelara®	Induction: single IV weight-based dose on day 1 Maintenance: 90 mg subcutaneous injection every 8 w	Monoclonal antibody to IgG1K, inhibits signals by IL-12 and IL-23	Moderate to severe CD and UC	Hypersensitivity to ustekinumab	Infections, headaches, joint pain, fever, N/V
Antibiotics	rifaximin	Zaxine®	550 mg BID or TID	Non-absorbable antibiotic, affects dysbiosis of microbiome	Hepatic encephalopathy Non-constipation IBS Traveller's diarrhea	nil	nil

Landmark Gastroenterology Trials

Trial Name	Reference	Clinical Trial Details
PEPTIC ULCER DISEASE		
FAMOUS	Lancet 2009;374:119-25	**Title:** Famotidine for the Prevention of Peptic Ulcers and Oesophagitis in Patients Taking Low-dose Aspirin (FAMOUS): A Phase III, Randomised, Double-blind, Placebo-controlled Trial **Purpose:** Evaluate the efficacy of famotidine in the prevention of peptic ulcers and erosive esophagitis, in patients receiving low-dose aspirin. **Methods:** Patients without erosions or ulcers on upper endoscopy, currently on low-dose aspirin, were randomized to famotidine 20 mg BID or placebo. The primary endpoint was development of new stomach ulcers. **Results:** At 12 wk, gastric ulcers occurred in 3.4% of famotidine patients and 15% of placebo-matched patients (OR 0.20; 95% CI 0.09 to 0.47; P=0.0002). Duodenal ulcers developed in 0.5% of famotidine patients and 8.5% of placebo patients (OR 0.05; 95% CI 0.01 to 0.40; P=0.0045). **Conclusions:** Famotidine is effective in the prevention of gastric and duodenal ulcers, and erosive esophagitis in patients taking low-dose aspirin.
INFLAMMATORY BOWEL DISEASE		
SONIC	NEJM 2010;362:1383-95	**Title:** Infliximab, Azathioprine, or Combination Therapy for Crohn's Disease **Purpose:** Compare the efficacy and safety of infliximab and azathioprine therapy alone or in combination, in patients with CD. **Methods:** CD patients who had not undergone previous biologic or immunosuppressive therapy were randomized to infliximab 5 mg/kg IV infusion or 2.5 mg oral azathioprine, or combination therapy of both drugs. **Results:** Among patients receiving combination therapy, 56.8% were in steroid-free remission, compared with 44.4% of patients receiving infliximab monotherapy, and 30% receiving azathioprine monotherapy (P<0.001 for comparison with combination; P=0.06 for comparison with infliximab). **Conclusions:** Patients' CD treated with infliximab monotherapy or infliximab-azathioprine combination had better corticosteroid-free remission than azathioprine monotherapy recipients.
A Comparison of Methotrexate with Placebo for the Maintenance of Remission in Crohn's Disease	NEJM 2000;342:1627-32	**Title:** A Comparison of Methotrexate with Placebo for the Maintenance of Remission in Crohn's Disease **Purpose:** Evaluate the role of methotrexate in maintaining remission of CD. **Methods:** Patients with chronically active CD who entered remission were randomized to methotrexate 15 mg IM or placebo for 15 wk. The primary endpoint was rates of remission at wk 40. **Results:** At the follow-up period of 40 wk, 65% of methotrexate patients were in remission compared to 39% of patients in the placebo group (risk reduction 26.1%; 95% CI 4% to 47.8%; P=0.04). None of the methotrexate patients reported serious adverse events. **Conclusions:** Patients with CD in remission saw increased remission rates and fewer relapse treatments at 40 wk.
Adalimumab Induction Therapy for Crohn's Disease Previously Treated with Infliximab	Ann Intern Med 2007;146:829-38	**Title:** Adalimumab Induction Therapy for Crohn's Disease Previously Treated with Infliximab **Purpose:** Determine the efficacy of adalimumab in symptomatic CD patients despite infliximab treatment. **Methods:** 325 adults with moderate-severe active CD were randomized to induction doses of adalimumab 160 mg and 80 mg at 0 and 2 wk respectively, or time-matched placebo. The primary endpoint was induction of remission at week 4. **Results:** Remission was achieved at 4 wk in 21% of adalimumab patients compared with 7% of placebo patients (95% CI 6.7% to 21.6%). **Conclusions:** Adalimumab induces remission more frequently than placebo in adult patients with symptomatic CD despite infliximab therapy.
UNIFI	NEJM 2019;381:1201-14	**Title:** Ustekinumab as Induction and Maintenance Therapy for Ulcerative Colitis **Purpose:** Determine the effectiveness of ustekinumab as induction and maintenance therapy in patients with UC. **Methods:** 961 patients with moderate-severe UC were randomized to IV induction ustekinumab (130 mg), or placebo. The primary endpoint was clinical remission determined by the Mayo scale. **Results:** The primary endpoint occurred in 15.6% of patients in the intervention group compared with 5.3% of placebo patients (P<0.001). The incidence of serious adverse events was similar between groups. **Conclusions:** Ustekinumab was more effective than placebo for inducing and maintaining remission in patients with moderate-to-severe UC.
VARSITY	NEJM 2019;381:1215-26	**Title:** Vedolizumab versus Adalimumab for Moderate-to-Severe Ulcerative Colitis **Purpose:** Compare efficacy of vedolizumab versus adalimumab in patients with moderate-severe UC. **Methods:** Adults with moderate-severe active UC were randomized to IV infusions of vedolizumab 300 mg or subcutaneous adalimumab 40 mg (total weekly dose 160 mg). The primary outcome was clinical remission at wk 52 as determined by the Mayo scale. **Results:** At wk 52, clinical remission was observed in 31.3% of vedolizumab patients compared to 22.5% of adalimumab patients (95% CI 2.5 to 15.0; P=0.006). Steroid-free remission occurred in 12.6% of vedolizumab patients and 21.8% of adalimumab patients (95% CI 18.9 to 0.4). **Conclusions:** In patients with moderate-to-severe UC, vedolizumab was superior to adalimumab with respect to achievement of clinical remission and endoscopic improvement, but not corticosteroid-free clinical remission.
LIVER DISEASE		
MELD Score as A Predictor Of Death in Chronic Liver Disease, Weisner et al. 2003	Gastroenterology 2003;124:91-96	**Title:** MELD Score as A Predictor Of Death in Chronic Liver Disease **Purpose:** Assess the capability for the MELD score to correctly rank potential liver transplant recipients. **Methods:** The MELD score was prospectively applied to estimate 3-mo mortality in 3437 adult liver transplant candidates with chronic liver disease. **Results:** Waiting list mortality increased directly in proportion to the MELD score. Using 3-mo mortality as the endpoint, the ROC curve for MELD was 0.83 compared to 0.76 for the Child-Turcotte-Pugh score. **Conclusions:** MELD score can be applied for allocation of donor livers as it accurately predicts 3-mo mortality in patients with chronic liver failure
PROVE 3	NEJM 2010;362:1292-1303	**Title:** Telaprevir for Previously Treated Chronic HCV Infection **Purpose:** Study the efficacy of telaprevir in patients without a sustained virologic response to peginterferon therapy. **Methods:** Patients with HCV genotype 1 without sustained virologic response to peginterferon therapy were randomized to one of four telaprevir and peginterferon treatment groups. The primary endpoint was sustained virologic response 24 wk after the last dose. **Results:** The rates of sustained virologic response in the three telaprevir groups were significantly higher than the control group rates (14%, P<0.001, P<0.001, P=0.02). Discontinuation of the drugs due to adverse events was more frequent in the telaprevir groups than in the control group (15% vs. 4%). **Conclusions:** In HCV-infected patients in whom initial peginterferon therapy failed, retreatment with telaprevir in combination with peginterferon and ribavirin was more effective than the latter two alone.
SPRINT-2	NEJM 2011;364:1195-1206	**Title:** Boceprevir for Untreated Chronic HCV Genotype 1 Infection **Purpose:** Evaluate virologic response with additional boceprevir treatment in patients with HCV genotype 1 infection. **Methods:** Previously untreated adults with HCV genotype 1 infection were randomized to placebo plus peginterferon-ribavirin or boceprevir plus peginterferon-ribavirin. The primary endpoint was sustained virologic response. **Results:** A virologic response was achieved in 40% of group 1, 67% in group 2 and 68% in group 3. **Conclusions:** The addition of boceprevir to standard therapy of peginterferon-ribavirin, compared with standard therapy alone, increased rates of sustained virologic response in chronically HCV infected adults.

Trial Name	Reference	Clinical Trial Details
Rifaximin Treatment in Hepatic Encephalopathy	NEJM 2010;362:1071-81	**Title:** Rifaximin Treatment in Hepatic Encephalopathy **Purpose:** Evaluate the efficacy of rifaximin in the prevention of hepatic encephalopathy secondary to cirrhosis. **Methods:** 299 patients in remission from recurrent hepatic encephalopathy were randomized to rifaximin 550 mg BID or placebo for 6 mo. The primary endpoint was time for the first breakthrough episode. **Results:** Rifaximin reduced the risk of a hepatic encephalopathy episode (hazard ratio 0.42; 95% CI 0.28 to 0.64; P<0.001). A breakthrough episode occurred in 22.1% of rifaximin-treated patients compared to 45.9% of placebo patients (hazard ratio 0.5; 95% CI 0.29 to 0.87; P=0.01). The incidence of adverse events was similar between groups. **Conclusions:** The antibiotic rifaximin was successful in maintaining remission from hepatic encephalopathy and reducing hospitalizations.
Prednisolone or Pentoxifylline For Alcoholic Hepatitis	NEJM 2015;372:1619-28	**Title:** Prednisolone or Pentoxifylline For Alcoholic Hepatitis **Purpose:** To elucidate the benefits of pentoxifylline and prednisolone for the treatments of severe alcoholic hepatitis. **Methods:** Patients with severe alcoholic hepatitis were randomized to one of four groups: double-matched placebo, prednisolone plus matched placebo, pentoxifylline plus matched placebo, or prednisolone plus pentoxifylline. The primary endpoint was mortality at 28 d. **Results:** Mortality at 28 d was 17% in the first group, 14% in the second group, 19% in the third group, and 13% in the fourth group. At 90 d and 1 yr, there were no significant differences between groups. **Conclusions:** For alcoholic hepatitis, prednisolone improved survival at a level below statistical significance. Pentoxifylline did not improve survival.

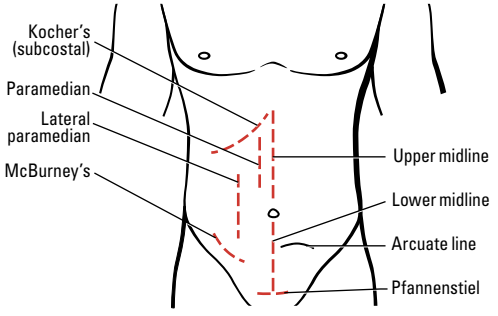
Acronyms

5-FU	5-fluorouracil
AAA	abdominal aortic aneurysm
ABG	arterial blood gas
ABI	ankle brachial index
ALND	axillary lymph node dissection
APR	abdominoperineal resection
ARDS	acute respiratory distress syndrome
ATN	acute tubular necrosis
AXR	abdominal x-ray
BRBPR	bright red blood per rectum
BCS	breast conserving surgery
CBD	common bile duct
CEA	carcinoembryonic antigen
CF	cystic fibrosis
CHD	common hepatic duct
CRC	colorectal cancer
CVA	costovertebral angle
CVP	central venous pressure
DCIS	ductal carcinoma *in situ*
DIC	disseminated intravascular coagulation
DPL	diagnostic peritoneal lavage
DRE	digital rectal exam
EBL	estimated blood loss
ERCP	endoscopic retrograde cholangiopancreatography
EUA	examination under anesthesia
EUS	endoscopic ultrasound
FAP	familial adenomatous polyposis
FAST	focused abdominal sonography for trauma
FNA	fine needle aspiration
FNH	focal nodular hyperplasia
FOBT	fecal occult blood test
GERD	gastroesophageal reflux disease
GIST	gastrointestinal stromal tumour
GU	genitourinary
HCC	hepatocellular carcinoma
HDGC	hereditary diffuse gastric carcinoma
HIDA	hepatobiliary imino-diacetic acid
HNPCC	hereditary nonpolyposis colorectal cancer
I&D	incision and drainage
IBD	inflammatory bowel disease
IPAH	idiopathic pulmonary arterial hypertension
IPF	idiopathic pulmonary fibrosis
IUGR	intrauterine growth restriction
IVC	inferior vena cava
IVIG	intravenous immune globulin
LAR	low anterior resection
LBO	large bowel obstruction
LCIS	lobular carcinoma *in situ*
LES	lower esophageal sphincter
LGIB	lower gastrointestinal bleed
LLQ	left lower quadrant
LMWH	low molecular weight heparin
LUQ	left upper quadrant
LVRS	lung volume reduction surgery
MALT	mucosa-associated lymphoid tissue
MBP	mechanical bowel preparation
MEN	multiple endocrine neoplasia
MIBG	metaiodobenzylguanidine
MIS	minimally invasive surgery
MRCP	magnetic resonance cholangiopancreatography
MSAFP	maternal serum α-fetoprotein
NET	neuroendocrine tumour
NS	normal saline
OCP	oral contraceptive pill
OGD	oesophagogastroduodenoscopy
PMN	polymorphonuclear neutrophils
POD	postoperative day
PPI	proton pump inhibitor
PTC	percutaneous transhepatic cholangiography
PTT	partial thromboplastin time
PUD	peptic ulcer disease
RAI	radioactive iodine
RL	Ringer's lactate
RLQ	right lower quadrant
RUQ	right upper quadrant
SBO	small bowel obstruction
SBFT	small bowel follow-through
SCC	squamous cell carcinoma
SIADH	syndrome of inappropriate anti-diuretic hormone
SMA	superior mesenteric artery
SMV	superior mesenteric vein
SNLB	sentinel lymph node biopsy
TED	thromboembolic deterrent
TEE	transesophageal echocardiogram
TTE	transthoracic echocardiogram
UC	ulcerative colitis
UGI	upper gastrointestinal series
UGIB	upper gastrointestinal bleed
URTI	upper respiratory tract infection
VATS	video-assisted thoracoscopic surgery
VIP	vasoactive intestinal peptide
VTE	venous thromboembolism

Basic Anatomy Review



Kocher's (subcostal)	Access to RUQ or LUQ contents i.e. gallbladder, spleen
Upper Midline	Access to stomach, duodenum, gallbladder, liver, transverse colon
Paramedian	Can make similar incision in each quadrant for access to each quadrant's contents Post-operative ventral hernias common Not commonly used
Lateral Paramedian	At outer 1/3 - medial 2/3 border of rectus Modification of paramedian but with lower risk of dehiscence or ventral hernia Not commonly used
Lower Midline	Access to pelvic organs, sigmoid colon, and rectum
Pfannenstiel	Suprapubic incision for access to pelvic cavity
McBurney's	Access to appendix, other RLQ and LLQ contents

© Cassandra Catlin 2014, after Agnes Chan 2012

Figure 1. Abdominal incisions

Lateral Abdominal Wall Layers and their Continuous Spermatic and Scrotal Structures (superficial to deep)

1. skin (epidermis, dermis, subcutaneous fat)
2. superficial fascia
   - Camper's fascia (fatty) ➔ Dartos muscle/fascia
   - Scarpa's fascia (membranous) ➔ Colles' superficial perineal fascia
3. muscle (see Figure 2 and Figure 3)
   - external oblique ➔ inguinal ligament ➔ external spermatic fascia
   - internal oblique ➔ cremasteric muscle/fascia
   - transversus abdominis ➔ posterior inguinal wall
4. transversalis fascia ➔ internal spermatic fascia
5. preperitoneal fat
6. peritoneum ➔ tunica vaginalis

Midline Abdominal Wall Layers (superficial to deep)

1. skin
2. superficial fascia
3. rectus abdominis muscle: in rectus sheath, divided by linea alba (see Figure 3)
   - above arcuate line (midway between symphysis pubis and umbilicus)
     - anterior rectus sheath = external oblique aponeurosis and anterior leaf of internal oblique aponeurosis
     - posterior rectus sheath = posterior leaf of internal oblique aponeurosis and transversus abdominis aponeurosis
   - below arcuate line
     - aponeuroses of external oblique, internal oblique, and transversus abdominis all pass in front of rectus abdominis
4. arteries: superior epigastric (branch of internal thoracic), inferior epigastric (branch of external iliac); both arteries anastomose and lie behind the rectus muscle (superficial to posterior rectus sheath above arcuate line)
5. transversalis fascia
6. peritoneum

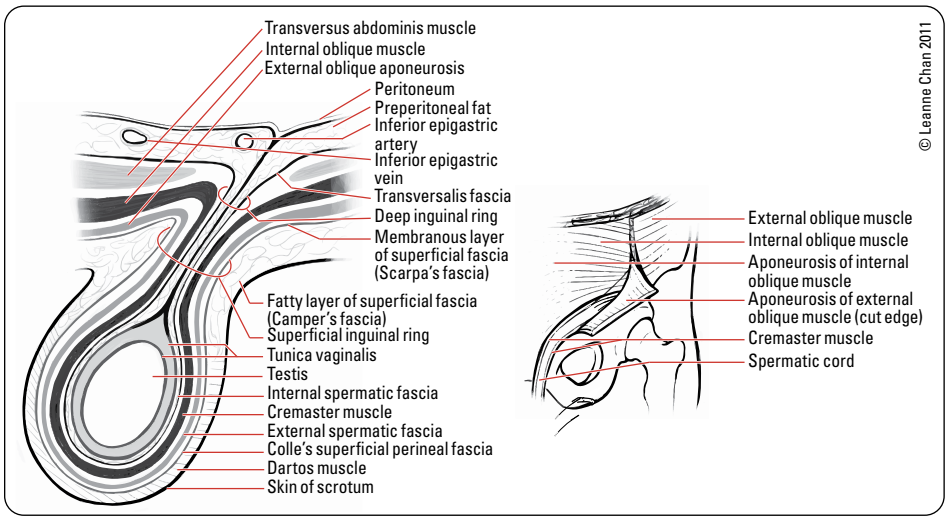


Figure 2. Continuity of the abdominal wall with layers of the scrotum and spermatic cord

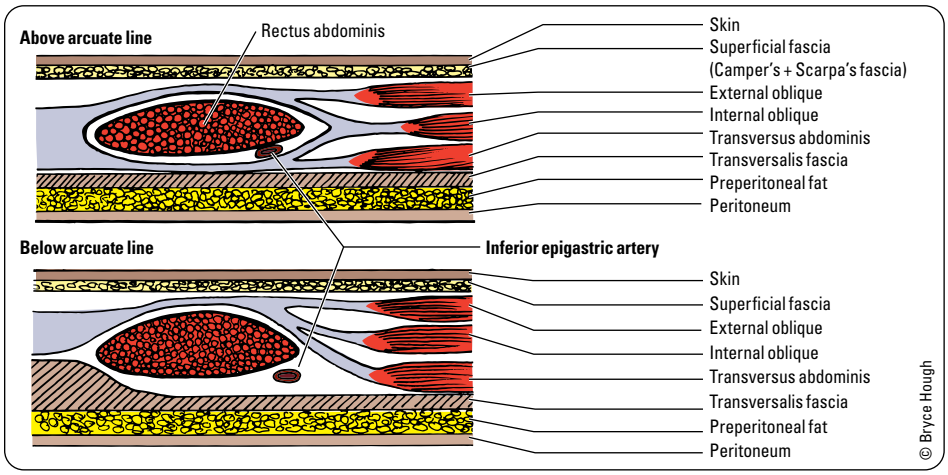

Figure 3. Midline cross-section of abdominal wall

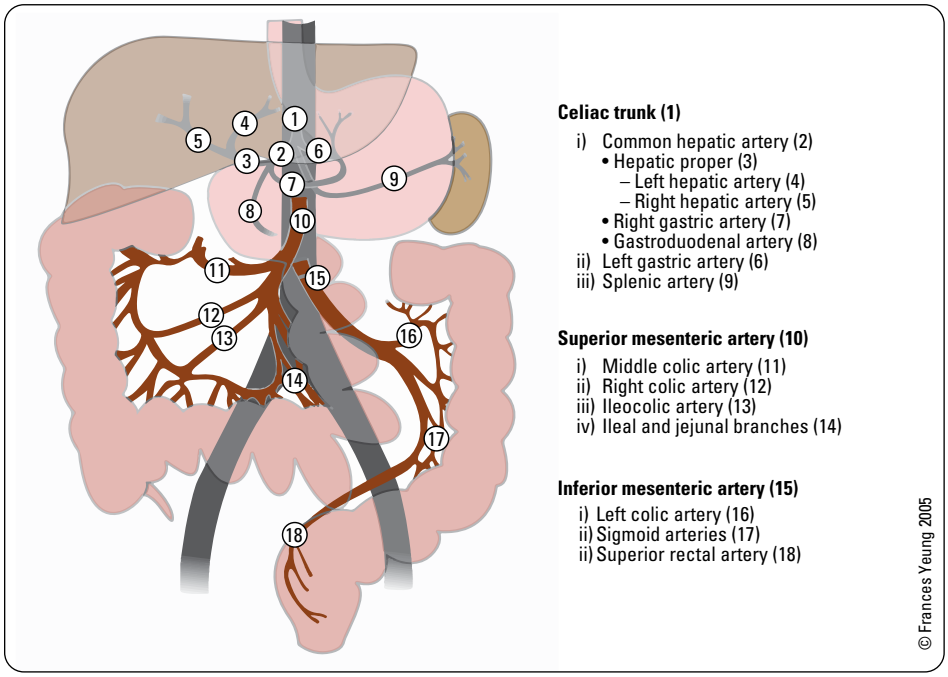

Figure 4. Arterial blood supply to the GI tract

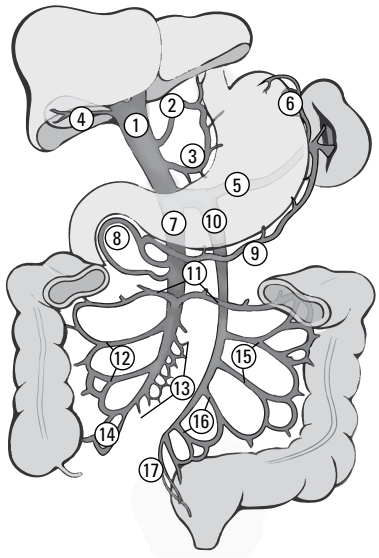
Organ	Arterial Blood Supply
Liver	Left and right hepatic (branches of hepatic proper)
Spleen	Splenic
Gallbladder	Cystic (branch of right hepatic)
Stomach	1. Lesser curvature: right and left gastric 2. Greater curvature: right (branch of gastroduodenal) and left (branch of splenic) gastroepiploic 3. Fundus: short gastrics (branches of splenic)
Duodenum	1. Gastroduodenal 2. Pancreaticoduodenals (superior branch of gastroduodenal, inferior branch of superior mesenteric)
Pancreas	1. Pancreatic branches of splenic 2. Pancreaticoduodenals
Small intestine	Superior mesenteric branches: jejunal, ileal, ileocolic
Large intestine	1. Superior mesenteric branches: right colic, middle colic 2. Inferior mesenteric branches: left colic, sigmoid, superior rectal

Venous Flow



Portal vein (1)

Superior mesenteric vein (7)

i) Ileal and jejunal veins (13)
ii) Ileocolic vein (14)
iii) Right colic vein (12)
iv) Middle colic vein (11)
v) Pancreaticoduodenal vein (8)
vi) Right gastroepiploic vein (9)

Splenic vein (5)

i) Inferior mesenteric vein (10) (superior rectal vein until crossing common iliac vessels)
- Left colic veins (15)
- Sigmoid veins (16)
- Superior rectal veins (17)

ii) Pancreatic veins
iii) Left gastroepiploic vein
iv) Short gastric veins (6)

Left gastric (coronary) vein (2)

Right gastric vein (3)

Cystic vein (4)

Paraumbilical vein – (within round ligament, not shown)

Figure 5. Venous drainage of the GI tract

Differential Diagnoses of Common Presentations

Acute Abdominal Pain

- acute abdomen = severe abdominal pain of acute onset and requires urgent medical attention
- in patients with acute abdominal pain, the first diagnoses that you should consider are those requiring potential urgent surgical intervention
- two presentations requiring urgent general surgery referrals are peritonitis and obstruction

Table 1. Differential Diagnosis of Acute Abdominal Pain

Right Upper Quadrant (RUQ)	Right Lower Quadrant (RLQ)
Hepatobiliary	**Gastrointestinal**
Biliary colic	Appendicitis*
Cholecystitis*	Crohn's disease
Cholangitis	Tuberculosis of the ileocecal junction
CBD obstruction (e.g. stone, tumour)	Cecal tumour
Hepatitis (includes perihepatitis/Fitz-Hugh-Curtis syndrome)	Intussusception
Portal vein thrombosis	Mesenteric lymphadenitis (Yersinia)
Budd-Chiari syndrome	Cecal diverticulitis
Hepatic abscess/mass	Cecal volvulus*
Right subphrenic abscess*	Hernia: femoral, inguinal obstruction, Amyand's (and resulting cecal distention)
Gastrointestinal	**Gynaecological**
Pancreatitis	See 'suprapubic'
Presentation of gastric, duodenal, or pancreatic pathology	**Genitourinary**
Hepatic flexure pathology (e.g. CRC, subcostal incisional hernia)	See 'suprapubic'
Genitourinary	**Extraperitoneal**
Nephrolithiasis*	Abdominal wall hematoma/abscess
Pyelonephritis	Psoas abscess
Renal: mass, ischemia, trauma	
Cardiopulmonary	
Right lower lobe pneumonia	
Effusion/empyema	
CHF (causing hepatic congestion and right pleural effusion)	
MI	
Pericarditis	
Pleuritis	
Miscellaneous	
Herpes zoster	
Trauma	
Costochondritis (Infectious*)	

*indicated need for urgent surgical evaluation

In All Patients Presenting with an Acute Abdomen, Order the Following:
Key Tests for Specific Diagnosis
- ALP, ALT, AST, bilirubin
- Lipase/ amylase
- Urinalysis
- β-hCG (in women of childbearing age)
- Troponins
- Lactate

Key Tests for OR Preparation
- CBC, electrolytes, creatinine, glucose
- INR/PTT
- CXR (if history of cardiac or pulmonary disease)
- ECG if clinically indicated by history or if >69 yr and no risk factors

Note: Choosing Wisely does not recommend routine preoperative blood work for ambulatory/elective surgery

Types of Peritonitis
- Primary peritonitis: spontaneous without clear etiology
- Secondary peritonitis: due to a perforated viscus
- Tertiary peritonitis: recurrent secondary peritonitis more often with resistant organisms

Localization of Pain
- Most digestive tract pain is perceived in the midline because of bilaterally symmetric innervation; kidney, ureter, ovary, or somatically innervated structures are more likely to cause lateralized pain
- Parietal peritoneum: supplied by somatic sensory nerves of body wall. Pain is sharp and well-localized
